heaped together, in its mass to a fullness; that from thence a flowring or putting forth arising, at the set intervalls of times, it might thrust the same subtilities out of doors: yea rather this growing hot glows not with a great, and open burning: but like a fire covered over with chips, sends forth a moist smoke or breath, rather then a flame: But so, that from thence, by reason of the nervous juice being depraved soon in its disposition, and not rarely, because of the lungs being stuffed with the consumptive matter, the convulsive, or phthifical or consumptive symptoms, did molest chiefly, in the whole course of the disease.

Blood to be taken away at the beginning of the disease.

It behoves us to designe the curative Intentions, according to the various times of the disease, and the diversities of the symptoms chiefly urging. About the beginning of this feavour, the taking away of blood, seem'd convenient allmost to all: This kinde of remedy, I often experienced with success, in little Children: For that by the means, as it were another breathing place is opened, to the mass of blood, silently and covertly growing hot, and obtruding its soot or smoak, on the more noble parts; and for that reason, its impure effloreſcencies or puttings forth, are drawn away from the brain, and lungs. Therefore, although this feavour of an ill Condition, may be accounted as it were malignant, yet forasmuch as the blood is not presently apt to be coagulated, but to be too much poured forth, and to bestow its serosities on the nobler parts, to wit, the brain and lungs; therefore *Phlebotomy*, so it be administred in the beginning of the disease, is convenient allmost to all.

For the same reason, *Cathartick* Medicines, and chiefly vomitory, are administred at the very beginning of the disease; for these do not only evacuate the *viscera* of concoction, and so draw away the chief fomenting of the disease, and as it were its originall, but besides, they draw forth the serosities from the blood, and so effect its cleansing, rather in the stomach and Intestines, then in the head and lungs. Further by Emeticks, for that the receiving *Glandulaes* of the *Lymphe-ducts*, are pulled with a great shaking, the superfluities of the nervous juice, least they should evilly affect the brain, and its dependencies, are expressed forth into the lower bowells: also for this end, the belly is to be kept continually loose, by the use of Clysters. But in the mean time, whilst the blood being infected with the taint of this disease, threatens the brain or *præcordia*, with the evill, it will not be safe to attempt any thing with *Diaphoreticks*, or sweating medicines, or *Diureticks* or such as evacuate by urine, or also with *Cathartick* vomiting and purging medicines: For these kinde of medicines, forasmuch as they greatly pour out the blood, and compell its serosities into more open issuings forth, all the recrements, being apt to fall away from the mass of the blood, are easily obtruded on the brain, or Lungs, when they are of a more feeble constitution: So in the youth above-mentioned, a loss of speech, came upon the raising of an untimely sweat: Also I have known, that *Sudorificks*, no other then chaly beats, in the morbid disposition of the lungs, have brought on a waisting or Consumption.

Vomits and Purges, are to be administred.

Phlebotomy therefore, and if need be vomiting, or purging, either one or other, or both, being to be made use of at the very beginning of the disease, the other Intentions shall be, to draw away the morbific serosities of the blood, apt to flow forth on the head or breast, and to derive them gently by other ways of evacuation, and to put them forth of doors. To this end, *Vesicatories* or blistering plaisters, ought to be applyed, to the nape of the neck, or *Parotida* or *jugular Arteries*, or to the Arm-pits, or the Groin, or about the thighs, or calves of the legs, sometimes in this part, sometimes in that; to wit, that the little Ulcers being here and there excited, and continually running, might plentifully pour forth the *serum*, imbued with the morbid, and heterogeneous particles.

Blistering plaisters.

Diureticks.

But Remedies, gently carrying the *serum*, into the Reins, and urinary passages, are most often administred with success: For this business, *diuretical Apozems*, and Julaps, are to be ordained after the following forms.

A diuretick Apozem.

Take of the Roots of *Scorzonera*, *cherfoil*, *grass*, and of *Eryngoes* candied each ℥ vi. 1. *Apple* cut, of the leaves of *pimpinell*, *meadow-sweet*, each i. handfull, of *Raysons of the Sun*, ℥ i ß. of *harts-horn*, burnt ℥ ii. being cut and bruised, let them be boyled on a clear fire, in four pints of spring water, to the Consumption of the third part; to the straining being cleared ii. pints, add of the *Syrrop* of *green Cytorns*, or *violets* ℥ ii. of *sal prunella* ℥ i ß. make an *Apozem*. The dose ℥ iiii. to vi. thrice in a day.

Or

Or into that ſtraining, put 15 *blanched ſweet Almonds*, and of the four cold ſeeds, each ʒ i. being bruiſed, make an Emulſion according to Art. *An Emulſion*

Take water of *Dragons*, and of *black-Cherries* each ℥ iiii. of *ſcordium* compound ʒ ii. of *Threacle* water ℥ i ß. of *ſyrrop of Clove-gilliflowers*, ℥ ii. of the ſpirit of *vitriol* xii. drops, make a Julap. *Julap.*

Take oftentimes in a day, in ſmall beer or poſſet-drink, half a dram, or ii. ſcruples of *ſal-prunella*. *A Power.*

Beſides, in this feavour, medicines gently ſweating, of that ſort chiefly, which reſtores the animal ſpirits, and defends them from any heterogeneous *Copula*, are of very great uſe: wherefore, either the *powder of pearls*, or the *ſpirit of harts horn*, or of *blood*, in a moderate doſe, are adminiſtred twice in a day, *viz.* Morning and Evening. *Gentle Diaphoreticks.*

Clyſters are to be given almoſt every day, and if it be thought fit, a gently looſning *purge*, may be taken once or twice in a week. *Gliſters.*

The dyet preſcribed ought to be ſlender, as in other feavours, let them be wholly interdicted from fleſh, or broath made thereof, only let the ſick feed on Grewell, or barly-broth, and let their drink be ſmall beer or poſſet-drink. *Dyet.*

If that notwithſtanding, any preventive phyſick, the morbific matter, ſhould lodge in the brain, or Lungs, or both together, ſo that a diſſolution, or inordination of the animal function, or alſo a violent cough, ſhould aſſalt them, it muſt be conſider'd, what is to be done in either ſtate of the diſeaſe, carried forth after this manner, into an evill condition; but then the curative Indications ought to reſpect the ſtupor, or madneſs, or cough: and laſtly, if in the declination of the diſeaſe, theſe ſymptoms do remit, proper Remedies are to be adhibited, againſt the *Atrophie*, as it were the laſt fortreſs of this Feavour.

1ſt. Therefore if the morbifick matter, as it is often wont, being brought to the brain, ſhould bring in an Inſenſibleneſs, or a ſoporiferous or ſleepy diſtemper, remedies drawing it another way, and deriving it ſome way from the head, and beſides ſuch as ſtir up the animal ſpirits, and take away the impure *Copula* ought carefully to be adminiſtred, wherefore in this caſe, the uſe of Epiſpaſticks or ſuch things that draw the water outwardly, ſhould be much increaſed, and let the *ſpirit of Harts-horn*, be exhibited allmoſt every ſixth hour, in a little bigger doſe, let blood be alſo taken, by the ſucking of Leeches, more largely from the jugular veins, the *Salvatella*, or the ſedal veins. If the diſtemper remits not, the head being ſhaven, let *Emollient fomentations* be often applyed thereto: Further, let *Cupping-Glaſſes*, *Plaiſters*, and *Cataplaſms*, be laid to the ſoals of the feet, and other means of Adminiſtrations, ſuch as are commonly preſcribed for the curing of the ſtupor, or Inſenſibleneſs, ought to be uſed: In like manner, if on the evill, or no *Criſis* of this feavour, a phrenſie, or madneſs ſhould come, remedies appropriate to thoſe diſtempers, are made uſe of. *The Curatory Method in the unſenſibleneſs and madneſs:*

2dly, But if either with, or without this ſort of diſpleaſure, brought to the head, the Lungs alſo have taken the evill of this diſeaſe, ſo that the ſick, not yet free from the feavour, ſeem to fall into a waiſting, or Conſumption, with a troubleſome cough, with abundance of thick, and often diſcoloured ſpittle; Medicines commonly preſcribed for ſuch kinde of Diſtempers, are convenient enough; wherefore, pectoral Decoctions, Electuaries, ſyrrops, diſtill'd waters of milk and ſnails, and other remedies of the like nature, ought diligently to be made uſe of; the forms of which may be found, in the before-deſcribed Caſes. *In the Cough.*

Thus far we have deſcribed the continual feavonr, for the moſt part convulſive, and ariſing no leſs from the fault of the nervous juice, then of the blood: I will here further propoſe an example of a diſeaſe, having the likeneſs of an intermitting feavour, but radicated chiefly in the nervous juice; the nature of which kinde of diſtemper, for that it is very rare, and truly pertinent to our convulſive *Pathologie*, will appear from the following hiſtory.

A noted Woman very young, and indued with a more weak conſtitution of brain, aud nervous ſtock, and for that cauſe very obnoxious to convulſive diſtempers, after ſhe had conceived with child, about the fourth month of her being big, from cold being taken, ſhe was grievouſly afflicted with Aſtmatical fits, and beſides, with a frequent ſinking down of her ſpirits: but by the uſe of remedies, indued with a volatile ſalt, ſhe grew well, within a fortnights ſpace, but after that, about 14. days, an unwonted and truly admirable diſtemper, fell upon this Gentlewoman. *A very rare Obſervation.*

One morning, awaking after an unquiet sleep that night, she felt a light shivering in all her body, as if she had had the fit of an Ague: frequent yaunings, and reatchings, with an endeavour to vomit followed thereupon: then her urine, which was but now of a citron colour, and of a laudable substance, became pale, and wateriſh, and was rendred at every turn, to wit, almost every minute of an hour: moreover, about her loins, and *hypochondria*, and in other places, pains with light Convulsions, running about here and there, were excited: which kinde of symptoms plainly convulsive, with her frequent making of a lympid urine, continued in the Morning allmost to Evening, in which space of time, a great quantity of water, at least three times more then the liquor she had taken, was rendred; in the mean time, neither was the heat great, nor did thirst trouble her, nor was her pulse encreased: In the evening the aforesaid distempers ceased, and her urine became citron colour, and moderate; and besides, all night she enjoy'd a moderate sleep, then the morning following, about the same hour, the fit returned, accompanied altogether with the like symtoms, and so dayly acted the same Tragedy.

The reason of it. Visiting this Gentlewoman, after she had been sick in this manner for 12. days, I framed the Ætiologie of the aforesaid case, to wit, that this disease, chiefly radical in the nervous stock, did depend upon the effervescency, and flux of the humour, watering the nervous parts: For it might be suspected, that this water being diffused from the blood, made degenerate by reason of the suppression of her Terms, upon the brain, and nervous stock, became more sharp, and serous than it ought to be, and for that cause incongruous to the containing parts: wherefore, being gathered together to a plenitude, by the nights sleep, it did stir them up, or provoke them, for the expulsion of it, every where into wrinklings, and contractions: hence shiverings, yaunings, streachings, and wandring pains, were excited in the whole body: Furthermore, from the sollid parts, after this manner contracted, and shaken, not only the nervous Liquor, but also the nutricious, every where laid up in the sollid parts, but not truly assimilated, were shaken off: and then, either *Latex*, being exterminated from its receptacles, and received by the veins, or Lymphaducts, or water-carrying vessells, was render'd to the Mass of blood: from whose bosome, before it had acquired a lixiviall tincture from it, being at last cast forth by the reins, constituted a clear, and Copious urine: But that this distemper observed such exact periods, the reason is, because the nervous water, being supplyed with an equall dimension, did arise to a fulness of running over, dayly at the set time: Therefore also, the urine appeared concocted, and yellow, before and after the fit, because then its matter consisted only from the *serum* of the blood: Afterwards, during the convulsive fit, the limpid humour being shaken off, from the solid and nervous parts, and passing quickly thorow the blood, adulterated the colour and the quantity of the urine. I prescribed to this big-bellied woman, Phlebotomie, and besides, a powder composed out of *Corall*, *pearls*, *ivory*, and other *Cardiacks*, to be taken thrice in a day, in a proper Liquor; morning and evening she took of the *tincture of Antimony*, 12. drops (whose singular effect in the too great flux of urine, I have many times experienced): By the use of these, all the symptoms ceased, in a short time. ℞

CHAPTER IX.

Of Universal Convulsions, which are wont to be excited, because of the Scorbutic dispoſition of the Nervous juice.

Universal Convulsions by reason of the Scorbutic dispoſition of the nervous juice. THus much concerning universal Convulsions, diffused thorow the whole nervous kinde, which come upon feavours; and especially concerning the Convulsions, which are wont to be excited, in the commonly called *malignant hectick Feavour*. There yet remains (which was proposed in the third place) for us to shew, by what means, and from what causes, universal Convulsions are induced, without

without poyſon or ſeavouriſh infection, by reaſon of the ſcorbutick, or otherwiſe vitious dyſcraſie or evill diſpoſition, of the nervots juice. For indeed, the Liquor watering both the nerves, and the nervous parts, ſometimes diſceding from its naturall diſpoſition, is ſo much ſtuft'd with heterogeneous and exploſive particles, that the animal ſpirits, admitting an incongruous *Copula*, every where growing to themſelves, are irritated into continuall, as it were cracklings, or convulſive exploſions: Theſe kinde of Affections of the ſpirits, are either divided or ſeparated, between which no Communication, or dependency intercedes, *viz.* When many parts of the body are troubled at once, with ſo many Convulſions proper to themſelves, which do not come ſucceſſively one from another, but are terminated in the ſame muſcle or member, where they begin: After which manner, I have known ſome ſick people, who have had their muſcles and tendons, all at once in their whole body, perpetually to leap forth, with ſo many diſtinct Convulſions. Or Secondly, the Convulſive Diſtempers, which are excited in the whole nervous kinde together, are continued or connex, which ſucceed one another, with a certain perpetual viciſſitude continued between themſelves: Foraſmuch as inordinate motions, almoſt of all the members, mutually relieving themſelves, being riſen in one part, preſently paſſe over to others. For ſo *Horſtius* relates of a maid, obnoxious to Convulſive motions, whoſe members and Limbs not only were forced into divers manner of flections and diſtortions, but beſides, as if agitated by an evill Spirit, not being able to ſtand in a place, ſhe was neceſſitated to run up and down here and there, and to dance, and leap in the Hot-houſe; nor could be hindred from it by any force or chiding, but that ſhe would run here and there; now ſhe would caſt her ſelf on her feet, now impetuouſly fling her ſelf after another manner, for if ſhe did endeavour never ſo little to be quiet, preſently her *Præcordia* was moſt grievouſly afflicted. Wherefore, the Buſineſs of our preſent task is, to enquire a little more exactly, into the nature and Cauſes of either Convulſive Affection, to wit, both of that, which is affected through the very much leaping of the tendons and muſcles together, and of this, which is cauſed through the madneſs and inquietudes of the members or of the whole body: that from thence it may appear, what method of healing ought to be adminiſtred in either Caſe.

Two kindes of theſe viz. Separate and Connex or joyned together.

As to the former kinde, it eaſily appears, that theſe kinde of diſtempers, are not ſimple, but complicated, to wit, of a Convulſion, and Palſie. For the muſcles and tendons, are perpetually urged with Convulſive motions, notwithſtanding, the ſick being made weak, they are not able ſtrongly to move any of their members, or their whole body: yea, to theſe Diſtempers, pains equally diffuſed thorow all the Limbs, are adjoyned. Hence we may infer, that the animal Spirits are imbued, with a manifold *Copula*, *viz.* both with exploſive, and alſo narcotick ot ſtupifying, and in ſome ſort irritative or provoking particles: ſo that, although being alway burthened, they enter into exploſions, yet, not many together, nor indeed any haſtily or ſtrongly are exploded, by reaſon of the other interjected Particles of another kinde; wherefore the motive force does not long continue, but is ſhort, and as it were interrupted: juſt as if gunpowder being kneeded with ſome muddy ſubſtance, ſhould be fired: for then the whole maſs is not let off at once, with a noiſe, nor does one heap preſently fire another, but a few grains only, and thoſe ſucceſſively, to wit, one a little while after another, with ſmall crackling noiſes, are let off or exploded: In like manner, the nervous Liquor is ſtuffed thorowout, with Convulſive particles, which even cleave to the Spirits: but foraſmuch, as ſome narcotick, and other painfull ones, are mingled with them, the elaſtick force of the former, however laſting, and greatly diffuſed, is yet much broken and every where cut off.

The nature of the broken Convulſive diſtemper.

For the illuſtrating this kinde of broken convulſive Diſtemper, I will here deſcribe a very notable caſe of a certain Gentleman lately living in this neighbourhood: which being truly admirable, not any writings or obſervations of Phyſitians, have ſcarce ſhewed the like. An honourable Gentleman whom I knew, ſprung from Parents, and grandfathers obnoxious to a ſomeways morbid diſpoſition either of the Brain, or nerves, about the hight or beyond the ſtrength of his Age, the fruit of this diſeaſed Race began to puniſh him: for firſt of all, he was wont to be tormented with a debility, and numbneſs of his Limbs, and with light Convulſions; with which kinde of Diſtempers, when he had a while laboured at length,

An obſervation.

for

for cure sake going to the Bath, having used too much the hot bathes, instead of a remedy, he brought back only an exasperation of the Disease, that from that time, the aforesaid Symptoms did not any more torment him by fits, but almost continually, to wit, the Convulsive motions, and painfull extensions, did incessantly exercise every Limb, yea, every part of his Body, so that all the muscles were perpetually drawn together, with repeated leapings all at once, and that not without great torment: The only means he had for quieting them, was to exercise his whole body, sometimes some of his members, perpetually with a local motion: for so long as he was awake, he was necessitated to be rock'd in his bed, or on his couch, or to be carried in a Coach; or to have his members pres't or rubb'd; for which end they had made for him a Bed, and a Chair set upon bow-fashon'd feet, such as are on Childrens Cradles, in which, when he lay down or sat upright, he was moved up and down continually, with a tottering or rocking motion; which unless he did, he was infested with most cruel pain, and horrid extensions of his muscles: This kinde of dayly trouble, of the Convulsive Distemper, in the night-time, and presently after sleep, entertain'd much more grievous Symptoms: for being newly awaked, his whole body presently was wont to quake, his muscles to be exercised with painfull stretchings, every Limb to be wetted with a squalid or ill-favour'd sweat, as if in the agony of Death, which was so very Corrosive, that, like *aqua fortis*, unless they presently wiped it off, it quickly eat and rotted the Linnen. The sick man, during this Conflict, was tormented for many hours, between the sweats and shiverings, untill being quite tired out, sleep creeping upon him, brought him some ease; but if at the approach of the fit, he was presently taken out of his Bed, he was better, and so prevented the wonted cruelty of the Distemper: Therefore, as soon as he was awaked from sleep, though it hapned within half an hour, immediatly to avoyd the torture, his servants being called, they took him out of his Bed: As to his Appetite he was well enough, he eat without loathing, nor was his stomack disturb'd with what he eat: But he did often complain of the pain of the heart, and sometimes a troublesome Spitting, with a stink in his mouth, as if he had taken *Mercury*, molested him for many days. All hot things, whether food or Physick, did nor agree with his constitution; he did not dare to taste, either wine, or strong beer: In the first years of his sickness, he abhor'd the very sight of the fire, afterwards becoming weaker; though the winter was sharp he would not sit neer the Chimny; his Urine was always of a Citron colour, which if it were evaporated in an earthen vessell, over hot coals, saltish fæculencies remained in the bottom, to above half the Liquor; his belly was continually bound, and never put forth its load, unless provoked by a purge or Clyster: Yea, besides the Convulsive motions, a Spurious Palsie possessed every member of his whole Body, for he could not lift up his hand, nor step a foot forward; his tongue shaking, brought forth his words but imperfect, but sometimes, when his minde was carried forth, by some sudden occasion of Joy, he would be able, his Spirits being raised with a wonderfull strength, suddenly to rise out of his chair, and without the help of another, to stand upright, and to jump, which interval however lasted scarce a minute of an hour, but that his members flagg'd, and were affected with their wonted languor and trembling. When this worthy Gentleman, had been sick after this manner above 12. years, and had consulted the most famous Physitians in all *England*, and had tryed very many Remedies, and almost of every kinde, *viz.* Antiparalytick, antiscorbutick, drying Diets, Sweating medicines, purges, Caustick, baths, Liniments, yea, and had twice tryed salivation, could finde no cure by any method of healing; wherefore, all hope of cure being wholly layd aside, for the latter seven years of his life, he made use of only Remedies, chiefly respecting some Symptoms, *viz.* he took thrice in a week a solutive medicine, of *Senna* and *Rubarb* with Correctives, now in form of a Syrrop, or of an extract another time; every night he was wont to take a dose of an opiate, out of conserves, and temperate *Species*: Besides, as occasions serv'd, he had ready a Julap, to be taken when his Spirits fainted: moreover, he continually drunk Beer, made of oaten mault, altered with temperate and diuretical herbs. By the use of these, he pass'd over at least seven years, without any great alteration for the worse; at length, old Age coming on him, together with the disease, more cruel fits of Convulsions, not as at first after sleep, but assoon as he was warm in his bed, invaded

vaded him, that he was forced to abſtain altogether from his Bed, and rarely put off his cloaths, unleſs to ſhift his Linnen: from hence tranſpiration being hindred, the ſerous Recrements, and others, wont to be evaporated, were fixed on the Lungs, which at firſt, brought in a frequent or ſhort breathing, afterwards an Aſthmatical Diſtemper, and laſtly a deadly Conſumption or waſting.

The reaſons of the ſymptoms chiefly tormenting.

If the Reaſons of the aforeſaid Symptoms be ſought after, it will be eaſie, to deduce all theſe evills from a depraved Conſtitution of the Brain, and nervous ſtock, and more immediatly from the dyſcraſie, and fault, of the juice watering thoſe parts. For when that Liquor, in which the animal Spirits, do abound, was, as to its temper, highly ſharp and Corroſive, like *Stygian* water, and as to its mixion, was ſtuffed full of both narcotick and exploſive particles, it is no wonder, becauſe the Spirits being very much burthened, and for that cauſe reſtrained from their due expanſion, that they ſhould be forced every where into ſmall exploſions, as it were Cracklings; and that the containing bodies, being looſed from their due extenſion and ſtrength, ſhould be alſo continually irritated into painfull Corrugations or ſhrinkings up.

The growing worſe preſently after ſleep whence it proceeded.

Thoſe Convulſive Diſtempers, did more ſharply infeſt after ſleep, becauſe the heat of the Bed, did exuſcitate or ſtir up the heterogeneons particles of the nervous juce, and rarifying them, as it were compell'd them into exploſions; then alſo, becauſe the nervous parts did imbibe its juce in ſleep, and a more plentifull proviſion of the morbifick matter, brought together with it; which being filled to a plentitude, at the firſt inſtant of waking, they immediatly endeavour to ſhake off what is troubleſome. For this Reaſon, it is obſerved, that the pains of Scorbutical people, and the fits of Aſthmatical, are made worſe by the heat of the bed, and by ſleep; therefore as in theſe, preſently to leave the bed, was wont to give eaſe, ſo likewiſe it did in our ſick man: But that the trouble, excited by the continual leapings, and painfull extentions of the muſcles, was ſomewhat allayed by the local motion, or moving from one place to another, of the body, or members, the reaſon is, becauſe the Animal Spirits, whilſt they are compelled to divers actions from without; they remit whatſoever inordinations are excited from within: for as in pain, and itching, which are lighter Convulſions, it helps to preſs, rub, or ſcratch the affected part, ſo the Convulſive motions of the muſcles, and tendons, are ſomewhat pleaſed, by the inordinate agitation of the whole body, or the members.

Why allayed by Motion.

The ſpitting.

As to the *Ptyaliſmus*, or copious ſpitting, with the ſtinking breath, which was wont to return at uncertain intervalls, we do ſuppoſe, that might perchance proceed from *Mercury* ſometime ſecretly given, although I have ſeen many labouring both with Convulſive, and alſo ſcorbutick diſtempers, in whom this kinde of perpetual defluxion of ſpittle from the mouth, was very troubleſome, without any ſuſpition of *Mercury*; alſo ſome (as ſhall be told hereafter) on whom a ſalivation coming (the exploſive matter being after this manner Critically evacuated) help'd the diſeaſe: moreover, it is likely, that this diſtemper was produced from the mere recrements of the nervous juice; and that the ſalival paſſages, when many, and enough were open, did receive, and convey forth of doors, the ſuperfluities plentifully depoſited in the *glandula's*, from the nerves, and alſo from the Arteries.

Why this ſick man obtained ſome truce from pains.

As to the lucid Intervalls, whereby the ſick man us'd to obtain ſome truces, though ſhort, the cruelties as it were of the diſeaſe being mitigated, as when but now his ſickneſs had bound him to his chair, he was able on a ſudden to leap up, and walk about; but yet, this unlook'd-for ſtrength being vaniſh'd, by and by falling again into his wonted languiſhment: I ſay theſe kinde of motions of labouring Nature, proſtrate under a great burthen, are its utmoſt endeavours, and ſome more ſtrong inforcements, to wit, whereby for a moment of time ſhe recollects her ſelf, and attempts as it were to ſhake off the yoak of the Diſeaſe; but becauſe ſhe is not able to ſuſtain long this ſtrife, ſhe quickly relapſes, and lies down under her former burthen. Truly it is a wonder, how much above the ſtrength of Nature, Anger, and fear, and ſome other paſſions of the minde, do ſtretch the nervous kinde, and compell them to ſhew a force plainly ſtupendious: But theſe prodigies of her attempts, are only of a ſmall duration.

The ſecret leading cauſe of the aforeſaid diſtemper.

The Conjunct cauſe of the aforeſaid diſeaſe being after this manner deſigned, and the Reaſons of the Symptoms chiefly tormenting, being ſhown, it remains yet

yet for us to inquire into the ſecret leading cauſe, to wit, by what occaſions, the nervous juice being become ſo degenerate, at firſt brings in the Palſie, and then leapings, or inteſtine Convulſions of all the muſcles: further, we ought to explain wherefore the fruits of this Diſeaſe, increaſing by little and little, came ſuddenly to maturity, by the uſe of the Baths; alſo wherefore this ſickneſs yielding to no Remedies became uncurable.

As to the firſt, it may be ſaid, that the ſick perſon, being ſprung from parents who were obnoxious greatly to Cephallic Diſeaſes, had contracted originally an evill Conſtitution of the brain, and nervous ſtock, ſo that within the 6th luſtre (*i.e.* about the 36th year) of his Age, he began to be ſick of a ſpurious Palſie, then, when the evident cauſes daily fixing the infection more on the bloud and humours, did happen upon this remote hereditary cauſe (for there were many chances, and unfortunate accidents, which continually brought ſadneſs, and melancholly upon this Gentleman) indeed therefore, the nervous Liquor being imbued above meaſure, with a fixed and Scorbutic ſalt, became highly ſharp and irritative, like *aqua fortis*, or the Stagma's of *Vitriol*; and ſo continually incited the Spirits, and the bodys containing them, into Corrugations and contractions, juſt as the aforeſaid Liquors when poured upon worms do the ſame thing.

Why this Diſtemper grew worſe by the uſe of the Baths.

But that this diſeaſe, leaſurly at firſt increaſing, was quickly brought into a much worſe condition, by the uſe of the hot Bathes, the reaſon eaſily appears: It is known by experience, that the hot Bathes, do very much exalt, and quickly bring to the hight, the Sulphureous-ſaline particles, in the humane body, and otherwiſe morbid, which abound in the Bowells, and humours, *viz.* do render them more fierce by agitating them throughly, and force them from their firſt paſſages into the blood, and from thence into the Brain and nervous ſtock, yea, and joyn together thoſe, that were before ſeperate, and idle, and incite them into a certain fermentation: wherefore, thoſe who are hereditarily obnoxious to the *Gout* or *Stone*, and have not as yet ſuffer'd any fits of thoſe diſtempers, very often feel the fruit of either diſeaſe in themſelves to grow ripe ſoon, by the uſe of the Bathes: When therefore in this ſick perſon, both the blood, and Liquor watering the Brain and nerves, were imbued both with narcotick or ſtupifying, and convulſive particles; and alſo when they did degenerate from their ſweet, and balſamy Diſpoſition, that towards a ſaltiſh, and this into a ſour, *Ciæmul* of a *Stagma* of *Vitriol*, the uſe of the hot minerall waters, was ſo far from bringing help, that on the contrary, theſe evills, for that very cauſe, preſently grew all very much worſe: and the Diſeaſe, proceeding from the humors being ſo depraved, as to their temper and mixture, could never be cured by any medicines, no eaſier than vinegar may be reduced into wine.

When this Gentlemans body, being at laſt dead of the *Phthiſis* or *Conſumption*, was opened by me, we could finde but very few foot-ſteps, of theſe kinde of moſt grievous Symptoms. Hence, as it appear'd, the *Palſie* and *Convulſion*, did not depend, ſo much on a thick and copious matter, heaped together ſomewhere in mines, as of an evill affection of the animal Spirits, who are ſubtle and Inviſible. I will lay forth, what was worthy taking notice of, in the anatomy of this perſon.

Things worthy to be noted in the body being diſſected.

The *Abdomen* being opened, the *Caule* (as is wont to be in moſt who dye of a Conſumption, and other Chronical Diſeaſes) was putrified, aud almoſt conſumed. In the mean time, the *Ventricle*, *Inteſtines*, *Pancreas*, and *Meſentery*, were well enough, to wit, the membranes were firm, well coulour'd, and free from any ulcer, or hard ſwelling: There grew to the greater Inteſtines certain excreſcencies like to the ears of a mouſe; for that there were very many of theſe kinde of things out of either ſide of the *Colon*, and right inteſtine, they ſhewed like twins at certain diſtances, like the branches of Trees: The like I formerly found in a Conſumptive perſon: The Reaſon of this ſeems to be, that the nouriſhment in Conſumptive people, (though it be deficient about the more ſolid, and outward parts, yet ſometimes) within neer the fountains of the nouriſhing juice, performs more than it ought, and for that cauſe, ſuperfluous and unnaturall additions grow forth.

The milt or Spleen, which always is thought ill of, and of moſt Phyſitians condemned, for being the Principal cauſe of the Scurvy, and of all other diſtempers, appear altogether blameleſs, and free from any fault: For, as in moſt ſound

people, we obſerved, it was of a darkiſh Colour, ſoft and of an equal *ſuperficies*, free from any obſtruction, or ſwelling, indued with veſſels, and *fibres*, diſtinct, and firm enough: out of its ſubſtance, flowed black blood when it was cut.

The Liver (which indeed might be wondred at) was indifferently well, neither was it, from ſo long and grievous a ſickneſs, become harder then uſuall, or ſcirrhous, or planted with little whelks, but it was ſomewhat big, and of a darkiſh colour.

The Kidnys, though free from any ulcer, or gravell, were not however free from fault: for in the middle of the right Kidney, was ſeen a great cavity, diſtinct from the Tunell, and much greater then it, full of clear water: the like I have very often found, in hydropical people: But indeed, this perhaps aroſe, from the *ſerum* depoſited in that kidny, that could not eaſily be ſtrained thorow its paſſages, and pores; for that the *ſerum* ſubſiſting therein, had in the beginning made for it ſelf a little den, which afterwards by degres was inlarged, and when for this Reaſon, the ſecretion of the *ſerum*, and its paſſing forth by the *ureter*, were ſomething hindred, its *Latex* reſtagnatiug into the blood, brought in the grievous trouble to the head; which indeed was the rather to be ſuſpected, becauſe alſo the left Kidny, being mightily extenuated, and conſumed, contained many Ciſterns, and Cavities full of clear water.

The Lungs, growing on every ſide to the *Sternum*, (or part of the breaſt where the ribs meet) ſides, and *Diaphragma*, ſeem'd without any diſtinction of *Lobes*, of one ſubſtance only of putrid ſpongy fleſh, ſtuffed throughout with a frothy or ichorous matter: without doubt, the ſick man had not contracted this evill ſo long before, to wit, when he was not able to perform any exerciſe of the Body, nor ſtay in bed that it might breathe out any thing more freely, the fæculencies and recrements of the blood, which were wont to evaporate thorow the skin, being layd up in the Lungs, were the cauſe, that they grew together among themſelves, and with other parts, and did vitiate their tone and conformation wholly, ſo that, a Conſumption being at laſt ariſen, was the effect and product, and not the cauſe of the reſt of the diſtempers, wherewith he had bin a long while miſerably afflicted.

In either ventricle of the heart, blood was concreted into a ſolid whitiſh ſubſtance, and bak'd like fleſh, which being formed neer the Cavities, and proceſſes of the veſſells of the Heart, reſembled the figure of a Serpent, with a manifold divided tail: than which indeed nothing is more uſual, in many dead People after long ſickneſs: The reaſon of which is, that the Blood being without life, from long ſickneſs, and from thence circulated ſlowly abont the *Præcordia*, begins to ſtand or ſtagnate in the heart, and depending veſſells, and by that means, is congealed leaſurely, into this kinde of fleſhy Concrete.

When the Skull was opened, we ſought among its contents, the chief Cauſe of the Diſeaſe: The firſt thing that occurr'd was, the bulk of the brain was leſs than it ſhould be, and folded into fewer folds, from whence we ſuſpected, that the Animal *S*pirits, were uot plentifully enough brought forth: Further, the whole ſubſtance of the head, was more moiſt than it ought to be, and wholly immerſed in a wet watery humour, that its Covering, *viz.* the whole meninges, were pulled aſunder, and the compaſſing or crevices, and all the ventricles, run over with clear water. 'Tis probable, that this deluge of the Brain, had lately hapned, to wit, foraſmuch, as by reaſon perſpiration being hindred, and the Secretion of urine being but little, the ſeroſities gathered together in the bloody maſs, were carried to the head, and therefore, the ſubſtance of the Brain, and eſpecially the chancelled or chequer'd bodies, were ſo wholly wetted, and ſoked, that being cut, their ſubſtance could ſcarce remain compacted, but that it would flow away, ſomewhat after the manner of thick Liquids: within the boſoms overlying, and inſerted to the brain, and its *Appendix*, and the veſſells coming from them, the blood had concreted into little, round, hard, and as it were fleſhy balls, juſt like thoſe within the ventricles of the heart, and the veſſells hanging to them, which alſo lately, when the Bloud circulated ſlowly, we thought might happen, for the ſame reaſon, for which the blood was coagulated within the *Præcordia*.

The trunk of the Spinal marrow, being drowned in clear water, was very much extenuated, that it could ſcarce fill half of the bony cavity or hollowneſs:

which we thought to be effected, by the deluge of salt *Serum*, in which it was as it were boyled.

The Nature, and the manner, of the continued convulsive distemper being made

So much concerning universal Convulsions, which being very much conjoyned with the Paralytick Distemper, are excited dividedly in many parts at once: There remains others, which we call'd continued, because being suddenly translated, from some parts to others, they mutually relieve one another, and compell the members; now these, now those, and often the whole body, to be involuntarily moved, and diversly bended, or agitated. In these Cases, the *Animal Spirits*, not only those implanted in private corners, and mines, get to themselves an explosive *Copula*, and being some how satisfied, or irritated, strike it off by certain turns; but when the whole mass of the nervous Liquor, abundantly abounds with elastick particles, they then every where cleaving to both the Spirits implanted, and flowing in, for that reason stir them up into Continuall Convulsions: But forasmuch, as not all the Spirits at once, are not able, however prediſposed, to be exploded, (because within the nervous passages, there is not room large enough for their so great agitations) therefore the explosive force, arising in these, or those parts, is by and by transfer'd, from thence, unto others, and so to others, and so like fire-draks, or wild-fire, it runs wandringly here and there, most swiftly creeping from these Limbs, to those, and then presently from all into the *Præcordia*, or *Viscera*; and back again. That the Image of those kinde of distempers may be known, we will here propose some more rare Cases; of sick persons, whom sometime past I endeavoured to Cure.

1 *Observation.*

A very fine and religious maid, tall and slender, begot of a Father sickly, and obnoxious to most grievous Distempers of the nervous kinde, about the 20th year of her Age, was afflicted for many days with an head-ach, very Cruell and periodical; at length, at the time of the winter solstice, 1656. the pain of her head ceased, but instead of it, a mighty Catarrh followed, with a thin and Copious spitting, also an ulcerous distemper of the nose and throat; when she had for some time endured this trouble, at length, by the prescript of a certain Woman, receiving the fume of *Amber* by a tunnell into her mouth, she was suddenly cured, to wit, the Catarrh, or violent Rhume ceas'd suddenly, but from thence she complained of a notable *Vertigo*, with a pain in the head, and of the tingling noise of the ears: on the Third day, the tendons of the hinder part of her neck, were pulled together, that her head was bended now forward, now backward, and now of one side, sometime it continued stiff and unmoveable; a little after this, the same kinde of Convulsive Distemper invaded the outward members, and Limbs of the whole body, her arms and hands were wonderfully turned about, that no jugler or tumbler could imitate their bendings, and rollings about; she was necessitated to spread abroad her leggs, and feet, here and there, to strike them against one another, and to transpose or cross them by turns: After this manner either sitting in a Chair or lying in a Bed she was perpetually afflicted with these Convulsive motions, unless when overwhelmed with sleep; and when she did a little restrain her members from the great labour of the Muscles, presently she was taken with a difficult and short-breathing with a sense of Choaking; but in the mean time, her eyes, jaws, mouth, and lower bowells, remained free from any Convulsion; neither was she troubled with vomiting, belching, nor any inflation of the belly, and *hypochondria*: Besides she was still her self, and had truly the use of her memory, understanding, and phantasie, she did, nor said any thing madly, or foolishly: but in these wonderfull evills, she shew'd an admirable example of Christian fortitude, and patience, even with godly and discreet speeches; her appetite was soon lost, so that she took any meat or aliment very unwillingly; thirst continually troubled her, and her strength was grown so feeble, that she could not stand or walk, her urine was of a Citron colour, very full of saltness, on whose *superficies* grew little tararous skins.

When I was sent for to this Gentlewoman, on the Sixth day of her sickness, I framed the Ætiology of this kinde of admirable distemper: For the consideration of her father, who at that time was sick in the same house, with most grievous Convulsive passions, kept me, that I did not with many others, refer all things to the delusions of witches: wherefore, that I might seek out the natural Causes of these Symptoms, it was in the first place plainly to be suspected, that this Gentlewoman

Gentlewoman had contracted hereditarily the ſeeds of Convulſive Diſtempers, which at length, about the flower of her age, broke forth into this kinde of fruit: for when her blood was very much imbued with heterogeneous and explo-ſive particles, they at length (as is wont in ſuch a diſpoſition) began to be poured into the head, and there to be fixed: being therefore firſt depoſited in the *Meningæ*, they induced the huge periodicall head-ach; then afterwards, the ſame matter having accidentally ſhifted its place, falling down into the finks of the throat and mouth, changed the *Cephalage* or head-ach, into a *Catarrh* or *Rhume*: and when laſtly by an untimely uſe of the adminiſtred Remedy, the defluxion ſtop'd, the morbifick matter flowing back into the brain, brought the *Vertigo*, and then, being thruſt forth on the nervous ſtock, it excited the aforeſaid Convulſive Affections.

The reaſon of the aforeſaid caſe.

As to the formal Reaſon, or the means of generation, whereby the Convulſive matter, falling down into the nervous ſtock, did produce theſe admirable Symptomes, we may lawfully ſuppoſe, that the ſame being thruſt forth from the Confines of the head, being yet more firm, into the ſpinal marrow, and its *Appendix*; and being like a malignant ferment, it firſt infected, with heterogeneous and highly exploſive particles, theſe parts of the juce watering the whole maſs; which cleaving to the ſpirits, every where diſpoſed thorow their whole *ſeries*, and agitating them, as it were with a certain fury, did ſtir them up into continuall exploſions: When in truth, the nervous juice, as is ſaid, was ſo fermented by the inflowing of the Convulſive matter, that which did other ways water the containing parts, with a gentle falling on them, and through the ſame; did paſs over the animal ſpirits, with an equal Expanſion, now the ſame did torment the nervous *fibres*, with various contractions, and Corrugations or ſhrinkings up, and did hinder both the ſpirits flowing in, being too much burthened with an heterogeneous *Copula*, from their due irradiation, and alſo variouſly moving thoſe implanted in every part, did incite them, as it were with a diabolical Inſpiration, ſo that no more obeying the Empire of the will, they ran into inordinate motions, and did renew them, tranſlated rapidly here and there, with a perpetuall reciprocation.

But, altho the heterogeneous particles, being poured forth with the blood, into the brain, and thence thruſt forth into the nervous ſtock, did not enter rightly the beginnings of all the nerves, but chiefly and almoſt only the ſpinal marrow, and its nervous ſhoots; ſo that the internal *Viſcera*, alſo the parts of the eyes, mouth, and face, remained free from any Convulſion: yet, that ſame exploſive force, being hindred by ſome violence, whereby it entred leſs in the outward members, preſently like wild-fire, a way being found, it was wont to run into the *præcordia*, and bowells of the lower belly: *viz.* becauſe the inflowing ſpirits, being ſtruck with a certain fury, and requiring a larger ſpace, in which they might exerciſe their madneſs, being excluded from one place, preſently enter another ſomewhere open: wherefore, if that fury had been repulſed, both from the members, and the *viſcera*, no doubt but it would have flown back on the brain, and brought thither, madneſs, or as it were an Epileptical Inſenſibleneſs: which Symptoms indeed hapned to be wanting, for that the brain of this moſt ingenious Gentlewoman, being indued with a more firm Conſtitution, did take from the nervous Liquor freſhly inſtilled, whatſoever was congruous and ſpiritous, for its proper food, and enjoy'd it: In the mean time, it did depreſs all the morbific particles, into the ſpinal marrow, by which the involuntary motions of the members were excited, after that manner as we ſaid but now.

The Curatory Method Obſerved in this caſe.

Being requeſted to undertake the Cure of this worthy Virgin, firſt, a light preparation of her body being made, I gave her a ſolutive potion of the Infuſion of *Senna* and *Rhubarb*, with *yellow Sanders* and *ſalt of Wormwood* added to it, by which ſhe was purged 12 times with great eaſe, the next day I took viii. ounces of blood from her left Arm, every evening I gave her an opiate of the water, and Syrrop of the *flowers of Lungwort*, with the *powder of pearls*: beſides, once within vi. hours, I preſcrib'd her to take a doſe of the *ſpirits of Harts-horn*, in a draught of the following Julap. Take of the *waters of black Cherries*, *Walnuts*, and the *flowers of Pæony*, each ℥ iii. of the Antipeleptic of *Langius* ℥ ii. of the *Syrrop* of the *flowers* of the *male-pæony* ℥ii. of the *powder of pearls* ℈ i. mix it and make a Julap: becauſe ſhe could not endure much purging, *Clyſters* with Sugar'd-

℞

milk, were made use of frequently: besides antispasmodic oyntments, being applyed to the hinder part of her neck, and the back-bone, we order'd often rubbing of the distemper'd members, with warm woollen Cloaths wetted in proper oyl.

By the use of these, the sick person within 6 days, seem'd to be very much helped; for the Convulsive motions allmost wholly ceased, and she could contain her members quietly in their due position, only her head sometimes by a lighter Contractiou was compelled to bend gently this way and that way; further she was able to stand a little, and rise out of her chair, but when she went to step forward, she went not rightly, but obliquely on one side: At this time going away, I left her much better, and in a manifest state of growing well: But after another week, when the North-winde being high, and arisen in Night time, the window not being fast shut, blew very much upon the sick person being in Bed, she presently taking cold, relapsed into that kinde of Condition, that she became obnoxious not only to Convulsive passions, but to an universal periodical palsie: for after that she was forced to move about, turn, and winde variously, all her limbs successively, with her head, and members by turns, bent, and thrown about here and there (as before) from morning to night; till at night these kinde of motions wholly ceasing, a resolution of her members, or palsie succeeded, so that she was not able to stir either hand or foot, or any other part of her body besides, or to exereise any motive bending of the body, lying in her bed allmost immovable like a stone; but being a little refresh'd with sleep, about morning, as she recovered some little strength or virtue of the regular motive faculty, by bending, tho but weakly here and there, her arms, and legs, so also the involuntary, and Convulsive motions, did constantly return, enduring from that time, all the day, which again at the Evening, were changed into these resolutions of the Limbs.

By these it appears clearly, that the sick Gentlewoman laboured with a twofold disease, *viz.* a Palsie, and Convulsion, and that the materiall Cause of either, was somewhat distinct: For it seems, that the animal spirits, every where abounding, being burdened with narcotick particles, were almost continually bound: besides that, in the time of sleeping, together with the nervous juice, the Convulsive particles, plentifully flowing in, clove also to the spirits: for the explosions of which, the spirits being incited, produced the involuntary motions: but also at that time, the narcotic *Copula* being somewhat shaken off, they were then able in some sort to perform the voluntary or regular also: Besides the Remedies but now recited, they did carefully administer very many others, allmost of every kinde, *viz.* Antiscorbuticks, antiparaleticks, Decoctions, sudorificks, or sweating medicines, distilled waters, spirits, Elixirs, Tincture, Baths, Liniments, with many others; by the use of which, the Symptoms were something remitted, but yet the disease was not wholly cured, the universal palsie soon ceased, that she was able at any time to move her Limbs, and to bend them here and there; and also the involuntary motions did trouble her but rarely, yet she continued Languishing, and weak; and when she being of a more fine temper, and prone to a Consumption, by reason transpiration was hindred, the recrements of the bloods being laid up in the Lungs, brought in a Cough, which every day growing worse, she at length dyed of a *Phthisis* or wasting.

2. *Observation.* Some years since, I was sent for to a Noble Virgin, sick almost after the same manner, and something worse: For this suffer'd almost perpetually, coming by turns, involuntary motions, to wit, shakings of the head, and members, or deflections, or movings about here and there: besides, she was afflicted with an exceeding troublesome, and plainly wonderfull Convulsion, of the *Diaphragma*, and muscles serving for breathing: for every minute of an hour and oftener, her back-bone was suddenly bent in, about its middle, and together her breast shooting out forward, and her *hypochondria* being drawn inwards, she made a noysie sobbing, now double, now threefold, but still with a less and less noise: this kinde of motion, and ebbing of a crashing noise, was wont to come for many hours, and so that she might be heard through the whole house; and when any short interval of this hapned, she was compelled presently to shake, or writhe together extreamly her arms, and hands, and sometimes her legs and feet, and also to fling about most furiously her head, and by and by to hold her neck

neck, as it were ſtiff and immovable: and then in ſpeaking, her tongue would be taken after that manner, that ſhe would repeat the ſame word very often, yea ſometimes twenty times at leaſt: when the Convulſive motions tormented her ſtrongly in her outward members, ſhe was free for a little while from that throtling, and noiſie diſtemper, and this ſpace of intermiſſion ſhe call'd her time of eaſe; tho in the mean time, her head, and members were carried violently here and there, with Convulſive Motions: if at any time ſhe lay on her left ſide, preſently a contraction of her right *hypochondrium* inwards, with a ſobbing or throtling, vex'd her. Within a few days, her ſtrength being very much loſt, by the aſſiduity of the paſſions, ſhe contracted ſo great an imbecillity in her Loyns, and joynts of her legs, that ſhe could not ſtand, nor lean on her feet: Her Stomach, diſtemperd either with weakneſs, or the Convulſion, retnrn'd back whatever was put into it, by vomit.

The nature and cauſe of the diſcribed caſe.

In this Caſe, as in the former, it appears, clearly, that the Animal ſpirits, not only thoſe implanted in this or that part or region, had contracted an hetrogeneous *Copula* to be ſhaken off by ſome turns, but alſo the ſpirits influencing ſome nerves, being imbued with exploſive particles, had brought in the perpetuall, and wandring Convulſive Motions. And when at firſt it hapned, that the ſpirits ſo afflicted, did aſſolt, not all the nerves together, nor any indifferently, but for the moſt part, only thoſe belonging to the *Diaphragma*, and the *Appendixes* of the ſpinal marrow, ſo that within thoſe ſpaces, the fury of the ſpirits, perpetually exploſing, was limited, for this reaſon it hapned, that the convulſive affections being reſtrained, in any one of thoſe parts, did break forth more furiouſly ſtrait in another; and when by their proper inſtinct, their motive force was imployed in one Region, the ſame was in the mean time, wont to be remitted in another. Moreover in this ſick perſon, the morbific matter, conſiſting both of narcotick and convulſive particles, cauſed together the paralytick, and convulſive diſtemper.

Coming to her on the 4th day, I gave her an Emetick potion, by which ſhe vomited 7 times, abundance of ropy phlegm, with yellow choller, yet without any eaſe: on the next day, I took ſix ounces of blood, from her left Arm, preſently from thence, the blood being more impetuouſly carried, towards the head, ſhe complained mightily of an head-ach, and giddineſs; But within 3 days ſhe being let blood in the foot, found her ſelf better: ſhe afterwards took Remedies for the diſtempers of the nerves, to wit, *ſpirits of Harts-horn*, and of *blood*, *Bezoartick* and *ſhelly powders*, *Julaps*, and *Electuaries*, antiſpaſmodical: by the uſe of theſe, the Symptoms ſeem'd to be ſomething remitted, but yet they remained ſomewhat after the manner but now deſcribed: After a fortnight, by the preſcription of a certain Country-Woman, ſhe took in a draught of beer, 6 ſpoonfulls of *blood*, taken from the ear of an Aſſe, by which ſhe ſeem'd on a ſudden to be cured: for forthwith all the Convulſive motions did leave, and ſhe remained free from them 24 hours; but yet the diſeaſe returning the next day, with its wonted fierceneſs, would not give place, neither to that Remedy, nor indeed eaſily to any others: ſhe therefore for the future, took medicines methodically preſcribed: Once within 6 days, ſhe was gently purged, beſides ſhe took the powder compoſed of *Bezoar*, *pearls*, and *Corrall*, with the roots and ſeeds of *Paony*, alſo an Electuary, preſcribed by *Horſtius* for theſe kinde of admirable Convulſions; alſo *Julap*, and *decoctions*, proper in convulſive Diſtempters: *Clyſters* were often uſed, frictious, oyntments, and veſicatories were adminiſtred with ſucceſs: within another week, the ſobbing affection wholly ceaſed, and likewiſe the other convulſive motions, being grown more gentle by degrees, very much remitted: Growing well of theſe diſtempers, a *Catharr* falling down in her throat, ſhe was ſo much troubled, that ſhe almoſt continually ſpit forth a ſharp, and as it were Corroſive ſpittle, as if ſhe had had a ſalivation by taking *Mercury*: which kinde of Remedy indeed, hath been found to have been the laſt event in this caſe: but I wholly abſtained from adminiſtring it, becauſe both the ſick, and her friends, would not give me leave.

After this plentifnll, and troubleſome ſpitting had continued for many days, the diſeaſe ſeem'd almoſt to be wholly Cured: ſo that this noble Gentlewoman, being free of her Convulſive motions, went abroad, and was well, both in ſtrength and ſtomach. Only ſhe complained, that oftentimes in a day, ſhe

was

was ſuddenly afflicted, for about a minute of an hour, with a ſhivering of her whole body; which kinde of Diſtemper coming upon her ſometimes in the night, broke her ſleep: within the ſpace of a month, this Symptom alſo, and likewiſe her Catarrh wholly ceaſed: But from thence, ſhe was ſometimes afflicted with an extream Soureneſs, in her ventricle, and the paſſage of the *Oeſophagus*, and ſometimes alſo in her mouth, and pallate, that it was feared leſt the inward skin being fretted, thoſe parts ſhould Contract an ulcerous diſpoſition; beſides ſhe was wont to be tormented often in her ſleep, ſometimes alſo being awake, with the night-mare or *Incubus*. For this I preſcribed, *Spring* and *fall*, a gentle purge to be adminiſtred, with the uſe of antiſcorbutick Remedies, and ſometimes *Chalybiates*, or medicines of *prepared ſteel*, which kinde of method ſhe obſerved ſo much to her benefit, that ſhe was well in health for many years, and is as yet well.

Among the many Remedies, which were taken againſt that Sourneſs, and as it were ulcerous diſpoſition of the pallat, and *Oeſophagus*, I preſcribed, that ſhe ſhould drink every morning, her own urine freſh made; this, whilſt it was very Saltiſh, was wont to give her great eaſe; but at ſometimes, her urine flow'd from her thin and plentifully, which being nothing ſalt, but like to ſour vinegar, from the drinking of that ſhe received little or no benefit.

The *Reaſon* of the Caſe but now deſcribed, ſeems not much unlike the former, unleſs that in this ſick Gentlewoman, the explosive particles had enter'd into more paſſages of the nerves, to wit, beſides the *appendixes* of the ſpinall marrow, into thoſe dedicated for the office of breathing, and alſo by fits, into thoſe deſigned for the motion of the Tongue, and almoſt perpetually tormented the Spirits abounding in them, with Rage or fury.

But that the Cure of this Diſeaſe hapen'd, by the falling down of the ſharp humour, into the emunctories of the mouth, and throat, we may from thence gather, that the material Cauſe of this, was the heterogeneous particles, and as it were nitrous, begotten in the blood; which, when from thence, being paſſed thorow from the brain, they were carried into the nervous ſtock, cauſed the aforeſaid Diſtempers: But aſſoon as by the help of Remedies, the more plentifull proviſion of that matter was hinderd, and the morbifick particles allready produced, both from the blood, and the Brain, and nervous ſtock, were derived into thoſe emunctories of the head, the Convulſive Diſtemper preſently ceaſed, and within a ſhort time, ſuch a Criſis or ſecretion ſtill remaining, the perfect Cure of the Diſeaſe followed.

Foraſmuch as the urine, being of it ſelf very ſalt, and as it were lixivial, became at ſome times ſouriſh, which did not give any help, as the former, to the ſourneſs of the throat: it may hence be gathered, that the ſalt particles of the blood, and humours, coming away by the urine, had a twofold ſtate or condition, to wit, of fixedneſs, and fluedneſs; wherefore the ſerum, imbued by them, became now of this, now of that nature: for it ſeems, that the Saline particles, being degenerate within the maſs of the blood, remained fixed, and rendred the urine for the moſt part Lixiviall: but thoſe which flowed without the blood, in the nervous juce, or were laid up about the ſolid parts, did degenerate into a flux or acetouſneſs: and therefore from theſe, being derived into the emunctuaries of the mouth, that noted ſourneſs of the mouth, and *Oeſophagus* proceeded: moreover, when theſe kinde of particles, being gathered to a fullneſs in the nervous juce, and ſolid parts, did ſwell up, and ariſing to a fluxion, boyled up into the blood: preſently theſe being ſent away from thence, in heaps, thorow the Reines, rendred the urine, increaſed in quantity, ſouriſh. But foraſmuch, as the Saline particles, being of a divers Condition, and that thoſe of the ſame kinde could not be mingled together, they mutually moved againſt one another, and break their forces, therefore the ſalt urine, and not the ſour healed the ſourneſs of the throat. It appears by a vulgar experiment, that the moſt ſharp *Spirit of Vitriol*, by the mixture of the *Salt of Tartar*, or any other lixivial, grows very milde: yea, and yet from thence appears, that the acid humour, ſweating out into the parts of the mouth and throat of this Gentlewoman, came near the nature of ſharp *Vitriol*; becauſe the fume of Tobacco, being taken at the mouth of the ſick perſon, was wonderfully ſweet, as it happens to ſuch, who have beforehand taſted *Vitriol*.

Becauſe

Becauſe we treat here of admirable Convulſions, which do not ordinarily happen, and whoſe nature, and cauſes ly deeply hid; for the better illuſtration of theſe kinde of Diſtempers, we will yet ſhew one or two more Caſes, no leſs wonderfull than the former.

3. *Obſervation.* About ten years ſince, I viſited the daughter of a certain Nobleman, troubled after that manner with Convulſive motions, that ſome thought her poſſeſſed with an evill Spirit: This Virgin about 16. years of age, fair, and well-made, yet begotten of a paralytick Father, without any evident Cauſe, about the winter-ſolſtice began to fall ill. At firſt ſhe was troubled, though not in any grievous manner, with an head-ach, and giddineſs for many days; then ſhe felt, now in one of her arms, and then in another, a trembling and ſudden Contraction; which kinde of Convulſions, returning often that day, endured ſcarce a moment; the next day ſitting nigh her Siſter in a Chair, ſuddenly leaping out, ſhe fetch'd one or two jumps, and many others ſucceſſively, with wonderfull agility, at the diſtance of many feet; then, when ſhe was come to the farther part of the Chamber, ſhe ſtood leaping a great while in the ſame place, and every time to a great height; when her legs were quite tired with leaping, ſhe fell on the floor, and preſently ſhe flung her head here and there with wonderfull violence, as if ſhe would ſhake it from her neck: As ſoon as ſhe ceaſed from this motion for wearineſs, preſently the ſame fury invaded her hands and feet, ſo that ſhe was forced ſtrongly to exerciſe theſe members, by ſtriking the walls or poſts, or by beating the pavement: when by reaſon of ſhame or modeſty, due to her friends, and by-ſtanders, ſhe did hinder her ſelf with great violence, from theſe motions (for all the while ſhe was her ſelf, and ſpake ſoberly) the diſtemper being ſent inwardly, ſhe was very much infeſted, with a mighty oppreſſion of the heart, with a bemoaning and very noiſefull ſobbing; then, when ſhe would eaſe her ſelf, ſhe was forced preſently, the fury being tranſmitted to the muſcles of the outward Limbs, either to leap about, or to fling here and there cruelly her head, or arms, or alſo to run about the Chamber, moſt ſwiftly, or to beat the ground with her feet: becauſe theſe kinde of vehement motitions, of her Limbs or *viſcera*, in the Tragedy of the diſtemper, did mutually relieve themſelves, returning as it were in a round.

The Curatory Method. Coming the 5th. day after this Lady had been ſick, I gave her a vomit of the infuſion of *Crocus Metallorum*, *wine of ſquills*, and *ſalt of Vitriol*, by which ſhe vomited 7 times, cancker'd oile or choller, in a great plenty, with the mixture of a ſharp, and as it were vitriolic humour: The next day ten ounces of blood was taken from the *Saphana* vein; beſides, ſhe took twice in a day, antidotes of the *powders* of pretious Stones, of *humane ſkull*, and the *root* of the *male paony*. By the uſe of theſe, within a week, ſhe ſeem'd to be cured, ſhe continued for many days afterwards free from the aforeſaid diſtempers: Bnt after two weeks at the time of the full Moon ſhe fell into a relapſe of the ſame diſeaſe more cruell than before, for beſides thoſe wonderfull leapings, and vehement Converſions and roulings about of her head and members, ſhe was forced beſides, to fetch often a moſt rapid courſe round about the Chamber: ſhe began at this time, from the præſcripts of others, to take anti-hyſterical Remedies, and purges at certain ſet intervalls, but without any help: At laſt, I being ſent for, becauſe ſhe ſeemed indued with a ſtrong habit of body, and with a notable fierceneſs of ſpirits, I gave her a ſtronger Emetick, by which ſhe vomited forth ten times, greeniſh Choller, like to ruſt, with phlegm, ſharp like ſtygian water, and ſhe was ſuddenly eaſed: After this, I gave her every morning, a draught of white-wine, dilated with the *water* of *black Cherries*, with ſows or hog-lice bruiſed and infuſed therein, and ſtrongly preſſed forth. By the Uſe of theſe, ſhe ſeem'd preſently to be cured, and was well above a Month: And when afterwards, the diſtempers being about to return, ſhe felt at any time ſome forerunners, preſently by the uſe of a vomit, and the expreſſion of the *Millepedes* or *Cheſlogs*, ſhe averted the approach of the Diſeaſe: within three months, ſhe ſo far recovered her former health, that ſhe has now liv'd for many years, free from thoſe kinde of Convulſive diſtempers: But from the time the convulſive paſſions wholly ceaſed, ſhe was ſometimes troubled, about the parts of her mouth, and throat, with a defluxion, of a moſt ſour humour, like the vitriolick *Stagma*; beſides ſometimes ſhe was obnoxious to the *Pica* or longing of women, and at ſometimes alſo to the Cough,

Cough, with a discolored spittle, threatning a Consumption, notwithstanding which, by remedies used in these kinde of Cases, she was easily cured.

The reasons of aforesaid case. As to the Ætiologie, or Rational account of the aforesaid Case, there is no reason that we should fear to refer both the Causes, and Symptoms of this disease, to the explosive particles (the brain being pass'd thorow without hurt) sent as a supply, Continually from the blood, into the nervous stock; which, forasmuch as they being poured forth in great plenty, were not restrained within private mines, to be struck off only by turns, cleaving every where, both to the implanted, and inflowing Spirits, forced them, as it were inspired with a madness, to be perpetually exploded, and to grow raging here and there, by bands: so that indeed, they were not able at all to be ruled; within the containing parts, but there was need to overthrow, and to tame them, impetuously tumultuating, and apt to be carried here and there, like a whirlwinde, by some very violent and strong exercise. In truth in was in this sick person, as it is in musical Organs, which if filled above measure, by too great a blast of winde, unless presently the passages of more Pipes be opened, the whole frame of the Organ is quickly shaken, and in danger to be broken to pieces: In like manner in this Lady, when the animal Spirits, actuating the pipes, and the depending *fibres*, of some of the nerves, were moved beyond their due tenour, there was a necessity, that their force should be bestowed on many vehement local motions together, whilst they inflated above measure the nervous bodies: wherefore, when their madness was hindred in on part, by and by like winde pent up, creeping somewhere else, it broke forth more violently, in some other part.

In this sick person, the use of one or two Vomits, brought help once or twice, because that by it, what was lodged in the gallie-vessell, yea the *glandula's* and emunctuories, and also about the *viscera* of concoction, being by this means emptied, the purging of the blood, and nervous juce, were more Copiously drawn into the same place; therefore indeed, that the animal Spirits, flowing within the Pipes of the distemperd nerves, might be less infected by them: By this reason also, the juice of the Sows or hog-lice was beneficial, forasmuch as it derived the morbifick matter, from the nervous kinde, to the urinary passages: Besides these Remedies, the Root and in a great part the branches of the morbific matter being cut off, and when others, as it were antidotes, hindring every where its vegitation, were carefully administred, whatsoever was left of it, Nature at length becoming superior (as she is wont in these criticall Cases) sent away, to the sinks of the mouth and Throat.

4. Observation. Whilst I was writing these things, I visited an illustrious Virgin, who was troubled with other kinde of Convulsive motions, and those universal, and no less to be admired: she was about 18. years of age, hansome, and well made, and before this time healthfull; when the Pestilence raging in this neighbourhood, she had come within the danger of its Contagion, she fell into a panick fear, with frequent swouning; the night fellowing, she suffer'd so great a *deliquium* or sinking down of her Spirits, and insensibility, that she seem'd just a dying: hardly strugling with so great an evill, afterwards she had every day Convulsive fits, though at first at uncertain hours, and returning after a manifold Kinde: But within a short time, its comings being made regular, twice in a day, to wit, they constantly returned at eleven of the clock, and before five in the afternoon, that no intermitting feavour, kept more exactly its periods; yea, also, the same accidents of the fit dayly chanced after the same manner.

When she had thus been sick for three weeks, one day I was sent for, that I might take notice of all the Symptoms, and the whole figure of the disease: she being up about ten in the morning, was well, in her Countenance, going, and speech, she behaved her self exceeding well, so that none would ever suspect her to be sick: at eleven of the clock, she began to complain of a fullness of her head, and numbness of Spirits, with a light swimning; by and by she felt a great pulsation, and as it were the leaping of some live animal, in her left *hypochondrium*: putting my hand on her side I plainly perceived this motion; then a stretching and belching followed, which done, she was presently put to bed, and a maid siting upon a pillow held her down; who during the fit, most strictly grasp the sick person, holding her to her bosom, with her arms foulded about her wast: besides servants were ready, and her relations standing by, who now press'd down her

her belly, and *hypochondria* rising up, and swelling to a great bulk, now held her hands and arms. The chief Symptoms of the Disease, which being excited by turns, almost divided the whole fit, were these two, *viz.* one while Cruel Convulsions of the Bowells did infest her, so that the *abdomen*, rising up into a mighty bulk, strove against the hands of the by-standers, held upon it, that it could not be pressed down; and at the same time, her *Præcordia*, being contracted upwards, the motions of her blood and heart, were almost stop't: in which space of time, this virgin, her head falling down, with a small pulse, and almost without voice, lay nigh sensless; after two or three minutes of an hour, these Convulsions ceased: and then the sick person, setting her self upright, look'd about cheerfully, and for a while, the force of the disease changed into talking and singing, both of which she without ceasing performed, most pleasantly and most elegantly, beyond her proper capacity: with these kinde of speeches, and pleasant jeasts, she fell upon all the standers by, that nothing in a Comedy could be more pleasant; then she utterd most sweet tunes of musick, and more pleasant, than any other could, or her self at another time: After she had past six or seven minutes of an hour, thus jesting and singing, the Convulsions of her Bowells and *Præcordia*, and the want of speech, came upon her as before: and these soon remitting, the force of the Spirits leaping back, from the inferior nerves on the brain, it was lastly imployed in the pleasantness of speech and Songs; as often, when she talkt to the by-standers, as any of them replyed any thing bitterly or reproachfully, she fell into those most grievous, and longer continuing, Convulsions of the *Viscera*: After this manner, she was wont to be molested, with an alternate distemper of the Bowells, and brain, about the space of an hour: Then towards the end of the *Viscera*, the fit declining, more light Convulsions being made, they repeated three or four times without any intermission, then these wholly ceasing, the force of the disease brake forth into her outward members, from whence it quickly vanished: for her Arms and Legs, for a minute of an hour, suffer'd leapings forth, and Contractions; presently after, the sick person being taken up, left her bed, free from all Convulsion, till a new fit returned; yea, indifferently well in strength, she walk'd about the house, and during the interval of her distemper, she cheerfully performed the accustomed Offices of Life, excepting that her stomack languishings all day she loathed food, in the evening, after the second fit, she supp'd moderatly.

This was the present state of the Disease, in whose fits, the more clear use of some faculties, seem'd in a manner to Compensate the irregularity of others: But about the beginniug of her sickness, it was somewhat otherways: for the Convulsions of her bowells, were far more grievous, and an insensibility was joyned to them: besides, in their intervall, talking idly, an incongruons singing, yea both laughter and weeping, without any known reason, breaking forth, were wont to follow one another: but now, the animal Spirits being forced into longer explosions, performed them so regularly, now this, now that, as a more Commodious way was made, that they seemed after a manner, to be done by the Command of the will, and of Reason.

That we may therefore, according to our *hypothesis*, frame an *Ætiology* or rational account of this Distemper; In the first place, it seems, that a vehement fear, did drive the Spirits inhabiting the brain and *Præcordia*, into great disorders: so that, they being disturbed out of their ranks, both the kinde of madness or foolishness, and the frequent swooning succeeded: Further, it may be suspected, that from the same impression, the hurt was carried to the brain it self, so that its conformation being somewhat vitiated, the heterogeneous and morbific particles, were admitted together with the nervous juice: Then, although the spirits at the beginning, being confused and troubled, after their short inordinations, at last recovered themselves, and performed the wonted offices both of the animal and vital function; yet by reason of the taint, impressed on the brain, the heterogeneous particles being constantly admitted, cleaving to those Spirits, induced explosive endeavors, as soon as the spirits were filled to a plentitude, with the extraneous *Copula*, they being irritated, entred into Convulsive explosions for the shaking or striking it off. *The reasons of the aforesaid Distemper.*

About the beginning of the Disease, when both the Disposition of the Brain,

and the Spirits inhabiting it, was more perverſe, and vitious, from the freſh received hurt, a fullneſs of the heterogeneous *Copula* ſooner happened, and ſo its exploſion following more often, and more inordinately, was diſpatched with greater tumult; But afterwards, when the hurt of the animal regiment abating, the ſupplements of that *Copula*, even as the nervous Liquor, were dayly bronght in with an equall dimention, the exploſions of the Spirits being made regular, and more milde, obſerved their juſt periods or ſet times.

That ſhe felt, upon the approach of the fit, a fullneſs and as it were an inflation in her head, with an heavineſs, and dullneſs of the ſpirits, the Reaſon is, becauſe at this time, the ſpirits inhabiting the brain, being now prepared for exploſions, were wont firſt of all to be moved, and as it were to ſwell up; then that pulſation in her left *hypochondria* ſucceeded; for that the Spirits inhabiting the nervous foldings, and *fibres*, thickly planted about the Spleen, began to be exploded: afterwards, when the Spirits flowing both within the meſenteric, and Cardiac enfoldings, were exploded together, thoſe elevations, and as it were leapings up of the *Abdomen*, and *Thorax*, were induced: and when in this diſtemper, the motions of the blood and heart were almoſt wholly ſtopped, therefore there was a ſmall and almoſt no pulſe, and ſhe became Speechleſſe, and in a manner ſenſleſs.

The Convulſion of the *Viſcera* and *Præcordia* remitting, a prattling and ſinging ſucceeded, becauſe a falling down or removal of the Spirits as yet exploded, being made from the nervous ſtock, into the brain, it changed the Convulſions into an exaltation of the fancy, and more ready exerciſe of the phantaſms, or Repreſentation of the Imagination: So long as the Spirits, within the middle of the brain, are regularly and orderly exploded, they bring forth the Acts of the habits and faculties ſo much more noble, and as it were above the ſtrength, and tenour of Nature, as in this ſick Gentlewoman: but on the contrary, when the exploſions of the Spirits in that Region, happen to be inordinate, they cauſe for the moſt part fooliſhneſs, or at leaſt the exerciſe of their powers, are incongruous and abſurd.

The Convulſions of the Bowels, and the phantaſtic actions, releiv'd one another mutually, and by turns, becauſe plenty of Spirits, being diſpoſed to be ſtruck off, made their tendency, as it were with a direct and reflected waving or undulation, now on this part, now on that by turns: then laſtly, when they were almoſt all exploded, the more often Convulſions of the *Viſcera* were ſtir'd up; and when a ſmall handfull only remained to be exploded, that being at laſt excluded, both from the head and bowells, it ran forth into the ſpinal marrow, and employed the laſt aſſolt of the diſeaſe, in the Convulſions af the Arms and Legs.

There yet remains one great difficulty in this Caſe, why the fits of this diſeaſe, were always repeated exactly at ſet hours, and yet had ſo unequall periods, to wit, that the Coming of the firſt, was only but ſix hours before the ſecond, and then the return of the next, did not hapen but in 18 hours ſpace. For the ſolving of this, it is to be ſuppoſed, that theſe fits did depend upon the nervous juice being ſtuffed to a plenitude, with heterogenious particles: which particles were altogether conveyed thither from the bloody maſs, and the blood did drink up the ſame, from the nouriſhing juice, ſent as a ſupply from the Bowells: Theſe being thus ſuppoſed, we muſt conſider, in what ſpace of time, the bloody maſs is filled with thoſe morbific particles, and then, in what meaſure, it pours them forth into the nervous Liquor. As to theſe, that it may the better appear after what manner it was done, in the caſe of this ſick perſon, you muſt know, that ſhe took in 24. hours ſpace, only at one time, a full meal: to wit, after the ſecond fit was ended ſhe ſupped moderately about 7 of the Clock; the reſt of the day wanting an Appetite, ſhe hardly took any food, therefore it is probable, that the morbific matter, was poured forth together with the nutritious proviſion, into the bloody maſs, chiefly in the night time; and that more plentifully, than that all could preſently be derived, into the nervous Liquor: The heterogeneous particles, which are firſt conveyed from the blood, newly ſatisfyed, into the nervous Liquor, being heaped up to the fulneſs, did excite the firſt fit, the coming of which therefore was longer delayed, becauſe both one ſpace is required wherein the blood, and then another wherein the brain and nerves, are to be filled: after this fit was over, becauſe the blood yet full, containing in it ſelf more

particles

particles, of the ſame kinde, pours them ſuddenly on the nervous juice, therefore the other fit is induced, within thrice the ſpace of the former: but this being ended, becauſe both the bloody maſs, and the nervous juice, are wholly freed from their burthen, the ſick perſon finding her ſelf better, than at any other time, took her food greedily enough; but after that, when to the next following fit, firſt the bloody maſs, and then the nervous juice, ought to be filled with the morbific matter, therefore 10. hours are required for this double task: but forasmuch, as there is only need, for the ſecond fit, that the other particles ſhould be derived from the bloody maſs, yet full, into the nervous juice, therefore for this effect, a much leſs ſpace doth ſuffice, *viz.* of 6 hours.

After I had ſeen this Lady, who had labour'd for many weeks with theſe kinde of periodicall fits, I order'd, that three hours before the ſecond fit, ten ounces of blood, ſhould be taken out of the vein on the foot; which being done, the coming of the fit, in the evening being expected, quite left her, neither did it return at all afterwards; but the other fit, obſerving its former time, dayly returned, till the Patient being let blood, a little before its coming, remained that day free from the diſeaſe, which however returning the day after, according to the ſame manner, exerciſed her for many months: In the mean time, becauſe the cold of the winter was very great, ſhe forbore for ſome time the uſe of remedies: but the ſpring coming on, this honourable Lady being brought to *Oxford*, was Cured by the following method. *The Curatory Method.*

Firſt I gave her this Cathartick, and I took care, that it was repeated every 6th. or 7th. day. Take of the *Sulphur of Antimony*, grains 6, of *Mercurius dulcis* 1. ſcruple, of the *Reſine of Julap* gr. iv. of *ginger* gr. vi. let them be beaten together in a morter, then adde of the *Conſerves of Violets* i. dram, make a *bolus*: It was wont to provoke two or three vomits, and three or four ſtools. The flux of her Terms came conſtantly in great abundance, at the ſet times: wherefore, when the blood ſeem'd very plentifull, and hot, I order'd *phlebotomy* twice or thrice in the midſt betwixt the times of her Terms: Beſides, every day that ſhe did not purge, ſhe took twice in a day, 4 pills of the following maſs, drinking after them, a little draught of the Julap below preſcribed. Take of the *Roots of the male-Paony*, ℥ ß. of *Virginian ſnakeweed*, *Contrayerva*, *Cretic Dittany*, each ʒ i i. of *humane skull*, prepared, ʒ i ß. of an *Elks claw* ʒ i. of *red Corral* prepared, of the *powder of Pearls*, each ʒ i. of the *ſalt of Wormwood*, ʒ ii. of the *ſalt of Corrall* ʒ i. with what will ſuffice of the *ſyrrop of the flowers* of the *male-paony* make a maſs.

Take of the water of the *flowers* of the *male-paony*, of *black Cherries*, and of *Wallnuts*, each ℥ iiii. of the antiepileptic of *Langius*, ℥ ii. of the *ſyrrop* of the *flowers of Paony*, ℥ i ß. of *Caſtor* tyed in a knot, and hung in the glaſs, ʒ i. mix them, and make a Julap.

When ſhe began to loath the Pills, they being omitted, ſhe took twice a day, to wit, in the Morning, and the Evening, about one ſcruple of the following powder, in a ſpoonfull of Julap, drinking after it 4. or 5. ſpoonfulls of the ſame. Take of *Bezar-ſtone*, of either *white Amber*, of *Pearls* prepared, of *red Corrall*, each ℈ i. of *humane skull* ℈ ii. of the root of *Virginian ſnakeweed*, and the *ſeeds* of *Rue*, each ʒ ß. mingle them, and make a powder, let her take ℈ i. Morning and Evening, with a doſe of the above-preſcribed Julap.

Then, when alſo this medicine began to be tedious to her, ſhe uſed the pills, or the *Elixir proprietatis*, and alſo ſometimes for many days the *Spirits of Hartshorn*: At laſt, ſhe began to be helped, by that powder, being daily taken, for ſome ſpace.

In the mean time, whilſt this method of healing was ordained; her hair being ſhaven from her head, it was covered only with a thin covering: She wore upon her Belly, an Hyſterical plaiſter mixed with *Galbanum*: for her ordinary drink, ſhe took a *Bochet* of *Sarſa*, and *China*, the *roots* of the *male-Paony*, and other proper things, infuſed in *Spring-water* and boyled. Within a month, the Fits were ſomething remitted: then, being by degrees made gentler and leſſer, at length they almoſt quite ceaſed: unleſs that at the time of her Terms, one or two fits of the diſeaſe was wont to trouble her: Further ſhe labour'd with an almoſt conſtant giddineſs, and queaſineſs of Stomach; in the middle of the Summer, ſhe drunk *Aſtrop-waters*, for a fortnight, and was perfectly well.

But as for the means in generall, to be ſhown for the Cure, of theſe admirable

it will not be easie to assigne, either fit remedies for this herculean disease, or a certain method of Cure, approved by often experience : for besides that these like cases are seldome met with, it is likewise observed, that the same Medicines which at this time were helpfull to this sick person, being given to another, or to the same, helpt nothing at another time : The reason of which seems to be, because the cause of the Disease consists in the discrasie, or evill disposition of the nervous juice, which Liquor, is not always perverted, after one and the same manner : But by the manifold combination of the salts and Sulphures, it gets a morbid nature of a various manner and kinde, and oftentimes changes it : wherefore, in the most grievious distempers of this kinde, not the vulgar medicines, taken from the shops or dispensatory, are to be prescribed, but magistralls, as cause arises, according to the appearances of the admirable Symptoms. A gentle vomit, Purge, blood-letting, ought in the first place to be ordained, and to be repeated, as often as shall seem fit. As to specifick medicines also, and appropriate in these cases, when the chief Indication shall be, to mend the temper of the Nervous juice, you may try many, and by their effect judge of their virtues : Therefore it may be lawfull, to try, what the Remedies indued with a volatile or armoniac salt, may effect. For this end, the spirits and salts, of Harts-horn, Blood, soot, and the flowers and spirits of *Sal-armoniac*, are taken : These helping nothing, you must come to Chalybiats or Steel medicines ; the tinctures and solutions of Corall and Antimony are given : which kinde of medicines are exhibited, in such a dose, and form, and so often, that some alteration may be made by them, on the whole blood or nervous juce : Further, If successe shall fail in such like, you must then proceed to *Alexipharmaca*, which help against poysons, and the malignancy impressed on the humours : to wit, to institute from these, decoctions, and distilled waters of vegitables, powders, Conserves, and other preparations ; and to compound variously some with others, and to administer them diversly. It is likely, that those kinde of medicines, which are wont to be helpfull to such, as are bitten by a viper, or a mad Dog, or that have taken woulfs-bane, or poyson, may be usefull also in the aforesaid Convulsions. It may be lawfull here, according to the example of *Gregory Horstius*, in his tract of the malignant Convulsive disease, and also of wonderfull Convulsions, to prescribe magisterial Remedies, in the form of a purging Electuary, and also of a powder, and Convulsive Antidote, and to compound them variously, partly of simple *Alexipharmacks*, or poyson resisters, and partly of *Antiepileptick*s, or things good against the falling Evil.

CHAPTER. X.

Of the Passions Commonly called Hysterical.

THE hysterical passion is of so ill fame, among the Diseases belonging to women, that like one half damn'd, it bears the faults of many other Distempers : For when at any time, a sicknbss happens in a womans body, of an unusual manner, or more occult original, so that its Cause lyes hid, and the Curatory Indication is altogether uncertain, presently we accuse the evill influence of the womb, (which for the most part is innocent) and in every unusual Symptom, we declare it to be something hysterical, and so to this Scope, which oftentimes is only the subterfuge of Ignorance, the medical Intentions, and use of Remedies are directed.

A description of the hysterical passion. The Passions, which are wont to be referred to this cense or order, are found to be various and manifold ; which rarely happen in diverse women, or which come wholly after the same manner : The most Common, and which commonly are said to constitute the formal Reason of the hysterical distemper, are these, *viz.* A motion in the bottom of the belly, and an ascention of the same, as it were a certain round thing, then a belching, or a striving to vomit, a distention, and murmur of the *hypochondria*, with a breaking forth of blasts of winde, an unequall breathing, and very much hindred, a choaking in the throat, a *vertigo*,

vertigo, an inversion, or rolling about of the eyes, oftentimes laughing, or weeping, absurd talking, sometimes want of speech, and motionless, with an obscure or no pulse, and deadish aspect, sometimes Convulsive motions, in the face and Limbs, and sometimes in the whole body, are excited: But universal Convulsions rarely happen, and not unless this disease be in the very worst state: Because, for the most part, the Tragedy of the Fit is acted without Contraction of the members, only in the inferior belly, *Thorax*, and head, to wit, in some of them, or successively in all: women of every age, and Condition, are obnoxious to these kinde of Distempers, to wit, Rich and poor, Virgins, wives, and widdows: I have observed those Symptoms in maids before ripe age, also in old women after their flowers have left them; yea, sometimes the same kinde of Passions infest men, as plainly appeared by the example already shewed.

The causes of the Symptoms inquired into.

As to the causes of those symptoms, most ancient, and indeed Modern Physitians, refer them to the ascent of the womb, and vapours elevated from it: The former opinion, although it plead antiquity, seems the less probable, for that the body of the womb is of so small bulk, in virgins, and widdows, and is so strictly tyed by the neighbouring parts round about, that it cannot of it self be moved, or ascend from its place, nor could its motion be felt, if there were any: as to that vulgar opinion, or Reason taken from the vapours, we have often rejected it as wholly vain, and light, for just reasons elsewhere: But we judge, the passions but now described, do neither always, nor at all proceed from the ascent, or the vapours of the womb: and that indeed, other very famous Physitians, have already determined: For in times past. *Charles Piso*, and of late the most learned *Highmore*, have vindicated the womb from all fault; and the passions, which are commonly call'd hysterical, are thought by this latter to arise from the blood, most impetuously rushing on the Lungs; and by the other, from a serous colluives heaped together neer the *origin* of the Nerves. How probable this latter opinion doth seem, shall appear from what follows: But as to the opinion deliver'd by Doctor *Highmore*, concerning this thing, tho it be far from our Custom to contradict any ones opinion, and that it is almost unlawfull for me, to diffent from this famous man; yet, because our Pathologie standing on a contrary *basis*, (viz. the cause of the hysterical distemper being imputed more immediately to the nervous stock, than to the blood) will seem to be only asserted, unless we shew the Reasons, which combat against that *hypothesis*, and forours, therefore taking leave, here we will try more exactly either opinion, put as it were in a ballance.

Doctor Highmores Opinion Examined.

In the fit therefore commonly called hysterical, this famous man supposes, the blood, for that it is thin, flatulent, and with a certain effervescency, to rush too much in heaps, into the pneumonick vessells, and the vessells of the heart, and in them to broyl up impetuously, and so to stuff up the lungs, and very much to aggravate them, that neither they can exercise their motion, nor that the blood can be drained from the bosom of the heart: Hence, from the blood stagnating in the *Præcordia*, a great oppression, difficult breathing, and often none, with a melting of the vital Spirits were wont to be inferred: then the *diaphragma*, that it might give place to the Lungs more and more distended, and that breathing at least might be some way made, is carried downward, with a mighty and long continued *Diastole*, and so by pressing down the Intestines, it lifts up the *abdomen*, and *hypochondria*, and feins a motion as it were the arising of a globe: But afterwards, the vital function labouring after this manner, the animal faculty arises in its aide, wherefore, a necessity of motions, in various parts urging the animal Spirits, being driven impetuonsly into the beginnings of the nerves, produce divers manners of Convulsions, running here and there. The Author endeavours to confirm this Opinion, by the great help in this disease had, by the taking away the bloody excretion, both from things helpfull, and things hurtfull, in this passion.

But though I cannot but praise this Doctrine of the suffocation of the womb, as very ingenious, and cunningly wrought, yet that I do not consent to it in all things, some reasons of great moment clearly hinder me. Truly I confess, that I do not understand, how in some hysterical persons, to wit, who are of a more frigid temperament, and are often troubled with the Pica, and longing disease; the blood should so immoderatly boyl up in the Lungs, without any conspicuous

nores

notes of its growing hot, in some other place. I have known young maids, by reason of the green-sickness, as it were without blood, to wit, whose blood indeed being without life, did remain without any exercise in the heart, and was from thence diffic ltly enough drawn forth, into the Lungs, who yet were grievously obnoxious to the passions called hysterical: Certainly it is not probable, that the blood of these persons growing immoderatly hot, should rush impetuonsly into the Pneumonick vessells, and should stuff up their pores and passages very thickly, when in the mean time, such become short-breath'd, by reason of the absence of the blood from the Lungs, or its difficult admission to them: Besides, by what means comes it to pass, that this violent course of the blood into the Lungs, which is supposed to be made in this Fit, brings forth no Inflammation in them? for that the blood, being too much heaped, or rapidly put into any part, is easily extravasated, and is wont to excite an Inflammation hardly to be shaken off. From whence it is therefore, in the hysterical distemper, the blood entring violently into the Lungs, and distending them, does not cause a peripneumonie or Impostume of the Lungs? Or wherefore the distempers as it were hysterical, come not on an Inflammation of the Lungs, otherwise caused? wherefore it seems improbable, that the blood swelling up, with its proper anger or heat, should rush into the Lungs, and by stuffing them, renders them too immovable, and so secondarily and consequently induce Convulsions of the *Diaphragma*, and other parts: but it may rather seem, that by reason of the *Diaphragma*, and other organs of breathing, being first affected with a Convulsion, the blood should be forced to stagnate in the *præcordia*: Besides, it may be observ'd, that the Lungs are not always afflicted before other parts; for oftentimes the convulsive Symptoms begin elsewhere, and not rarely bear the region of the breast wholly untouch'd: Because in some, the *vertigo*, and Corruscations or sparklings of the eyes, begin the fit, to which succeed either weeping, or laughing, or convulsive motions of the Limbs, without any straitness of the breath, or oppression of the heart: in others, before respiration troubles them, any way, a swelling in the bottom of the belly, with a vomiting, and rumbling of the belly, begins and often ends the fit; so that the difficulty of breathing, oftentimes follows these Symptoms at a great distance, and is wont to be prevented, by the tying strictly of swathing-bands, about the *hypochondria*. Moveover, it seems, that this ascent as it were of a certain round thing, from the *Hypogastrium* or lower part of the belly, can never proceed from the depression of the *Diaphragma*; because in the hysterical fit, this part is not always pressed down towards the lower parts, but oftentimes drawn up to the higher parts, and drives the Lungs upwards, so that the spirit or breath being almost shut forth, threatens the danger of Choaking. By these, and other reasons, we are at length perswaded to that opinion, that the distemper named from the womb, is chiefly and primarily convulsive, and chiefly depends on the brain and the nervous stock being affected, and whatever inordination, or irregularity from thence happens, about the motion of the blood, is only secondary, and is made dependingly, by the Convulsions of the Bowells.

The hysterical distemper chiefly belongs to the Brain and nervous stock.

But that this doth consist within the bounds of the head, both the comparing of the symptoms, which happen in the living, and the anatomical observations of the dead, clearly shew; because we may observe, that this distemper often takes its rise, from a sudden fear, great sadness, or anger, or other violent passion, in which the spirits inhabiting the brain are chiefly affected besides, to some an ill manner of dyet, and varions accidents whereby the humours being vitiated, are heaped more plentifully within the head, at first brings this evil. Yea, the manner of the fits clearly evinces the same, forasmuch, as a fullness of the head, a *vertigo*, a sparkling of the eyes, a ringing noyse of the ears, begin in many the hysterical fit, and often conclude it: Besides I have opened some women, dead of other diseases, tho while they were sick, very obnoxious to hysterical passions, in whom the womb being very well, I have found in the hinder part of the head, the beginnings of the nerves, moistned and wholly drowned with a sharp *serum*, as shall be more largely declared anon.

Having weighed these, and other Reasons, we doubt not to assert, the Passions commonly called Hysterical, to arise most often, for that the animal spirits, possessing the beginning of the Nerves within the head, are infected with some taint;

taint; to wit, they being either acted or brought into Confusion, or being tinged with vitious humours, get to themselves an heterogeneous and explosive *Copula*, which they carry far away with themselves, into the Channels of the nerves: and when the same spirits are filled to a plenitude, with that *Copula*, thorow all their *series* or orders, either of their own accord, or being occasionally moved, they enter into explosions, and so stir up Convulsive motions: But that such a *Copula* adhering to the spirits, is chiefly derived together with them, into the interior nerves, the reason is, because in this passage towards the *præcordia*, and *viscera*, the animal spirits, by reason of the distemper of the minde, are very much disturbed; wherefore, they more easily admit any evills brought from another place, and more readily conceive irregularities. For the animal spirits, chiefly for this occasion, contract a convulsive disposition: forasmuch as they, from a violent impression, are perverted out of their Courses, and their wonted manner of Influence, and acting; hence they not only repeat their inordinations, but also receive the heterogenious particles into their embraces, and more easily combine with them: Wherefore, forasmuch as the animal spirits, running thorow the nerves of the wandring pair, and Intercostals, are continually entangled with all perturbations both of the Concupiscable, and irascible Appetite, it is no wonder, if they acquire a convulsive disposition, before the rest.

The cause of the disease, most often begins, about the beginnings of the nerves.

It being supposed (which indeed ought to be supposed) that the animal spirits have contracted an heterogenious and explosive *Copula*, now the nervous *origines*, and carried it together with it self into the interior nerves, and spread it thorow all their passages, it will not be hard to assigne the Reasons of the hysterical fit, and of all its Symptoms. For first of all, the disease being ready to fall upon one, oftentimes the *Vertigo*, a rolling about of the eyes, and a certain inflation of the brain, as it were prævious skirmishings, are stirred up, because the whole band of the Spirits, being in readiness for explosions, the more light companies of them, leaping back towards the brain, are first struck off; then Presently a perturbation succeeds, in the bottom of the belly, or *hypochondria*, for that the Spirits within the enfoldings here and there, are next disturbed: For we have elsewhere shown, if at any time the animal Spirits are exploded, in a certain whole *Series*, those which abode in the extream parts, first of all enter into that assertion: Wherefore the beginnings of this Disease, are found to be or the most Part, in the head and Bowells: but that the Convulsions are first perceived, now in the bottom of the belly, now in the *hypochondria*, the reason is, because the morbific matter, is sometimes carried by the passage of the intercostal nerve, into the utmost mesenteric enfoldings; but sometimes the same, being slid down, not beyond the ends of the wandring pair, subsists much neerer, to wit, about the enfoldings of the spleen, or stomack.

The same cause after wards disposed, thorow the whole passage of the Nerves.

When therefore the animal Spirits (as hath been shown) within the nerves of the wandring pair, and intercostals, are imbued from their *origine*, even to their utmost ends, with an heterogeneous and explosive *Copula*; they at length, either from mere fullness, or by an irritation somewhere made, are stirred up to explosions; in which affection, if any Spirits leap forth towards the middle of the brain, they induce the *Vertigo*, the inflation and other prævious accidents of the head: but the Spirits inhabiting the other extremity of the nervous Trunk, *viz.* the mesenteric enfoldings begin chiefly to be exploded, which presently by their letting off, compell the lower Parts of the *hypogastrium* to be lifted up, and contracted upwards, and so induce the ascention of a certain bulk, as it were of the womb: then, when the upper parts of the enfoldings of the mesentory, are by degrees intangled with the same distemper, and the bowells annexed to the same are elevated, and drawn forceably towards the upper parts, the violent swelling of the *Abdomen*, as it were with a certain leaping forth succeeds: Further, the Ventricle is not only elevated, by changing its place, all its *fibres*, to wit, the direct, oblique, and transverse, being affected at once, with the Convulsion, is often distended like a blown bladder: hence very often vomiting, or at least a rumbling, and murmur of the *hypochondria*, are excited: but as soon as the Spirits being exploded, with a certain *series*, it comes to the Region of the *Thorax*, the *diaphragma* being drawn together, with an huge diastole is sometimes depressed, and so meeting with the ascention of the *viscera*, causes an Inflation, and high intumescency or swelling up, with a mighty straggling; so that the

The reason of the hysterical Symptoms unfolded.

the laces of those in this distemper, must be forthwith loosned, or else they are in danger of falling into a trance: In the mean time, the *Diaphragma* being so depressed, and its diastole continued, the bloud remains almost immovable in the *præcordia*: and so by its stagnation, causes a great oppression, and very often a failing of the vital function: Further, the Convulsion of the *Diaphragma*, happens sometimes towards the upper parts, and so, that driving the Lungs upwards induces a violent Systole, and protracted longer than it should be; and when by this means, the blood is driven forward, into the pneumonic vessells, and is not at last received from the bosome of the heart, it stagnates there, and besides in the whole Body; from whence the oppression of the heart, and oftentimes a swooning, yea sometimes a want of speech, and motion, now with a blewness of the face, and now with a dead aspect follow: After these things are acted in the lower, and middle Region, at length the distemper reaches to the head, by the passage of the nerves, as it were a fiery inkindling, and the spirits being there exploded leaping now towards the middle of the brain, produce a swimming in the head, and often symptoms very like the *Epilepsy*; sometimes the spirits there exploded, rush into the beginnings of the other Nerves, and there stir up the like explosions; wherefore, hysterical people, towards the end of the fit, often Laugh, or weep, or talk Idly; sometimes the parts of the face, and mouth, yea, sometimes the arms, and other members, are troubled with convulsive motions, and so, when at length all the spirits, which had contracted an heterogeneous *Copula*, are exploded, the fit ends; but presently after, matter for another fit, begins to be gathered together.

From whence the diversity of the Symptoms happens.

It sometimes happens, that the convulsive disposition is not drawn out so long, and largely, for besides that oftentimes the nerves only of the wandring pair, and the intercostalls are troubled with it, that neither the brain, nor the outward members, are at all molested; yea sometime, neither the interior nerves themselves, are possessed with the morbific cause, thorow their whole processes: for the convulsive Disposition (as we but now intimated) oftentimes arrives not beyond the enfoldings of the spleen, or stomack, and then the fit beginning from the inflation of the *ventricle*, or left *hypochondrium*, is thought to arise, not from the fault of the womb, but of the spleen: which kinde of distemper, by and by being brought to the Thorax, and there involving the *Diaphragma*, and Lungs, with a Convulsion, stops respiration, and the motion of the heart, or in some manner perverts it: but then from thence, the fit passes over; now with, and now without a great perturbation of the Head. These things happen indeed after a various manner, according as it happens, that the morbific matter, or explosive *Copula*, descending from the head, is gathered together, as it were heaps of gun-powder, more or less, now in this, now in that part! But concerning which matter, by what means, the same being brought forth in the head, first affects the beginnings of the nerves, and so constitutes the procatartick, or more remote Cause of the passion called Hysterical, now remains next to be inquired into.

The more remote Cause of the disease subsists, either nigh the beginnings of the Nerves.

As to the morbific matter or explosive *Copula*, which cleaving to the spirits, flowing within the head, and with them derived into the nervous passages, is often the cause of the distempers, commonly termed of the Womb; we say, that this, as in other kinds of Convulsions, is the heterogeneous particles, poured forth from the blood, which yet are wont to be affixed to the spirits, flowing into the beginnings of the nerves, cheifly for two causes: to wit, either by the fault of the spirits themselves, or by the force of the matter it self, instances of either kinde, are ordinarily met with. It sometimes happens, that the animal spirits, planted within the brain, and in the passage leading from it, to the *præcordia*, are very much disturbed, by a sudden passion, as of fear, anger, sadness, *&c.* And forced into disorders; and that by that means, they being driven out of their orders, do acquire to themselves heterogeneous particles, whereever met with; and combine with these, that by and by, for that reason, they acquire an explosive disposition, as we have already declared. Further in the second place, sometimes the morbific matter it self, being made more fierce and strong, in spite of the succour of the animal *Æconomie* or rule, is poured forth into the brain, and its appendix, from the bloody mass, which cleaving fast to the spirits, presently disposes them into explosions: This is ordinarily discerned

in

in the evil criſes of feavours, alſo in ſome malignant diſtempers, alſo in Scorbutic and other Chronical diſeaſes ill cured. An ill, or weak conſtitution of the brain, or nervous ſtock, whether it be hereditarie, or acquired by reaſon of an ill manner of living, very much cheriſhes theſe cauſes. For in bodies ſo diſpoſed, both the animal ſpirits, from every light occaſion, are moved in Confuſion; and the paſſages of the brain, and nervous *Syſtem*, more eaſily lye open, for the running in of the heterogeneous, and exploſive matter. In truth, for this reaſon, women are more obnoxious to convulſive diſtempers, than men, and ſome women then others, as we will ſhew more largely hereafter.

But altho theſe kinde of paſſions of women, called hyſterical, moſt often proceed from the fault of the head, or from the morbific cauſe, ariſing within the *Encephalon*; yet ſometimes, ſuch diſtempers are ſtirred up, by reaſon of a Cauſe beginning ſomewhere elſe, *viz.* Now in the womb, now in the other Bowells; and of this Convulſive Pathologie, there are chiefly two heads, *viz.*

Or near the womb, or other Inwards.

1ſt. Sometimes it happens, that a Tumour, or an ulcer, or a congeſtion of ſharp humours, ariſes in the membranous parts, about the womb, or planted about the other *Viſcera*, and often irritates the parts ſo diſtemper'd, by reaſon of the breaking of the union, into painfull Convulſions: then foraſmuch as the animal ſpirits, placed round about, and thoſe inflowing, are moved iuto frequent diſorders, they at length, getting to themſeves heterogeneous particles, ſent either from the diſtemper'd part, or from ſome other place, are diſpoſed to convulſive aſſaults, and when firſt of all, the convulſive motions happen only in the neighbourhood of the affected place, to wit, that the bulk aſcending in the lower part of the belly, or its ſwelling up be only perceived; afterwards they are propagated by the paſſage of the nervous bodies, and by the conſent of the convulſion there begun, leaſurely into the other *viſcera*, of the lower belly, then to the *præcordia*, and laſtly into the head it ſelf; and the diſtemper, being thus by little and little delated to the ſpirits inhabiting the brain, they moreover having gotten in their proper Sphear, an heterogeneous *Copula*, retort the ſame back to the *viſcera*, and ſo the morbific cauſe, being made reciprocall, is begun at either end of the nervous Trunk. Some time paſt I have ſeen a noble virgin, in whom a ſmall Tumour ariſing, with moſt cruel pain, below the *Os pubis*, did ſtir up huge Convulſions; firſt in the lower belly, and afterwards aſcending to the *Præcordia*, and head, were at length ſtretch'd to the outward members: for once or twice in a day, after that great pains did torment her in the affected part, the *abdomen*, and by and by the *hypochondria*, were wont to be lifted up: then difficulty of breathing, on an Inſenſibility ſucceeded, and preſently the diſtemper being brought outwardly, moſt horrid Convulſions, and Contractions of the members, and Limbs followed. Sometimes it alſo happens, that convulſive ſymptoms are induced in Child-bearing women, by reaſon of ſome hurt or evill brought to the womb: *Harvie* Relates, that wonderfull convulſions were cauſed by the injection of ſome ſharp thing into the womb: So ſometimes, tho rarely, it happens, that a morbific matter or exploſive *Copula* is fixed to the ſpirits dwelling about the extremities of the nerves and near the womb, immediately from the place there affected and without fault of the brain.

This laſt happens after a twofold manner.

Either by reaſon of the diſſolution of the union.

There yet remains another caſe, or manner of affecting, by which the convulſive diſpoſition is produced from the fault or the parts, lodg'd at a great diſtance from the brain (tho in the mean time, the taint, which is the cauſe of this diſtemper, is often mediately communicated to the brain it ſelf) to wit, when at any time, the nervous juice is hindred ſomewhere, in its motion or circulation, from thence ſtagnating in the nervous parts, and loading them, does often bring in a convulſive diſpoſition: So, when ſome uſual Evacuation, whereby the ſuperfluities of the nervous Liquor, were wont to be ſifted forth, is ſtopp'd, as from Iſſues ſuddenly ſhut up, or old ulcers dryed up without a purge, many fall into convulſive diſtempers: Yea, it may obtain here ſome place, what is wont commonly to be noted for a cauſe, of the hyſterical paſſions, in maids and widdows, to wit, the untimely reſtraint of the ſeminall humour, which ought to be beſtowed about the pleaſure of *Venus*; at leaſt, if they receive help from the ſtate of a conjugal Life, it therefore happens, becauſe the reſtagnations of the nervous humour, which often fix a taint to the brain and nervous ſtock, by this means are prevented: Moreover, the nervous juice flows back towards its begin-

2. *Or by reaſon of an obſtruction of the Nervous juice.*

ning, becauſe its paſſage is ſomewhere ſhut up, by a ſwelling or cancrous Tumour. Laſtly in this City, a notable inſtance of this kinde of diſtemper hapned, *viz.* A certain maid of 12. years of age, had contracted an *hernia* or burſtneſs, hence by the order of her Mother, ſhe wore a truſs ill fitted, for a fortnight, not without great pain and torment, a little hard knot much preſſing upon the *glandulas* of the Groin: within this ſpace (when before ſhe was perfectly well) ſhe began to complain of a giddineſs and heavy dulneſs of her head; and ſo a little after, ſhe felt convulſive, and as it were hyſterical diſtempers, frequently falling upon her; rogether with it great ſwellings aroſe behinde her ears, and in her neck of the ſame ſide; to which ſhe was never before obnoxious in all her life. It is not to be doubted in this caſe, but that from thoſe *Glandulas*, which are the Emunctuaries, or ſinks of the nervous Liquor, being too much preſſed together, the ſuperfluities of that humour, wont to be ſent away from thence, by the Lymphatic veſſells, reſtagnating in the head, brought forth thoſe evills: becauſe the ariſing of the aforeſaid ſymptoms, ſo ſuddenly and manifeſtly followed, upon the wearing of that Truſs upon the Groin, that even her Mother laid the cauſe of the Diſeaſe, upon that occaſion. Beſides alſo I have obſerved in others, the recrements of the nervous humour, being ſomewhere ſtopp'd in their Courſe, reſtagnating towards the head, have not only brought in convulſive ſymptoms, but from thence the *Kings Evill*.

Objections againſt the aforeſaid hypotheſis anſwered.

So much for the formal Reaſon, of the different original of the diſtemper, called hyſterical; as alſo of the *genuine* Cauſes, of its ſymptoms: Out of which, it ſeems to appear plainly, that thoſe paſſions, do not depend always on the womb, but much more often, on the fault of the brain, and of other parts of the nervous ſtock: But many things are objected againſt theſe, which according to the old opinion, caſt all the blame on the womb: To wit, it ſeems ſo to be done becauſe the aſſault of this diſeaſe invades almoſt only women; yea and women that are not well about their womb, *viz.* Child-bearing women, or ſuch who have their courſes ſtopt, are chiefly obnoxious to it: Beſides it may be argued from things helpfull for it, becauſe a plaiſter worn upon the lower part of the belly, alſo a ſtrict girding of the belly, and *hypochondria*, by which the aſcent of the womb may be hindred, do not ſeldom drive away the fit, juſt falling on them; this alſo ſhews it, that ſweet things held to the noſe brings on the fit, and ſtinking things drive the ſame away, it is ſaid to happen quite contrary, if the ſame things be laid to the belly, or privy member.

That we may wipe off theſe objections, we ſay firſt, that the ſymptoms, which ſeem hyſterical, do not only happen to women: for we have ſhown already, by the hiſtory brought by us, that a certain man has been obnoxious to thoſe kinde of fits, with the aſcention of a bulk in the bottom of the belly: but that women are much more often troubled with thoſe convulſive diſeaſes than men, two reaſons may be ſhown, *viz.* Firſt, for that their animal conſtitution is much weaker: to wit, they have the brain and nerves ſofter, and of a leſs firm texture, that they are not able to ſuffer any thing ſtrongly, or to reſiſt every injury; alſo the animal ſpirits in them, being more prone to flight and diſtraction, more eaſily admit an heterogeneous and exploſive *Copula*: from hence Women, from any ſudden terror or great ſadneſs, fall into mighty diſorder of ſpirits, when men from the ſame occaſion, are ſcarcely diſturb'd at all. Secondly, women more readily receive the convulſive diſpoſition, becauſe they gather a more plentifull heap of the morbific matter: for that, whilſt they lead for the moſt part a ſedentary Life, the blood, for want of ventilation, becomes more impure; beſides in this ſex it originally abounds with heterogeneous and fermentative particles; wherefore it is convenient for it, to be more often purged, by the flux of their Courſes; by which notwithſtanding, not always what is extraneous, and incongruous, is wholly caſt forth, from the bloody Maſs, but that there remains, that which being poured on the brain, and its appendix, as occaſion is given, becomes the cauſe of the convulſive diſtemper: Moreover, when the menſtrual flux, being ſtop'd, a convulſive diſpoſition is occaſioned, it is not therefore to be thought, that ſuch a diſtemper is rais'd up from the womb, but that the bloody maſs, being more than uſually imbued, with heterogeneous particles, carries them, together with the nervous juice, to the head: yea, chiefly for this reaſon alſo, child-bearing women, are found obnoxious to the paſſions,

paſſions, as it were hyſterical, for beſides that the membranes of the womb being hurt, a convulſion there begun, by reaſon of the felt trouble, creeps upwards and is at laſt communicated to the head; it moſt often happens, that the blood being infected, by the termes being retained, grows hot with a feavouriſh burning, and then inſtead of a *criſis*, the malignant infection, is carried to the brain, from whence convulſive, and not ſeldom ſoporiferous, or ſleepy diſtempers, are excited.

But that it is argued, that this diſeaſe ſeems to be hyſterical, becauſe Remedies applyed about the *abdomen*, often bring help; it will be eaſy to ſhew, that the morbific cauſe planted in the meſentery, oftner than in the womb, is ſometimes either taken away by that means, or reſtrained from its Influence: beſides, the ſame kinde of applications, about the *hypogaſtrium*, are no leſs profitable, altho the original of the diſtemper, be derived from the head it ſelf: for we have ſhewn before, that when the heterogeneous, and exploſive matter, deſcending from the head, brings a convulſive diſpoſition, to the ſpirits diſpoſed within the whole proceſſes of the interior nerves; the convulſive motions therefore excited, begin from the extremities of the nerves, and ſo creep upwards towards their beginnings; ſo that firſt of all the *viſcera* of the lower belly, then the *præcordia*, and laſtly the brain it ſelf are affected; but if the outmoſt ſpirits, *viz.* thoſe dwelling in the enfoldings of the meſentery, be reſtrained from entring into exploſions, all the reſt, in the remaining nervous paſſage, continue in their orders: and this, plaiſters worn upon the navel, do often effect: for they repreſs, and compel into order, with their odour, the ſpirits from leaping forth; yea alſo, not ſeldom, they ſhake off and drive away, the *Copula* cleaving to them: wherefore, when the exploſions there about to be made, are reſtrained, the convulſive fit is wholly prevented: which yet is more apparent, for that, if the Convulſion begun in the lower belly, and from thence aſcending like a Globe, be preſently ſuppreſſed, and by a ſtrong binding together of thoſe parts, it be hindred that it creep not upwards, oftentimes the convulſive paſſion is broken off, the *præcordia*, and the brain being untouch'd: wherefore it is a common cuſtome, for ſick women, to binde ſtrictly the *Epigaſtrium*, with ſwaths or rolers, and ſo to ſtop the progreſs of the ſymptoms, towards the upper parts: For when the animal ſpirits, enter into Convulſions ſucceſſively, as it were a fiery enkindling, whereever the tinder, or cheriſhing matter is cut off, or intercepted, the diſtemper is there reſtrained.

As to the various effects of odors, to wit, that ſweet things bring on the fit, but ſtinking things drive the ſame away, it may be ſaid, that the former do looſen the animal ſpirits, by pleaſing them, and too much releaſe them from their wonted tasks of Influence, and ſo provoke them ready to be exploded, in ſuch diſorders, yea and as a flame put to them, do ſomewhat inkindle them: but on the contrary, ſtinking things repreſs the ſpirits, drive them back from excurſions, and exorbitances, and compell them into order, yea like ſulphur, mixt with *aurum fulminans*, take away from them their exploſive force.

What we have hitherto ſaid, of the paſſions called from the womb hyſterical, will yet more clearly appear, if for the Confirmation of our *Hypotheſis*, we ſhall add arguments taken from anatomical obſervations; I will therefore lay before you a notable Caſe, by which the former reaſon, and Cauſes of the convulſive diſtempers, may be very much illuſtrated.

Obſervation. A very noble Lady of a moſt curious ſhape, and highly indued with a virtuous diſpoſition, of minde and manners, of late lived near to this place, who being for many years obnoxious to convulſive diſtempers, for that ſhe had originally, or hereditarily contracted this ſickly diſpoſition, aud had experienc'd the fruits of this morbid ſeed, almoſt every luſtre of her age, but chiefly as often as ſhe was with child, (for ſhe very frequently miſcarried) was wont to be tormented above meaſure, with convulſive paſſions, as it were hyſterical; becauſe, preſently after the reſtraint of her monthly flowers, the heterogeneous particles being tranſlated to the brain and nervous ſtock, cauſed fits of this moſt cruell diſtemper.

After ſhe had newly conceived, in the firſt months, according to her old cuſtom, ſhe was preſently moleſted with convulſive diſtempers; about the nineth week of her big belly, from taking cold, ſhe fell into a dangerous feavour, in which very

acute pains tormenting her, in her loyns and bottom of her belly, for many days, ſeem'd to threaten an abortion: but theſe pains, as the event ſhew'd, rather to be termed Colical, proceeded from a ſharp humonr, falling down into thoſe parts, from the brain, by the pipes of the nerves; for towards the declining of the feavour, this matter being ſomewhere elſe tranſlated, a great looſneſs or Diarrhæa, pains of the feet, and as it were an ulcerous diſpoſition ſucceeded.

As ſoon as this Lady became well from her feavour, and thoſe pains, the convulſive diſtempers returned, for every morning, wakeing from ſleep, ſhe was wont to ſuffer Convulſions, and cruel contractions, about the parts of her face and mouth, as alſo in her armes and thighs; which ſymptoms, without doubt, did ariſe from a ſerous heap or gathering, laid up in the head, about the beginnings of the nerves; and by them imbibed, together with the nervous juice, more deeply in ſleep; and when afterwards the ſame matter, was carried by the pipe of the interior nerves, into the foldings of the Meſentery, aud loyns, moſt cruel pains of thoſe parts, and alſo fits as it were hyſterical, did moſt grievouſly infect her.

But theſe convulſive motions of her face and members, after a little time ceaſed, but yet ſhe ſtill remained weak, and without ſtrength, with a pale countenance, an infirm and trembling gate, and deſirous only of congruous food, and hot Liquors: about the end of the third month, at which time ſhe was wont continually to miſcarry, her *menſtrua* broke forth, which coming away for two or three days together, with little pieces of broken membranes, ſhe expected to miſcarry: But that flux ceaſing, pains as it were of one in labonr, in her *abdomen* and loyns, as before aroſe, and for the ſpace of a week, tormented her day and night; at length, having uſed a bath of *Emollient* herbs, and afterwards put to bed to ſweat, ſhe brought forth the burthen of her womb: the conception ſo coming away with mighty pain, was about the bigneſs, and like the figure of a Turkie egg: the exterior coat of it was torn and broken, the interior remaining whole, contained about half a pint of clear water and nothing elſe beſides; there appeared no ſhape of a childe, or any rudiments that it would ever be one: Afterwards for 4. or 5. days, her flowers flowed forth, with ſome pieces of broken membrances: in the mean time, pains with their wonted fierceneſs tormented her, and when the ſpace of a week being elapſed, they left not off of themſelves, remedies at length were ſought to allay them.

To this end, firſt Liniments, Fomentations, Baths, and Clyſters, were often adminiſtred; alſo medicines purging the filth of the womb, on which the cauſe of all the evill was caſt, were taken inwardly: Short intermiſſions of her tortures, followed upon the uſe of the former; but then the diſtemper returned, with great trouble; yea the diſeaſe much increaſing, in three weeks time, got many other horrid ſymptoms: for beſides the pains in her belly and loyns, which became more cruel every day, alſo ſhe was ſhortly after tormented in her back, neck, ſhoulders, as alſo in her arms and thighs, with moſt cruell pain; and that more bitterly, as ſoon as ſhe was warm in her bed; beſides, ſhe was afflicted with a frequent giddineſs, vomiting, and nauſeouſneſs, and often in a day, with moſt grievous convulſive fits, *viz.* Firſt a bulk was ſeen to aſcend in the bottom of her belly, and preſently it lifted up her whole belly forceably, by and by reſpiration being reſtrained, an Inſenſibility, with a dead countenance ſucceeded: after that, ſhe had thus lain as one dead, for three or four minuts of an hour, ſhe was wont ſuddenly to leap up, that ſhe could hardly be held down, or kept by thoſe ſtanding by; then follow'd cruell contractions, and diſtortions in all the parts of the mouth, and face, as alſo in all the members of the body: Theſe ſymptoms were indeed judg'd to be hyſterical, becauſe this noble Lady ſo lately had miſcarried.

But weighing every one of theſe, I was at laſt of this opinion, that the cauſe of either fit, *viz.* Both the *dolorifick*, and the convulſive, did depend wholly on the evill affection of the brain, and nervous ſtock, and that without any fault of the womb; for that a ſharp humour, being heaped up within the head, did from thence deſcend thorow the paſſages of the Nerves, into parts at a great diſtance; which lodging upon the membranes and *fibres*, and fermenting with the humour, flowing in from the bloody maſs, did irritate them very much, and ſo ſtir'd up moſt cruel pains: Then afterwards, when the heterogeneous and exploſive particles,

ticles, being admitted with what humour within the head, and entring into the nervous paſſages, did cleave to the ſpirits; therefore the convulſive diſpoſition, then breaking forth into grievous fits, was induced, as ſhall be by and by more largely laid open.

Inſtituting Curatory Intentions, according to this kinde of *Ætiology*, I order'd to have blood taken from this ſick Lady, at what time ſhe moſt grievouſly laboured, out of the *Saphena vein*, and within two days, to be given her a gentle Cathartick, and that to be reiterated, once or twice in a week: Alſo on other days, Morning and Evening, I gave her ſpirits of *Harts-horn*, and at other hours, twice or thrice in a day, of the *powder of Pearls* and *Crabs-eyes*, with a doſe of the following Julap. Take of the *water of Snails*, and of *worms magiſteriall* each ℥ iii. of *Saxifrage*, and *black cherries* each ℥ iiii. of *hyſterical water* ℥ ii. of the *ſyrrop of Corralls* ℥ i ß. of the *tincture of Coſtor* ℥ i. mingle them: The bath of ſweet herbs was frequently uſed, when neceſſity urged, ſhe took *Opiats* always with good ſucceſs: *Veſicatories* were applyed to the inward part of either thigh, alſo to the hinder part of her neck; alſo *Fomentations*, *Oyntments*, *Clyſters*, *Cuping-glaſſes*, *Sneezing-powders*, with many other manner of adminiſtrations were preſcribed, according to the exigences of the ſymptoms.

By this method obſerved for about 14. days, the noble Lady having received very much eaſe, was wholly rid of her convulſive fits. Yea, the torments of her Bowells and members, and the other ſymptoms being very much leſſen'd, ſhe hoped quickly to recover her health: But after this, partly by reaſon of an ill order of dyet, which the ſick Lady always indulg'd her ſelf in, or taking little, but chiefly, by reaſon of a ſudden paſſion of fear and ſadneſs, which an unluckie accident hapning within her own houſe, had cauſed, ſhe fell into a relaps, by and by the diſeaſe growing into a much worſe Condition, for both the Convulſions, and pains, did infeſt her more bitterly; yea and her ſtomach being almoſt tyred out, with continual vomiting, would not admit either of food or medicines. She took Aſſes milk for ſome days, with ſome ſucceſs; which notwithſtanding, for as much as breeding Choller in her ſtomach, ſhe found it troubleſome, ſhe ſhortly omitted: at length in ſpite of all Remedies, preſcribed carefully by the Conſultation of many Phyſitians, my noble patient from day to day grew worſe, and by degrees death approached: Two days before her death, the torments of her belly and loyns very much abated, and ſhe became more than uſually chearfull, and conceived ſome hope of Recovery; But in the mean time ſhe complained of a pain and great heavyneſs in her head; and about the beginning of the night ſhe ſlept ſoundly, but being awakened ſhe fell into a very horrid convulſive fit, which preſently paſs'd into a quick deadly *Apoplexie*, for being made inſenſible, and ſpeechleſs, ſhe left this life within twelve hours.

The rational account of the diſeaſe taken from anatomical Obſervations.

When various judgments had paſſed, about the cauſe of the ſickneſs, of which this illuſtrious Lady dyed, moſt flinging all the evills on the diſtemper of the womb, others on an Ulcer or Impoſthum, which they ſuſpected lay hid, ſomewhere about the *viſcera* of the *abdomen*; it pleaſed her friends, that her dead Carcaſe, kept long opened for the Funeral, ſhould be dilligently inſpected, and ſo the genuine Cauſes of the diſeaſe, and her death, might be inveſtigated; which task being left to my care, I executed with all the dilligence I was able.

Therefore in the firſt place, it was worth obſervation, about the habit of the body, that the members and lower parts, nigh and beyond the ſeats of the pains, were very much waſted; as her thighs, quite worn away, appeared like a Skelliton: In the mean time, her face, neck, and arms, remained full, and plump enough: from whence it appears, that the nervous Liquor, does help no leſs to the buſineſs of nouriſhment, than to the exerciſe of the animal faculty: wherefore, when that Liquor, being much hindred in its paſſage, the loyns and belly, taken up with the continual Convulſions, did not deſcend, with a due influx, to the inferior parts, they for that reaſon, became preſently both without ſtrength, and lean, and waſted. This kinde of Atrophie, differs in this, from other hectical waſting, which happens from the vice of the blood, becauſe in this latter, an hippocratick or waniſh face, is the chief ſigne of the Diſeaſe, in that firſt mention'd, the countenance, and aſpect, ſhow little or nothing of evill.

The dead body of this noble Lady, tho very lean, and that her bowells were all

all the emptied, yet quickly putrified, for within 40. hours all the skin was diſcolour'd, and appeared in this part livid, in that green, and in others blackiſh; and her Corps ſo ſuddenly putryfying, yielded a moſt horrid ſmell, the reaſon of which without doubt was, that by reaſon the muſcles were exerciſed with perpetuall Convulſions, the principles of their mixture, were ſo much looſned, that they being in a readineſs for diſſolution, quickly after death, fell aſunder one from another, after the like manner, as we may obſerve of the fleſh of wilde beaſts, which being tyred with a long courſe, or beaten to death with Clubs, for this much ſooner putrifies, then the fleſh of thoſe, which are kill'd quickly, and peaceably.

Her belly being opened, the Inteſtines, and ventricle appeared whole enough, *viz.* Intire and well colour'd, but they were emptie, and as it were blown up, for as much as they were troubled, almoſt with perpetual evacuations, *viz.* Thoſe placed above or below: in all this Cavity, no foot ſteps of an Ulcer, or Impoſthum were perceived. Whilſt we were ſearching the cauſe of the diſeaſe, and rolling the Inwards here and there, there was ſomething met within the meſentery, worthy notice, to wit, about its middle, where it is fixed to the back, and contained the greater folds of the nerves, a ſubſtance ſomewhat looſe, and inflated, as it were with many little bladders, equalling an hands breadth, was ſeen, after that manner, as when in a ſhoulder of Veal, the inter-ſpace of the muſcles, are blown up, by the Butchers, that thoſe parts might ſwell up, and ſeem fuller, and fatter: In this place of the meſentery, becauſe it was more tumid and ſofter, we thought ſome humour, the cauſe of the pain, to lodg there, but opening it, I found only the membranes to have been looſned one from another, and to conclude nothing but winde, within its inter-ſpaces: which ſeperation of the membranes, and devulſion one from another was without doubt induced, by the frequent Convulſions or exploſions of the ſpirits, which within the enfoldings, and nervous *fibres*, there thickly planted, were almoſt continually provoked; and thoſe Convulſions hapned, by reaſon of the heterogeneous, and exploſive particles being derived thither, from the head, by the pipe of the Nerves.

But as to thoſe torments of the belly, and as it were an aſcent of a bulk or ſubſtance in the convulſive diſtempers, and the inflation of the *Abdomen*, it is not to be doubted, but that the ſeat of the morbific cauſe, did lye hid in that part of the meſentery: but becauſe ſo much ſuſpition was had of the womb, being chiefly affected, we did next inquire how much this Inward deſerv'd it: Therefore having dilligently ſearched the tunnell, placed within the *Os pubis*, I found the womb in its due place, and as to all parts ſound, and well furniſhed: its body was drawn to its juſt proportion, altho it was but 5. weeks ſince ſhe had miſcarried, *viz.* It was like a ſmall pear in figure and magnitude; the *Glandulas* on either ſide of the bottom of it, which are called the teſticles, appeared very ſmall and flaggy, without any ſuperfluous or virulent humour contained in them: the body of the womb, whereever it was diſſected, equal'd a thumbs breadth in thickneſs, its inward Cavity was no bigger than what would hold a bean: within this hollowneſs, as uſe to be in the Caverns of other Inwards, was included a mucous or dreggy matter, in a very ſmall quantity: but in truth, about the womb, or its *appendix*, there was nothing, to which might be imputed as a morbific cauſe, of the ſymptoms but now deſcribed: from whence therefore it may be demonſtratively concluded, as I at firſt thonght, that the paſſions termed from the womb hyſterical, are moſt often excited, from ſome other cauſe, than the fault of the womb.

The Inteſtines being removed, we found alſo the reins ſound enough, but one of them was of an unuſual figure, *viz.* It was cleft into many lobes, like the Kidney of a Calf.

The *Milt*, *Pancreas*, and *Caul* without fault: the *ventricle* was much blown up, and its inward Coat was plain without folds, or wrincles, which certainly hapned, by reaſon of its frequent Vomiting, this Inward being almoſt continually troubled with Convulſions: Beſides, for this reaſon, the tone of the ſtomach being broken, it did neither rightly deſire, or concoct the food, or aliment.

The *Liver* very much differ'd from a ſound conſtitution, for it was tumid, and ſomewhat hard, of a pail colour, like rotten wood, wholly dry and without blood,

blood, and this without doubt, the frequent use of Cordiall, and highly hot liquors had effected.

The *Lungs* were of a blewish colour, and every where obstructed, and stuff'd with a stinking and frothy matter: Certainly this Inward and the Liver had been vitiated of a long time, wherefore as the blood being degenerate, and very much depraved of a long time, from its right temper, had yielded the first seeds of this sickness, so also it afforded a constant cherishment of it.

But indeed, we sought, and that not in vain, for the chief and as it were originall cause of the disease, in the head; therefore the skull being taken off, the vessells of the *Meninge*, and those creeping about the brain, appeared full, and distended with blood, when in the rest of the body, scarce any blood had flowed forth, in the cutting of it: the thicker *meninge* being removed, thorow the other thin and pellucid one, was discerned a clear water, filling the enfoldings and crevices of the brain, and as it were overflowing its whole substance: In truth the serous heap of waters, had filled full all the Cavities, and inward places of the brain: the enfoldings of the *choroides*, or net-like membranes of the brain, being a long while immersed in water, and as it were boyled, were become discolour'd and half rotten: nigh to the beginning of the Splanchnick nerves, or belonging to the Spleen, the water insinuating it self very much, had separated the *pia mater* from the trunk of the oblong marrow or pith, for two fingers breadth: without doubt, the morbific matter descending from the head, by the passage of these nerves, into the enfolding of the mesentery, was the cause of the pains and Convulsions: Further, the same matter also, afflicting the heads of other nerves, and passing thorow their pipes, produced afterwards, these most cruel distempers in other parts, to wit, almost every where, of the whole body.

The Method of Curing the hysterical distempers.

As to the Cure, or means of healing, used in the passions commonly called Hysterical: forasmuch as the symptoms of this disease are very much convulsive, therefore it is fit, that anti-spasmodic or anti-convulsive Remedies, such as were before described, should be chiefly indicated; but when these distempers most often happen to the female sex, in whom for the most part, the menstrual flux, and other accidents of the womb do challenge a part in the morbific cause; therefore medicines respecting the various dispositions of the womb, are to be added to the former, and many ways to be compounded with them. The Therapeutic or Curatory Indications, are either Curatory, to be administer'd in the fit; or preservatory which are instituted out of the fit, that take away the cause of the disease, and prevent its comings or accessions.

Curatory.

1. As to the first, if the fit is wont to be light, and without other perturbation of the spirits, it may be permitted to pass away of it self; but if it being more heavily troublesome, there will be need to bring some help to nature much oppressed, this only thing is to be done, that the spirits being freed from the Embraces of an heterogeneous *Copula*, they may remit their inordinations and explosions: for this purpose, it is grown into use, to put to the nose stinking, and ill smelling things, the scents of which compell, and repress the too fierce spirits, ready to leap forth, into their orders, and also shake off from them, the heterogeneous *Copula*, and often drive it quite away: *Asafœtida*, *Castor*, *Galbanum*, being put into fine Linnen and applyed to the nostrills are convenient; also burning of *Partridg feathers*, *old skins*, and *sulphur*. Besides the spirits and *oyl of sut*, or of *Harts-horn* do not seldome help: yet I have known these kinde of fumigations, being very troublesome to some women, to increase the fit; it is probable that the same sometimes may too much irritate the spirits, and drive them into greater disorders; and as stinking things put to the nose, so the like poured into the mouth, do often bring help: wherefore we give often with good success, to hysterical people, *Tinctures of Castor*, *Solutions of Asafœtida*, and *Galbanum*, *spirits of Harts-horn*, and *Sut*, with proper waters. Take of the *spirits of Harts-horn*, from 12. to 15. and 20. drops, let them be taken in a little draught of the following Julap. Take of the *waters* of *penny Royall*, and *mugwort*, each ℥ iii. of the *water* of *Briony* compound ℥ ii. of *Castor* tyed in a knot and hung in the glass ʒ ß. of the whitest sugar ℥ i. mix them. Take of the *Tincture* of *Castor* ℈ i. to ʒ ß. let it be taken in a little draught of small beer. Take of *Asafœtida*, and *Galbanum* ʒ ii. let it be dissolved in *spirit of wine* to the extraction of a red tincture.

The

The doſe ℈ i. in two or three ſpoonfulls of *featherfew water*. *Riverius* very much crys up that of *Solenander*. Take of musk, and of *dragons-blood*, each ℈ i. take more or leſs of it in water of *Lillies of the Valley*, ʒ iii. or iiii. *John Anglicus* commends *parſnip-ſeeds*, or the *ſeeds* of *Penny-royal* in wine, or other proper Liquor, as a moſt certain Remedy. If the fit perſiſting a long time, ſhould cauſe want of ſpeech, or motion, the more ſharp Clyſters, as of *bryony-Roots*, and *Carminatives* boyled in water, are to be adminiſtred, and fricſions of the thighs, and feet are to be order'd; and if they ſhall yet grow ſtronger, Cupping-glaſſes are to be applied to the belly and groin, yea alſo, let them be often provoked to ſneezing: it is convenient to give ſome, in the middle of the fit, a draught of ſimple cold water, or in which *Champhir* had been diſſolved.

Preſervatory. 2. The preſervatory Indication comprehends theſe three Intentions, *viz.* In the firſt place to take away, or to derive to ſome other place the impurities of the blood, apt to be poured forth on the brain, and nervous ſtock. Secondly, to fortifie the brain, and ſo to ſtrengthen the indwelling ſpirits, that they may either not at all receive, or may eaſily ſhake off the heterogeneous *Copula*. Thirdly, to amend whatſoever is enormous in the womb, and contributes to the convulſive diſpoſition.

1. The firſt Intention is performed by purging, and phlebotomy, and other common ways of purifying, and purging the blood and humours. If there be opportunity for an emetic, I judge it beſt allways to begin with it, eſpecially in Cacochymicks, or bodies full of evill humors, in the longing diſeaſe, and Pica, and in ſuch whoſe great load of viſcous phlegm, ſtuffed within the folds and coats of the ventricle, hinders the virtues of other medicines: The next day after the Vomit, unleſs any thing bids the contrary, let blood be taken, in women of a hotter temper, preſently from the Arm, and afterwards if need be, from the foot, or from the ſedal veins with Leeches; but in bodies troubled with obſtructions, and leſs hot, let blood be taken more ſparingly, and more rarely, and only in places ſcituate below the womb: After theſe Evacuations (if they are to be ordered) rightly performed, once within ſix or ſeven days, a purge is to be preſcribed according to the following forms. Take of *pill-fetida major*, ʒ iß. of the *reſine of Julap* xii. grains of *Tartar Vitriolat*, and *Caſtor*, each ℈ i. of *ammoniac* diſſolved in hyſterical water, what will ſuffice to make xii. pills, for iii. doſes. Or take of the *reſine of Jalap* gr. xviii. of *Calomelaus* ʒ i. of *Caſtor* ℈ i. make a powder, let it be divided into iii. parts for iii. doſes, let it be given in the pap of a *roaſted apple*, or in *Conſerves* of *Borage*: ſo thoſe induced with a more hot temperament, a doſe of extract, or our ſolutive ſyrrop may conveniently be adminiſtred: for the revulſion of the morbific matter from the head, Iſſues made in the calf of the leg, or thigh, and ſometimes veſicatories, legatures, and painfull rubbings, are wont to be adminiſtred: But not only a purging of the blood, and a revulſion of its recrements from the head, but an alteration of its Liquor, and reduction of it to its due temperament have here a place: Wherefore in ſome hyſterical people, ſteel Medicines help, in others the uſe of Spaw-waters, or whay, in others the baths are wont to be ſignally profitable.

The ſecond Intention, to wit, the rectification of the brain, and animal ſpirits, is performed with Cephalic, and properly anti-convulſive medicines: which indeed are to be diligently exhibited, almoſt every day, when they do not purge or bleed: ſince there are various *ſpecies* of ſuch like Remedies, and ſeveral manners of adminiſtrations, we will here add ſome of the more choice forms.

Take of the Lees of *bryony*, *Aſſa fetida*, *Caſtor*, each ʒ i. of the *Salt of Coral*, *Amber*, *Tin*, each ʒ ß. of *Galbanum* diſſolved in hyſterical water, what will ſuffice to make a Maſs: doſe, half a ſcruple, to ℈ i. morning and evening, drinking after it a doſe of proper liquors.

Or, Take of the *ſeeds* of *Wilde-parſnips*, of *nettles* each ʒ ii. of *vitriol of Steel* ʒ i. of the extract of *Gentian*, *featherfew*, each ʒ i ß. with what will ſuffice of the *ſyrrop of Mugwort*, make a maſs, let half a dram be taken after the ſame manner.

If the form of a powder pleaſes better; Take of the *Roots of Virginian ſnake-weed*, and *Contrayerva*, each ʒ i ß. of *Coral* prepared, of *Pearls*; of *white-Amber*, each ʒ i. mingle them, make a powder: Doſe ℈ i. to half a dram, morning and evening, with an appropriat Liquor.

Opiats are Compoſed after this manner. Take of the *Conſerves* of the *flowers*

of

of the Lilly Convallis, of the *male-pæony*, of *betony*, each ℥ ii. of the *ſeeds* of *Pæony*, of *red Coral* prepared, each ʒ ii. of the powder of *Cretic Dittany* ʒ i ß. of the *ſalt of wormwood* ʒ ii. with what will ſuffice of the *ſyrrop of the rinds of Citrons*, make an Electuary. The doſe morning and evening the quantity of a nutmeg. After the ſame manner may be given to poor people *Conſerves* of the *Tree of Life*, or of the *leaves of Rue* twice in a day.

The Liquors appropriat againſt the hyſterical affections, and to be drunk after the aforeſaid Medicines, are, either diſtilled waters, which are to be taken by themſelves, or with other things, in form of a Julap, or decoctions, or tinctures and Infuſions.

Take of the *water of Mugwort*, and of *penny Royal*, each half a pint; of *hiſterical water* ℥iiii. of the *Tincture of Caſtor* ℥ß, of the *Syrrop of Coralls*, ℥i ß, mix them. The doſe from ℥i to ℥i ß, with any of the medicines afore deſcribed.

Take of the *leaves of Penneroyall*, of *Fetherfew*, of either *Southernwood*, of *Calaminth*, of *Nep*, and of either *Horehound*, each i handfull; of the *Roots of Bryonie* ℥iiii, of the *ſeeds of Parſnips* ℥ii, cut and bruſed, put them into white-wine or Cider, ſix pints, and ſo diſtill them, according to art.

Take of the *Root* of the *male Peony*, *Angelica*, *Valerian*, each ℥ ß, of the *leaves of mugwort*, *ground Pine*, *Calaminth*, *Peneroyal*, and *Miſſetow of the Oak*, each i handfull, of the Seeds of either *wilde Parſneps*, each ʒiii, of *Raiſins* i. handfull; let them be boyled in 4 pints of *Spring-water*, to the half: add to it of *white-wine*, *lib* i ß, ſtrain it, and keep it in cloſe veſſells; The doſe ℥iii, or 4 twice in a day.

Take of the *wild-Parſnep Seeds* bruſed ℥ ii, of *Caſtor* ℥ i, let them be put into a Glaſs, with i quart of *white wine*. The doſe ℥ ii twice in a day.

3. As to the third Intention, which inhibiting the diſorders of the womb, doth promote the cure of the paſſion called hyſterical; I ſay, firſt of all what in times paſt was believed, concerning the Cauſe and ſcope of curing the diſeaſe, that the womb did aſcend, therefore that it ought to be reduced into its right place; is altogether fictitious, as we have elſewhere ſhown: The falling down of the womb, or its coming forth, oftentimes happens; but rarely, or never produces the hyſterical Diſtempers: Beſides, the diſlocation of the womb in childbearing Women, ſometimes happens, preſently after their bringing forth, to wit, when the body of the womb being made Capacious, and newly emptied, doth not ſink down or fall within the Tunnel, in its right place, but upwards inclines now to the right ſide, now to the left, and there being drawn together like a purſe, is folded into a great bulk, which kinde of bulk, remaining long, nigh the ſide of the groin, is wont to give a ſuſpition of another child, or the ſecondine or afterbirth to be left behinde, or alſo of ſome hard ſwelling tumor there increaſing; but afterwards, when the *menſtruum* coming plentifully away, the womb is reduced to its due magnitnde, that tumor by degrees vaniſhes: but while it there remaineth unleſs for that reaſon, the *Lochia* or *menſtrua* were ſtopp'd, it doth not produce the hyſterical paſſions. For the reducing of this part the ſooner into its due poſition, fomentations, Liniments, and Plaiſters, are convenient. But moſt times that Symptom, paſſes over, of it ſelf, without any further harm. To what other diſtempers the womb is obnoxious, in child-bearing, and by what method to be helped, we have fully ſhown in another place. As to the other vices of that part, which happen to ſome women, not bearing children, we declare, that they chiefly are either a diſeaſe of the womb, made by the breaking of the unity, *viz*, which is either ſome ulcer, or Tumor; or an inhibition of ſome wonted excretion, or putting forth, to wit, a ſuppreſſion either of the menſtruous blood, or the whites, or the ſeminal humour: Moreover becauſe of the *menſtrua* being retained, the heterogeneous particles being often poured forth into the head, bring in the Convulſive paſſions: in like manner, when the whites are ſtopped, the excrementitious matter, being ſupped up by the blood, is deliver'd to the brain and nervous ſtock: yea, when an uſual evacuation of the ſeed is hindred, the ſuperfluities of the nervous humour, flow back upon the brain, and infect its indwelling Spirits, with an exploſive and morbific tincture: There is no need here, to diſcourſe more largely or particularly, of thoſe Peculiar diſtempers of the womb, but to compound medicines, and intricate adminiſtrations, proper for womens diſeaſes, with anticonvulſive Remedies.

CHAPTER. XI.

Of the Distempers commonly called Hypochondriack, *which is shown to be, for the most part Convulsive: briefly also of* Chalybeats *or* Steel-Medicines.

IN the foregoing Chapters, we have clearly shown, that the Passions called hysterical, do not allways proceed from the womb, yea, more often from the head being distemper'd; next we shall inquire concerning the hypochondriacal Distempers, of what original and nature they are, and upon the fault of what parts they chiefly depend. The vulgar opinion is, that the symptoms wont to accompany this disease, are wholly produced from the spleen; wherefore, they are ascribed very much to vapours, arising from this inward, and variously running up and down, here and there; when in truth, these sickneses for the most part are convulsions, and contractions, of the nervous parts: but that it might appear, by what causes they are wont to be excited, we ought to consider first, the Symptoms themselves, and to place them into some order or rank.

A description of the hypochondriacal Affections.

As to the Distempers therefore, which are vulgarly termed *hypochondriac*, it is observable, that they happen chiefly to men of a melancholly temperament, with a dark aspect, and more lean habit of body: it is rarely, that this disease troubles fair people, with a fresh Countenance, or also those indued with a too Phlegmatic complection: It betrays it self in manifest signes, about the hight or midest of their Age; men are found to be more frequently obnoxious to this, than women, being made habitual in either, it is very hardly, or not at all to be cured, in women, by reason of their weaker Constitution, it is accompanied, with a great many more Convulsive Distempers, wherefore, Commonly it is said in this Sex, the hysterical, to be joyned with the *hypochondriacal* Passion.

The Symptoms which are imputed to this Disease, are commonly very manifold, and are of a divers nature, neither do they observe in all, the like beginning, or the same mutual dependency, among themselves: for they seem in these, most to affect the Inwards of the lower belly, in those the *Præcordia*, in others the Confines of the Brain: and in most, though not in all, the ventricle labours much; concerning the appetite it is often too much, but presently burthened with what it hath taken in; and when the food, staying longer in it, by reason of slowness of Concoction, their Saline particles being carried forth into a flux, pervert the whole mass of the Chyle, into a pulse or pottage, now Sour, or austere, now salt or sharp: from hence pains of the heart, great breakings forth of blasts, rumbling of winde, and often vomiting succeed; and becaus of a pneumatick defect, or of Spirits, the Chyme or juice, is not wholly made volatile, and carried forth of doors, but that the ballast of the Viscous or Slimy matter, sticking to the coats of the ventricle, is left behinde; an almost continual Spitting infests them; a distention in the *hypochondrium*, and often there, and under the ventricle, a cruell pulsation is felt: also there pains ordinarily arise, which run about here and there, and for many hours miserably torment with a certain lancing: In the mean time, from the Contractures of the Membranes, and from the fluctuation of winds, stirred up by that means, rumbling and murmurs are produced: Also in the *Thorax*, oftentimes there is a great constriction and straitness, that the respiration becomes difficult and troublesome, upon any motion: also, most grievous asthmatical fits fall upon some: moreover, the sick are wont to complain of a trembling, and palpitation of the heart, with a noted oppression of the same: also a sinking down or melting away of the Spirits, and frequent fear of a trance, comes upon them, that the sick think Death is always seising them: In this Region, about the membranes, and chiefly the *mediastinum*, or that divides the middle of the belly, an accute pain, which is now Circumscrib'd to one part, now extended to the shoulders, is a familiar Symptom of this Disease. But indeed in the head, an Iliad of evills doth for the most part disturb hypochondriacal people, to wit, most cruell pains returning at set times, do arise, also the

the swimming of the head, and frequent *Vertigoes*, long watchings, a Sea, and most troublesome fluctuation of thoughts, an uncertainty of minde, a disturbed fancy, a fear and suspition of every thing, an imaginary possession of diseases, from which they are free; also very many other distractions of Spirits, yea sometimes Melancholly, and madness accompany this sickness: besides these interior Regions of the Body beseiged by this Disease, wandring pains, also Convulsions, and numbness, with a sense of pricking, invade almost all the outward parts; nightly Sweats, flushings of the Blood in the face, and the palms of the hands, eratick feavours, and many other Symptoms, of an uncertain original, do every where arise; concerning which, forasmuch as the genuine Causes, and the manner of their coming to pass, could not be readily determined, presently all the fault is cast upon the Spleen, and Physitians accuse that, as if it were the chief author of every irregular Distemper; but by what right or authority, by and by shall be sought into: In the mean time, it is to be observed, that the chief Symptoms of this sickness, are Convulsive, and depend immediately upon the irregularities of the animal Spirits, and the nervous juice, rather than on the evill disposition of the *Viscera*, serving for Concoction. But indeed, from whence the first rise of this most complicated Disease proceeds, and by what means it brings forth the divers manners of distempers, in so many places, will not be so easie to determine.

The hypochondriacal distempers belong to the nervous kinde.

It would be a tedious thing, to shew here, what the ancient and modern Physitians thought of the *hypochondriack* Passion, and of its essence, and Causes; we will only take notice, that most of them do ascribe this sickly Disposition, to the only fault of the Spleen; In the mean time some contend that the whole confines of this Inward, partaking of part of the fault, the blood flowing every where in the Splenetick, and Epigastric Vessells (or those belonging to the Spleen and belly) for that it being guilty of an hot and dry intemperature, and so obnoxious to too much fermentation, brings forth the original, or gives a beginning to this manifold evill: But the famous *Highmore*, affording relief, as well to the Spleen, as the Womb, hath cast the chief Cause of this Disease, wholly on the vitious Constitution of the ventricle; and from thence, he would have the reasons of the aforesaid Symptoms, to be originally sought, But indeed, that he might frame a fit *hypothesis*, for the solving the *Phænomena* of this sickness, he first supposes, the tone of the stomach to become too loose, and weak, that for that reason, it hardly, and very imperfectly Concocts the aliments: so that the thin, and more Spirituous part of the Chyle, being sent from thence, sooner than it ought, to the blood, perverts its disposition, to a hot and sour temper; then the residue of the food, by a longer stay, within the Ventricle, degenerates into a ponderous, and viscous or clammy Phlegme; which also, by its Stagnation (even as it is observable in things to be eaten, being longer kept) becomes very sour, or sharp: But from hence, that learned Man argues, that from the blood made too serous and thin, its effervescencies quickly passing thorow it, are induced: and from the stomach, loaded with ballast of ropy or viscous matter, the winde and distentions of the Ventricle, and *hypochondria*, as also the belching, and troublesome Spitting, do arise: whereby indeed, he wholly exempts the Spleen, from this fault, he contends, that it doth neither draw to it self the melancholly dregs of the blood, nor serves for any office whatsoever, about the Sanguification or the making of blood; but that its use almost only consists in this, that this Inward swelling up, or growing turgid with very hot blood, it administers heat to the adjacent Ventricle, and cherishes it with gentle warmth.

The causes of the hypochondriac passion is inquired into.

Altho I may so far assent to this famous Author, concerning this opinion, that I yield, the ventricle doth often grievously labour in this Distemper, forasmuch as the tone of which, being made lax, and its strength broken, by reason of the indigestion of the aliment, a load of viscous Phlegm, or Petuitous matter, is begotten even in its bosom, to which, by reason of the Saline particles, being brought into a flux, by their long stay, oftentimes a notable soarness, and austereness happen; then because the fault in the first Concoction is not mended, the dyscrasies and disorders of the blood, receive that want of digestion in the second: But yet he cannot draw me into that opinion, that the ventricle is always chiefly in the fault, or that the other Symptoms, of the hy-

The Hypothesis of Dr. Highmore sifted.

pochondriacal Disease, depend only on its vitious Constitution: For I have known many, cruelly afflicted with this sickness, who have been well enough in their stomach: although they have very much complained of the pulsation in the left hypochondrium, of the straitness of the breast, and a wandring pain excited in it, also of the trembling, and oppression of the heart, with a continual fear, and disturbed Imagination; in the mean time, they were wont to desire food greatly, and to digest whatsoever was eaten, without any trouble of the ventricle, or heaviness, and also without any spitting or acid belching: yea, I have observed others, great drinkers, and using an evill manner of living, to have contracted a looseness of the stomach, with an ill digestion, windiness, and frequent vomiting, who sound enough about their *præcordia*, and animal faculties, were not at all accounted for *hypochondriacs*: Besides, in this Distemper, the ventricle is often rather sick from the vitiousness of other parts, or of the Blood, than from its own default; because, it is usual for those sort of sick people, to be well in their stomach, so long as they may lye abed, and breath it forth; but when they are raised up, the pores being shut up, and the dregginess of the bloudy mass stagnating within, presently to be afflicted with the pain of the heart, an aggestion of winde, and frequent endeavours to vomit.

For these, and other Considerable Reasons, I judge the original of the *hypochondriacal* Disease, to be derived from some other fountain, than the weakness of the Ventricle: but forasmuch, as among the parts here primarily suspected, to be affected, great complaints are made against the Spleen; it will be worth our while, to enquire, what office this Inward doth discharge, then, as often as it fails in it, whether it contributes to this Disease.

The use of the Spleen is inquired into.

Tho I may grant with Doctor *Highmore*, that the Spleen doth cherish the Ventricle with its warmth, and so perhaps in some measure help Concoction: yet I do not conclude, this part to be framed chiefly for that end, but for some more noble uses; because, there seems to be need, for the digesting of the food in the stomach, not so much of heat, as of an active ferment: For fishes being actually cold, devour their food whole, and without the help of heat, easily concoct the same, being resolved as it were by a certain *menstrum*: besides, it is observed of the spleen, that though in man, its whole substance lyes near to the ventricle, in most other creatures, who are indued with a longish form, as to the greatest part of it, it is removed far from the Ventricle: Further, if the Spleen be the only Chimny, in which the blood warming the Ventricle is contained, what is the reason, that it, rather than the Liver or Lungs, becomes of a livid or blewish colour, and is stuffed with a black blood, and that less hot?

See his discourse of fermentation. Chap. 5th.

When I consider these things, which sometime since I have observed; concerning the use of the Spleen; it seems far more probable, that a certain dreggy portion, *viz.* a matter, consisting of an earthly, and fixed salt, is layd up in this Inward, by the blood carried to it, by the arteries, which being exalted there as it were by digestion, and into the nature of a ferment, is lastly committed to the blood, flowing from it by the veins, which inspires or quickens it, with a certain leven or fermentation, and performs the same thing about its Spirit, or making it Spirituous, as our ferment commonly called Leven, doth, being put into a batch of bread or dough; for as a certain portion of the unbak'd bread or dough, being kept to a sourness, preserves the same nature, that it doth ferment or leaven other bread or dough, and stirs up in it the otherwise sluggish particles into motion; so it seems, that the blood being laid up in the milt or Spleen, and there getting a sourness, as it were by stagnation, puts on the nature of a ferment, whereby indeed the rest of the mass of blood, and perhaps the other humours, are actuated, and as it were Spiritualised, into a more lively motion. What hath been ingeniously wrote, by a late author, *viz.* the most learned *Velthusius*, concerning the use of the Spleen, may have relation to this: for he hath determined as highly probable, a ferment to be contained in this Inward, whereby the sluggish particles of the blood, are brought into a state of activity: Because, taking notice, that in children, and others indued with a sanguine temperament, and more fat or dull habit of body, even as their manners, and disposition of minde were inclined to idleness, softness, and dulness, so their Spleen was ever of a reddish colour, and full of florid blood, like the Liver: from hence he concludes, that the spleen doth but little perform its office

fice in these, as the gential parts before ripe age, or in those of weak loyns; but on the contrary, forasmuch as men of a middle age, and chiefly in those, who are of a severe Countenance, and of a lean body, as in them appear marks of cunning, Sagacity, fortitude, and constancy, so their spleen is found to be of a livid or blewish colour, and imbued with blood, as it were muddy: further he argues from hence, that the blood, being kept long in the spleen, as in a Conduit or receptacle, turns plainly into ferment, by which its remaining mass, being from thence inspired, is made more subtil, and begets more acute Spirits, both in the vital, and in the Animal Kingdom or Government: For he supposes, our bodies naturally to abound, with too much humidity, by which indeed the function of the parts, and many of the *viscera*, are very much dull'd: but that the spleen, doth communicate to the mass of blood, solid, firm, and constant parts, and not easily to be dissipated; and that those do wipe away that moistness, and with it carry away in some measure, that softness, from the blood and Spirits, which is predominate in tender age: almost after the same manner, as the north-winde, or the eastern gales, fanning and intimately penetrating the air, with the dryness and strength of their parts, breathe health or strength to the air, and to our Bodies.

But since I have in another place, declared what I have formerly thought, concerning the Spleen, there will be no need to repeat it in this: yet I shall further note, that in bodies of living creatures, compacted out of a quinarie of elements, as the spirits ought to be more strong then the rest: so indeed they being intangled with a viscous humidity of Sulphur, and water, are so hindred, that oftentimes they are not able to exercise their strength or powers lively enough; hence saline particles, for that they are very much fermenting, are required for this, that the spirituous little bodies, almost overwhelmed by the embrace of the others, and stupifyed, might lie awakened, and set at liberty, and into motion. Wherefore we experience in our selves, when the spirits are dull'd, by the blood being too much exhal'd, that notable help is brought, by sharp liquors, as chiefly small wines, and Cider: for these kinde of Remedies sharpen the spirits, and shake off all heavines. Such a kinde of fermenting virtue, we easily believe to be continually exercised, by the Spleen being in right order, towards the blood and nervous Liquor.

For as this Inward is formed with a threefold sort of vessells, *viz.* with arteries, and veins, and besides with great enfoldings of the nerves, and a most thick Contexture of nervous *fibres*; we think the use of each of them, to be set apart for this end: to wit, by the Arteries, the blood is carried to the Spleen, hence it lays up its dreggs, composed of a fixed Salt, and an earthly matter, in its passages and porosities, and these there layd up, as it were by a certain digestion, are brought into a juice very fermentive: A portion also of which, being carried back to the blood, by the veins, is continually mixed with it: and so its whole mass, is inspired with those kinde of fermentive particles, from the Spleen; by which, a certain austerity and sharpness, with vigour of motion, is given unto it; so that, for that reason, the blood it self is carried more lively in the vessells; also from thence, the nervous juice, procreated from the blood, being more active supplies the animal regiment: But truly, the Spleen doth not only by this means mediatly, and by the intervention of the blood, inspire the brain and nervous stock, with a fermentive virtue; but it may be lawfully believed, that this is done somewhat more immediately, by the passage of the nerves, dispersed in the spleen: for, because in this part, anatomie discovers a great company of Nerves, and nervous enfoldings, and of *fibres* springing from them, it may well be doubted, for what use they should serve: Concerning this, it is first to be observ'd, that the ventricle, and the Spleen, have a most intimate Commerce with the brain; insomuch, that *Helmont* did place the seat of the Soul, in those Inwards, but this is possible to be done, by no more commodious way, than by the aforesaid nerves: Wherefore, we may here diligently suspect, that not only the animal Spirits, are the messengers between the one part, and the other, but also, that the nervous Liquour, which is both the food, and the ventricle of these spirits, doth descend now from the brain towards these Inwards, and now being received from these *Viscera's* by the nerves, doth creep thorow towards the head: which kinde of spleeny Juice, being dila-

ted

ted to the brain, sharpens the animal Spirits, and raises them up being slothfull, and irritates them into quick motions: from whence it is commonly said, the sharpness and sagacity of the minde, doth proceed from the Spleen, and Splenetick people, are accounted Ingenious: But it is probable, that the rage, and force of the passions, being begun by the Spirits inhabiting the brain, are carried to the spleen, by the passage of the nerves; and so the spirits there dwelling, are pathetically troubled, and the blood flowing thither, is moved into a multitude of perturbations: for from hence it in some measure falls out, that in anger, sadness, and other distempers of the minde, according as the ferment if the Spleen, being more or less moved, is inspired to the blood, its liquor diversly boyls up: Further, for this reason it happens, that great inflations and Commotions, of the left *hypocondrium*, come upon splenitic people, from every violent passion.

The reasons of the hypochondriacal Symptoms laid open.

These things being thus premised, concerning the use of the spleen, it will be easie, according to our *hypothesis*, to lay open very many of the symptoms, belonging to the *hypochondriac* Distemper; and to give reasons for each of them: For when the Spleen is wanting in its office, that is, when it doth not strain forth the melancholly recrements of the blood, nor cook them into a fermentative matter, as we but now observed in children, and others of a sanguine Complexion, or too phlegmatick, to happen often; the disposition of the minde, is made duller, the body grows fat with idleness, yea, and the blood being more sluggish than it ought to be, is apt to stand still within its vessells, or at least to be less lively circulated: But on the Contrary where the fermenting power of the spleen, is too much axalted or perverted, the blood by that means being more sharp than usual, or made more sour, it runs about rapidly here and there, and conceives irregular motions; yea, and the nervous juice, falling away from its right temper, imbues the animal Spirits, with an heterogenious and an explosive *Copula*, and so irritates them, as it were with goads, into frequent Convulsions: as that not wholly uudeservedly, many kindes of diseases, may be imputed to the Spleen being out of order: But the ways or means of affecting, whereby the Spleen being evilly disposed, doth produce the symptoms of the hypochondriack passion, or at least contributes to the rise of them, are chiefly these following.

The Influences of the Spleen in producing the Symptoms unfolded.

First, it sometimes happens, that the spongie substance of the spleen, from the fæces of the blood, being too much impacted, in its pores, and stagnating, is very much stuffed, and obstructed: that from thence, it doth not sufficently receive, the recrements of the bloody mass: but the same being carried thither, but not received do flow back into the neighbouring branches of the Cæliack Artery, from whence they are presently carried, into the membranes of the ventricle, the Caule, the mesenterie, and other nigh parts, and are wont to be affixed to them; hence the tone of those *viscera*, are so much spoyled, that they do not rightly perform their due offices, about the concoction of the Chyle, and the membranes planted every way about, being much imbued with heterogeneous and irritative particles, for that they are almost continually pulled by convulsions here and there stirred up, they are grievously obnoxious to wandring pains, contractions, distentions, and the encrease of Windes; by reason of this kinde of regurgitation of the blood, from the Spleen, being obstructed, it is likely, that the pulsation, which is felt by hypochondriacks, under the Ventricle, is excited.

2. When the fæculencies of the blood, are excluded from the Spleens being obstructed, being fixed (as was said) to its neighbouring parts, they bring forth the sickly distemper of the left *hypochondrium*: but though indeed, that Inward sufficently receives the melancholly or atrabilious juice, carried to it from the blood, by the Arteries, yet oftentimes it does not rightly Cook it, but the Salt being too much excited, it changes it into a too sharp, or acid, austeer, or sour; or some other kinde of vitious humour: whereby, when as the whole mass of blood, and the nourishable Juice, contained in its bosome, are almost wholly infected, the fruits of the hypochondriack seeds, bud forth thorow the whole body; the blood grows unduely hot, is in some places impetuously moved, and again in others is apt to stagnate or stand still: from hence, it is familiar with Spleenetick people, presently afrer eating, to grow red in the face, to have the palms of their hands hot, their hypochondria to swell, oppressions of the heart, and noted variations of the pulse, to succeed, But these fermentative particles being translated, from the blood, every where into the solid parts, wandring pains, running

ing up and down here and there, and a sense of pricking, are stirred up in many members of the Body: moreover, from this Infection of the blood, for that its mass is changed, from a benign and balsamick temper, into a salt and tartareous, a lean habit of body, with a black and dark Countenance, is induced.

3. From the blood being so depraved, by the fault of the Spleen, oftentimes the taint is carried to the animal government; for heterogeneous and Convulsive Particles, are poured frequently into the brain, and from thence, into the nervous stock; so that the animal Spirits, dwelling in either province, conceive various irregularities: by reason of the evill being impressed on the head, hypochondriacks use to be troubled with various phantasms, with an heap, and fluctuations of thoughts: besides, to them happen frequent *Vertigoes*, Scotomies, headaches, and often parlytical Distempers: then, forasmuch as the morbific matter, slides down from the head, into the nervous stock, Convulsive Diseases are excited, in very many parts of the body, but chiefly about the *Præcordia*, and *Viscera* of the lower belly: for when the Spirits flowing within the nerves, which respect those parts, are greatly disturb'd, by reason of the distemper of the minde, the Convulsive particles, the more readily enter into those pipes, and more easily impress on those Spirits, a Convulsive Disposition: Therefore, partly by reason of the infection mediatly transmitted to the Brain, and partly by reason of the hurt, (as hath been shown) immediatly Communicated from the Spleen, the Palpitation of the heart, trembling, and frequent swooning, Constrictions of the Breast, impediments of breathing, Pains of the stomach, belching, Vomiting, and many other accidents in those Inwards, happen to hypochondriacks.

4. Besides these inordinations, which are wont to be derived by the passage of the blood, from the Spleen; into the humours and sollid parts, and to the brain it self, and nervous stock; there are other farther evills, which seem to arise from this Inward, also by the passage of the nerves: Because, as we have shown, their extreme branches, and the nervous *fibres* themselves, interwoven in the *Viscera*, do drink in with their outward most little mouths, a certain humor, and convey it sometimes upwards, it is highly probable, that the nervous *fibres*, distributed to the Spleen, (of which as we but now hinted, there is a mighty Guard) do receive its most sharp juice, which Creeping higher, thorow the nervous pipes, becomes a Cause of Convulsive motions: In truth, that there may be those intimate Commerces, between the brain, and the Spleen, to wit, far sooner, than what can be made, by the compassing about of the blood, it may be lawfull to believe, that the nerves of the wandring pair, and the intercostal, to be the neerest means of the passage, whereby these parts Communicate one with the other, and mutually affect themselves. For it seems, that when the black bile or melanchollic tumor in the Spleen, grows turgid or swells up of its own accord, or is moved by some evident cause, its particles enter the nervous *fibres*, thickly distributed to the same, which disturb the animal Spirits flowing in them, into explosions, or at least into some disorder: then the Spirits being so distrubed, infect those next to them, and they others, till by their continued series, the passion begun within the Spleen, is propagated even to the brain, and there produces inordinate Phantasms, such as happen to hypochondriacks, also on the other side, when a grievous distemper of the minde, occasionally excited, within the brain, doth disturb the Spirits inhabiting it, the impression being carried to the Phantasie, by the series of the Spirits, planted within the nerves of the wandring pair, and the Intercostals, and successive affection, it is brought even to the Spleen; hence its ferment being put more into commotion, stirs up Convulsions, both in that Inward, and in the whole neighbourhood of fibres and membranes; and besides, forces the blood into ebbings and flowings, and into various æstuations or vehement motions; yea and reflects the perturbations of the Spirits, upon the brain. From this kinde of reciprocal affection of the brain and Spleen, it comes to pass, that hypochondriacks are so unquiet, unstable, and fluctuating, at every thing thats proposed, as if, according to the Poet, Ten mindes strove in them at once.

A certain noble Gentleman, of a melanchollic temper, and always accounted for a Splenetic man, very much complained of a pain, and inflation of his left hypochondrium, with a frequent rumbling noyse, and sour belching, also of a trembling 1. *Observation*

trembling of the heart, of an assiduous vertigo, too much waking, and a disturbed phansie: About the 35th. year of his age, the disease growing worse, he began hardly to sleep, and yet more rarely to get it at night, and to be molested in the day time, with a world of fluctuating thoughts, to have in suspition all things and persons, and greatly to be afraid of every object: his *Præcordia* seemed to be very much bound, and straitened, and to sink down to the bottom, as if the heart it self were depressed even into the belly; which Symptom, troubling him, he became very sad, and dejected in minde: yet afterwards, those distempers of the minde remitting, he felt with it his heart to be a little lifted up and also his *Præcordia* to be loosened, and stretch'd forth; besides, he very often sustained pains and Contractions variously excited, about the muscles of the *Viscera*, and Members, and running up and down here and there.

As to the nature of the disease, it is plain, that it is this kinde of Distemper, which is commonly called hypochondriacall: but as to what respects the Causes of these to be admired Symptoms, we may suppose, the mass of blood being degenerate, and stuffed with melanchollic or atrabilarie fæculencies, to administer or continually to suggest its adust recrements to the head; from whence, the Liquor watering the brain and nerves, being made sharp, and improportionate to the Spirits, did stir up the containing Bodies, into painfull Corrugations, or wrinklings, and Contractures: Further, when this Infection is chiefly derived from the head, into the Nerves of the wandring pair, and the intercostall, the brain and the *Præcordia*, are very much punished, by the malady from thence raised up. But that the Blood is depraved by that means, it seems to be imputed to the vice of the Spleen, forasmuch as this Inward, being amiss, it did not rightly strain forth the atrabilarie dreggs from the blood, but rather did more pervert whatsoever recrements it received from it, and the same being exalted into an hurtfull ferment, sent it back to the blood, and so very much infected its mass, and imbued it with a plainly acetous, and vitriolick evill Disposition.

It is plain to be understood, that those symptoms troubling the Head, *viz.* too much waking, the *vertigo*, a disturbed phantasie, with many others, did proceed from the heterogeneous particles poured forth from the Blood, into the brain: As to that straitness of the Breast, and falling down of the heart, with great fear and sadness, it may be thought, that the nervous *fibres*, inserted to the heart, and chiefly to the *Pericordium*, being moved into Convulsions, and wrinklings, do binde hard those parts, and pull them downwards; wherefore, there is perceived in the whole breast, as it were a certain constriction, and the heart it self seems to be depressed: Further, forasmuch the *Præcordia* being so streitened and depressed, the blood within the bosom of the heart is stop'd, and compell'd, as it were to stagnate, both the vital and the sensitive Soul, is much hindred, from its wonted expansion and irradiation, and for that Cause, being lessened and shortened in its constitution, those Cruell distempers of fear and sadness arise, but when the Convulsions remitting, that constriction of the heart and its *appendix*, is released, the Soul also, as a flame more expansed or enlarged, endeavours by little and little to shake off the Chains of those Passions. For the Cure of these Distempers, he had for a long time tried very many remedies, and medical Administrations, but without much benifit, at last he was somewhat eased by the use of Spaw-waters, and from thence by degrees finding himself better he became free from those grievous Symptoms, however, he still liv'd obnoxious to the *hypochondriac* Distemper.

2. *Observation.* A Certain young Academic, originally of a Sanguine temper, fair, of a florishing Countenance, excellent disposition, and mild, by reason of immoderate and untimely Studies, in the mean time exercise, and good order of dyet being wholly neglected, had contracted an obstruction of the Spleen, or some other morbid distemper of that Inward: For he had almost continually infesting him, an inflation, and tumor of the left *hypochondrium*, with a most heavy *Pain*. After he had laboured with this sort of Distemper, about half a year, he began to complain of a frequent giddiness, a blindness of his eyes, an unquietness of his minde, and of disturbed sleeps: Which Symptoms were then plainly imputed to vapours arising from the Spleen: but after that followed, a trembling of the heart, with a frequent *deliquium* of the Spirits, a pulsation of the *hypochondrium*, and at length pains, and Contractions in the outward members, with a frequent

quent ſtupor, and a ſenſe of pricking running up and down here and there: and laſt of all, being broken with a world of evills, contrary to his *genius*, and native Diſpoſition, he became greatly hypochondriacall.

That I may diſpatch the Pathologie of this Caſe in a word, it appears here plain enough, that the Spleen was firſt of all in fault; by whoſe fault, when the bloody maſs was depraved, the taint creeping from thence, into the humour watring the brain and nervous ſtock, and infecting it, did induce the aforeſaid Convulſive Symptoms.

The Method of Curing the Hypochondriac Diſtempers.

The Curatory Method to be uſed againſt the hypochondriacal Diſtempers requires chiefly theſe four generall Indications. *viz.* In the firſt place, that the Impediments of the Cure may be taken away, the Intention of which chiefly reſpects the purging, and preſerving the firſt paſſages. Secondly, it muſt be endeavour'd that the obſtructions of the Spleen, may be Corrected. Thirdly, that both the recrements of the bloody maſs may be purged forth, and that its due diſpoſition may be reſtored. Fourthly, and laſtly, that the enormities of the brain and nervous ſtock, and alſo of the watering humour, and the inhabiting Spirits, contracted by the fault of the blood, and Spleen, may be amended, or taken away: when any of theſe Intentions, or all of them together, ſhall be endeavoured at, fit times ſhould be choſen, in which each being ſingly propoſed, may be performed, without any neglect or hindrance of the reſt.

8. As to the firſt Indication, when a great load of crude or aduſt matter, is wont to be laid up in the firſt paſſages, and when the tone of the Ventricle us'd to be ſpoyled, and its ferment variouſly perverted, againſt every one of theſe kindes of evills, you muſt bring timely help, with fit remedies; therefore, gentle and moderate evacuations, both by Vomit if it proſpers well, and by Stool, ought to be adminiſtred: For ſuch, whoſe ſtomach eaſily caſts forth its contents upwards, I perſwade, that once in a month Vomiting ſhould be ſeveral times provoked by taking *Liquor of Squills*, or *Salt of Vitriol*, or by drinking plentifully ſmall beer poſſet-drink, or warm water; in the time between, a gentle purge, and only a little moving is to be orderd often: For this end, The pills *Tartareous*, of *Bontius*, or Stomach-pills with Gums, or our ſolutive extract, may be of uſe. Take of the beſt *Senna* ℥i, of *Rhubarb* ʒvi, of *Epithim* ʒiii, of *yellow-Sanders* ʒii, of the *Salt of wormwood* ʒii, of *Celtic Spike* ʒi, being cut and bruſed, let them be digeſted in x ounces of *White wine*, and as much of fumitory water, for 48 hours, let the clear ſtraining be evaporated, with the heat of a gentle bath, to the conſiſtency of an extract, adding towards the end, of the powders of *Senna*, of *Rhubarb*, and *cream of Tartar* each ʒii, let them be bruſed together in a glaſs morter, and reduced to the conſiſtency of Pills. The Doſe ʒß, ℈ii, or ʒi, the Remedies reſpecting the tone, and ferment of the ventricle, as they are manifold and divers, out of them the moſt fit or commodious for the Diſpoſition of the Ventricle, are to be choſen; for to this bitter things, to that Saltiſh, to another ſharp and perhaps biting things, are deſirable. Among the number of theſe kinds of medicines, (which are commonly called Digeſtives) are *Elixir Proprietatis*, *Tinctura Sacra*, *powder of Aron* Compound, *Salt of Wormwood*, *Cream of Tartar*, *Tartar vitriolat*,, *Vitriol of Steel*, with many others. Beſides theſe inward Remedies, alſo external applications do often bring help: Becauſe the Stomach being ill affected, a fomentation of *white-wine*, with *wormwood*, *century*, and other bitter plants boyled therein, alſo oyntments, or plaiſters, often bring help: Concerning which, there will be no need here to diſcourſe particularly; and to preſcribe forms of the Medicines themſelves.

2. The ſecond Indicatiou, for the mending the vices of the Spleen, (to wit, if there ſhall be in the ſame any obſtruction, Tumour, or pain, or ſimple dyſcraſie or Intemperament,) is wont to be performed, or at leaſt attempted, by Remedies both internal, and exrernal: Thoſe which are of the former Sort, fall in with thoſe indicated in the 3d place, (to wit, with ſuch, as for the purifying the Blood is intended) becauſe, when chiefly, or almoſt all, that which is carried, or born to the Spleen, is done by the paſſage of the blood, the irrigularities of the *Latex* of this, as well as of that Inward, by a Social labour, ought to be cured, with the joynt ſtrength of Medicines; by what means is ſhown by and by. In the mean time, ſome external Applications, under the form of a plaiſter, or an oyutment, or a fomentation, more neerly and immediatly reſpect the bo-

dy of the Spleen, and often bring notable help, forasmuch as they discuss tumors, and allay the Convulsive Distempers, and quiet them. Great plenty of these kinde of outward medicines, are every where extant among Authors, the choyce of which ought to be made, according to the various passions of the Spleen, or the divers Constitutions of the Patient, so that there will be no need here, to shew their particular forms.

3. The Remedies indicated in the 3d place, to wit, which take away the dyscrasies or evill temper of the blood, contracted from the vice of the Spleen, and also clear the primary fault of the Spleen, are of a manifold, and divers kinde, and manner, the choice of which ought to be administred, according to the various infection of this, or that: of these, some are compounded, and prepared according to the prescription of Physitians, as *Electuaries*, *Powders*, *Apozems*, *Tinctures*, *Infusions*, and the like; others more simple, as *whey*, *asses milk*, *Spaw-waters*, and *Bathes*.

There are two chief Cases of sick people, in which magisterial Remedies ought to be all accommodated, according to their strength and quallities: to wit, either the blood is thick, coldish, and earthy, with the Spleen being obstructed, which requires more hot, fermenting, and chiefly Chalybiate medicines; or the blood being clearly aduſt, and hot, ferments too much, and together greatly troubles the *hypochondria*, and in them, the blood and humours boyl up; in which state, Remedies only temperate, and allaying the fermenting, and immoderate boyling of the humours, are to be chosen, where chalibiats are wholly to be avoided.

When therefore to a cold ventricle, cold discrasies or evill temperaments, of the blood and Spleen also happen, I am wont to prescribe, according to the following forms.

Take of the *Troches of Rhubarb*, of the *Powder of the root of Aron*, of *winteran Bark*, each ʒii, of the *root of virginian Snakeweed*, *Centrayerva*, *Diatrion Santulon*, of *Crabs eyes*, each ʒi, of the *extract of Gentian*, of *Century*, each ʒiß, of *ammoniae*, dissolved in the water of *Earth-worms*, what will suffice to make a mass of Pills: let them take 4 pills in the morning, and at 4 a clock in the afternoon, drinking after them a little draught, of *wormwood-wine*, or *chalibiate wine*, with moderate exercise.

Take of the *Conserves* of the *yellow of Oranges*, and of *Lemons*, each ℥iii, of preserved *mirabolans*, *n.* ii, of the *Species* of *aromaticum Rosatum*, of *winteran Bark*, each ʒii, of the *Salt of wormwood* ʒii, of the *vitriol of Steel* ʒi, (or *Steel prepared* ʒiii.) with what will suffice of the *Syrrop of Citron rines*, make an Electuary, To be taken twice a day, drinking after it a draught of *wormwood-wine*, or of the Infusion of the *herb* or *flowers* of *Tamarisk*.

For those who are not pleas'd, but with medicines in an elegant form, and in a very little quantity, the tinctures of *Antimony*, and of *Corrall*, also of *Steel*, with the *Spirit of wine*, (the body being first dissolved by a proper *menstrum*, and reduced to a *Calx*) are convenient: as also the *Spirits of Sut*, of *blood*, or of *harts-horn*, to be taken twice a day, with a proper liquor, to 12. drops, more or less, are of known benefit, above any other medicine that I know of: moreover the often drinking of *Coffee*, also that made of the Infusion of the leaves of *Thea*, gives ease to some.

If that the fervor of the blood, and too fermenting, with the trouble of the Spleen, and unquietness of the minde, be joyned to the hypochondriac Distemper.

Take of the *Conserves of hyps* or *Conaradine*, ℥vi. (or of the flowers of *Tamarisk*, and the leaves of *wood-Sorrel*, each ℥iii.) of the *Species* of *Diarrodon Abbatis*, of the confection of *Alkermis*, each ʒi, of the *powder of Ivory* ʒiß, of *Pearls* ʒß. of the *Salt of Tamarisk*, and *wormwood*, each ʒi. with what will suffice of the *Syrrop* of *green Citrons*, or *Clove-Gilliflowers*, make an Opiate, to be taken twice in a day, the quantity of a nutmeg.

Take of the *powder of Ivory*, ʒii. of the *Powder* of *Pearls*, ʒi. of the *Species* of *diarrhodon Abbatis*, of *Diamagarit frigida*, each ʒiß. make a fine powder, add of *white Sugar*, dissolved in *Baume-water*, and boyled to the consistency of Tablets ℥ vi. make thereof according to Art, Lozenges, or little cakes: take ʒiß or ʒii twice a day. To these, and other medicines of this nature, may be joyned the use

uſe of Spaw-waters, which indeed, in either, yea, in all caſes, of hypochondriac Melancholly, are almoſt always taken with good ſucceſs: For want of thoſe waters, our artificiall Spaw-waters, may be conveniently ordered, yea, and whey, and if any notable atrophie be, let Aſſes milk be dayly taken.

Beſides, theſe inward Remedies, and other outward Applications, before-recited, *Phlebotomie*, or the taking away of blood with Leeches, from the ſedal veines, may be of uſe frequently: yea, ſometimes it may be convenient, to open the Salvatella Vein, according to the preſcript of the Ancients: Beſides Cauteries, or Iſſues, which may continually carry forth the aduſt recrements of the blood, and by degrees excern them, are wont to be benificiall almoſt to all.

4. The fourth Indication, reſpecting the affections of the brain, and nervous ſtock, or the Convulſive Symptoms having relation to or coming upon the former, is rarely in uſe of it ſelf, and apart from the others, but that Remedies deſtinated to this end, are complicated with thoſe aboveſaid. Liquors indued with a volatile Salt, or an armoniac, as *Spirits of Harts-horn*, and *Sut*, are highly neceſſary for this Intention, as alſo the reſt but now recitied; wherefore ſuch Remedies, unleſs any thing ſhall ſhew the contrary, may be dayly given at fit hours. Further, when Spaw-waters are drunk, let tablets or pills, ſuch as are above-preſcribed, for the Convulſive diſtempers, be taken at leaſt twice in a day. In the frequent turning, and giddineſs, alſo in the paſſions of the heart, the ſinking down of the Spirits, with dread, and as it were a fear of Death, juſt ſeizing on one, I have known very often, great help to be had, by the uſe of Chalibeat, or ſteel Medicines.

The preparations and effects of Steel Medicines unfolded.

Since we have made mention ſo often, of Chalibiat or ſteel-medicins, it will be worth our while, to inquire into their various preparations, and for that reaſon their divers manners of effects, which they are wont to produce in the humane body, that it may from hence appear, by what means, and for what reſpects, theſe or thoſe preparations of Iron, are greatly profitable to ſome hypochondriacks, and to others as much hurtfull.

The virtue and operation of Chalybeat, or ſteel'd mecicines, depends upon the porticles of the concerts, being after a various manner diſſolved, unfolded, and brought forth into act: For ſteel, or Iron, conſiſts chiefly of a *Salt Sulphur*, and *Earth*: and but ſlenderly indued with Spirits and water: But the particles of the former Elements, chiefly the Sulphureous, and ſaline, being in their mixture combined together, with the Earth, remain altogether fixed, and ſluggiſh, but being ſoluted, and pulled one from another, they come to be of a very efficacious Energy.

The aforeſaid particles are diſſolved in a twofold manner, and ſet into the Liberty of acting: *viz.* either by Art, whilſt medicins are prepared, or by Nature after they are taken inwardly; for the metallic Body, is wont to be diſſolved, and eaten, by the ferment of the ventricle, juſt like a Chymical *menſtrum*: we will conſider the ſeveral *Species* of either, and their manner of being made, that it may appear, what alteration is impreſſed, on the ſteeled medicine, in the preparation; and what effects every preparation of it, doth impreſſe on mans Body.

The moſt ſimple way of preparing Iron, is a diviſion of its body, into little integral parts, with a file, which reſemble the nature of the whole mixture, and contain both little ſulpureous bodies, and ſaline, combined among themſelves, and with other terreſtrial. The filings of Iron being inwardly taken, is diſſolved by the ferment of the ventricle, as it were by an acid *menſtrum*; the ſignes of which are, both a ſulphureous and unſavorie belching, as from the eating of hard eggs, alſo the blackneſs of the ordure, from ſteel being diſſolved within the *Viſcera* of Concoction, active particles, both Sulphureous and Saline, Plentifully ſally forth, and being involved with the nutritious juice, are carried into the blood; which as they excell in a divers virtue, do often conſpire, as it were with the joynt forces of either, to bring benefit to the ſick. The Sulphureous little bodies being brought to the blood, add to it a new, and more plentifull Proviſion of Sulphur, wherefore its maſs, if before it was poor and liveleſs, doth nimbly ferment within its veſſells, and being inkindled farther in the heart, acquires a more intenſe heat, yea, and a deeper colour; for it is ſo obſerved, in many affected with the dropſy, ariſing from white phlegm, the Pica or evill

longings, or green-sickness, to have a pale countenance, cold bloud, and watery; but by the use of steel, the countenance soon to be more florid, and the blood to be imbued with a more intense tincture, and heat: moreover, from the filing of Iron, dissolved in the ventricle, also Saline particles are brought forth, and often they bestow a more plentifull fruit or increase, both on the solid parts, and on the humors; for since their natures are vitriolick, and stiptic or binding, they bind together and strengthen the too lax, and weakned *fibres* of the *Viscera*, and so restore the broken tone: Besides these Saline particles, inhibit the force of the blood; repress it from too much heat, and boyling up, and froth, and retain it in an equall circulation: Besides (which is their chief virtue) they contract and straiten the too loose, open, and gaping little mouths of the Arteries; that, for that reason, neither the *Serum*, nor the bloody *latex*, may sweat out, or be broke off, from the file of its circuit: Wherefore in the Dropsie, and great bleedings, Remedies, imbued with the Saline particles of Iron, are of famous and efficacious use, for very many Diseases proceed from this cause, forasmuch as the little mouths of the Arteries, being too open, and the interspaces of the vessells above measure loosned, the *serum* or bloody *latex* breaks forth; which kinde of Affections, the Vitriollic Particles of Steel, do often help, by binding and corroborating, the sanguiferous Vessells, and nervous *fibres*.

After this manner, the *filings of Steel*, being taken inwardly, seems at once to add to the blood, both spurs, and a bridle. But forasmuch, as from this medicine, an incitation, much more than a restriction, doth arise, therefore it ought to be given only to them, whose blood is very thick, and cold, as country people and strong persons; in very hot, and spirituous bloud, and in hot inwards, 'tis no ways convenient: moreover, in delicate persons, and men of a more tender constitution, 'tis dangerous, lest the little portions of the steel, when they cannot be sufficiently dissolved, should like fragments of glass, be driven into the membranes of the *Viscera*, and there pertinaciously sticking, produce some ulcer, or deadly torments, which indeed I have known sometimes to happen.

2. After the filing of Iron, the next way of preparing it, is calcining it with Sulphur, to wit, let thin peeces of steel, being strongly fired, be laid upon a roler of *Sulphur*, that the mettle may melt into little round balls, which are to be calcined to the consumption of the Sulphur, and pounded in a morter, are to be reduced into a subtle powder, which is of choice use. In this preparation of Iron, some sulphureous particles are exhaled, the signe of which is, that this powder, an acid liquor being poured upon it, much less boyls up, or grows hot than the limature or filing of Iron: but being taken by the same mouth, it excites a Sulphureons savour. In the mean time, in this preparation, the saline particles, seem to be somewhat augmented, by new ones sticking to them, from the mettall burning with Sulphur, so that active particles of either kinde, to wit, Sulphureous and Saline, come almost to an *Aequilibrium*: and when by this means, this medicine, the substance of the mettle being loosned, may be finely poudered, it becomes of far more excellent use, than the filings of Iron: In most Cases, where steel ought to be given in substance, as in a Cachexie or a fullness of evill humours, the longings of maids or the green-sickness, and such like, this medicine is convenient to be used.

3. In the third place, follows the preparation of steel with vinegar: to wit, the filings of the whole steel, is moysten'd with vinegar, and dryed, till it may be reduced into an impalpable powder: in this preparation, the Sulphureous particles are yet much more, yea, as to the greatest part evaporated, only a few being left, in the mean time, the Saline, by reason of others sticking to them, from the vinegar, are much encreased, which are mingled with the terrene particles: This chalibiated powder, very little or nothing froths, or boyles up, a sharp liquor being sprinkled upon it, also being taken at the mouth, has with it scarce any sulphureous Savour: wherefore, it conduces less, to the taking away of the obstructions of the Bowells, or to the restoring the ferment of the blood: nevertheless, in a more hot Constitution, in hemorrhages or fluxes of Blood, and the hypochondriac Distemper, it is wont to be administred with greater success, then the former preparations.

4ly. Follows the rust of Iron, which being an extract of the metallic body, seems to be as it were a fifth Essence: because, in this excrescency, some particles

cles of every kinde, to wit, ſulphureous, ſaline, and terrene, being looſned from the whole ſubſtance, are combined among themſelves; and conſtitute as it were a new mixture, more ſubtile, and defæcated or clearer from dreggs: For that in this concrete, there remains leſs particles of ſulphur, therefore it doth not ſo potently ferment the blood, or take away the obſtructions of the *Viſcera*, as ſteel prepared with ſulphur; but in more hot diſtempers of the parts, or humours, it egregiouſly performs the requiſite Intentions, of a ſteeled Medicine.

To this Claſs may be referred by right, our preparation of ſteel, to wit, in which all the particles of the mettal, being looſned from the bond of mixture, are contained together: which notwithſtanding, (the concrete being firſt reduced into pouder) and immediatly diſſolved, in any water or Menſtruum. This powder being inwardly taken hath the like vertue as ſteel prepared with ſulphur; but to the liquor or menſtruum, in which it is diſſolved, it imparts almoſt only ſaline, or chiefly vitriolic particles, the ſulphureous flying away, and the terene ſinking to the bottom. I am wont to give in great quantity, and not ſeldom with excellent ſucceſs, common water impregnated with the diſſolution of this, inſtead of the natural acidulous or ſpawiſh waters: moreover, I make thereof medicated wine, beer, cyder, whey, or other Liquors, this pouder being diſſolved in them; and preſcribe them to be taken, for ſeveral intricate Intentions: So much for the preparations of Iron, in which the elementary particles of every kinde, are comprehended in a various proportion: There remain others, in which the particles almoſt only of one kinde, to wit, the ſaline, or earthie, are left, the reſt, as to the greateſt part, being driven forth: of which ſort, are chiefly vitriol, or the Salt of ſteel.

5. For the making the vitriol of ſteel, firſt, the mettal is wont to be eaten thorow, with a very ſharp and corroſive Liquor, and to be diſſolved into elementary parts: In the diſſolving, the ſaline particles of the menſtruum, are joyned to the other ſalines of the Iron, and are with them intimately combined; in the mean time, the remaining ſulphureous, and terrene, being laid aſide, and excluded from their company; then common water being poured to this ſolution, the ſalts of either kinde being combined, are imbibed by the Liquor, and that being laſtly filtrated, and evaporated, they are reduced into chriſtalls. This kinde of making of ſalt or ſalification, ſuccedes, if you do it, either with the Spirit of vitriol, the oyle of ſulphur, or ſtygian water, or any others, diſtilled from the ſtagmas of mineralls: Yea, *Sal Armoniac* only, being ſoluted by melting, diſſolves Iron after the ſame manner, and cauſes it to Chryſtalize.

Salt of Steel thus prepared, hath a ſweetiſh taſte, with a certain ſharp ſtipticity or binding, and participates much of the nature of *vitriol*, that it ſeems not to differ much from Verdigreaſe. Taken inwardly for a medicine, it ſomewhat ferments the humors, and powerfully bindes the nervous *fibres*: for cold Cachecical, and Phlegmatic people, this medicine is not convenient, becauſe there are in it no particles of *Sulphur*: but it is often adminiſtred with ſucceſſe, in hot diſtempers of the bowels, where there is a predominancy of aduſt *Sulphur* and in wandring effervеſcencies, in ſcorbutical, and unequall heats, both of the blood and nervous ſtock, by it ſelf, or mixed with other medicines, as an enforcement: but yet in more tender Conſtitutions, 'tis dangerous, leſt the tone and *fibres* of the ventricle ſhould be hurt, by its acrimony, and too great conſtriction or aſtringency.

6. In the laſt place, follows the aſtringent *Crocus Martis*, or the *Crocus of Steel*, prepared by fire, through a long Calcination, *viz.* The filings, the off-ſcourings, or thin plates of Iron, ſhould be ſo placed in a reverberating fornace, that they may be continually heated, by a moſt ſtrong flame: The filing being thus expoſed to the naked fire; firſt of all it grows reddiſh, and runs together into little hard round balls; but after 3. or 4. days, ſwelling up ſuddenly into an higher heap, it becomes extream light, impalpable, and of a moſt curious purple Colour: In this preparation, the Sulphureous and ſaline particles, whilſt by the force of the fire, they begin to come away from the concreet, do mutually take hold one of another, and ſo being combined together, grow into little balls; but afterwards, thoſe particles, both Saline and Sulphureous, being wholly profligated, and fiery particles ſucceeding in their place, the whole maſs ſwelling up into a bulk, and made as it were ſpungie, becomes moſt light.

A Medicine thus prepared, in some Cases, is of most excellent use, and second to none of the Chalybeats: to wit, almost in all extravasations, or too great eruptions of the *Serum* and blood, as in outward *hæmorrhages*, or in inward bleedings, in the *Diarrhæa*, the *Diabatis*, and in a vehement Catarrh; also I have known no remedy better than this, in the *Ascitis*, or in the beginning of a Dropsie: and this also, I have heard to be highly approved of lately by a most famous and expert Physitian, of our own Country: Concerning which medicine notwithstanding, since it is wholly destitute, both of Saline and sulphureous Particles, and consists almost only of earthly and fiery particles, it is very ambiguous, by what faculty it operates, and produces so praise-worthy an effect in man's body: for there seems to be in this, left no more *Caput mortuum*, or dead head, or *terra damnata*, then in vitriol, or in any of the other mettalls, distilled be a most intense fire. As to this if I may Conjecture, it seems first, that to this preparation, some Activity is due, whereby it exerts it self, and unfolds its virtues, either by shutting up obstructions, or by binding together the Vessells, or nervous *fibres* of the *Viscera*, from the fiery particles, shut up in the most fixed earth, and from them breaking forth within the body: Bnt the chiefest reason of helping consists in this, that the earthy particles, the Saline (by which they were strickly held) being wholly gone, desire greedily to be reunited to them, or such like: Wherefore, this *Crocus martis*, being immersed in our Bodies, snatches to it self, whatsoever Salts it meets with, and intimately binds them, and so, while it sucks up like a sponge, very many saline particles, it takes away many enormities, arising chiefly from the flux of the Salts. By this means, *Burnt harts-horn*, *Spodium*, and *Antimony Diaphoretic*, when they bring help exert or put forth their virtues.

CHAPTER. XII.

Of the Convulsive Cough and Asthma.

An example of a Cough meerly Convulsive.

THe history before related, doth clearly manifest, that sometimes a Cough may be caused, without any great fault of the Lungs, by reason of the sliding down of the morbific matter, upon the pneumonick nerves, or those belonging to respiration: to wit, where it was shown, in the Case of the noble Virgin, labouring with Convulsive fits, and also with a grievous and continual giddiness, that, when by the prescript of the Physitian, a fomentation of Cephalic Decoction, was applyed to her head, presently the Giddiness ceas'd, and in its place follow'd a great Cough, without any spitting, but night and day, almost perpetually troubling her: which without doubt happned, by reason of the Convulsive matter, being driven from the brain, into the beginnings of the nerves: This kinde of example, of a Cough meerly Convulsive, more rarely happens, in persons of ripe years, as the like distemper I have not often seen: But in children 'tis usual, (also sometimes I have known it in Men) for a cough to arise, from a serous Colluvies overflowing the Lungs: which, when at first it was Simple, and moderate, afterwards it became vehement, and Convulsive; so that in Coughing the *Diaphragma* being drawn upwards, and held in a long *Systole*, or frequently repeated, the Lungs being greatly straitned, were much hindred in their motion. In the mean time, by reason of the breathing being hindred, and the blood being restrained within the *Præcordia*, and for that cause stagnating in other places, the sick were in danger of being choaked, and often acquired a livid, or dead countenance. But in this Case, besides the Convulsions raised up about the *Præcordia*, by the force of Coughing, the Ventricle also, being often brought Into a consent, cast forth by vomit, whatever it contained in its bosom: yea, and I know in some tender ones, after this manner affected, the Disease wandring from thence into other parts, did raise up Convulsive motions in the Face, eyes, and limbs, and at length became deadly. This kinde of Convulsive Cough is very frequent among children, and some years lays hold on

This distemper frequent enough in children.

on so many, that it seems to be plainly Epidemical; when it roots it self, it is very difficult to be cured, by Remedies, yea often being long protracted, it is hardly otherwise to be cured, but by the state of the year being changed.

If the causes of the aforesaid Case be inquired into, it will be so plain, to refer the procatartic or more remote cause, to the redundancy of the Serous humour in the bloody mass, and in some sort in the whole body; a portion of which matter, dropping forth from the little mouths of the Arteries, on the Lungs, creates the ordinary Cough; afterwards, when the serous Colluvies or heap of waters yet exuberateing in the Blood, and stuffed with Convulsive particles, is also heaped up within the head, the same entring the pneumonic nerves, increases the simple, into a Convulsive Cough: For when those nerves, being irritated first about their extremities, are exercised above measure, for that reason they more easily imbibe the Convulsive matter, laid up nigh their beginnings: and so, when at length, they are driven into irregular motions, in two places, to wit, in the head, and at the tale, and that for two distinct causes, *viz.* from the irritation of the Spirits, and from their explosion; it is no wonder. if the Cough, at first Common, being afterwards brought into this evill state, becomes so cruel and Convulsive: Moreover, when it sometimes happens, that the same matter, heaped up in the head, does enter some other nerve, therefore Convulsive passions of another manner often come upon the Convulsive Cough. *The reason of it.*

Having shown after this manner, that a cough doth arise, not only, nor always by the fault of the Lungs, but sometimes from a solitary Convulsive cause, but oftener superinduced by this, on a pneumatic Distemper: also we do not doubt to determine almost the same thing, concerning another certain Distemper of the *Thorax*, to wit, the *Asthma*: For whether this Disease be continuall, or periodical, in either Case, the Symptom chiefly urging, is difficult Breathing; which indeed seems to be excited for this reason, because the Lungs being too much inflated, and distended, extremely fills the Cavity of the *Thorax*, neither do they fall down as they should do, by turns: hence the Spirit or breath remaining within, is not sent forth freely enough, neither indeed can fresh aire be easily induced, by reason the space is before filled: whilest the Lungs are so longer contained in a continual, or very little remiss Diastole, oftentimes the *Diaphragma*, is urged contrary to its manner, into a violent Systole, and being drawn upwards, is wont more and more to lift up the Lungs, and to hinder their falling down; whereby it comes to pass, that respiration becoms yet more difficult, and more laborious. *The Convulsion Asthma.* *Sometimes it depends of the Lungs, together with the nerves being affected.*

We easily believe, that this kinde of hard breathing Distemper, doth sometimes happen by the fault of the Lungs, because anatomical Inspection hath plainly detected it: For if a great Serous Colluvies, being layd up in the *Thorax*, very much stuffs the Lungs, and so much obstructs all their pores and passages, that the blood being hindred in its Circute, cannot freely pass thorow the Pneumonic Vessells, for that reason indeed, such like anhelous Distempers are sometimes made: Then, as often as the blood growing more hot and rarified, by exercise or the heat of the Bed, requires a larger space for its Circulation, within the Lungs; then presently from such an occasion, a more frequent Respiration, or an asthmatical fit is stirred up: If beside this morbid Disposition of the Breast, the Sanguineous mass, also abounding with a serous water, should be apt to sudden fluxions and effervescencies of the Serum, from hence also, by reason of the violent course of the Serum growing hot, into the Lungs, being before obstructed, and greatly filled, very often most grievous assaults of this Disease, and almost suffocating do happen. Moreover, sometimes, beside, the roots of the asthma (as it is said) being fixed about the *Præcordia*, certain shoots of the same disease, budding forth from the head, meet with the former, and being complicated with them, produce the more cruel fruits of the *Dyspnæa*, or want of Breath. For, because the Lungs being stuffed with *Serum*, another quantity of the same, more largely redounding in the blood, being imbued with Convulsive particles, is poured on the head, the same more readily entring the pnenmonic nerves, than others, causes the *Asthma* of the *Thorax*, at first Simple and modetate, to become periodically vehement, and Convulsive.

Of these kinde of Distempers, *viz.* the *Dyspnæa*, being excited by the singular fault of the Lungs, and with a Companion, very many instances, and examples have

have fallen under our observation, and do almost dayly happen. For there is nothing more usual, then for those that are sick of an inveterate cough, or any other evill disposition of the Lungs, at length the Dropsie, or Scurvie hapning to become Asthmatick, to wit, when the Blood being made much more impure, lays up also its serous dreggs in the head, these more readily, and indeed more easily enter then others, the pnenmonic nerves, as being weaker, and often irritated neer their extremities, and in them do heap up matter, for a Convulsive *Dyspnæa*.

An Asthma sometimes meerly Convulsive proceeds from the nerves only being affected.

Further, sometimes I have observed, most grievous fits of an *Asthma* to have hapned, without any notable fault of the Lungs, so that truly I did think that this disease was sometimes meerly Convulsive, and its fits only excited, because the serous colluvies or watery heap, being stufft with, explosive particles, entring into the nerves, performing the Diastole of the Lungs, grows to the Spirits therein flowing, which being afterwards struck off together, and for a long while, by reason of plentitude or irritation, the Lungs are detained as it were inflated, and stiff, so that they can perform neither the offices of drawing in, or of breathing out: But the fit being finished, a free and equal respiration follow'd, as before the fit began, and no cough, or signs of a sickly disposition of the Lungs, did appear. As I have observed this kinde of *Dyspnæa* or difficult breathing meerly Convulsive, to have hapned in many, I will here shew you one or two histories of it.

A certain strong and fat Gentleman, having used for some time a more full and inordinate Diet, without any exercise, began to be ill about the beginning of the winter: at first he was troubled with a pain and heavines of his head, with a grear giddines, and fear of swooning, and believing himself just about to dye, being otherways healthfull; within a few days, these Symptoms pass'd into an apparent *Stupor*, or rather Lethargie: he being let blood in his Arm, I caused carefully to be applied Cupping-glasses, Vesicatories, and sharp Clysters, with many other Remedies: In the space of 42. hours coming to himself, he was sensible, and shook off all torpor or drousines. But although his brain was cleared, yet he was taken with a great weakness, and numbnes in his membe rs which Distempers however were shortly cured, with antiparyletic and antiscorbutic Remedies: But after a fortnight, he began again to complain of an heavines and giddines in his head, then the next day after, he fell into a horrid *Asthma*: that the Lungs being suddenly inflated, and endeavouring to come upwards, the Breath, which was very quick and laborious, was hindred, and not being able to come forth, he was in danger every minute of an hour to be choaked. This fit as it was cruel, so it pass'd over within 12. hours, without any spitting, cough, or vomit, and then, within a weeks space, he lost all the trouble of his breast; but then the like fit of the *Dyspnæa* or difficult breathing returning, exercis'd him somewhat more gently; and afterwards, he was wont to be troubled with such a fit of the *Asthma*, nigh to the great mutations of the Air, chiefly in great cold, or the falling of Snow.

2. Observation.

I knew another Gentleman, sick of an inveterate Scurvy, who having no manner of Cough, was troubled now with a great head-ach, and for many days with a giddines or *Vertigo*, then at another time, being free from those Symptoms, he was taken with a most cruell fit of the *Asthma*, and he endured these Distempers, now this, now that, frequently, but especially about the greater tropicks of the year.

The Reason.

It is not to be doubted, but in the aforesaid Cases, those fits of the *Asthma* did wholly depend, on the Convulsive matter, being fallen into the nerves, serving to the stretching forth of the Lungs, which cleaving to the Spirits, and being by them struct off, or explosed, by reason of plentitude or irritation, caused the *Præcordia* to be lifted uywards, and as it were inflated, and by that means hindred, from its reciprocal motion.

An Asthma sometimes excited by reason of the Bronchia being Convulsively affected.

Moreover, we suppose, that such a kinde of Convulsive *Dyspnæa* or difficult breathing, is sometimes excited, by reason of the *bronchia* of the *Trachea* (or the sharp arteries of the Throat) being too much streightned, and often almost drawn together: we have shown in our discourse of the Nerves, that very many branches of nervous *fibres*, and of the nerves, do every where embrace all the ramifications of the asper Arterie, and bind them about, which nerves if it happen,

pen, that they, being possessed by the morbific matter, should be irritated into frequent Convulsions, for that reason it follows, that the channells or passages which they compass about, must be greatly bound together, and in some places wholly shut up.

There was a very choyce Virgin, of a tender constitution, and of a flourishing countenance, scarce past the second lustre of her Age, (*i.e.* about 12. years old) that began to be grievously tormented with *Asthma* fits; and before she was entrusted to my cure, she had liv'd obnoxious to them at least 4. years. sometimes she remained free, from any fit of this disease, for two or three months: yet oftentimes, by reason of errors in Diet, or the great mutations of the year, or the air, she fell into most cruel fits of the *Dyspnæa* or difficult breathing: So that her Lungs being inflated, and carried upwards towards her throat, and there held almost in a continual Diastole, she could hardly, nay, not at all breathe; in the mean time, for that respiration might be somehow made, the *Diaphragma* and the muscles of the breast were exercised with repeated endeavours of motions. This kinde of fit by degrees remitting, within 7 or 8. hours, at length gave over; but then after a week or two, it was wont to come again, either of it self, or from any the least occasion; after that the force of the Disease, its matter being bestow'd on very many of these kinde of fits, pass'd away, this excellent virgin was well enough for many weeks, yea sometimes months after, and breath'd freely, without any fault of the *Thorax*. For this person, I instituted this following method, Spring and fall, and now it is more than two years, since she has had any fit of this Distemper. 3 *Observation.*

Take of our *Sulphur of Antimony*, gr. vi. of *Cream of tartar*, vi, grains, mix them: Let it be given in the pap of a rosted apple, with this medicine she was wont to vomit 4. or 5. times: four days after, she took this cathartic, which was wont to be repeated, twice, after 6. or 7. days between: Take *Calomelun* xii. grains, of the *Resin of Jolop*, v. grains, of *castor* gr. iiii. with what will suffice of *Ammoniac* dissolved, make iii. pills: every day besides, she took morning and evening, of the tincture of *Antimony*, grains xii. in a Spoonfull of the following Julap, drinking after it 6. or 7. Spoonfulls of the same. Take of the *water of Snailes*, ℥vi. of *earth-worms* ℥iiii. of *water of penny-royal*, and *rue*, each, ℥iii. of hysterical water, ℥iii. of *Castor* tyed in a knot, and hung in the glass, ℈ß. of *white-sugar* ℥i. mix them in the glass, and make a Julap.

About the Autumn of the last year, another noble Virgin, being sick after the same manner, *viz.* with a Periodical *Asthma*, I was sent for to cure her, who received great help by the aforesaid Remedies, being used in a little lesser dose, and the same repeated at the first of the Spring. 4. *Observation.*

In these Cases also, nothing seems to appear more clearly, than that the cause of the Disease, without any phlegm or viscous humour, being impacted in the Lungs, as is commonly beleeved, doth subsist within the nervous stock; and that this kind of *Dyspnæa* or difficult breathing, meerly convulsive, is excited, by reason of the Pneumonic nervs, being possessed by the Convulsive Distemper. The verity of this may be yet more clearly evinced, by an anatomical observation, lately Comunicated to me, by the learned Physitian Doctor *Walter Needham*. That most famous man told me, that he knew a Butcher of *Wallsallen* in the County of *Stafford*, who when he had been long sick of a periodical *Asthma*, returning within 14. or 20 days at fartheſt, at length he dyed in a fit. The Body being opened, all his *Viscera* appeared sound, chiefly his Lungs, neither were there to be seen any signes, either of excrement gathered together in the *Bronchia*, or of the blood restagnating in the veins; this only hapned besides nature, that the bladder of the gall, contained in it many stones. But (added he) the causes unknown to us, certainly not Conspicuous to our eyes, were to be attributed to the nervous stock being affected. *An Anatomical Observation*

Sometime past I was consulted with, about a noble child, who being about 12. months old, was grievously afflicted with Convulsion fits, and as it were Epileptic, of which he quickly dyed. I often observed, that whilest the Convulsion of the outward parts intermitted, he was taken with a cruel sobbing, or hooping Cough: from whence I suspected, that the morbific matter, was no less fixed in the breast, than in the brain. But after its Death, the body being opened, the Lungs well furnish'd, appeared clear from any fault, that it clearly ap- *Another Anatomical Observation.*

peared that this cough meerly Convulsive, was excited by reason of the Distemper of the nervous stock.

As to what respects the Remedies, and curatory means, which ought to be used in the aforesaid cases, when that convulsive Symptoms come upon the Cough, or difficulty of breathing, first excited from the default of the Lungs, and so by reason of the taint, communicated to the brain; it must be carefully heeded, that Convulsive medicines be aptly compounded, with those respecting all the Intentions of the *Thorax*. Yea that sometimes these, sometimes those, being given by themselves, may between whiles fill up the times of curing, it will not be needfull in this place, to bring the bechic, or Pneumonic medicines, and forms of them, since an immense company of them, are extant every where, among Physical Authors. It will be sufficient for our purpose, to add a method of medicine, also some more select Remedies, convenient for the Cough, and *Asthma*, meerly Convulsive.

The cure of the Convulsive Cough. As to the former Distemper, which is most familiar to children, the cure is difficult, and for the most part not to be performed, but of a long time. The chief Indications, will be to purge forth, both the serous and sharp humours, from the blood and *Viscera*, that their inclination and falling down in the brain, and perhaps also within the breast, may be sometimes prevented; then to Corroberate those parts that they may not easily admit the superfluities, of the boyling Serum. For these ends, vomits and more gentle purges, for the most part are usefull, and in some measure ought to be repeated: Vesecatories are often profitable; yea, if the Disease be contumacious, Issues are to be made in the nape of the neck, or the arm, or about the Armpits. Drink and liquid aliments, are to be taken in a lesser quantity, than usual, and in stead of them, a Bochet is to be used, of *Sarsa*, *China*, *Sanders*, *Shavings of Ivory*, and *harts-horn*, with diuretic, and anticonvulsive Ingredients: In this Case, some remedies as it were special, are greatly commended, of which sort are pixed musk, given in powder, or boyled in milk, and so given dayly in a frequent dose: a decoction or *Syrrop of Castor*, and *Saffron*; decoctions of the *root of Paony*, *Misletow* of the *Oak*, also of *hyssop*, help many; the waters of *black-cherries*, of *Saxifrage*, and of *Snailes*, distilled with *Whey*, and appropriate ingredients, are often taken with success.

The cure of the Convulsive Asthma. 2. By what method, and with what Remedies, I have cured the periodical *Asthma* in some young ones, hath been already shown, But in most, distemper'd with this Disease the most famous *Riverius* hath observed, a vomit is chiefly helpfull, although he hath not rightly shown the reason: which indeed seems to consist in this, to wit, that this medicine, greatly shaking, and irritation the Emunctories, planted about the first Passages, strongly presses out from them, and carries forth of dores, the recrements of the blood and nervous juice, apt to be troublesome, and to restagnate on the brain, and Nervous stock. *Zacutus* the Lusitanian, highly extolls, and not without reason, a cautery to be made, sometimes in the hinder part of the head, sometimes in the nape of the neck, or about the Armpits: A preparation of *milipedes*, *viz.* in form of a dry powder, or a distilled Liquor, seldom wants success. For by such like Remedies, the superfluities of the *Serum*, are deduced from the head, and nervous stock, and carried away, thorow the urinary passages: For the same reason, a gentle purge, evacuating the ill juice, is often us'd: for this end, the decoction of an old Cock, with altering medicins, and gently purging, being stowed in its belly, is prayed by many: Besides, the remedies hitherto cited, some others are said to be appropriate, and as it were Specifical to the *Asthma*, of which sort are, the *balsom of Sulphur*, turpintin'd, also *Spirits of Harts-horn*, or of *Sut*, impregnaeed with the same; *Syrop of Tobacco*, of *Ammoniack*, our *diasulphur Lohoch* of *Garlick*, pills of the *roots of Enula Campane* made up with the *milk of Sulphur*; with the *flowers of Benzoin*, with liquid pitch, or liquid amber, with many others, which would be too tedious here to enumerate.

And now the cheif *Species*, and manners of Convulsions, together with the Causes of the Symptoms, and the means of curing, being sufficiently explicated, it is time to put an end to this our Pathologie of the Brain and nervous stock, and to our Discourse of *Convulsive Diseases*.

FINIS.

THE FIRST
INDEX or TABLE,
WHEREIN IS
Alphabetically digested the principal matters contained in the Treatises of Fermentation and Feavers.

A.

AGues, *Of Agues*, Page 68.

Of the Pineal Glandula *of the Brain*, 106
Of the orbicular prominences called Nates and Testes in the Brain, 107, 108.
Of the uses of the Cerebel or little Brain, and its parts, 110, 111, 112.
Of the orbicular prominences, and annular protuberance, for what uses, 121, 122, 123.
Of the Brain of a Fool dissected, 162
Of the anatomy of a Monkeys Brain, ibid.
Breast, *Why a Child new born seeks out the Mothers Breast, or Beasts new brought forth into the world their Dams teats*, 109
Breathing, *How effected*, 155
How variously interrupted, 175
Brutes, *A single Machine*, 162

C.

Candle, *Why a Candle burns blew in the Mines*, 29
Carotides, *See Arteries*,
Cerebel, *Its description, and of its processes*, 67, 68.
The uses of the Cerebel, and its parts, 110, 111, 112.
Of its parts and accidents, 112, 113.
Of its difference in substance from the Brain, 123
Chewing, *How made*, 143
Choaking, *Why there is a sense of Choaking in the Throat in some distempers*, 161
Chorcedes, *The use of the Chorotides*, 99
Of the Choroeidal Infoldings, 106
Cloude *In Urines, what it means*, 3
Colick, *The cause of the pains in the Colick*, 170
Colour, *In Urines*, 2, 3.
Of the colour of sick peoples Urines, 6, 7, 8.
Conclusion, *Of the Anatomy of the Brain, and the use of the Nerves*, 192
Consistence, *Of Urines*, 6
Contents, *Of the Urines of healthful and of sick People*, 13, 14.
Cough, *Why a troublesome Cough often causes Vomiting*, 156
Cramp, *What it is and how, and how made*, 46
The Causes of it, ibid.
Who are most obnoxious to the Cramp, ibid.

Creſts, *Of ſome Creatures, why erected in anger or pride,* 150
Crying, *How made,* 143

D.

Diaphragma, *Why the motion of the Diaphragma conſpires with the præcordia,* 163
Of the Nerve ſerving to the uſe of the Diaphragma, 174, 175.
Of the irregular motions of the Diaphragma, 175
Why the Nerve of the Diaphragma proceeds from the Brachial Nerve, 176
Diſtillation, *of Urine,* 1, 22.
Dura mater *Deſcribed,* 56
Its uſes and offices, 78, 79.
Of the Veſſels belonging to the Dura Mater, 79
What the motion and ſenſe of the Dura mater is, 79, 80.
Its ſeveral uſes rehearſed, 80, 81.

E.

Eares, *Why all Animals at a noiſe or ſound erect their Eares,* 118
Elements, *Of Urine,* 1
Experiments, *Of flame and fire,* 28
Of cutting aſunder the Muſcles to perceive their motions, 38
Experiments of a live Dog concerning the voluntary motions of the Muſcles, 39
Of intumifying a Muſcle, 42
Experiments of injecting Liquors into the Carotidick Artery, 72
Experiment whether the pulſe of the heart depends on the influence of the Animal ſpirits, 152
Eyes, *Why the eyes ſo readily ſhew the affections and paſſions,* 110
The reaſon of the little black ſpecks or ſpots, which ſometimes ſeem to be before the eyes, 139
Of the Nerves that move the Eyes, 140
Of the pathetic Nerves of the Eyes, ibid.
Why Love is admitted by the Eyes, 143
Why the Eyes are made red in ſome paſſions, as anger, joy, &c, 154
Why the eyes and mouth anſwer ſo readily to the motions of the præcordia & Viſcera, 160
The reaſon of flame proceeding from the Eyes of perſons in burning Feavers, 33
The Fibers in the Eyes, the cauſe of the act of ſeeing, 140

F.

Farcy, *Of the Farcy in Horſes, what it is, and how cured,* 134
Fibres, *Of the Nerves, whence they ariſe,* 128
The Fibres in the Noſtrils perform the act of ſmelling, 139
The Fibres in the Eyes, the cauſe of the act of ſeeing, 140
Figures, *Of the Muſcles explained,* 49
Figures of the brain explained, 62, 63.
The third Figure of the brain explained, 89
The fourth Figure of the brain explained, 90
The fifth and ſixth Figures concerning the ſkull explained, 73, 74.
The Figure of a Mans brain, 60, 61.
The Figure of the brains of Fiſh and Fowl, 75
Figures of the Nerves explained, 144, 145.
Figures of the Nerves in Tables, from 182 to 192
Figures of the Carotidick Arteries, the wonderful net, pituitary kirnel, and the lateral bloſſom explained, 86
Figures of a Sheeps brain, and all its inwards explained, 94
The Figure of the oblong marrow, 101
The Figure of the marrowy part of the brain of a Sheep explained, 105
Fire, *Why it burns fiercer in cold than in moiſt and hot weather,* 27
Why the Sun beams put out the Fire, ibid.
Why Fire ſeems to leap forth in the night from the mains of Horſes, skins of Cats, and other hot Animals, 32
Fiſhes, *Why they want the crankling turnings in their brain, as in Man and Beaſts,* 92
Of the optic Nerves in Fiſhes, 104
Of the chamfered bodies in Fiſhes brains, and their difference from other Creatures, 103
Flame, *How made,* 27
Why flame ſhut up from the air goes out, 28
Why the flame of a Candle burns blew in the Mines, 29
How the Vital Flame is inkindled in the blood, 30
Why the Vital Flame is not ſeen, 32
The reaſon of a ſhining Flame, ſometimes ſeen about perſons indued with an hot nitrous blood, ibid.
The reaſon of Flames proceeding from the eyes of people in burning Feavers, 33
Forms, *Predeſtinated to natural bodies,* 33
Fowls *Brains, why they want the turnings and windings as are in Men and Beaſts,* 92
Their difference from Beaſts, ibid.

G.

Genital, *How made,* 173
Glandula, *Of the petuitory Glandula in the brain of a Man and a Beaſt,* 71

H.

Hands, *Why the Hands and Arms of Men conſpire ſo readily with the affections of the brain and heart,* 174
Head-aches, *Great from the diſtemper of the* Pia Mater, 90
An Hiſtory of Head-aches, 100
Hearing,

Hearing, *How made*, 144
Of the species of hearing, 119
The difference of the hearing Nerves in a Man, and in a Beast, 120
Heart, *Its office as to the Blood*, 31
The heart a meer Muscle, ibid.
Of the Nerves going to the Heart, 150
Whether the pulse of the Heart depends upon the influence of the animal spirits, 152
Histories, *Of one troubled with a Tenanism or Cram*, 46, 47.
Of one that died with a Scirrhus or hard swelling of the Mesentery, 82, 83.
Of Head-aches, 100
Horse, *Of the Tube or pipe in a Horses brain*, 66
Of the Carotidick Arteries in a Horse, 85
Why different from other Beasts, 88
Humours, *Of the humours in a Muscle*, 38
A double humour contributes to the making of the animal spirits, 99
How the serous humour is sent from the brain, 98, 99.
Of the use of the Nervous humour, 128, 133.
Of the Nervous and Nutritious humors, 130, 131.
Whether the bloody humor be Nutricious, 130
How the genital humor is made, 173

I.

Imagination, *What it is*, 91
Infoldings *Of the Nerves*, 140
Of the Gunglioform Infolding, 157
Of the Mesenteric Infoldings, 158
Of the Hepatic Infolding, ibid.
Of the Nervous Infolding of the Spleen, 167
Of the Renal Infolding, 168
Inspection, *Of Urines useful*, 20
Instinct, *Of Motion, what it is*, 43, 44, 45.
Of natural Instincts, 115
Involuntary *Function, what it is*, 116, 117.
Of the Nerves serving to the Involuntary Function, 116, 117.
Juices, *Of the Juices nervous and nutritious*, 130
Judgments, *How to be given of the Urine*, 17, 18.
The Ignorance of some in the Judgment of Urines, 18
Judgment of Urines wanting colour, consistence, contents and quantity, ibid.
Judgment of Urines having preternatural contents, 19

K.

Kings-evil, *Why Cured by stroaking*, 134
Kissing, *Why it irritates Love*, 143

L.

Laughing, *Why proper to Man*, 117.
Caused by the fifth Conjugation of the Nerves, 143
How made, 160
Life, *A kind of flame*, 27
Life, and fire many ways extinguish'd alike, 31
Liquors, *How they receive heat*, 26
Love, *Why admitted by the eyes*, 143
Why provoked by kissing, ibid.
Lungs, *Why the colour of the Lungs is suddenly changed in new-born Creatures*, 30

M.

Mamillary *Processes, what they are, and their use*, 137, 138.
Marrow, *Of the oblong Marrow, and its uses*, 101, 102.
How joyned to the spinal Marrow, 124
Of the spinal Marrow, 124
Of the Nerves from the spinal Marrow, 178
Of the blood-carrying Vessels from the spinal Marrow, 179
Man, *A curious Machine*, 162
Meninges, *See* dura mater *and* pia mater,
Memory, *How made*, 96
Mesentery, *Of the Infoldings of the Mesentery*, 158
Why so many Infoldings of the Nerves are about the Mesentery, 164
Monkie *Dissected*, 162
Why it is so crafty and mimical a Creature, ibid.
Motion, *What it is*, 34
Three things to be considered in every motion, ibid.
Of spontaneous and voluntary motion, ibid.
Of involuntary motion, ibid.
Of the motion and sense of the pia mater, 90
The Vehicle of the Instinct of Motion, what it is, 34
Of local Motion, ibid.
Of the increase of the force of Motion in Artificial things, 39, 40.
How the Motion of the Muscles is made, 42
How the instinct of Motion is performed, 43, 44.
Of the Motions of the animal spirits, 95
How the Motion of the Muscles correspond with the Motion of the Heart, 136
Of the irregular Motion of the Diaphragma, 175
Upon what the peristaltic Motion depends, 169
The use of intestine Motions in the belly, 165
How the Motion of Hypochondriacal pains is made from the right to the left side, and so contrary, 169
Of the Motion of the Muscles, see Muscles and Musculary motion.
Muscles, *Of the formation of a Muscle*, 35
Of the opposite Tendons in every Muscle, ibid.
A Muscle described, 35, 36.
Of the simple and compound Muscle, 36
Of the membranous covering of a Muscle, 37
Of the action of a Muscle, 37, 38.

Several experiments of cutting a Muscle, 38
Of contraction and relaxation in a Muscle, ibid.
Of the humors in a Muscle, ibid.
An experiment of a living Dog, concerning the voluntary motions of the Muscles, 39
How a Muscle is moved, ibid.
Of the traction of a Muscle, 40
Elastick particulars contained in a Muscle, ibid.
Of the trembling of the Musculous flesh of a Beast, after its head is off, and heart taken out, 40, 41.
How the animal spirits blow up the fleshy fibres in a Muscle, 41
Experiments of intumifying a Muscle, 42
Of the nature of the animal spirits coming from the brain into the Muscles, ibid.
Of the fresh supplies of the animal spirits for the motions of the Muscles, 44
Of the little hairy fibrils of a Muscle, 45
Of the irregular and convulsive motions of the Muscles, ibid.
Explanations of the figures of the Muscles, 49
That the motions of the Muscles have an analogy with the heart, 135, 136.
Muscular *Motion, how it is made,* 42
Of the Muscular motion, 34
The blood affords an Elastic Copula for Muscular motion, 43
The reason of the instinct of Muscular motion, 43, 44.
See further under Muscles and motion.
Musick, *Why easily learned by some, and not by others,* 119

N.

Nates, *And Testes of the brain, what they are,* 106, 107.
Neck, *Why it swells in anger, or great passion,* 150
Nerves, *The Vehicle of the instinct of motions,* 34
Of the Chambers of the Optic Nerves, 103, 104.
Of the Nerves which serve to the involuntary function, 116, 117.
Whence they arise, 116
The fourth, fifth, sixth, seventh, eighth pair of Nerves serve to the involuntary function, 121
Of the Nervous System in general, 125
What the Nerves are, 127
When the Nervous fibres arise, 128
Of the Nervous juice, 131
Its use, 133
Of the first four pair of Nerves arising within the skull, 137
Of the smelling Nerves, ibid.
Their use, 138
Of the Optic or seeing Nerves, 139
Of the Nerves that move the eyes, 140
Of the pathetic Nerves of the eyes, ibid.
Of the fifth, sixth and seventh pair of Nerves, 141
The fifth Conjugation of the Nerves described, 141, 142.
The sixth Conjugation of the Nerves described, 143
The seventh Conjugation of the Nerves described, 143, 144.
The first and second figures of the Nerves explained, 144, 145.
Of the eighth pair of Nerves, or the wandring pair, 145, 147.
Of the wandring pair in Man, 147
Of the wandring pair in Beasts, 148
Of the Nervous Infoldings, and their uses, 146
Of the returning Nerve, 147
The uses of the wandring pair, 149
Of the Nerves inserted into the heart, 150
Of the communications of the wandring pair, 156
The Intercostal Nerve described, 157
The uses of the Intercostal Nerve, 160, 161, 162, &c.
Of its lower branchings serving the lower belly, 164
Of the Nerves that serve the Spleen, 166, 167.
Of the Renal Infolding, 168
Of the Nerves serving the Pancreas Choledoci, Vessels Duodenum and Pylorus, 168, 169.
Of the Nerves of the Womb, 169
Of the Nerves belonging to the Ureters, 170
Of the Nerves serving for Dung, Urine, and Seed, 171
Of the Nerves belonging to the Testicles, 172
Of the spinal Nerve, 173
The spinal Nerve constantly found in Man, Beasts, Fowls and Fishes, ibid.
The use of this Nerve, 174
Of the Nerve of the diaphragma, and its use, 174, 175.
Why the Nerve of the Diaphragma proceeds from the Brachial Nerve, 176
The difference of the Nerves of the wandring pair, and the intercostal Nerves in Man and Bruits, 176, 177.
Of the ninth pair of Nerves arising within the skull, 177
Of the tenth pair arising within the skull, 178
Of the Nerves arising from the spinal marrow, ibid.
Why the brachial and crural Nerves are larger far than others, 178, 179.
Net, *Of the wonderful Net, and its use,* 85
The explication of the figure of the wonderful Net, 86
Nourishment *Of the Body, how made,* 134, 135.
Noise, *Why Beasts at an affright make a sad dun noise,* 118
Why noise or shreeching is made in great passion, 150

O.

Offices *Of the brain, and its parts,* 77
Of th skull, 77, 78. *See Uſes.*
Optick *Nerves, ſee Seeing Nerves,*

P.

Paſſions, *Why troubleſome to the Præcordia, and why ſeen in the face,* 108, 109.
Why more clearly ſeen in the eyes, 110
Phantaſie, *How made,* 96
Pituitary *Glandula, what it is,* 104, 105.
Pia mater, *Its deſcription,* 58, 59.
Its uſes and ſeveral parts, 81
Of the ſanguiferous Veſſels covering the Pia mater, 83
What ſenſe and motion is in the Pia mater, 90
Pineal *Kirnel, what it is,* 106, 107.
Præcordia, *Their agreement with the Diaphragme,* 163
Why they ſeem to be drawn downwards in ſome Hypochondriacks, 167
Prominences, *Of the Orbicular Prominences of the Brain,* 106, 107, 121, 122.
How different in ſome Creatures, 122
Protuberances, *Of the annular Protuberances of the brain,* 121, 122.
How different in Man, and in ſome Beaſts, 122.

Q.

Quantity, *Of Urines,* 2
Of the Quantity of ſick people Urines, 6, 7.

R.

Reſpiration, *Variouſly interrupted, and how, See Breathing,* 175

S.

Saltneſs, *Of the Saltneſs in Urines,* 1
Shreeching *Out in a ſudden paſſion, why made,* 150
Seed, *How made,* 173
Seeing, *Of the Seeing Nerves,* 139
How Seeing is performed, 140
Senſe, *What it is,* 34
The formal reaſon of the common ſenſe, 95
Senſory, *Of the common Senſory, what it is,* 102
Sleep, *How made,* 97
Sight, *Why ſometimes things appear double to the ſight,* 103, 104.
Why the ſight of ſome things cauſe ſpittle in the mouth, 141
Skull, *The parts of the Skull unfolded,* 70, 61.
Of the cune form or wedg-like bone of the Skull, 70
The fifth and ſixth figure concerning the Skull explained, 73, 74.
The uſes of the Skull, 77, 78.
Of the furrows in the Skulls of Men and Beaſts, 78
Of the difference of the Arteries paſſing through the Skulls of Men and Beaſts, 84
Smelling, *Of the Smelling Nerves,* 137, 138.
Why large in Beaſts, 137
The cauſe of the nearneſs betwixt the taſte and the ſmell, 139
The Smelling fibres differently figured in ſeveral Creatures, and why, ibid.
Why the Smell of ſome things cauſes ſpittle in the mouth, 141
Sneezing, *Why people Sneeze, going ſuddenly out of a dark place into the Sun-ſhine,* 142
Why men before other Creatures Sneeze, 175
Why and how Sneezing is made, ibid.
Soul, *Two parts of the inferiour ſoul,* 95
In what the eſſence of the ſenſitive Soul conſiſts, 130
The corporeal Soul of flame and light, 29
The Soul depends upon the temperament of the bloody maſs, 31
The root of the corporeal Soul is in the blood, and its branches in the brain and nervous ſtock, 33
Two chief faculties in the corporeal Soul, 34
Sounds, *Of the Ideas of Sounds in the head,* 118, 119.
How ſharp and flat Sounds are performed, 150
Spirit, *In Urines,* 2
Spirits, *How the animal Spirits blow up the fleſhy fibres in a Muſcle,* 41
Of the nature of the animal Spirits proceeding from the brain by the Nerves into the Muſcles 42,
Of the freſh ſupplies of the animal Spirits for the motion of the Muſcles, 44
How the animal Spirits are begotten in the brain, 87, 88.
How firſt begot in the Cortex of the brain, 93
After what manner the animal Spirits diffuſe themſelves for the producing the faculties of the Soul, 95
The place of the exerciſe of the animal Spirits, 101, 102.
The reaſon of the paſſage of the animal Spirits through the Nates and Teſtes, 108
Of the acts of the Spirits of the involuntary function, 114, 115, 116.
The difference of the Spirits flowing from the brain and from the Cerebel, 114
The paſſage of the Spirits compared to light, 126
Of the great troops of Spirits, how they paſs through the Channels of the Nerves, and ſupply the whole Body, 130
Whether the pulſe of the heart depends upon the animal Spirits, 152
Of the flowing of the animal Spirits from the nervous infoldings, 165

Spittle, *Why the sight and smell of some things causes Spittle to come into the mouth,* 141
Spleen, *Its office,* 166
Sulphur, *In Urines,* 1
Sulphur, the food of flame, 29
Sulphur in the blood, the cause of its flame. 32

T.

Tables, *Of the figures of the Nerves explained from page* 183 *to the end.*
Taste, *The cause of the nearness of the Taste, with the smell,* 139
Tendons, *Of the Muscles, what they serve for,* 35
Tenasm, *What it is, and causes of it,* 46
An History of it, 47
Testes, *Of the Testes of the brain,* 107
Testicles, *Of the Nerves belonging to the Testicles,* 172, 173.
A spirituous Liquor distilled into the Testicles, 173
Tongue, *The fifth and ninth pair of Nerves serve to the Tongue, one for its motion, and the other for its taste,* 177
Tunnel *Of the brain,* 99

V.

Veins, *Of the Veins belonging to the Spine,* 181
Venerial *Act, how the pleasure and titillation in the Venerial act is made,* 171
Why the loynes are enervated by the Venereal act, 173
Ventricles *Of the brain,* 96, 97.
Vessels *That arise in the hinder part of the brain,* 68, 69.
Of the Vessels of the Dura mater, 79
Of the joyning together of the Vessels of the brain, 82
Of the sanguiferous Vessels covering the Pia mater, 85
Of the blood-carrying Vessels in the Spinal marrow, 179
Why the blood-carrying Vessels of the Spine, are frequently ingraffed one into another, 180, 181.
Vomiting, *Why caused by a troublesome Cough,* 156
Ureters, *Of the Nerves belonging to the Ureters,* 170
Urines, *The elements and accidents of Urines,* 1
Of the quantity and colour of sound peoples Urines, 2, 3.
How Urine is made, 3
Why Urine after plentiful drinking comes forth clear, 4
Of the consistence and contents of the Urines of sound people, 5, 6.
What the cloud in Urine signifies, 5
Of the quantity and colour of Urine of sick people, 6, 7.
Of a large quantity of Urine suddenly flowing, 7
The several colours of sick peoples Urines, what they signifie, 8, 9.
Of the deep colours, 10, 11.
Of pale-coloured Urines, 8, 5.
Why Urines grow red in the Scurvy and Gout, 11
Of a green and black Urine, 12
Why the colours in Urines change, 13
Of the contents of sick Peoples Urines, 13, 14.
What Urines signifie full of contents, 14, 15.
What the crust of the Urine sticking to the sides of the pot or glass is, 15
Of the gravel, sand, or stones in Urines, 16
Of the white contents in Urines, 17
Judgments of Urines how to be given, 17, 18, 19.
The ignorance of some in the judgments of Urines, 18
Sickness sometimes not shewed by the Urine, ibid.
The chief use of the inspection of Urines, 20
The examination of Urines, 21
How Urines are to be ordered e're you give judgment, ibid.
Why many things taken in at the mouth, colour the Urine, ibid.
Of the oder or smell in Urines, 21, 22.
Of the sweet smell in Urines, 22
Of the evaporation and distillation of Urines, 22, 23
Of the putrefaction of Urines, 23
How the pain in difficult Urine or making of water is made, 172
Uses *Of several parts,*
Of the brain and its parts, 77, 78.
Of the skull, see Skull.
Of the Dura mater, 78, 79.
Of the Pia mater, 81
Of the wonderful Net, 85
Of the Choroides, 89
Of the Brain properly so called, 91
Of the crankling turnings and windings in the brain, 92
Of the Cortical and Medullar substance of the brain, ibid.
Of the callous body of the brain, 93
Of the Fornix, 93, 94.
Of the Ventricles of the brain, 96, 97.
Of the Tunnel, 99
Of the five-like bone, 100
Of the oblong marrow and its parts, 101, 102.
Of the chamfered or streaked bodies, 102, 103.
Of the chambers of the optick Nerves, 103
Of the pineal kernel, 106
Of the choreidal infolding, ibid.
Of the Nates and Testes, 107, 108.
Of the Cerebel and its parts, 110, 111, 112.
Of the orbicular prominences, 121
Of the annular protuberance, 122
Of the spinal marrow, 124
Of the nervous humour, 128, 133.
Of the mamillary processes, 138

Of

Of the cribrous bone, ibid.
Of the Nerves, ſee Nerves,
Of the wandring pair, 149
Of the intercoſtal Nerve, 160
Of the infoldings of the Meſentery, 164, 165, 166
Of the Nerves that ſerve the Spleen, 166, 167, 168.
Of the Womb, 169
The uſe of the Renal infolding, 168
Of the Nerves ſerving the pancreas cholduli veſſels duodedum & pylorus, 168, 169.
The uſe of the ſpinal Nerve, 173, 174.
Of the Nerve of the Diaphragma, 174, 175.
Of the ninth pair, 177
Of the Nerves ariſing from the ſpinal marrow 178
Of the boſoms in the ſpine. 181

W.

Water, *Of making water, ſee Urines,*

THE THIRD
INDEX or TABLE,
WHEREIN IS
Alphabetically digested all the principal matters contained in the Treatise of Convulsive Diseases.

A.

Amulets, *For the Epilepsie*, 23
Apozems, *For the Epilepsie*, 24
Diuretick Apozems in a Feaver, 58
Asthmah. *Convulsive*, 102, 103.
Of a Convulsive Asthmah, by reason of the Bronchia being affected, 104
Histories of such an Asthmah, 105, 106.
Anatomical observations on the same, ibid.
The Cure of it, 106

B.

Blood, *The Blood not the immediate cause of the Convulsive motion*, 5
The Blood the cause of the morbific matter of spasms, 6
Why the Blood is soon congealed in Convulsions, 39
Brain, *The Convulsive Copula proceeds immediately from the Brain*, 5
The Brain the cane of the Morbific matter of Convulsions by receiving it from the blood, 6
The evil disposition of the Brain two-fold, ibid.
The Brain the cause of the Hysterical passion, 78
Breast, *Why men beat their Breast in the fits of the Epilepsie*, 18
Bronchia, *The Bronchia being affected, the cause of a Convulsive Asthmah*, 104

C.

Chalybiats, *See Steel Medicines*,
Children, *Of Convulsions in Children*, 25
Children very liable to Convulsions, 26
The causes of them, 26, 27.
Why they follow upon their breeding of teeth, 28
How to cure the Convulsions of Children, 29
How to preserve Children from them, ibid.
How to Cure the Convulsion in Children coming of breeding of teeth, 30
Of other sorts of Convulsions in Children, 30
How to Cure them, ibid.
Children are subject to a Convulsive Cough, 102
The reason of it, 103
Convulsions, *Of Convulsive motions in general*, 1
What they are, ibid.
The conjunct cause of Convulsions, 3

EXERCITATION
OF THE
OPERATIONS
OF
MEDICINES
IN
Humane Bodies.

SHEWING
The Signs, Causes, and Cures of most Distempers incident thereunto.

In Two PARTS.
With 14 copper cuts:

AS ALSO
A Treatise of the SCURVY, and the several sorts thereof, with their Symptoms, Causes, and Cure.

By *Tho. Willis* M. D. and *Sidley* Professor in the University of *Oxford*: Also one of the College of Physicians in *London*, and Fellow of the Royal Society.

Licensed, October 31. 1678. R. L'Estrange.

LONDON,
Printed for *Thomas Dring* at the Harrow, *Charles Harper* at the Flower *de Luce*, and *John Leigh* at the Bell in *Fleetstreet*. 1679.

THE PREFACE TO THE READER.

WE have obſerved that it hath been of exceeding great Benefit to many other Arts and Sciences, that Experiments and Obſervations either by chance or on ſet purpoſe being found out, that preſently the Ætiology or the reaſons thereof, as much as may be, ſhould be ſet down, which thing we have much deſired in Phyſick, which may be juſtly placed amongſt the nobleſt of the Sciences. In Mathematicks and Mechanicks experience and practice did firſt aſſiſt the Theory, then this ſhewing the cauſes of things and the means of their effecting, hath not only adorned, but very much increaſed and illuſtrated the practice. But the Medicinal Art, although at firſt known to Empiricks, and taken up by quacking Jugglers and old women, as if it were a Myſtery into whoſe Reaſons it were not lawful to ſearch, has remained hitherto unexplicated: Wherefore the unlearned, and

indeed ſometimes the learned at this time give Medicines (like People ſhooting at random) raſhly and almoſt fortuitouſly; being uncertain whither they will tend, or what end or effects they ſhall have. From hence it is, that not only ſome learned Cynicks, but the vileſt of the ſcum of the people bark againſt and fling dirt upon Phyſick. And truly I know not how ſhe will be wholly excuſed from being called a Lyar, Vain and Jugler, ſo long as yet the reaſons of curing by medicine, on which the life and health of Man much depends, and oftentimes by which 'tis no leſs indangered, lye hid. But this Doctrine of Medicinal Operations either neglected or ignored, ſhewing like a great Chaſm, hath been the only, or at leaſt the greateſt impediment that Phyſick is not come to its perfection, and its whole Syſtem rightly framed: For though the matter of Medicine gotten from each family of the Vegetables, Minerals, and Animals, ſeems ſufficiently digeſted and compleated, and that the Types and Natures of all Diſeaſes being collected by moſt accurate Obſervations, are explicated by innumerable Authors, and beſides that the humane Body as it were a martial Field, where thoſe Champions try their Skill, be exactly deſcribed as to all its parts by Anatomiſts, yet what is of greateſt moment, and without which the aforeſaid things ſignifie little, is not yet ſufficiently and clearly detected, to wit, what the weapons of thoſe Champions are, what Furniture, what Force and reſiſtance they have, alſo what Action, Paſſion, and Reaction may be between the Particles of the Medicine and the Spirits, Humors, and ſolid parts. But ſince almoſt the whole buſineſs of this Pharmaceutick Drame is acted behind the Curtain, therefore the various congreſſions of Particles, Fermentations, Impulſes, and other

other diverſities of motions, which performed within ly hid from the Senſes, are to be ſearched out by a more deep Scrutiny of the Intellect, which if it may be at laſt performed, there is nothing more will be deſired, whereby Phyſick being perfected in all its parts, may grow to a true Science and be practiſed with greater certainty not inferior to the Mathematicks. For ſo the Empirical remedies left us by the Antients would not be adminiſtred promiſcuouſly and amiſs (as is wont now by medicaſters) in every ſtate of the Diſeaſe or caſe of the Sick, but opportunely and always according to the moſt apt intentions of healing. Beſides, new and more efficacious Medicines (as often as ſome great and unuſual Diſeaſes require them,) may be eaſily and ſafely found out, without any error of the Phyſician or danger of the Patient. For whilſt it clearly appears what kind of Particles in the Patient are either to be altered or ſtirred up into motion, and what are required in the Agent for that work, it will be no difficult thing aptly to deſign this, and rightly to accommodate one to the other. But the buſineſs is far otherwiſe performed by thoſe Pſeudochymiſts with notable danger and abuſe of the humane Body, who not contented with the uſe of received and approved remedies, bragg that they have framed in their Furnaces no leſs than a great Elixir, a certain Panacea, or an univerſal Medicine, whilſt in the mean time they unskilfully meddle with Minerals, expecting a certain uncertain event rather than deſigning any thing ſeriouſly; If perchance there ſhould appear an unuſual product with this new Medicine (the virtues of which are alltogether unknown, or are none, or poyſonous) they promiſe themſelves preſently to cure all

Diſeaſes

Diſeaſes, and give it boldly in every caſe to the great hurt, and not ſeldom to the Diſtruction of the Sick; ſo ſecurely and raſhly are theſe Executioners wont to ſport with mans Life, whilſt they are led to the preparing or adminiſtring theſe Medicines (in which always lurks ſome venemous Sting) without any counſel or direction of Method, but by mere chance and with a certain blind undertaking.

Therefore it is highly to be wiſhed, both for the Dignity and Augmentation of Medicine, and for the Cure and ſafety of mans Health, that the Energies and manner, as to the nature of each, and as it were the mechanical means of the working of Medicines in our Bodies might be laid open. For if it ſhall be plainly known by what means Medicines being taken do preſently exerciſe their powers in the firſt Paſſages, and from thence by and by diffuſe them thorow the whole Body, and what alteration they receive in each Region, and what they do or perform upon the Spirits or Blood, and Humors or ſolid Parts, then indeed Evacuation may be much more ſafely and certainly uſed, and with greater Benefit to the Sick.

But if having boldly aſſaulted this Province, to wit, the ſhewing a reaſon of the pharmaceutical Operation before untouched, I ſhall not ſufficiently perform my work, I do however deſerve Pardon becauſe I am forced to travel thorow not only an unknown Cuntry, but alſo one that is uneven and as it were a Labyrinth; and if perhaps going thorow this tract I have not yet ſufficiently found out all the more ſecret Receſſes, and every more intimate Corner, and what is acted in them; yet I ſuppoſe that I have made way for others, who may have a mind

more

more accuratly to find them out.

For truly if these two things which I have followed in the whole Disquisition should be exactly known, *viz.* By what means Medicines or their Particles affect the Animal Spirits in every place, also by what and how many ways they Ferment the Blood and Humours, from thence a Path would lead to the unfolding the Reasons of every Evacuation. For the better laying open of the ways of the whole curing by Medicines, we have taken care to have accurately discribed the Ventricle and Intestines, even to all the Membranes and Fibres of them, in which the Animal Spirits dwell, and where they are first of all affected by the Particles of the Medicine. For although the Substances, Figures, Cavities, Sites and Connexions of these are long since sufficiently enough delineated, yet we have manifested most clearly without any example or following of any other Authors, the Nervous and Musculary and Glandulous Membranes of each of them, and some Fibres meerly sensible, and others motional, as also the thick set enfoldings of the sanguiferous Vessels, and innumerable Glandulas incrusting the Back of the interior Coat from the Mouth even to the Anum, this making very much for the illustrateing the pharmaceutical Doctrin: concerning which Anatomical Inventions I must acknowledg my self to be beholden (as formerly to some others so now again) to the Industry and sedulous Pains of the Learned Doctor *King*; and also my Friend Doctor *Masters* hath set to his helping Hand, in the finishing of this Task.

At the begining of this Work I did design to handle the whole Pharmacie and to weigh the reasons

of

of all or at leaſt its chief Operations: But whilſt this work was under my Hands it grew into ſo great a Bulk through the Fertility of the ſubject, that I was forc'd to break off long before the end, and to finiſh it before I had half done. For beſides the univerſal Medicines whoſe Energies and manner of working we have already deſcribed, there are other remedies (commonly called Specifick and Appropiate) which belong to this Speculation; to wit, which are given to cure either ſome peculiar Diſeaſes, or which are ſaid to reſpect ſome Region or part of the Body. Of ſome of theſe and eſpecially of Medicines proper for the Breaſt I had begun ſome Meditations. But when I conſider that I muſt Sail in a dangerous Sea, every where full of Rocks of Cenſures and Contumelies. I think it no Wiſdom to venture my whole Cargo at once in this weak Bottom, but firſt of all with theſe few to try my Fortune, which if it be proſperous, I may perhaps be leſs affraid to expoſe the reſt of this Nature hereafter.

The

THE TABLE TO THE First Part.

Page.

A.

ABdomen *sometimes the Cause of simpathick Vomiting.* 23
Affections spasmodick often precede the Diabetes. 82
Air how it affects the Blood and Spirits. 107
Ale and Wine medicated 54
To Corroborate the Spirits. 109

Antimony Diaphoretick, its preparation and reason of it 101
The Ceruse of Antimony how made. ib.
Apozems diuretical. 74
To allay the great heat of the Blood. 122
Preservatory Apozems. 123
Armoniack { *Flowers how made.* 101 / *Spirit how made.* 102
Art medicinal, its beginning, increase, and progress. 1
Arteries carry the fermental humour. 11

Page.

How the Arteries are endued with moving Fibers. 126
An anatomical description of an Artery. 133
The Coats of an Artery according to Gallen. ib.
The preparation of its Anatomy. ib.
Four Coats of an Artery. ib.
The description and use of the four Coats of the Arteries. 134
To what end the net-like-form of those Vessels is. ib.
The use of the glandulous Coat of an Artery. ib.
The foldings of the Vessels in an Artery different from the other Viscera, *and the reason of it.* ib.
The use of the inward Coat of the Artery. ib.
Aurum Vitæ *how prepared.* 35

B.

Bezoartick Minerale, its preparation and the reason of it. 100
Blasts sometimes the cause, sometimes the effects of the extension of the Viscera. 42
Bloody flux, see Dysentery.
Blood. The operation of Purging Medicines, how performed on the Blood. 46,47
The analogy between Blood and Milk. 68,70
Of its coagulation, inhibition, and retention of it from coagulation. 70
What alterations chymical Liquors produce, being poured upon warm Blood. ib.
That the Blood may rightly put away the serum, *it ought to be preserved or reduced from being too thick or from too much fusion or being too thin.* ib.
Of the separation of the serum *from the Blood.* ib.
What is requisite in the too strict joynting of the Blood. 71
And what in the too lax. ib.
The Blood chiefly the cause of the Diabetes. 80
The too strict joynting of the Blood the cause of the suppression of Urine. 81
Medicines to thicken the Blood. 86
For reducing and fixing the Blood. ib.
The Blood made more rapid in Sweating. 90

The Table.

Page.

The dyscrasie of the Blood a cause of Sweating. 91
How Spirits of Blood are gotten. 102
How the Blood and Spirits are affected by the Air. 107
How the Blood offends when too little enkindled, and when too much. 155
How the Blood is to be helped when too strict, or too loose in its joynting or composition. 116
How the Blood is to be defended from putrefaction. ib.
How its accension is to be increased. 121
How to allay its too great enkindling. 122
The Blood not infected by Opiats. 138
Bolus *purging.* 53
Diaphoretical. 97,99
To cause Sleep. 153
Bovius *his* Hercules. 35
His Epicine Menstruum. 36
Bowels sometimes the cause of sympathick Vomiting. 23
Box, Spirits and Extracts of Box how made. 103

C.

Cardiack { *Medicines,* see Cordials. / *Passions and their Remedies.* 124
Cathartick how different from vomiting Medicines. 25
How Cathartick bring away the Contents of the Viscera. 44
How Cathartick work in a liquid, and how in a solid form. ib.
And how now on these parts, and now on those. ib.
That their action is within the Ventricle. 45
How they operate in the Duodenum *and small Guts.* ib.
How on the Bilary and Pancreatick Pore. 46
How on the Glandula's *and mouths of the Arteries.* ib.
How on the Blood, nervous Juice, and the solid parts. ib.
Three degrees of Cathartick operation. 47
Cathartick operate not by attraction or election. ib.
The difference and reason of their operation. 47,48
A double faculty of Cathartick. 50
By what elementary Particles they depend. ib.
From what their irritative faculty proceeds. ib.
The Cathartick force of a Medicine from Sulphur. ib.
How the more strong Cathartick work. ib.
The forms of Cathartick. 51
Scarce any Cathartick to be had out of Minerals. ib.
The reason of it. ib.
Cathartick numbred. 51,52

A particular Disease of Sweating, and an history of it. 110
Sweat, the English Sweat, a disease. 111
The description of it out of Senertus *and* Polidor Virgil. ib.
The History of it, and the method of its Cure. ib.
The reason of the Disease. ib.

Page.

The Cause of it. 112
The reason of its Symptoms. ib.
Why being cured they are apt to relapse into this Disease. 113
Syrup { *Of red Poppy the dose.* 153 / *Against the trembling of the Heart.* 131

T.

Tables describing the Figures. 16,17
Tablets { *Or Morsels purging.* 54 / *against the trembling of the heart.* 131
Tartar *its tincture how made, and the ætiology of it.* 78
Spirit of Tartar *how got, and the reason of its preparation.* 104
Tinctures purging extracted by Salt of Tartar. 52
Diuretical Tinctures. 74
Tinctures of Tartar. 78
Tinctures to fix the Blood. 86,87
Diaphoretical Tinctures. 97
To stop Sweating. 106
To corroborate the Spirits. 109
Against the passion of the Heart. 128
Tobacco a Narcotick. 152
The effect of the taking it and the Reasons. ib.
Tunicle fleshy what Contractions it follows. 9
Turbith mineral how prepared, and the reason of the preparation. 34
Tympany how first arising. 7

V.

Vapours affect not the Heart. 131
Vegetables yield divers kinds of Purgers. 51
Which want little chymical preparation. 52
Veins receive the nutritious Juice. 11
Ventricle described. 6,16
Three Coats in the Ventricle. ib.
The use of its hairy Crust. ib.
Of its glandulous Coat. ib.
Of its nervous Coat and its Office. 7
Of its affections as to motion. ib.
Of its folds and wrincles and of their use. ib.
Of its fleshy Coat and the orders of the motional Fibres therein. ib.
Of the outward Coat of the Ventricle. 9
Of its nerves and nervous foldings. 10
Of the Vessels belonging to the Ventricle. ib.
And of their Nerves. ib.
The use of them. 11
How the Ventricle is affected in Vomiting. 19
An instance of it. 23
How mercurial Medicines operate in the Ventricle 34.
How the Palsie of the Ventricle is to be cured 39
How the Contents of the Ventricle are carried forth by Purgers. 41
What the action of Purging Medicines is within the Ventricle. 45

Whence

Page.

Whence the change of motions within the Ventricle proceeds. ib.

Vessels { *Belonging to the Inteſtines.* / *And their Uſe.* } 14

Belonging to the Ventricle. 10

Viſcera *extended by blaſts and ſometimes cauſe them.* 42

Vitriolated Emeticks. 29

Vomiting and Vomitory Medicines. 19

How the Ventricle and the Oeſophagus *is affected in Vomiting.* ib.

How Vomiting differs from other Convulſions. 20

The conjunct Cauſe of Vomiting. ib.

The more remote Cauſes of it. 21

Vomiting either Idiopatick or Sympatick. ib.

Of the Sympathick or by Conſent. 22

By what parts it is ſtirred up. ib.

Vomiting from the Pylorus. ib.

From the mouth of the Ventricle being affected. 23

The ſympathick Cauſe of Vomiting in the Oeſophagus. ib.

Sometimes in the Bowels and Head. ib.

And in the remote parts of the Abdomen. ib.

How Vomitory Medicines differ from Cathartick. 24

How Vomitory Medicines operate in the Ventricle. 25

How they affect it, and what ſort of matter is caſt forth by Vomitory Medicines, ib.

The manner of the working of Vomits deſcribed. ib.

Wherefore Vomiting is eaſily quieted. 26

Why Vomits work in ſome ſooner or preſently. ib.

How they work in ſolid forms. ib.

Why they operate not alike in every doſe. ib.

They are not endued with a ſpecifick Salt. ib.

How Vomits work not on peculiar Humors. 27

How that vulgar Error aroſe. ib.

Vomiting more Efficacious but more dangerous than other Evacuations. 27,28

The indications of Vomiting Medicines to whom permitted and to whom prohibited. 28

Vomits diſtinguiſhed. ib.

Several preſcriptions of Vomits. 29

And the reaſons of their preparation. 30,31,32, 33,34

How antimonial and mercurial Vomitories operate in the Body. 32

Medicines to ſtop Vomiting. 36

The reaſon of immoderate Vomiting. ib.

Its Cure. 37

Vomiting Critick or Symptomatick. ib.

The method to be uſed in Vomiting when the Stomach is primarily affected. ib.

Y*Awning how performed.* 8

The TABLE to the Second PART.

Page.

A.

ABdomen *directs the motion of the* Diaphragma. 12
Air, of the influence of the Air for exciting a Consumption. 34
Why the grosser or City Air is helpful to some Consumptive persons and not to others. ib.
A sulphurous Air helpful to some Consumptives. ib.
Anasarca, *the description of an* Anasarca. 123
How it differs from an Ascites. ib.
The Original from the Blood. ib.
The material & the efficient causes of an Anasarca. ib.
How the Blood is a cause. 124,125,126
The material cause of an Anasarca *is partly the* Serum *of the blood & partly the nutritious juice.* 126
Why the hydropick humor of an Anasarca *is limpid, and not milky or bloody.* 127
The differences of this disease. ib.
The prognosticks of it. ib.
The Cure of it by two indications. ib.
The intentions of Cure. 127,128
How purgers work upon the humor of an Anasarca. 128
Forms of medicines to be taken in an Anasarca. 129,130,131,132
An example of Cure of this disease. 132
Anodines useful in a Pleurisie. 71,72
Apozems *against spitting of Blood.* 54
Against the inflammation of the Lungs. 64
Against a Pleurisie. 71
Against an Asthma. 86
Against the Jaundies. 98
Against a Tympany. 121
Against the Itch. 170
Arteries, of the asper *Artery.* 3
Of the pneumonick Artery. 6
Its description and use. ib.
The matter of a Consumption brought to the Lungs by the pneumonick Artery. 30
The tracheal Artery a cause of spitting blood. 51
Ascites, *of an* Ascites. 105
See Dropsie.
Asper *Artery what it is.* 3
Asthma *a terrible disease.* 82
The evident cause of it. 83
Why asthmatical persons are worse in bed. ib.
Where the morbifick matter of an Asthma *lyes.* ib.
Of a mixt Asthma *partly pneumonick, partly convulsive.* 84
The causes of an Asthma *recited.* ib.
The prognosticks of this disease. ib.
The chief indications & what is to be done in the fit. 85
Forms of Remedies for this disease. 86,87
Two histories of this disease. 88,89
Atrophy in a Consumption depends on the Blood made unfit to nourish. 26
And sometimes proceed from the fault of the bowels. 27
Or else from the nervous Juice. ib.

Page.

The nervous Juice of it self sometimes the chief cause of an Atrophy. ib.
Two chief kinds of Atrophys. 28
Too great expence of Seed induces an Atrophy. ib.

B.

BAlsams *good against a Cough.* 38
Belly, by how many causes the Belly swells. 115
Why the Belly swells in the Dead. 116
Blood, the disposition of the blood in pneumonick veins. 8
The impediments of the Blood in the Lungs. 18,19
The opinion of Sylvius *of the fermenting of the Blood in the Lungs.* 18
Dr. Willis *his opinion of the same.* ib.
The cause of the pneumonick stopping of the blood. 18,19
The reasons of the impediments of the Blood. 19
Why it lodges its Serum *in the Lungs.* ib.
The various cause and ways of doing it. ib.
The blood lodged in the lungs causes infection there. 20
The Blood hindred in the Lungs by reason of its too thick consistance. ib.
Several other impediments of the Blood in the Lungs. 20,21
Want or default of Air an impediment of the blood. 22
The kinds of the consumptive discrasie of the blood. 27
It proceeds sometimes from the fault of the bowels. ib.
The fault of the Blood sometimes the cause of a Consumption and how. 32
What affection of the blood produces an inflammation of the Lungs. 60
The Blood not rightly sanguifying the cause of an Anasarca. 113
The reason of it. 114
The hydropick temper of the Blood springs from a double respect. ib.
What they are. 115
Blood flowing from several parts, see Hæmorrhages.
The Remedies to stop Blood. 143 see Hæmorrhages.
Spitting of Blood, see Spitting.
Blood-letting, see Phlebotomy.
How letting forth the Blood alters it. 137
Bolus *good against the Jaundies.* 98
Breast, a disease of the Breast, see Empyema.
Of the Dropsie of the Breast, see Dropsie.
The chief disease of the Breast is a Consumption or Phthisis. 26
What the consumptive diseases of the Breast are. 34
Breathing, the Organs of breathing and their use. 1
Of the Muscles serving thereto. 10,11
Wherefore the triangular Muscle being small in a Man is stretched through the whole Bone in a Dog. 12
Of what kind the actions of Breathing are. 13
That they are of a mixt Action. ib.
Of the sundry kinds of Breathing hurt, their causes and the account of their Symptoms. 17
Breathing hurt by means of the Organs. ib.
The use and ends of Breathing. ib.

Breathing

Breathing hurt by the fault of the Air. 22
Which proceeds from the pneumonick Organs. 23
Various obstructions of Breathing. ib.
Bronchia, *Of the* Bronchia. 5
Of their Sistoly and Diastoly. ib.
Of the Lobes of the Bronchia. ib.
Of the little branches of the Bronchia *dispersed and dissoyned the one from the other, and the use of the said Frame.* ib.
Of the uses of the bladdery Cells of the Bronchia. 6
Of their musculary Fibres. ib.
How the Bronchial Pipes are filled. 21
How they are stopped with Concretions. ib.
After what manner the straitness of the Bronchia *arises.* 82
The straitness of the Bronchia *the cause of the* Asthma *according to the opinion of the Ancients.* ib.

C.

Cantharides how they excite blysters and draw forth water. 151
Cardiacks useful in a Pleurisie. 71
Catarh obstructs breathing. 23
Cathartick against the Jaundies. 38
Clysters against the inflammation of the Lungs. 65
Against an Ascites. 112
Consumption, see Phthisis.
Of the Consumption of the back or Tabes dorsalis. 28
The cause of it. ib.
Of the Consumption of the Lungs. 29
Whence the consumptive matter is, and how it enters into the Lungs. 30
Why the Consumptive matter hurts the lungs by degrees. 31
Evident Causes of a Consumption. 32
The primary cause from the Blood, nervous Juice, or the default of the Lymphaducts. ib.
And sometimes from transpiration being hindred. 33
Several other reasons of a Consumption of the lungs. ib.
What an hereditary disposition to such a Consumption is. ib.
In what it consists and what the Consumptive diseases of the Breast are. 34
How the Air excites a Consumption. ib.
Why gross Air is helpful to some consumptive Persons and not to others. ib.
When a Cough induces and when it becomes a confirm'd Consumption. 36
Of a beginning Consumption. 42,43
Forms of Remedies for a Consumption. 44,45
Of a confirmed Consumption. 46
The reason of it. ib.
Forms of Remedies against it. 46,47
An history of a Consumption. 47
Cordials useful against the Jaundies their Forms. 101
Against a Tympany. 122
Cosmeticks or medicines for the Skin several forms of them. 164,165
A mercurial Cosmetick and its use. 165
Cough described. 24
The formal reason & manner of its being done. 24,25
The kinds of Coughs. 25
Of a moist Cough. ib.
Of a dry Cough. ib.
A Cough sometimes healthful in a Consumption and sometimes dangerous. 31
The three times or distinct state of a Cough. 35
When new, there is no suspition of a Consumption. ib.
When it begins to induce a Consumption. 36
When it becomes a confirmed Consumption. ib.
The method of curing a Cough. ib.
Three Indications thereof. 36,37
Forms of Medicines most in use. 37,38
Of the Convulsive or Chin-cough of Children. 40
The reason thereof. ib.
The causes and the prognosticks of the disease. ib.
The Empirical Cure thereof. ib.
The rational Cure thereof. 41
Of a consumptive Cough. 42
Three Indications of its Cure. ib.
An history of an hooping Cough. 48
Cupping Glasses used in a Pleurisie. 70
Cuticula, *the description of the* Cuticula. 161

THE

Part I.

THE FIRST PART OF Pharmaceutice Rationalis, OR OF THE OPERATIONS OF MEDICINES IN Humane Bodies.

SECT. I.

CHAP. I.

The Design of the whole WORK.

THE Art of Medicine from the first Invention thereof to the time of *Hippocrates* was merely Empirical, as may be found by those who consult the Annalls. For that as several men made tryal of several remedies, if they found any by Experience to be helpful in any Disease, the same was made use of to others also in the like Case. Wherefore, as *Herodotus* tells us, the antient Egyptians did not carry their sick to the Physitian, but set them in the streets and high-ways that they might consult the Passengers for Cure of their Diseases. And so, both the Priests of these and of the Greeks, taking notice by what remedy every one was healed, committing it to writing, they laid up careful in their Temples their observations, that they might on occasion be communicated to other sick people. After this, the Heap of observations dayly increasing, Ἰατρικὴ Physick began to be reduced into precepts and

The beginning of the medicinal Art.

Its increase and progress.

Part 1.

method, and upon this double hinge, almoſt all the whole buſineſs turn'd, to wit that the matter of Medicine with all its furniture, might be aptly diſpenſed, and in ſeveral forms of preſcriptions, and alſo that the *Indicationes Therapeuticæ*, or the ſetting forth of the method of Curing, with the uſe of the medicinal Houſholdſtuff, might be rightly made known. If any one were very skilful in theſe two parts, he was thought to bear away the Bell in the Medicinal part of Phyſick. But truly in this matter, and in the practice of Phyſick we may deſervedly place among the things that are to be deſired, what hath as yet been unfolded by no body, by what order, and by what affection of the parts of the humane Body, Medicines being taken inwardly, or outwardly applyed, do perform their operations, to wit, how and why this vomits that purges, others ſweat, or move to ſome alteration, or operation of ſome other kind; what affinity there is of the parts and particulars in the agent, and patient, or diſſimilitude, pulſion, impulſion, and reaction: and then with what ſtrugling and fermentation they are agitated, when mix'd together, and by what Workmanſhip or Energie they produce their effects. The vulgar Solution of theſe was wont to be, that Medicines did work by certain ſpecifick Virtues, and did exerciſe their peculiar Powers, which thing truly is no more than to explicate the ſame thing by the ſame thing, as if they ſhould ſay that ſome things are Vomits, becauſe they are indued with the faculty of provoking us to vomit. Therefore for as much as this Therapeutic ſpeculation has been almoſt left hitherto untouch'd by Phyſitians, it will ſeem worth the while to enquire into the reaſon as it were mechanically, which way Medicaments of every kind do exerciſe their force in our Bodies, to wit, that at our pleaſures theſe do ſtir up the motion of avoyding the excrements in the Bowels or ſtop it, theſe excite the effervescencie of the Blood and Humours, or reſtrain them, and moreover by what peculiar reſpect they are able to yield comfort, as it were Tribute, to the wants of every part or member, or to irregular parts. Here, although it is not much to the purpoſe in what order the *Species* of Medicines are recited, yet for methods ſake it ſeems good to me firſt of all to ſhew ſome general reaſons of them, and in the next place to reduce them into *Claſſes*. Therefore as to the operations of medicines we ought chiefly to diſtinguiſh the places in which the virtues or their Energies do firſt and chiefly ſhew themſelves, which commonly are wont to be divided into three Regions: *viz.* Firſt, into the firſt paſſages, in which chiefly are comprehended the Ventricle, Inteſtines, the Pipe of the Gall, and Pancreas, and alſo the Mouths of the Meſeraick Veſſels. Secondly the Maſs of Blood and all its Sanguineous Appendices, to wit, the *Præcordia*, the Liver, the Spleen *&c.* Thirdly, the Brain, and all the Syſtem of the Nerves, with the Members and the habit of the Body. Beſides theſe diſtinct Spheres of Activity, of which ſometimes theſe or thoſe apart from the reſt, ſometimes more, or all together are reach'd by Medicine. In the ſecond place likewiſe we ought to conſider the immediate Subjects on which Medicaments do operate, and thoſe are not doubtleſs the ſolid Parts, but are either the animal Spirits, or the Humours; nevertheleſs they alſo by the means of theſe are ſometimes affected. Medicines inwardly taken, do act either immediately upon the animal Spirits, thoſe which reſide in the Fibres of the *Oeſophagus*, of the Ventricle, of the Inteſtines, and in the firſt paſſages of other leading Pipes; or by means of the Blood upon thoſe which do inhabit the Brain, and the nervous or membranous Fibres of more diſtant parts. When the Virtue of the Medicines touch them, whether theſe parts or thoſe, they ſtir them up either by irrirating them into an extruding motion, or by comforting them make them expand themſelves more largely, and as it were rejoyce, or by aſſwaging qualifie their Diſorders, and take away their Pains, or laſtly by ſcattering them, they lull their Furie aſleep. The Humours in which Medicines inwardly taken do impreſs their force, are both the Ferments, and Obliniments of the Ventricle and Inteſtines, The Blood with the nouriſhing *Succus*, and droſs, *viz.* the *Serum* or Whey, either *Bilis*, the Pancreatick Juice the wateriſh Humour; and alſo the nervous Liquor: upon which ſometimes ſingly, and ſometimes together, Medicines do diverſely operate, in as much as they fling them down and deſtroy them, or reduce them from that ſtate: Sometimes they ſtir them up when ſloathful, or if too much boyling, they allay and gently aſſwage them, or laſtly they alter them being enormant in Quality, Conſiſtencie, Temperament and other Accidents, and ſenſibly reſtore them to their genuine Conſtitution.

The ſhewing the reaſons of medicinal Operations deſired.

The Reaſon of theſe things enquired into mechanically.

The Places of the operations of Medicines in the firſt place noted.

The Subjects of them the Spirits and the Humours.

After what manner Medicines do work upon the Spirits.

The Spices of the Humours recited.

After what manner Medicines act upon them.

Part I.

Conſtitution. When therefore there are ſo many and ſo various Conſiderations about the Operations of Medicines, the thread of our method leads to the places in which their forces do firſt and moſt chiefly appear; and in that reſpect we will begin with Catharticks, both Vomitory and Purging: Then we will handle next Diuretick Medicaments, Diaphoretick, and Cordials: and laſtly we will ſpeak of Opiats and Specificks, as they are vulgarly called, that is, of Medicines reſpecting, either the defects, or inequalities of the inward parts of each particular Member. In the handling of each of theſe, we ſhall obſerve theſe three things *viz.* Firſt, We will ſhew in every kind of Evacuation the means whereby Medicines do operate and affect, either the Spirits, or the Humours of humane Bodies, or both of them, and with them alſo the ſolid parts. Secondly, We will take notice of all the Kinds of every Claſs of Medicines, or at leaſt the chief of them, together with the more ſelect forms of Preſcriptions. Thirdly we will deſcribe the Chymical Remedies of the firſt rank which belong to each, and the Reaſons of them, that is, the Variations of Changes and Accidents which happen in their preparations, as alſo we will add the reaſons of their Virtues and Effects, which appear in them when they are prepared. In the fourth place there may be ſuperadded to theſe another Exercitation in the medicinal part of Phyſick, to wit, that other more elegant, and more profitable proviſions of theſe kind of Medicines, the reaſons of Chymical preparations being rightly weighed, may be found out. But we will reſerve this Inſtitution for ſome other time becauſe it contains Secrets eaſily violated by thoſe raſh Quack-ſalvers, who not without danger to the ſick make experiments dayly of every medicinal Precept they find written, without any Controul. But that which is next to be done is that we deſcribe, briefly and accurately the firſt Paſſages, vulgarly ſo called, in humane Bodies: *viz.* In which Medicines do firſt of all begin to operate, and are as it were the ſtage of every medicinal Action.

The deſigned method of this Tract.

Three things to be conſidered in every Evacuation.

CHAP. II.

The Deſcription, Uſe, and Affections of the Parts among which Medicines begin to work.

SInce that Medicines are carried by the ſame ways into the humane Body as Food, and are born every where throw the ſame Pipes, it will be therefore of uſe, for the right underſtanding the means how it is done, as well for the reaſons of the Chyle as of the Evacuation, that we deliniate a certain Scene of the Parts and Inwards, in which either of theſe do act their Comedie. But to do this fully and amply in all its proportions, were to exhibite the Anatomie of the whole humane Body. Wherefore we will only deliniate briefly thoſe parts, into which Medicines are received, and where they begin to operate. Theſe are then the *Oeſophagus* or mouth of the Stomach, the Ventricle, and the Inteſtines with their appendices, in which not only Vomits and Purges, but alſo Cordials, Opiates, Diaphoreticks, yea and all other kind of Medicines, do firſt of all manifeſt their Virtues, and are determined to ſhew their Energies. We will not therefore give you a perfect deſcription of theſe (which hath already been done accurately by other Anatomiſts,) but only brief Commentaries, which may ſerve to illuſtrate the buſineſs of Evacuation. Since then all Medicines more immediatly act upon the Spirits, or the humours, or on both together, and that the Subjects of them are the Fibres, Membranes, Veſſells, and leading Pipes, we will particulary declare how theſe abide in the aforeſaid Inwards, and how they are wont to affect.

The firſt paſſages. viz. *The Mouth of the Stomach, Ventricle, and Inteſtines, are the Stage of every medicinal operation.*

The Spirits, and the Humours, the immediat ſubjects of Medicines.

The mediat are the Fibres, membranes, veſſels and leading Pipes.

The *Oeſophagus*, according to the opinion of all Men, and common Obſervation, conſiſts of three Coats. The interior of theſe hath as it were a certain Covering on its innermoſt Superficies, conſiſting in Fibres, as it were very ſmall Hairs which covers its hollowneſs all over as it were with a certain Down; the reſt of the ſubſtance of this Coat, is altogether nervous, endued with Fibres of various kinds, and diverſely interwoven, like to the interior Coat of the Ventricle and Inteſtines

The Oeſophgus *conſiſts of three Coats.*

The more inward Coat full of Nerves, and covered with a hairy Cruſt.

Part I.

ſtines. Moreover this Membrane is continued to that which covers the Palate, Mouth, Jawes, and Lips: and alſo deſcending down even to the Ventricle, compaſſeth about its Mouth, and covers it round below on the inſide of the Mouth, for the ſpace of three Fingers breadth. This extreme part, within the Orifice of the Stomach, of this Nervous Coat, which is ſomewhat thick, and hairy, appears very diſtinctly from the more inward Coat of the Ventricle which it covers; which by a ſmall Elixation may be more fully diſcerned; for then that Coat coming down from the Throat, appears wonderfully white, and otherwiſe, and more inward than that of the Stomach. This part without doubt ſerves chiefly to make the ſenſe exquiſite. Hence therefore grateful things being eaten, and ſwallowed down, a grateful affection of pleaſure accompanies them even to the entrance of the Ventricle: ſo alſo from ingrateful things eaten, or thought upon by an irritation here made, there oftentimes follows Nauſeouſneſs and Vomitings. Moreover the deep letting in of this Coat into the Ventricle makes that intimate and quick intercourſe between the Stomach and the Throat; ſo that if either part be provoked to Vomiting, preſently the other is led by conſent: and ſince the ſame Coat cloaths alſo other parts of the Mouth and Palate, theſe in like manner by a natural conſent are affected in Vomiting.

Covers for ſome ſpace and enters into the Mouth of the Ventricle.

And makes the ſenſe of the laſt in the whole throat and Mouth of the Ventricle.

2. The next Coat of the Throat is ſomewhat fleſhy and thick, as if it were a pierced Muſcle. *Hofmannus* indeed aſſerts it to be a Muſcle and to be obnoxious to the Palſie and to Convulſions. The fleſhie Fibres of this Coat were commonly thought round and tranſverſe: but *Clar. Stenon* hath obſerved them to be ſpiral and of a double order, which mutually ſtrike between one another, and are formed like two Cockles put oppoſite one to another. Upon theſe, as much as I have been able to collect by my own obſervation, the whole *Oeſophagus* ſeems to be compoſed of two Muſcles knit together, which make four parallel Lines with the Oppoſite Fibres, and cutting one another acroſs. This plainly may be perceived, if this middle Coat of the Throat be taken off from the reſt, and the extreme parts being tyed, it be diſtended by inflation, and ſometimes immerg'd in ſeething Water, that the Fibres may be contracted and ſwell, for ſo there will be diſcerned two ſeries of deſcending Fibres with their Tendons. Then if this Coat be turnd on the other ſide, and be likewiſe blown up, the oppoſite orders of the aſcending Fibres will appear to your ſight. Laſtly, if the Coat be cut in two in the middle by the long Tendon, and folded out plain, there will appear two parallel Lines on one ſuperficies, and as many oppoſite upon the other.

The ſecond Coat of the Oeſophagus *or middlemoſt being fleſhy ſerves for motion.*

Two oppoſite orders of the moving Fibres.

3. The third and outmoſt Coat of the *Oeſophagus* which is common to that and to the Ventricle, ariſing from the *Diaphragma* or Midriff (to which it is united as it paſſes throw the Hole of it,) is moſt ſmall and is indued with membranous Fibres only, and they very ſmall.

The third or outmoſt Tunick of the Oeſophagus.

As to the uſe and office of theſe parts, we ſay in General that the inmoſt Coat ſerves chiefly for the ſenſe, the middlemoſt for the office of Motion, and the third that it might be as a covering for the whole: But becauſe theſe are the firſt paſſages, or porch to Evacuation, it will be worth our pains that we inquire a little more largely and particularly into them.

The uſe of theſe Coats.

Firſt then this interior Coat of the *Oeſophagus* which is covered over with an hairy Cruſt as it were a certain Down (which alſo is common to the Palate and Tongue) ſeems to be ſo made for the better invitation to Eating, which is a thing ſo neceſſary to maintain Life, to wit, that whilſt grateful food is ſwallow'd down, it might be able in the whole paſſage of the *Oeſophagus*, to be lay'd hold on by thoſe little hairs, and to ſtick for ſome time to them, that it might impreſs a ſenſe of its pleaſure. But that the Coat it ſelf conſiſts of ſo many variouſly interwoven nervous Fibres is, that it is chiefly made for Senſation, next for ſtrength and firmneſs, as a little basket woven with very many twiggs, and thirdly that that part might be the better extended. But the chief Office of them is to receive the approach of ſenſible things, and preſently do deliver them to the common ſenſe, ſo that according to the affections either to things pleaſing or diſpleaſing there ſtirred up, the motions of ſwallowing or rejecting might be continued, or excited a new.

What the Office of the Hairy Cruſt is.

The nervous Coat is chiefly made for the ſenſe.

Here alſo it may be juſtly inquired into, whether this ſo very nervous Coat, ſo very much interwoven with numerous and various Fibres, may not alſo ſerve for ſome motion? For that it happens that the *Oeſophagus* and its parts are diverſly moved,

Inquired if not alſo for motion.

moved in Swallowing, Spitting, Vomiting, Yauning, and other affections, and when the other inward membranous parts, and chiefly the Ventricle and Inteſtines, are on every ſide moved: It ought to be unfolded how theſe various Actions, or paſſions are executed, and by what Fibres, and after what manner they are affected. Part I.

Fallopius the chiefeſt Anatomiſt of his time, when he had obſerved in the Muſcle (which is the chief or the only Inſtrument of Local Motion) two parts, one of them which conteined the fleſhie body of the Muſcle, to conſiſt of fleſhie Fibres, and the other, which was the Chord or String, of nervous Fibres: and by theſe two the Body only of the Muſcle to move and contract it ſelf, but the Chord only to be drawn, not to move it ſelf; at length he concludes that no particle in the Animal can move it ſelf, unleſs it be Fibrous and hath true fleſh. *Obſerv. Anatom.* p. 412. *The opinion of Fallopius, of the motion of the Membranes.*

Agreeable to this we have ſhown lately in a peculiar Tract, that, and how, every motion of Contraction is performed only by fleſhy Fibres, *viz.* Theſe by the ſudden ruſhing in of the Spirits (which leap from the tendinous Fibres) being inflated and blown up, are preſently made ſhorter, ſo that they thereby ſnatch up the parts hanging next them. But truly ſince it very plainly appears, ſome nervous parts, and eſpecially the hollow *Viſcera* or inward parts, not only to be contracted, but expanded, much blown upon, and inlarged into a greater capacity, which cannot certainly be made by the motion of Contraction; and ſince further it plainly appears that the animal Spirits move no leſs among the nervous Fibres, than in the fleſhie, and not only to fill them gently, but ſometimes to leap forth, very much irritated, or thruſt forth more impetuouſly. Theſe I ſay being premiſed, we will not doubt to conclude that the animal Spirits filling the nervous, or membranous Fibres, do not only effect ſenſation, which is their proper function, but alſo certain local motions, to wit, expanſion, or inflation. For whilſt the animal Spirits in their extruſion being agitated, and notably rarified, do more impetuouſly enter into theſe Fibres (which as well as the fleſhie, being diſpoſed not in certain orders but every where about, may be very much attenuated, and in the greater expanſions diſtended, and dilated) there is a neceſſity that the inward parts framed of theſe ſhould be every where blown up, and their ſides on all parts unfolded, and being to the utmoſt attenuated, ſhould be enlarged into a greater Capacity. Truly by the inſtitution of Nature, as often as it happens to come to paſs after this manner, it is certainly, that whilſt the parts which the membranes do order, ſtretch under or cover, by this means are expanded, the ſuperfluous Humours, or thoſe that being infixed moleſt them, or ſuch as ſtick to them, might be ſhook off and removed. For this end, and by this means, we think Stretchings, Yaunings and other certain motions of inflation and diſtention to be excited. Wherefore as in Yauning, we find the Pipe of the *Oeſophagus* whether we will or no to be inlarged, and as it were blown up, and ſtretch'd out by a certain wind, we may conclude this affection to ariſe from thence, for as much as the inward Coat of the Throat, that it might ſhake off its too much humidity (wherewith it is grieved) it is ſtretch'd out, and enlarged with a certain thruſting forth of the Spirits. Moreover whilſt we ſtrive to hinder this motion of Yauning (becauſe it ſeems always troubleſome, and unhandſom) preſently the fleſhy Fibres of the outward Coat, are moved to contraction: whereby there ariſes a certain ſtrugling in the Coats of the *Oeſophagus* (which we may eaſily perceive) made by theſe oppoſite endeavours of expanſion and contraction. By what means the animal Spirits do blow upon the membranous *Viſcera* in convulſive Affections, and lift them up, and intumeſie, counterfieting the ſpringing up of live Animals, is ſhown by us in ſome other place. Further, when by ſome incongruous Medicine, or Poyſon, Diſtentions and horrid inflations of the Ventricle or Inteſtines, and that not ſeldom, ſudden and exceſſive riſing up of the whole *Abdomen* happen; they are thus made, in as much as the animal Spirits being highly irritated, and brought to uſe their exploſive force, they run altogether into the membranous Fibres, and extend them to their utmoſt, ; that the inward or *Viſcus* which is knit to them is preſently wholly blown up, and as much as it poſſibly may be is enlarged. But we will return from this little diverſion of the membranous Motion, to conſider the uſe of the other Coat of the *Oeſophagus*.

Contraction only performed by fleſhy Fibres.

Expanſion cauſed by the nervous Fibres.

As in Stretching, Yauning, and Inflations of the inward parts.

How Yauning is made.

The Extenſion of the membranes cauſed by the thruſting forth of the Spirits.

The exterior Coat of the Throat, ſomewhat fleſhy, and thick, for that indeed it

Part I.

it conſiſts of two orders of fleſhy Fibres, which aſcend and deſcend obliquely, and ſhoot mutually one through the other, may be thought to be as it were a double Muſcle, and as one order of the double Fibres deſcending, ſerves for ſwallowing, the other without doubt aſcending, performs the buſineſs of Spitting, and Vomiting. I have known ſome by reaſon of a vehement Palſie in this fleſhie Coat of the *Oeſophagus*, to have ſwallow'd with very great difficulty, and others by reaſon that theſe Fibres where wholly looſned, to dye with Famine. Beſides, it may be ſuſpected that the ſenſe of being ſtrangled, and that round thing which aſcends in thoſe, labouring with the Hyſterical paſſion to be from the Nervous Fibres of the inward Coat, whilſt the Spirits in them are driven forth, being too much inflated and diſtended, 3. There is not much to be ſpoken of the outmoſt Coat of the *Oeſophagus*, which is common; for this conſiſting of moſt ſmall, and membranous Fibres, ſeems almoſt to be only for a Cover to its inward parts.

The middlemoſt fleſhy Coat of the Oeſophagus conſiſts of two orders of motional Fibres.

Its outermoſt Coat.

The Deſcription of the Ventricle.

The Ventricle (in which the *Oeſophagus* ends, thruſting its nervous Coat into its left Orifice) is ſomewhat long, like a Sleeve with a more ample bottom, ſpreading it ſelf Orbicularly, with a plain, and ſhort top, in which are two Orifices, placed one againſt another, at ſome diſtance. By that on the left ſide, the food that is taken in, deſcends by a right and perpendicular Pipe into the Cavity of the Stomach, where it is diſſolved, and changed into Chyle; By the right hand door, whoſe paſſage is oblique, aſcending again, it paſſes thence into the Guts; ſo that whatſoever goes out of the Stomach at either door, muſt be by a ſteep aſcenſion; and as the Ventricle purges it ſelf of what is contained within it on the left ſide, by Vomiting, or on the right ſide by Seige, there is a neceſſity that its bottom, and ſides ſhould be contracted together, and to widen upwards and to incline either to this or to that Orifice.

So much for the Faces of the Exterior part of the Stomach: but we will more largely conſider its inward parts (which belongs to Evacuation) its Coats, with the textures of its Fibres, its Orifices, Veſſels, and leading Pipes, and alſo the Actions, and uſes of them all. The Ventricle as well as the *Oeſophagus* conſiſts of three Coats, one common with the *Diaphragma*, and two proper, outward, and inward.

It hath three Coats.

The Innermoſt is nervous and covered with an hairy Cruſt.

This innermoſt is wholly nervous, and (as we obſerv'd in the Throat) its inward ſuperficies is every where covered with an hairy ſubſtance, or ſtraight Threds inſerted perpendicularly to the Coat it ſelf (like to ſhaggie Silk.) This Cruſt on the inſide covering the Ventricle, after a little ſeething appears very plainly, but yet diſtinct from that which covers the Throat (being more livid, and more white) and ſeems like that which covers the Tongue. And indeed the ſharp and Cruſtie Superficies, both of the Tongue and of the Ventricle, ought to be ſo, that the particles of the chawed Food, and of what is ſwallowed down, might for ſome time be detained by it, and from thence by degrees delivered over to the nervous Coat, which elſe might by their immediate and naked touch be too much irritated, and afterwards might be in danger of growing hard. Beſides, this hairy Cruſt of the Ventricle ſerves alſo for other uſes; for the reliques of the Chyle, being therein lay'd up and kept for leven, or a certain ferment, they are become requiſite, both for the Appetite, and for Digeſtion. But further this downyneſs on all ſides defends and covers the Mouths of the Veſſels, which are very thickly inſerted into the nervous Coat, and alſo receive the humours flowing off from the Arteries and Nerves; whilſt that in the mean time the Veins ſuck the Chyle, and other overflowing Juices in this part. This hairy Cruſt on the backſide, or convex ſuperficies, by which it ſticks to the nervous Coat, is ſowed all over with innumerable ringy glandulaes, which without doubt do cover the Mouths of the Veſſels, ſticking in the nervous Coat, and as it ſhould ſeem, receive and ſtrain through them the humour deſtinated for them, or more immediatly lay'd up by them.

The uſe of the hairy Cruſt.

This glandulous Coat ſeems to be diſtinct from the other Coats.

This covering or hairy Cruſt, may be eaſily ſeparated from the Stomach after it hath been dipped into warm Water, and appears to be a Coat of it ſelf, firm enough, and diſtinct from others, and for the reaſon aforeſaid may not improperly be called the Glandulous Coat. This therefore being taken away, the nervous Coat appears conſiſting of Fibres of various kinds, and diverſly interwoven, by whoſe rare Web *A. A.* innumerable ſanguiferous Veſſels with their cloſe Branches do ſhew themſelves; and terminate in its interior ſuperficies, where they ſtick to the glandulous Coat. The portions of both theſe Membranes, to wit,

wit, the nervous and glandulous are represented by Figures in the fourth Table.

Part I.

This nervous Coat constitutes the interior Cavity of the Ventricle, like to a Chymical Vessel or Matrace, in which the Food is dissolved, and digested into Chyle. Its Fibres chiefly serve for sensation, and perhaps somewhat also for motion. As to the first, these being empty, they stir up Hunger, and being wrinkled up either through Dryness, or Saltness, or Heat, by Spiced Meats, or Wine, they cause Thirst: when sharp and acid Humours do prick or pull them, it causes the Gnawing of the Stomach. Lastly, all Medicines do first of all act upon these Fibres, and according to the sensible impression made upon them, the Operation after this or that manner happens, as shall anon be more specially declared. As soon as these Fibres are filled by fit Aliment put into the Ventricle, presently there arises a certain Satiety and Complacency in the Spirits inhabiting them, and from thence a certain refection and as it were rejoycing by the consent of their whole Convention, or of all the sensitive Soul. In the mean time as the Veins do suck the most subtil part of the Chyle, most rich Food is given to the vital Flame.

The nervous Coat is hid with innumerable Blood-carrying Vessels.

The Office of this Coat as to the sense.

As to the motion of this Coat, although we should deny to it spontaneous Contractions, yet it very manifestly appears, that it is frequently distended, inflated, blown up, and inlarged into a greater Capacity: which comes to pass, not only by the Winds begot within the cavity of the Stomach, but more often by the Spirits inhabiting the Fibres themselves; which, if they be very much irritated and agitated into an explosive Impetuousness, they highly inflate, and distend them all at once, whilst they tumultuously and in heaps run into them, and so intumifie the whole membrane like to a blown up Bladder. For if these nervous Fibres are made hollow and like a Pipe, and that the Wind on a sudden is blown into them, there is a necessity that that Vessel about which they are woven, should be thereby distended and dilated. In like manner also it is when the Spirits, as it were struck with a Fury, do rush more impetuously into them. For this conjunct Cause, the Ventricle, being so affected, is wont to be blown up in Hysterical Paroxysms, and Colicks, and very often in the Hypochondriack passion. From hence also sighs arise, and their reciprocations, which happen, because that the Ventricle, by these Fibres, is sometimes inflated, and sometimes thrust back by the *Systole* of the *Diaphragma*. Lastly, deadly and venemous Medicines, in as much as they stimulate the Spirits, and furiously stir them up into these Fibres, they often induce horrid Inflations and Distensions of the other Inwards of the Ventricle, and almost from the like Reason we affirm the Tympanie to arise.

The Affections as to motion.

How the Inflations and distentions of the Inwards are made by the nervous Fibres being affected.

The reason of the Tympany hinted.

This Interior Coat in healthful Bodies has many wrinkles, or folds, shewing themselves in the hollow Superficies of the Ventricle, which seem to be as it were so many Furrows or Inclosures, into which the small portions of the Chyle are scattered here and there, and detained by degrees for the sake of the better concoction, and that they might not flow together into a thick Mass. These Folds are made, for that this Coat is much larger then the exterior fleshy Coat, it is therefore necessary that it should have folds, or wrinkles, that it may be contained by the other. In Gluttons and great Drinkers, in whom by the too often, and too much filling of the Ventricle the fleshy Coat is very much extended, they have also the interior equally extended, all its wrinkles vanishing, it seems plain and smooth like a blown Bladder. The aforesaid wrinkles and folds are expressed in the first Figure of the fourth Table.

How the folds and wrinkles of the Ventricle are made, and for what use.

2. The next Coat of the Ventricle, which is specially and wholly fleshy, consists altogether of fleshy Fibres, and seems to serve only for motion, and that for the Contractive only. But truly the whole Body of the Ventricle is covered with a membrane or this fleshy Pannicle, which draws it together and composes it diversly, for many various uses and offices that it meets with. And for that the Stomach in the work of Chylification, and in the Operation of Medicines, ought to be altered and changed into various gestures, therefore this Coat contains manifold orders of motional Fibres, never enough to be admired. Although it be not easie to describe them being so very intricate, yet because it makes much for the reasons of Evacuation, I shall to my power endeavour to give you this particular Anatomie hitherto almost untouched.

The Fleshie Coat of the Ventricle.

Many orders of motional Fibres in the fleshy Coat.

That you may see this Furniture, let the Ventricle of a Man or Sheep being emptied, having a ligature about both orifices, be inflated, and oftentimes immersed in

How the furniture of the Stomach may be seen.

Part I.

in ſcalding Water, that the Fibres a little contracted may ſwell, until it ſeems half boyled; then the outward Coat or the membrane Covering the whole Ventricle may be noted. The Fibres of this, running from one Orifice to another, compaſs about the Bottom and the Sides of the Stomach, the whole length of them, and they appear to be ſhorter or longer according to the various compaſs of their ſtretchings out, and alſo more ſtreight or more oblique. Moreover in ſome places *viz.* near the Orifices and about the bottom and ends of the Stomach, they are much thicker than in the middle, and there indeed they may be ſeen after a manner fleſhie and moving. The nervous Fibres of this Membrane (as may in like manner be obſerved in moſt of the Muſcles) cut the fleſhy Fibres lying cloſe under them in right angles; ſo that they not only cover them, but bind them faſt, that they may be contained each of them in their orders, and that they may not leap out. The ſecond Table very aptly repreſents this Figure.

Viz. to immerge it in hot Water.

Then the outward Coat being obſerved and ſeparated is to be taken off.

Then the order of the Exterior Fibres of the fleſhy Coat will appear.

This Coat therefore being ſeparated, and removed, underneath lyeth the ſeries of fleſhy Fibres in right Angles, which compaſſing about on the ſuperior Plane, the Bottom, and Sides of the Ventricle, even to the depth of it, which is the *Interſtitium* of the Orifices, they terminate in the Orifices themſelves. Without doubt the Office of theſe is, while they are contracted, to draw upwards the bottom and ſides of the Ventricle, and thereby to ſtraiten its cavity, ſo that what is contained therein, being ſpread abroad either towards this or that Orifice, might be evacuated. The exterior or convex Superficies of this fleſhy Coat with the order of motricious Fibres, is exactly delineated in the third Table.

But that its extruding motion might be determinately made, either towards this or that Orifice, and the matter included in the Stomach might be conveyed forth either by Vomit, or by Seige, is the work of the other Series of Fibres, which being tranſverſe in reſpect of the other, bring together one Extremity of the Stomach, ſc. the left or right, againſt the other; So that whilſt the Fibres of both kinds do coact, the Stomach being contracted in all its dimenſions, and broad upwards, doth caſt out what is contained therein by that Orifice to which on occaſion it is inclined. And that there are ſuch Fibres, and that they ly under the former, may be very plainly made manifeſt to theſe who ſhall ſee the other interior or concave ſuperficies of this Coat. Therefore the Ventricle may be ſo inverted, the Orifice of the *Pylorus* being a little cut, and its joyning turned back, that the interior and concave ſuperficies, and the exterior and convex may come together, and then the hairy Cruſts of the interior Membrane with its wrinkles and folds, as is above deſcribed, and elegantly expreſſed in the firſt Figure of the fourth Table, will appear. Then after a light immerſion in warm Water, the hairy Cruſt being ſeparated, and taken away, we may ſee the nervous Coat it ſelf, covered over with a moſt thick Ramification of Veſſels: we have taken care that the portions of either of theſe and the ſuperficies of them, with the Glandula's, and to which of the Veſſels they ſtick, may be diſcerned in deſcribing exactly the ſecond and third Figure of the ſame Table. Then laſtly the nervous Coat being wholly taken away, the interior fibrous Superficies of the fleſhy or middle Coat, as it is delineated to the Life in the fifth Table, appears in view. So that in this Ramification of fleſhy Fibres there is a notable order, which are ſeen to ariſe behind the Mouth of the Ventricle, and to compaſs about its left extremity, and then they are carried forward towards the right region of the Stomach. A notable company of theſe running along on either ſide in ſtreight Lines to the top or ſummit of the Ventricle, enter into the hole of the *Pylorus*, hiding here and there the length of its Cavitie, terminates in the Orifice it ſelf, as it is repreſented in the fifth Figure. But the other Fibres of this Order range on both ſides of the Stomach obliquely, and ſo likewiſe towards its bottom, where they meet. The Office of the former ſeems to be applied to what is to be done by either of the Orifices, by one for the avoyding the excrements, which is done by the lower, and alſo reſpectively by the upper; for the ſame Fibres draw to the right or left, according to the convulſion beginning at this or that end of them; as we have ſhown in our Tract of the motion of the Muſcles, lately publiſhed. If at any time a contraction begins towards the *Pylorus*, whilſt there the bottom of the Ventricle and the ſides are drawn together by other Fibres, both interior, and exterior, its mouth alſo is by thoſe right ones inclined towards the *Pylorus*, therefore what ever is contained in the Stomach is tranſmitted to the Inteſtines. But if the contraction be begun by other Fibres at the end of theſe, towards the mouth of the Ventricle, whilſt there, its

How the order of the interior Fibres may be found out.

Their deſcription.

The uſe of its Fibres.

Bottom

Part I.

bottom and sides are drawn together by other Fibres, the *Pylorus* also is drawn together towards it, for the action of Vomiting. As to what respects the other oblique Fibres of this order, whilst by a Convulsion beginning from the right end of them, they are drawn downward and obliquely, by their motion they incline the left chamber of the Ventricle towards the bottom and *Pylorus*, cooking for nourishment, what is there more strictly compressed and rolled together: On the other side also, by the Convulsion begun from the left, they being contracted upwards and obliquely, cause the bottom and right chamber of the Ventricle to be snatch'd up towards its mouth, to excite Vomiting. According to either of these contractions, the exterior fleshie Fibres, constituting the convex superficies of the middle Coat conspire in the action, so that they strain more the cavity of the Ventricle, and more aptly compose the endeavours for evacuation upward or downward. Wherefore according to which, an irritation being here or there made, a contraction begins either towards the *Pylorus* or the mouth of the Ventricle, and the whole capacity of the Ventricle being collected, and brought upwards, it is inclined hither or thither, and endeavours to cast forth either above or below. We have taken care that either superficies of this Coat, and the distinct series of the motricious Fibres therein, be exactly described in the Figures of the third and fifth Table. I shall not in this place reherse and explicate every species of contractive motions, which this fleshy Tunicle of the Ventricle hath; of which sort are such as are wont to be stirr'd up in those that are affected with the Cramp, we shall shew them in another place, and we will declare how they are moved by the operations of Medicines, when we shall treat of each in their kind. In the mean time we will take notice of those motions to which this fleshy Coat is wont to obey, the Instinct or Impulse diversly to be communicated, *viz.* First of all, and chiefly from the nervous Coat lying under, which, as from the contents of the Ventricle it is variously affected, by and by, for retention or expulsion sake provokes into contractions of this or that sort. But the Nerves inserted into this fleshy Coat, carry to it the various instincts of motions from the ἐγκέφαλος the neighbouring parts, or remote from above or from beneath. From hence the Ventricle is oftentimes disturbed, and after divers manners moved by the Phantasie, by the Appetite, yea and by divers affections either of the Soul, or of every part of the Body.

The same fleshy Fibres effect opposite contractions.

What contractions the fleshy Tunicle follows: The instinct from whence.

The outward Tunicle of the Ventricle is common to it and the *Oesophagus*, of the same texture and substance, as we intimated even as to the use of it; this being the covering of the whole Ventricle, it cloaths the fleshie Fibres of the under-lying Coat, binds them with its Fibres, and holds them fast together as it were with Twiggs. The Fibres of this membrane (as we have already observ'd) are in certain places more thick, that when the Ventricle is fill'd beyond its measure it might be very much distended. These seem to serve but little for motion, but yet somewhat to sense; although there should be but a very small use of it, for that nothing from without can fall upon it, nor any thing taken in at the Mouth can touch it. But if that some serous Humour or impostume, or constant bilious Suffusion happen on the neighbouring or contiguous parts, for as much as this Coat is much, and often irritated, there is excited in the Stomach almost a continual nauseousness, want of Appetite, and frequent Vomiting, as I have observed in very many that have been dissected after they have been dead. The chief use of this Tunicle is, that being the whole covering of the Ventricle, it cloaths the fleshy Fibres of the underlying Membrane, sustains the Ramifications of the Vessells, and serves as well for the strengthning the Ventricle, as for to conserve its heat. Moreover it is not improbable, that there are in certain places of this Coat nervous Fibres, in the place of Tendons, respecting the fleshy Fibres lying under them.

The outward Coat of the Ventricle very nervous.

And perhaps tendinous.

The Ventricle being after this manner like a sleeve, made up of its three Tunicles, as it were a threefold Garment, hath two doors or orifices, placed on the top, over against one another. One of them on the left side stands for the Insertion of the Mouth of the *Oesophagus* into the Mouth of the Ventricle; and is after the same manner, as if the Pipe of a Tunnel were directed into the hole of a Bladder, to be filled: The right and perpendicular Pipe admits whatever is put in and swallow'd down into the Stomach. The other Orifice on the right side is continued by a long and oblique Ascention into the *Duodenum*, and by degrees puts into it the Chyle elaborated in the Ventricle.

The twofold Orifice of the Stomach.

Part 1.

Near this Orifice the wonderful Enfoldings of the double Nerve, wandring to the Ventricle, being delated as it were at its utmoſt bound, are plac'd, making as it were a kind of Net wherewith its whole circuit is hidden: Beſides both the hairie, and nervous Tunicle of the *Oeſophagus* cloaths the cavity of this farther; hence it is that the Mouth of the Ventricle being exceeding ſenſible doth wonderfully communicate with the other noble parts, and chiefly with the Brain and the *Præcordia*, ſo that indeed it was not for nothing that *Helmont* did place here the ſeat of the Soul.

The Nerves and nervous foldings belonging to the Mouth of the Ventricle.

The deſcription of the Pylorus.

The other Orifice commonly called the *Pylorus* on the right ſide of the Stomach having a capacious hole, by degrees grows long and narrow, and ends in a ſmall hole, and from thence being retorted it is continued into the *Duodenum*. Here the Tunicles are much more thick than in any other place of the Ventricle. The nervous innermoſt is very rough with wrinkles and furrows, and is lifted up into the very hole it ſelf, in a longiſh lump like to the Pipe of a Gutter, for the end certainly, that the Chyle going forth by degrees may not be ſuck'd back again into the Stomach. The fleſhy Tunicle, as every where beſides, hath two ſeries of Fibres; for ſome compaſſing about the Hole they bind it, and as occaſion ſerves, ſhut it faſt; and others being carried by its ſides the whole length of them, gathering together the other parts of the Stomach upward, do lead towards this door. But on the other ſide, theſe Fibres by reaſon of the contraction being at the other ends of them, do often draw the *Pylorus* towards the left Orifice, as in Vomiting: and if ſo be the Convulſion be long continued, the *Duodenum* is drawn upward, and for that reaſon, Choler and the Pancreatick Humours are drawn forth into the Ventricle.

The Office of the Pylorus.

The Office of the Pylorus is, not only largely to tranſmit what is contained in the Ventricle, and together in great heaps, to the Inteſtines (which indeed it frequently doth in purges and *Diarrhœas*) but rather the Chyle being well digeſted, to receive it into its boſom, and to keep it there for ſome time, and then by little and little and by very ſmall portions thruſt it forth. For truly its den being long, and capacious, it ſeems to be a certain reſting or baiting place in the Ventricle into which a portion of the Chylous Maſs, being more thorowly digeſted and perfected, may retire, and abide in quiet, until another part more crude, and latelier put in, may be more concocted in the bottom of the Ventricle. Hence it is, that when things have been eaten, oftentimes that which is ingrateful is vomited up, the other more grateful meats in the mean time remaining in the Stomach; *viz.* for that there are very many as it were diſtinct Cells in the Ventricle, in which thoſe things put in are divided one from another, and may ſo remain. Moreover it is to be obſerved that vomiting Medicines when they work gently, do only ſtir the parts next the left Orifice of the Ventricle, but if they do more ſtrongly irritate them, they draw from within, and upwards the *Pylorus* it ſelf with the *Duodenum* hanging to it, ſo as to make an Evacuation of the forc'd *Bilis* into the Ventricle.

Veſſels belonging to the Ventricle.

The Veſſels belonging to the Ventricle are Nerves, Arteries, and Veins; the deſcription of the former is exactly enough delivered in our Neurologie: *viz.* That the wandering parile Nerves ending on either ſide of the Stomach give to it notable branches, foldings, and manifold ſprouts; moreover the nervous foldings of the Intercoſtal Pares, being placed here and there in the *Hypochondria* and in the *Abdomen*, ſend very many and eminent branches to the Ventricle: which is the reaſon, that vomiting ſo often ſucceeds in Hyſterick and Hypochondraick Paſſions and in Colicks.

Nerves.

Innumerable Sanguiferous Veſſels belong to the Ventricle.

There belong very many blood-carrying Veſſels to the Ventricle, which may be plainly ſeen, if the Stomach of a Man, a Dog, or a Hog, the Cæliack Veſſels being firſt bound, and cut off, be taken out, and the Orifices being drawn together, it be blown into, it will then be a very pleaſant ſight to ſee the leſſer Truncks of the Veins and Arteries, part of them inſerted in the top of the Ventricle; and part of them in its bottom, which by and by run one throw another into leſſer Branches, and then dividing themſelves again into very little and more ſmall branches and ſhoots, mutually to clip, and on every ſide ſtretched out to creep about the whole compaſs of the Stomach, and with its branchie ſhoots to hide it. Theſe Sanguineous Veſſels tending inwardly, and at length ſcattered in innumerable ſprouts are terminated

Part I.

nated in the inmoſt nervous Tunicle; whoſe interior ſuperficies through the thickneſs of the Puncts in which the Veſſels end, is dyed red and as it were made bloody. This manifeſtly appears if that after the Stomach is immerſed in warm Water, the hairy Tunicle be ſeparated; for then the nervous Tunicle by reaſon of the cloſe endings of the Veſſels ſeems hidden as it were with a little bloody Net.

Which end in the interior ſuperficies of the nervous Coat.

If you inquire into the uſe of them, they are ordained to be the cheif Inſtrument, for to convey the heat which is for concoction and digeſtion in the Ventricle, and hence they convey a ſufficiently plentiful matter and Fire, *viz.* in as much as the Blood growing hot, round about the bottom and all the ſides of the Ventricle, like a Cauldron, it is detained as a perpetual lighted fire; and indeed ſomewhat to this end, that bloody Lake ſeems to be there ſituated. But yet beſides this, theſe Sanguiferous Veſſels as we think, have another, not leſs neceſſary Office, *viz.* The Arteries to lay up ſome humour in the Ventricle, and the Veins to carry away thence perpetually ſome other, ſo that there may be made by their means an immediate and conſtant commerce backward and forward between the Chyle and the Blood.

The uſe of them.

But truly as Aliments being put in are diſſolved not only by concoction, but much more by Fermentation in the Ventricle, and diſpoſed into an homogeneous Chyle, they by a certain ſpiritual Liquor there, which as it were ferment (even as the Barm of Ale ferments other Ale) are imbued: This kind of Humour (and indeed plenty of it is required) the Arteries only can furniſh, and this being conjoyned with the reliques of the chyle ſticking in the hairy Cruſt, without doubt conſtitutes that juice which is commonly called the Ferment of the Stomach. Moreover when from things eaten oftentimes a quick Refection is required, and that truly it cannot be made by the long wanderings of the Inteſtines, and of the Chyliferous Veſſels, what more like way is there than that the Veins ſticking moſt cloſely within the cavity of the Ventricle, ſhould receive a certain more ſubtle portion of the Chyle, and forthwith pour it into the Blood? After what manner the Sanguiferous Veſſels inſerted into the bottom and top of the Stomach do hide all its ſuperficies with a thick and manifold Ramification, is to the life expreſſed in the firſt Figure.

The Arteries carry the fermental Humor.

The Veins receive the nutritious Juice.

3. We will go from the Ventricle to the Inteſtines, which being twofold, to wit, thin and thick, there will be no need here to write the Hiſtory of them all, for that the number of them, and their conformation is already very well known, not only to Anatomiſts, but to every Butcher. In the former, as much as belongs to the medicinal part, there ought to be conſidered firſt their ſite and Fabrick, ſecondly their Tunicles, and thirdly their Veſſels and leading Pipe. The Office of theſe is, to receive the Chyle elaborated and dreſſed in the Ventricle, to ferment it more, and from it more elabourated and perfected to preſs forth the nutritious Juice into the Chyliferous Veſſels. Among theſe Inteſtines Cathartick Medicines do chiefly perform their operations.

The Inteſtine twofold, viz. ſmall and big.

Although there be but one continued Pipe of the ſmall Guts, yet for the diſtinct Offices that they have, they are diſtinguiſhed as it were into three *Stadia*, and as if there were ſo many Guts, have ſo many diſtinct names impoſed on them. In the firſt of theſe the Chyle deſcending from the *Pylorus*, by and by is ſtained with new Ferments, *viz.* Choler and the Pancreatick juice, with which, ſince all its Maſſe by degrees, and all its parts ought to be imbued, therefore every portion paſſeth by a ſwift paſſage into this Region, *viz.* the *Duodenum*. In the next Circuit, to wit, the Jejune or empty Gut, the Chyle fermenting is ſtrained more freed from ſourneſs, and acquires a greater volatileneſs; and as here alſo it ought not to ſtay long, by and by being fermented, it is carried forward, and leaves for the moſt part the pipe empty. Within the third Den, the Chyle being volatiliſed and perfected, is copiouſly heaped up, and ſtays there for ſome time, whilſt the Inteſtine *Ileon* being ſo full of Chyle, ſtrains it a little with is fleſhy Fibres, the more pure and ſubtiler part is preſſed forth to be tranſmitted to the blood, into the milkie Veſſels (and alſo according to our opinion into the Meſaraick Veins) and at length the reſt of the *Fæces*, and almoſt worn out are moved forward to the thick Inteſtines.

The ſite and dimenſions of the ſmall Guts.

All theſe Inteſtines, or the whole Pipe of them, have their Coats formed after the

There are three Coats of the Inteſtines.

Part I.

ſame manner, which alſo do not much differ from the membranes of the Ventricle, unleſs that they are a little thinner. All the Inteſtines, both the ſmall and the thick (except in the beginning and end of them, and a certain part of the *Colon* which is joyned to the *Omentum*) are as it were plainly knit to the brim of the Circular Meſenterie: Concerning which in the mean time it is wonderful, how that theſe Inteſtines which are about ſix Ells long, may be comprehended in that compaſs, that they are not above a Span diſtant from the Centre. Alſo we may obſerve, that the Plane of the Meſenterie is collected into many and great folds, and hath in its Circumference the length of three Ells; moreover that the Circumference of the Meſenterie, that it might preſs together the length of the Inteſtines, doth enfold in every ſingle handful about twelve handfuls of the Inteſtines. As for many reaſons it ought to be made after this manner, ſo chiefly, both that the Inteſtines might ſubſiſt in a little and narrow place diſtinctly, and without confuſion; and alſo that they might be moved, by a ſlow and ſucceſſive motion, and as it were creepingly, from one end to the other. For as much as the Tendons of the motricious Fibres, by which the Pipes or Cavities of the Inteſtines are drawn together, are placed on the Brim or Border of the Meſenterie, it is from this Inward, that the inſtinct of every Inteſtinal motion proceeds, as ſhall anon be more clearly ſhown: In the mean time, we will a little handle the Coats of the ſmall Guts.

How they are tyed to the Meſenterie.

The inmoſt Tunicle has very many tranſverſe wrinkles.

The inmoſt of theſe hath very many tranſverſe Wrinkles, as it were eminent Ridges, which are movable, and are as ſo many remoras of the Chyle, and alſo ſerve to moderate its retention, *viz.* that it paſs not too ſoon, and before it be perfected enough, and throwly preſſed, flow with the *faces* themſelves to the thick Inteſtine. Theſe Wrinkles, as *Fallopius* hath very well obſerved, for that they are much longer in this inward Coat than the outward, therefore it is criſpie and crumbled. For if this be taken off from the other, and that their foldings be ſtretched out, this will exceed the other three times in the length.

The nervous Coat of them is alſo covered with an hairy Cruſt.

Further, this interior altogether nervous Coat, containing in it the little mouths both of the milkie and bloody Veſſels, is cover'd with the like cruſty Nap as the inſide of the Ventricle, and ſeems to be for the ſame uſe, *viz.* it covers and defends the mouths of the Veſſels, and moreover ſuſteins the firſt approaches of the Chyle, and of other contents, and then delivers them over by little and little to the nervous Coat. But this Coat conſiſting of every kind of Fibres, and conſtituting the inmoſt Chamber of the Inteſtinal Pipe, ſerves firſt of all for Senſation, and provokes according to the impreſſions made on it ſelf, the fleſhy Coat lying over it, to aſſiſt the excretorie motions more ſlow, or more ſwift upwards (but that rarely) or downwards. If at any time the internal ſuperficies of this be ſtimulated by ſharp things contained in it, or incongruous Humours do ſtrike againſt its Fibres, preſently by reaſon of the feeling Senſe, troubleſome griefs and torments are ſtirred up. Beſides this nervous Coat is found to be very obnoxious both to diſtentions by included winds, and alſo to expanſions, and intumifications by reaſon of the Spirits among its fibres. But this beſides its nervous fibres, with which it is diverſly interwoven, is every where covered alſo (as we have before mentioned to be in the Stomach) with a thick or cloſe ramification of blood-carrying Veſſels terminating therein: hence, as we may ſuſpect, the Arteries perhaps do leave every where a certain recrementitious humour in the cavities of the Inteſtines, and the meſaraick Veins, no leſs than the milkie Veſſels receive there a portion of the Chyle, and carry it immediately to the Blood.

Innumerable ſanguiferous Veſſels do terminate in it.

2. The fleſhy or middle Coat.

2. The ſecond or middle Coat of the ſmall Guts is a little thicker, and altogether fleſhy. Of this there are two orders of motricious Fibres lying under one another. The firſt and interior is ringie, which compaſſing every where with a cloſe ſeries the whole Pipe of all the Inteſtines, or all their whole Cavities, is implanted as it were by a Tendon, on the border of the Meſenterie. The other order is of ſtreight Fibres, or longways, which lying over the others, and cutting them in right angles, ſtretch the whole length of the Inteſtines; and the outmoſt Coat ſeems to be in the place of Tendons to them, which being altogether nervous or as it were tendinous, is wrapped about with an univerſal ſeries of theſe Fibres.

In which is two orders of motricious fibres.

Viz. of ſtreight and circular.

Their uſe is enquired into.

As to their uſe, as it is the buſineſs of the Inteſtines to move forward the Chyle,

Part I.

Chyle, and the *faeces* part by part, and so indeed by urging it to carry it at length throw all their Pipes; moreover whilst that they themselves are contracted, and abbreviated, so that their Cavities may be straitned to press forth the more subtil part of the Chyle into the milkie Vessels, and Mesaraick Veins, it is very obvious and easy to be conceived, how the aforesaid Fibres do perform this double task: for whilst the circular Fibres are successively or one series after another contracted, they make narrow the depth of the Intestines, and at the same time the long ones being inflated and intumified, they make it more strait, and also make it shorter, so that there will be a necessity that the contents of these inwards, be compressed behind, and urged continually forward.

What kind of motion the Intestines have.

In the mean time it is not to be thought that the contractions of either kind of Fibres are so great and continual, that all the contents of the Intestines are driven forward altogether from one part to another (although that this doth sometimes happen in purges and looseness as we think) but ordinarily those lighter, and broken Convulsions, but yet made one series after another, and often repeated, do as it were shake the Intestines, so that they make the Chyle and the *faeces* gently to move forward from place to place. But by reason of these shakings of the Intestines, and their often repeated contractions, the Chyle being perpetually agitated, is the more elaborated and easily pressed forth into the Vessells gaping for its reception. But if it be ask'd by what instinct the forementioned Fibres of either kind be provoked into motion, and are determined, now these parts now those, one series after another to contraction, I say that the Intestines have it even as the Ventricle, *viz.* it depends upon the Sense of the nervous motion in either of the fleshy Coats, so that the contractions of that follow the irritations of this. As often as any thing that is disagreeing, or incongruous, impresseth any troublesome sensation upon the nervous Fibres, presently to shake it off, the moving Fibres draw together the affected part of the Intestine, that they might drive away whatever is troublesom.

Their instinct chiefly from the irritation of the nervous Coat.

From what causes the nervous Fibres are wont to be irritated.

First of all the reliques of the Chyle, which after the pure Juice is enough pressed forth, do ordinarily, and gently irritate the nervous Fibres, they becoming decay'd and troublesom; for until the distribution of the Chyle be throughly acted, the moving Fibres being contracted before, lest that it should slide away too soon, they are still, afterwards Convulsions being stirred up behind, they cast it forth as unprofitable. Secondly the nervous Fibres are a little more sharply agitated by Choler, and the pancreatick Juice from their Pipes, also by sharp Humours, and hurtful Suffusions from within the Arteries, whereby the same more often, and more strong contractions succeed. Thirdly yet a more vehement Irritation, and preternatural, is wont to be caused, from disagreeing, and disproportionate Aliments, also from Medicines and Poysons, the last of which but one is a little farther particularly treated of.

Moreover the fleshy and moving Fibres of the Intestines, sometimes by reason of other more remote Causes are stirred up to solutive contractions of the Belly. For violent passions of the Mind or the Body do frequently introduce a *Diarrhœa*, *viz.* in as much as the Spirits being placed among the ἐγκέφαλον or principal parts of the nervous appendix, being more notably disturb'd, forthwith making known their disorder by the Pipes of the nerves or the nervous shoots, to the Spirits inhabiting the Intestines, they provoke them into an excremental Convulsion. After what manner soever the irritation is made, contractions follow, for that the animal Spirits leap forth both from the tendinous border of the Mesenterie into the fleshy annular Fibres, and also from the tendinous Fibres of the outward Coat into the fleshy longitudinal Fibres, both which, whilst they so blow up and intumifie, they thereby do render them more short and contracted. It would be too much from the purpose, any further here to expound what parts the Mesenterie obeys in performing this Peristaltick motion of the Intestines; for besides that the tendons of the circular Fibres are rooted in the border of it, you are farther to be advertis'd that in its Plane the moving Fibres do tend directly from the Centre to the Circumference, the office of which cannot be otherwise thought to be, than that they, according to the instinct here given, being there variously contracted

By what reason contractions do succeed irritations.

Part I.

tracted, do ſtir up the like contractions, either in theſe or in thoſe parts of the Inteſtines.

The outermoſt Coat of the Inteſtines.

We have not much to ſay of the outmoſt Coat of the Inteſtines; this having its riſe from the *Peritonæum*, and being wrapped about the former Coats, ſince it is altogether thin and nervous, it is commonly eſteemed to be only as a covering for the reſt: but yet, as the Series of the longitudinal Fibres do immediatly ly under this Coat, and that none of their tendons are any where elſe to be found, and that indeed this Coat is tendinous, we may very well ſuſpect that the animal Spirits do leap forth of the nervous Fibres of this, for the contractions of thoſe fleſhy Fibres, and that the Convulſion ceaſing, they return back into theſe.

The Veſſels and Pipes belonging to the Inteſtines.

The Veſſels and Pipes, which belong to the ſmall Guts, are the Vehicles either of the Spirits, or the Humours, of the former ſort are the Nerves and their enfoldings and ſhoots, all which we have largely enough unfolded in our Neurologie. What belongs to the other leading Pipes, they are ſuch as either carry the Humours to the Inteſtines, as the Choler-carying and Pancreatick Paſſage, and the Arteries; and after a ſort alſo the Nerves (as we have ſhown in another place diſcourſing of the Colick) or ſuch as do carry away the Humours from theſe Inwards, as the milkie Veſſels, and the meſaraick Veins. Every one of theſe Pipes, and alſo the Spirits, and Humours that flow in them, and moreover either what are contained in the cavities of the *Viſcera*, or that remain in their nervous or fleſhy Fibres, are either Subjects, or Objects of Evacuation, and are wont firſt and immediatly to be affected by all manner of Medicines, but after what ways, the Knowledge ſhall be deſigned in the particular of every kind of Evacuation.

Concerning the biliarie Paſſage, and the Pancreatick Pipe, for as much as ſo many Authors have already ſpoke very much of them, and notwithſtanding the Truth may yet ly hid, or remain ambiguous yet (ſince there is a neceſſity that it muſt be very prolix and intricate) this will be no opportune place to enterpriſe the diſquiſition. What Vomits and Purges act in theſe parts ſhall be ſhown hereafter,

Innumerable Blood-carying Veſſels belong to the Inteſtines.

As to what appertains to the Sanguiferous Veſſels, the obſervation is common, that very many Arteries and Veins do branch themſelves forth thorow the whole Meſenterie, and from thence diſtribute to all the Inteſtines innumerable Suckers. Concerning which we ſhall further advertiſe, as they are inſerted into the outer Coat, a few Suckers only hang to this, but the greater branches, almoſt all of them preſently hiding themſelves within, do run back to the inmoſt Coat in which they terminate, and do ſend forth on all ſides infinite and exceeding ſmall Shoots, which very thickly hide its Superficies.

The uſe of them inquired into.

But it may cauſe a wonder wherefore that there ſhould be in theſe almoſt bloodleſs Inwards of themſelves, ſo great an afflux of Blood deſigned. It is not unlikely that this is only done for the diſpenſing of the heat and nouriſhment, when as the Muſcles and the outward Coats of the Inteſtines are contracted with fewer Veſſels, there had need be the greater plenty in theſe. *Mebius* that he might looſe this Knot, affirms that Nature had given ſo great plenty of Arteries to the Inteſtines, that the excrements of the Mothers Blood whereby the Embryo is nouriſhed, at that time might be carryed away to the Inteſtines. The reaſon of which he ads for that the Inteſtines of the *Embryo* or Infant being newly born contain a black Excrement. But truly this Argument eaſily falls if we grant (as it is likely) with *Harvie* and our late Writers, that the *Embryo* ſucks and receives a nutricious Liquor in at the Mouth in the Mothers Womb, But it may rather be ſaid, that theſe Arteries do purge away the Dreggs of the Blood in adult living Creatures, oftentimes by the Inteſtines as a Sink, the unneceſſary being carryed away by diſgeſtion and by other wayes: and in the mean time the Veins receive a certain portion of the Chyle, and preſently mix it with the Blood.

Of the thick Inteſtines.

There will be no great need to ſpeak here much of the thick Inteſtines, as to what appertains to evacuation, becauſe that the Virtue of Medicines taken in at the Mouth is almoſt exhauſted, before they can come into theſe Inwards, ſo that the irritation of theſe ariſe partly by a conſent of the ſuperior Inteſtines, and partly by their contents being violently diſturbed, rather then from the Medicine

cine it self. They have the same Coats as the small Guts; and as the *fæces* ascend strait into the *Colon*, there is need of more strong fleshy Fibres, which make a strong motion of contraction. Hence if there be an Inflammation or *Sphacelismus* (as I have often known,) about the beginning of the *Colon*, so that the fleshy Fibres being hurt that they are not able to make the Contractions to lift the *fæces* upwards, they flowing back towards the *Ileon*, do cause the incurable Iliack Passion. Moreover in this Intestine those champered coverings or Caverns are added, that the *fæces* being the longer detained in the Belly, the trouble of often letting them forth may be taken away. The Evacuation belonging to this Region, consists chiefly in Clysters. In some the interior Coat of the *Colon* is so very tender and sensible, that by reason of a Clyster injected, although to ease Pains, presently the Spirits growing hot, and being thrust forth among the nervous Fibres, they hugely put up the membranes, and distend them, so that they excite great trouble through the whole *Abdomen*. What we have now delivered concerning the Excretory motions of the Inwards, depending upon the contractions of the fleshy Fibres, will be better manifested, if our Hypothesis be consulted of the fashion and motion of the Muscle not long since published. As for the rest, for the more clear illustrating of the Anatomie of these parts, we have taken care to add here the Figures of each of them most exactly, and to the Life delineated by a most skilful Artist, and although in the description of the Ventricle with the *Oesophagus* and Intestines, we have followed *Fallopius* and others both Ancient and Modern, and have assigned to every one of them only three Coats; yet by the separation of these (after their being immersed in hot Water) being a little more accurately made four distinctly appeared. For the hairy Crust, which some have esteemed only an addition to the nervous Coat, is a peculiar Membrane, thick enough of it self, and for the innumerable little Glandulas with which its exterior superficies abounds, may be properly called the Glandulous Coat, as may manifestly appear by the Figures.

Part I.

The Iliack passion often comes by the Inflammation of the Colon.

THE

THE EXPLICATION OF THE VI: FIGURES.

The first Table represents the Ventricle of a Man with its Vessels strutting with Blood, enptied, and blown up that all the Arteries and Veins with their Ramifications (which are truly and most exactly delineated) may be seen.

A *The* Oesophagus.
B *The Mouth of the Ventricle, nigh to which the motricious upper oblique Fibres, for the sudden opening and shutting of it, appear streight.*
C *The Orifice of the* Pylorus *with the* Duodenum *hanging to it.*
DD *A Portion of the* Duodenum *whose fleshy Fibres more thick in that place, appear under the outmost Coat.*
FF *To* C: *The Den of the* Pylorus.
GG *The top of the Ventricle, where the sanguiferous Vessels being inserted, do flow downwards, and disperse on all sides their Branches and Shoots.*
HH *The bottom of the Ventricle in which the sanguiferous Vessels ascending upwards are inserted, and disperse most thickly on all sides their little Branches and Shoots.*
III *The mutual Embracings and wonderful communications of the Vessels of either insertion.*
KL *The right end and left of the Stomach.*

The second Table expresses altogether the outmost nervous Coat of the humane Ventricle, whose nervous Fibres being carried the length of it, do cut the underlying exterior fleshy Fibres almost in right Angles.

A *The* Oesophagus *in whose exterior Coat all the nervous Fibres descend in a right Line cutting the underlying fleshy fibres obliquely.*
B *The Mouth of the Ventricle.*
C *The* Pylorus; *with its Den.*
E *A part of the* Duodenum *thereto hanging.*
F *The top of the Ventricle, where the blood-carrying Vessels appear thickly planted.*
GGG *The slender and nervous Fibres stretched the whole length of the Stomach from one Orifice to the other, and beyond either.*

The third Table exhibits the humane Ventricle naked without its outward nervous Coat, that the exterior or Convex superficies of the middle Coat with its fleshy Fibres may appear.

B *The* Pylorus *with the* Duodenum *thereto hanging.*
C *The Orifice, and Den of the* Pylorus, *either of which the circular Fibres, whilſt they are contracted do ſtraiten, and (as you may ſee) ſhut up.*
D D D *The circular Fibres compaſſing about the Ventricle in its depth or Profundity.*
E E E *The Top or height of the Ventricle where thoſe Fibres ariſe, whilſt they are contracted upwards towards it, they cauſe the whole joyning of the Stomach to be very much ſtreitned.*

The Fourth Table whoſe firſt Figure ſhews the Ventricle turned inſide out, with the interior and concave Superficies changed into the exterior and convex, that the hairy Cruſt, with its Wrinkles and Folds covering the Stomach, may be ſeen.

A *The left Orifice, or the Mouth of the Ventricle.*
B *The Den of the* Pylorus *in which the thicker Coats exiſt.*
C *Its Orifice to which the* Duodenum *is knit.*
D D *The top of the Ventricle, or height between the Orifices.*
E E E E *The ſides, end, and bottom of it in which the hairy Cruſt of the interior Coat and the Wrinkles and Furrows in it are expreſſed to the Life.*

The Second Figure repreſents a Portion of the nervous Coat in which the hairy Cruſt being taken away, the interior or concave ſuperficies, with the moſt thick Ramification of the Veſſels appears.

The Third Figure ſhews a Portion of the hairy Coat, or glandulous, in which its exterior ſuperficies whereby it ſticks to the nervous Coat repleniſhed with glandulas and little Mouths of the Veſſels, is beheld.

The Fifth Table ſhews the interior ſuperficies of the fleſhy Coat, and the concave inverted or turned outwards that one of the Series of the moving Fibres may be ſeen.

A *The Mouth of the Ventricle, near to which the ſeries of Fibres is ſeen to ariſe, partly forward in ſtraight Lines, and partly carried in oblique Lines.*
B B B *A manifeſt company of Fibres, which compaſſing about the mouth of the Ventricle run along its top to the* Pylorus, *and covering the length of its Den do terminate in its Orifice.*
D *The Orifice of the* Pylorus.
E *The Den of the* Pylorus.
F F F F *Other fleſhy Fibres, which tending obliquely from the left ſide of the Stomach towards its right, deſcend down to its Bottom.*

The Sixth Table repreſents all the Coats of the ſmall Guts ſeparated one from another, that the nervous Fibres with the Glandulas and Ramifications of the Veſſels, alſo the orders of the moving Fibres may be clearly and diſtinctly obſerved.

A A *Exhibits the outmoſt Superficies of the whole Inteſtine whoſe moſt ſlender nervous Coat with its moſt ſlender nervous Fibres round it, as may be ſeen, appears ſtretched out.*
B B *The exterior ſuperficies of the fleſhy or middle Coat, which, the others being taken away, with the Series or its order of longitudinal moving Fibres is plainly ſeen.*

Part I.

CCC *The annularie or circular Fibres of the ſame Coat, which, the firſt Series or order being taken away, manifeſtly appear.*

DD *The interior nervous Coat, whoſe interior Superficies, the hairy Cruſt being taken away with its thick ramification of Veſſells, is expoſed to ſight.*

EEE *The exterior or convex ſuperficies of the hairy or glandulous Coat, by which it ſticks to the nervous Coat, with the glandulaes and moſt thickly planted little Mouths of Veſſels, is ſhown.*

SECT. II.

SECT. II.

CHAP. I.

Of Vomiting and of Vomitory Medicines.

HAving after this manner laid forth the Stage for medicinal Action, or at leaſt briefly ſhadowed forth its firſt Circle, it now is incumbent upon us to deſcribe the ſeveral kinds of medicinal Operations, the reaſons of them, and the ways of their Affecting. Therefore we will inquire from the beginning what is acted in the firſt *Stadium*, to wit, in the Ventricle, and how vomitory Medicines do work. Where in the firſt place it behoves us to explain, what kind of Affection Vomiting is, alſo for what cauſe, and upon what occaſions, either according or beſides Nature it is wont to be excited. Then in the ſecond place ſhall be ſhown upon what Parts, or Spirits inhabiting them, or the watry Humours, and after what manner Medicines, while they provoke to Vomit, do operate,

How the Ventricle and Oeſophagus are affected in Vomiting.

As to the firſt, when any one is affected with Vomiting, he may perceive in himſelf the Bottom of the Ventricle to be drawn upward, and the upper Orifice to be opened, and in the mean time (as it ſeems) the *Pylorus* being ſhut faſt, or drawn inward, by an inverſed motion at the ſame time the whole Pipe of the *Oeſophagus*, to wit, from the Bottom to the Top, to endeavour as it were with a certain kind of pumping, that what is therein contained may be thruſt up higher, and at laſt caſt forth at the Mouth. Theſe kinds of motions of theſe parts, are made without doubt by the fleſhy Fibres which compoſe the middle Coat of the Ventricle. For we may perceive in this Coat, two diſtinct Orders of fleſhy or motional Fibres, which compaſs about the Stomach thorow its whole dimenſions, and being together contracted, they gather cloſe its Bottom and Sides, draw them upwards, and incline them either towards this or that Orifice; for that the Contents may be caſt forth at the door, ſometimes at this, ſometimes at that. As to the interior Fibres, which determine the contractions of all the reſt either to this or to that Evacuation, if there be any where made about the Bottom or Sides of the Stomach, a gentle irritation, the Convulſion begins towards the *Pylorus*, and the internal moving Fibres are at their right Ends firſt and ſooneſt contracted, the whole joyning of the ventricle being there contracted, it pours forth its loding into the Inteſtines: but if the irritation be vehement, and very provoking in any part of the Stomach excited, it will not be eaſily reſtrained or transferred towards the Inteſtines, the Convulſion beginning towards the left ends of the interior Fibres, and leading towards the Mouth of the Ventricle, it makes there the whole Capacity of the Stomach being extremely ſtraitned and contracted, to be drawn up together, ſo that the *Pylorus* being drawn inwards and ſhut faſt, and the Mouth of the Ventricle open, what ever is therein contained, is caſt out upwards. The ſame fleſhy Fibres, as the animal Spirits variouſly ſtirred up do leap forth out of theſe or thoſe Tendons firſt, in the right or left ends of them, there they begin their Convulſions, and are determined to provoke to Stool or to Vomit reſpectively. Moreover whilſt that the Ventricle is diſpoſed after the aforeſaid manner to the upper egeſtion, the *Oeſophagus* conſpires alſo in the action for the caſting forth its Contents upwards. And for as much as we have noted in the fleſhy Coat two double orders of moving Fibres, of which one of them aſcending obliquely, the other deſcending, they all mutually do cut one another; the Office of the former ſeems to be, that they in ſtraining to Vomit being one ſeries after another contracted, may ſhut up the

By what fleſhy Fibres the Emetick Convulſion is performed.

Part I.

Throat behind for the casting forth of its Balast, and so cause it to be forced to that gaping of the Mouth.

Vomiting or a Convulsive motion.

Vomiting therefore, for as much as it is a violent motion of the Stomach, and very often involuntary, it is not undeservedly called Convulsive; which further we do affirm to proceed from the Explosion, or a certain great Expansion (according to our Spasmologie deliver'd in another place) of the animal Spirits, which possess these fleshy Fibres. For truly these Spirits being highly irritated and then presently bursting forth, they first of all rush impetuously from the Tendons planted near the left Orifice, and then presently out of others into the fleshy Fibres, and highly inflate and abbreviate them, so that the whole parts of that Coat being brought nigh together one after another, the whole Cavitie of the Stomach being straitned, and folded together, and so contracted upwards towards the left Orifice, it drives forward or more upward as it were with the stroke of a Bolt, whatsoever is therein contained, that it may be bolted forth by Vomiting.

How Vomiting differs from other Convulsions.

In most of the other kinds of Convulsions, the convulsive motion is wont to be made towards the same limit as the natural: but Vomiting seems to be an affection contrary or at least oppolite to the ordinary and natural Action of the Stomach. For it is its solemn and almost constant gesture, the whole or its parts, to be drawn downwards, or towards the *Pylorus*: for there is need of such a motion and of its tendencie, whereby the aliment swallowed down may be able to descend into the bottom of the Ventricle and there to be more straitly pressed, to be rolled from side to side, to be digested into Chyle, and at length to be transmitted to the Intestines. Therefore for these uses the moving Fibres of either order being inflated by the gentle incursion of the Spirits they easily compose the Ventricle after that manner which the instinct of Nature suggests.

But if any Irritation happens to the nervous Fibres of the Stomach, whilst the hurt is but small and easily removed, the expulsive Contraction is begun rather towards the *Pylorus* than towards the Throat: but in Vomiting the Convulsion of the moving fibres beginning at the other ends of them, *viz.* the left ends, and straitways becoming violent and impetuous compells the whole Cavity of the Stomach collected together, and greatly straitned, to be drawn up, and to be evacuated that way. The reason of which is, that if there be any thing very troublesom and disagreeing to Nature setled in the Stomach, it ought not be carried about the ordinary way, by the long *ambages* of the Intestines, that it might be at last expelled at the Fundament; but to be cast out by a more near *exit*, and that out of hand to be sifted out, lest by its stay it might cause an incurable disease. Besides, when very great grief happens in other parts at a distance from the Ventricle, lest that, whilst Nature is busied about them, the Stomach (where is the first Enkindling of Life) should receive any hurt, oftentimes for its greater safety Vomiting is excited by a consent. So that it is provided by the deep providence of the Divine *Architect* for the more certain custody of the humane Body as it were a Tower, as often as as an external Enemie shall invade, or that a sedition shall arise among the proper Inhabitants, forthwith, whatsoever Guests, as persons suspected, are cast forth at the neareſt Passage, to wit, the Gate of the Ventricle.

The Conjunct cause of Vomiting.

Therefore the next or conjunct cause of Vomiting is a sudden and vehement Explosion of the animal Spirits seated in the fleshy Coat of the Ventricle, by which indeed they are very much irritated, and then expansed, and rarefied, as they leap impetuously from all the tendinous Fibres, and then first and chiefly from those that are placed near the Mouth of the Ventricle, into the fleshy Fibres, so that they suddenly blow them up, and abbreviate them, wherefore as the Sides and Bottom of the Stomach being of course brought near together, and all together snatch'd upwards towards the left Orifice, they cast forth what ever is contained therein to the Pipe of the *Oesophagus*; from whence (when as its contraction from the Bottom to the Top immediatly follows) it is caried forth at the gaping of the Mouth.

By what reason the Spirits are stirred up in Emetic Convulsions.

These sorts of Spirits begin the emetick Explosions, because they are highly irritated: but after what manner that is done we have shown in our Tract of convulsive Affections; for that they being highly endued with an Elastick Nature, from a certain ὁρμῶν, yea sometimes they leap forth of their own accord by reason of some heterogeneous joyning together, and impetuously fling themselves forth

forth on all ſides. But for what cauſes and by what means it happens that they are ſo irritated, we ſhall inquire anon. In the mean time it may be obſerved that the Spirits inhabiting the Fibres of the Stomach do exiſt in ſome more thick and firm, that they are not, unleſs by a more ſtrong irritation, agitated into an emetick Exploſion; but in others they are either more ſubtil, or too much elaſtick, that from a light occaſion they are incited to a vomitive Convulſion. Moreover when any thing hurtful or moleſting afflicts the fleſhy Fibres of the Stomach, a Convulſion is excited in theſe towards the *Pylorus*, in others it is more readily carried towards the Mouth of the Ventricle, and from thence either Vomiting or Purging proceeds. Part I.

The more remote cauſes of Vomiting.

As to what appertains to the more remote cauſes of Vomiting, of which number are whatſoever do much or grievouſly irritate the Spirits ſeated in the fleſhy Fibres of the Stomach; which truly happens to be done after very many ways, we ſhall reduce them to ſome certain Heads. And in the firſt place may be referred hither improportionate objects approaching the interior and nervous Coat of the Ventricle or rather the Spirits inhabiting it; for this being hauled, oftentimes provokes the other lying over it into emetick Convulſions. Theſe Provocatives are either taken in at the Mouth, to wit, diſagreeing Food, Medicines, or Poyſons, or elſe a Matter begotten in the Ventricle, or laſtly brought thither from afar by the Arteries and the Nerves; or in the ſecond place the Spirits inhabiting the fleſhy Fibres of the Stomach are irritated by reaſon of ſome trouble from other Spirits at a diſtance inflicted here or there, and communicated from thence to the Ventricle by the Pipes of the Fibres or Nerves. Vomiting excited after the former manner, may be called the proper affection of the Ventricle, and this latter to be done by conſent. We ſhall note ſome Inſtances of all of theſe.

Vomiting in reſpect of the Ventricle is either Idiopathick or Sympathick.

The former proceeds from the irritation of its nervous Coat.

In the firſt place therefore an irritation made in the interior Tunicle, of the Ventricle provokes Vomiting before any other cauſe whatſoever. For this part being nervous and very ſenſible of impreſſions from all things conteined in the Stomach and according as theſe are either pleaſant or grievous, the fleſhy overlying Coat is ſtirred up to the motion of embraceing or caſting off; and as to the latter of theſe, as the improportionate object is more or leſs troubleſom to Nature, either Vomiting or Purging is ſtirred up. Further in this Coat of the Stomach there ſeems to be placed ſome peculiar ſenſibleneſs, both as to the touch and to the taſte diſtinct from any other thing in the whole Body. For truly when Medicines, or ſome Aliments, as *Stibium*, *Mercurius Vitæ*, the Flowers of Antimony, the Spawn of the Barbel, with many others being chewed in the Mouth, they have cauſed no trouble to the Senſe, but theſe being ſunk down into the Stomach, how cruelly do they irritate this Coat, and quickly ſtir up moſt grievous Convulſions. Moreover if any one ſhould ſwallow down, though unknown, a ſmall portion of diſagreeing Aliment by Antipathy, though it be never ſo ſmall, cover'd over with other Meats, and hid as it were with a Mask, it is known by the Stomach, and as if he were an Enemy entred clandeſtinly, he is immediatly by an excited force caſt out of doors. The emetick provocatives taken in at the Mouth are either Medicins, the reaſons of whoſe actings ſhall be given hereafter, or Poyſons, which produce that effect, for as much as they being of an infeſtous nature, do at the firſt touch overthrow the Stomachal Spirits, and bring them as it were into a Furie, or in the third place Aliments of which there is enough commonly known, for if they offend in a manifeſt or occult quantity, or in quality, or in the manner of taking them, or are improportionate to the Stomach, they for that cauſe do not rarely ſtir up Vomiting.

The emetick irritation.

The emetick Matter.

1. *Either taken in at the Mouth.*

Secondly, the emetick Matter is ſometimes begotten in the Ventricle; to wit, when the things taken in are not in fault, and when the Chyle or fermentative Juice of the Ventricle degenerates into a ſharp, auſtere, or bitter, or otherways infeſtous Humour, and for that cauſe irritative, as it very often happens in Cholerick and Hypochondriack perſons.

2. *Or begotten in the Ventricle.*

Thirdly, nor is this provocative Humour leſs frequently poured into the Ventricle, from another place: for beſides that Choler, and (as ſome are of opinion) the pancreatick Juice, ſometimes ſingly, and ſometimes together, being emptied into the Stomach, mutually ſtriving and boyling up do provoke its Fibres into vomitive Convulſions, there is moreover an heterogeneous Matter tranſlated hither by the Arteries, which oftentimes ſtirs up very great Vomitings; ſo it very often

3. *Or is pourid in thither from a nother place.*

Part I. often happens in the Paroxyſms and Criſes of Fevers, and eſpecially in the Plague, and ſmall Pox. Sometimes the ſanguineous maſs boyling up, not being indeed able to expell its ſuperfluities by the διαπνοὴν or Perſpiration, it pours it forth by the branches of the Cœliack Arterie, and by the cavities of the Ventricle and Inteſtines; ſo that their Coats being notably hauled they ſuffer horrid Vomitings, and alſo dyſenterick Paſſions; alſo the Vomitive matter ſeems not only to deſcend by the Arteries but ſometimes alſo by the Nerves. Hence very often the Colick ariſes as we have clearly enough ſhown: But truly I have obſerved in many (who have been obnoxious to convulſive Paſſions) after a ſhort Headach, with heavineſs, and Vertigo, that a vomiting affection hath followed: that they returned back by Vomit what they have daily taken in, without any notable impurity of the Stomach. The matter ſo poured forth by the Arteries or Nerves upon the Coat of the Stomach, ſo it be looſe and eaſily to be diſſipated, is quickly ſhaken off again, ſo that the Affection ſoon paſſes away, but if it be more fixed and adhering more pertinaciouſly to them, yea ſometimes growing into Humours of various kinds it induces a daily vomiting diſpoſition, and not eaſily curable.

Sympathetick Vomiting or by conſent.

So much of Vomiting, whoſe material or irritative cauſe being placed ſomewhere about the internal ſuperficies of the Stomach, and affecting the nervous Fibres by a naked touch, ſtirs up the Spirits inhabiting in the fleſhy Fibres into emetick Exploſions. There remain very many other ſpecies of Vomiting, in which an irritation is made in other places, and preſently the Stomach is ſtirred up to Convulſions by conſent: For indeed as there is ſo much alliance, and mutual dependency between this Inward and moſt of the other parts, it often happens, by reaſon of ſome of the animal Spirits ſomewhere very greatly diſturbed, that by and by the other Spirits that reſide in the Ventricle, either by the continuity of the Fibres, or by the paſſage of the Nerves, come to be in like manner affected, and to be driven into vomitive Exploſions.

By the conſent of what parts it is ſtirred up.

The places of this ſort of Sympathetick Vomiting are either more near, to wit, both the Orifices of the Stomach with the *Duodenum* and the *Oeſophagus*, or more remote, *viz.* the ἐγκέφαλος, and *meninges* (or thin Skins about the Brain and Heart) as alſo the Spleen, the Reins, the Ureters, Meſenterie, the Matrix, and perhaps other Inwards of the *Abdomen*; in one of which, or many of them together there being excited a Convulſion, and from thence communicated to the Stomach by the Pipes of the Nerves, it ſtirs up its fleſhy Fibres into emetick Contractions. In like manner when the animal Spirits in the Head are very much diſturbed, their diſorder by and by doth effect by conſent thoſe other inhabiting the Ventricle, and ſtirs them up into the like Convulſions or ἀταξίας: we will note ſome inſtances of each of theſe, with the reaſons of them.

2. Either Oriſice being affected.

In the firſt place either of the Orifices or doors of the Stomach, as they are very ſenſible by reaſon of the manifold Inſertions of the Nerves, they are eaſily irritated; and for that cauſe being brought ſometimes inwardly ſometimes outwardly, and variouſly expanſed, or ſhut up, they excite excretory Convulſions in the whole Ventricle, tending either upwards or downwards. There is nothing almoſt in it ſelf but that that it is ſenſible of, and the acid or bitter Humours fluctuating in the Stomach, and biting the left Orifice do provoke a Nauſeouſneſs and Vomiting. No leſs is the ſame effect produced by the flowing of the *Bile* into the *Pylorus*.

Vomiting from the Pylorus *being affected.*

It would be too much from the purpoſe to relate the Dreams of *Helmont* of the dignity and dominion of theſe parts; he affirms the left Orifice to be the Seat of the Soul, and the right, to wit, the *Pylorus*, of the Appetite, and to be the ſhop of the other Paſſions merely natural; beſides from its indignation, and obſtinate ſhutting up, horrid Vomitings to proceed. Although we do not at all aſſent to theſe; yet by reaſon of this Door's being too much ſhut up, that Vomiting and other evil affections of the Stomach do ariſe, the following Hiſtories will declare.

An anatomick Obſervation of this.

An illuſtrious young man, being a long while Cachectical, and labouring with often Vomiting, and that dayly for many Months and almoſt continually, at laſt his ſtrength being quite worn out he dyed. The Carccaſe being opened I found the *Pylorus* full of *Scirrhi* very tender, and ſenſible Pimples, round about, which had almoſt ſhut up its Mouth; ſo that the Chyle geting between the ſpace of the Nodes, did extreamly putrefie, and for that cauſe the whole Inward was almoſt

moſt continually affected with a moſt troubleſome Senſe, and Convulſion. No leſs will a very rare caſe of a certain Man of *Oxford* ſhew, an almoſt perpetual Vomiting to be ſtirred up by the ſhutting up of the left Orifice. A ſtrong Man, and otherwiſe healthful enough, labouring for a long time with often Vomiting, he was wont, very often, though not allways, preſently to caſt up whatſoever he had eaten. At length the Diſeaſe having overcome all remedies, he was brought into that condition, that growing hungry he would eat until the *Oeſophagus* was filled up to the Throat, in the mean time nothing ſliding down into the Ventricle, he caſt up raw (or crude) whatſoever he had taken in: when that no Medicines could help, and he languiſhed away for hunger, and every Day was in danger of Death, I prepared an Inſtrument for him like a Rod, of a whale Bone, with a little round Button of Spunge fixed to the top of it; the ſick Man having taken down meat and drink into his Throat, preſently putting this down in the *Oeſophagus*, he did thruſt down into the Ventricle, its Orifice being opened, the Food which otherwiſe would come back again; and by this means he hath daily taken his ſuſtenance for ſixteen Years and doth yet uſe the ſame Machine, and is yet alive, and well, who would otherwiſe periſh for want of Food. Without doubt in this caſe the Mouth of the Stomach being always cloſed, either by a Tumour or Palſie, nothing could be admitted into the Ventricle unleſs it were violently opened.

Part I.

Vomiting from the Mouth of the Ventricle being affected.

A notable caſe of this Vomiting.

No leſs frequently a Convulſion being excited, by reaſon of Irritations above this left Orifice, and below the *Pylorus* in its neighbouring parts, and propagated by the continuity of the Fibres into the Ventricle, it there ſtirs up emetick contractions. When in the ſwallowing down of Food by the Pipe of the *Oeſophagus*, it ſticks by reaſon of a Palſie or Obſtruction, and ſtimulates the nervous Fibres, preſently the fleſhy Fibres being contracted upwards they alſo by a conſent force the Ventricle into a Convulſion. The like effect at all times happens from the Palate and *Uvula's* beeing irritated. Hence very often an endeavour to Vomit, or vomiting is ſtirred up, from ingrateful Meat or Drink, allmoſt as ſoon as taſted in the Mouth, alſo by a feather put down the Throat. For the ſame reaſon alſo in the Pthiſick ſometimes a Vomiting accompanies, or follows the vehement Cough; to wit, throw the hauling or concuſſion of the ſame Coat, which in like manner covers the Throat, and the top of the wind-pipe. In like manner in the lower appendix of the Ventricle, *viz.* in the Inteſtines, if that any trouble happens any where with a Convulſion, oftentimes that affection, by the Continuitie of the Fibres creeping upwards, provokes Vomiting. For this reaſon Vomiting is excited in the Cholerick Diſeaſe, Iliack Paſſion and other Torments of the Inteſtines. Hence alſo ſome whoſe *Viſcera* are very tender in taking of a Gliſter conſtantly Vomit. It were eaſie, to heap up very many Inſtances of this kind, but we will paſs on to other cauſes of Vomiting.

The Sympathic cauſe of Vomiting in the Oeſophagus.

Alſo below the Ventricle in the Bowels.

3. Beſides theſe now mentioned ways in which an irritation is made in the Ventricle it ſelf, or in its appendix, it ſometimes happens that the Stomach, guiltleſs and well enough of it ſelf, ſuffers through default of other parts ſeated at a great diſtance; which is not done by the great continuity of Fibres, but by the Paſſage or Commerce of the Nerves. For truly by the leading Pipe of theſe, when that the Animal Spirits are diſturbed in one place, others dwelling afar off they receive the like irritations and fall into contractions: hence from a wound or grievous blow upon the Head, for as much as the Spirits within the *Encephalon* being diſturbed; by the paſſage of the eighth pair of Nerves, they ſtir up the others reſiding in the Ventricle into the Convulſions, Vomiting frequently follows: for the ſame reaſon, ſome being in a Ship, or riding in a Coach are troubled with huge Vomiting. The cauſe of which Sickneſs is not by any means (as ſome affirm) the agitation of the Humours; but truly the Animal Spirits inhabiting the Brain, being compelled into inordinate motions, they fall tumultuouſly upon the beginning of the Nerves, and by their leading Pipe ſtir up the emetick contractions of the Inwards. In the mean time the Matter caſt out by Vomiting, is mere choler, which is by reaſon of the former Convulſion powred forth by the Choler-carrying Veſſels; ſo far is it that it ſhould be the primary cauſe of Vomiting. Further when that the Stemms out of the Trunk of the ſame eighth pair of Nerves and the inferior Branches, diſturbed in the peculiar Inwards of the *Abdomen*, are irritated into Convulſions, other Stemms however untouched do not unfrequently receive the like diſturbance, and they themſelves impart to the

The cauſe of Vomiting ſometimes in the Head.

In the remote parts of the Abdomen.

Part I.

the other Inwards. and chiefly to the Ventricle, convulsive Motions. This of Vomiting is manifest for that it is stirred up in Nephritick Paroxysms, also in the Passions of the Colick, and hysterick Affections so called.

Thus far of Vomiting in general, and of its subject, formal reason, causes and various manners of doing it, in which hath been shown, that this affection is altogether stirred up by the Spirits inhabiting the fleshy Coat of the Ventricle being highly provoked, and drawn by their acting into convulsive Explosions, and they for the most part and chiefly into that sort of contractive Motions, by reason of the troublesom sense impressed on the interior nervous Coat; besides that those irregularities of the Spirits so affected, by reason of the Spirits being disturbed in other places, do communicate by the continuity of the Fibres, or the Pipe of the Nerves, their disorder to the Ventricle. These things being premised, it remains next that (as it was in the second place proposed) treating of vomitive Medicines, we do shew by what manner and by what sort of strife they operate in the Ventricle, and other parts of our Body.

How the emetick Medicines do operate.

Concerning these it is very obvious to conceive, that Vomits being taken in at the Mouth, and received into the Ventricle, do at the first irritate its interior nervous Coat, and press on it a sense of the trouble, and afterwards by the instigation of this the over-lying fleshy Coat is affected, and stirred up to excretory contractions for the casting off this Grief. But truly as to the manner of irritation and the ways of excretion, there are some differences, and the reasons of them are not very manifest.

For first of all when that cathartick Medicines, being taken into the Stomach do provoke its fleshy Fibres into exterior contractions, from whence comes it, that from these more often and rather Vomiting is stirred up, and from those purging, not indifferently either?

2. Further concerning those which for the most part and almost constantly move Vomiting it is to be observed, a certain Energie either in the manifest reason of its working, to produce that effect, as when that which is taken is truly ingrateful in taste, in smell, or any other sensible quality, or that they offend in quantity; and moreover some Medicines, to be given, being more properly and specifically disposed for Vomits, the emetick Virtue of which is altogether hid from our senses, only it betrays it self by manifest effects in the Stomach. The solutions of these will make very much to the well building up of Emetologie.

Vomitory Medicines from Cathartick differ, are either.

1. As to the first, that such a Medicine should rather operate by Vomit, than by Stool, that ought to consist in the particles of it, which, as they are deadly or at least disagreeing to Nature, besides that they may be so as to the quality, or quantity, that neither may indeed be overcome by the Stomach; neither may they be able to be suffered by it so long until being scoured off by little and little from the Fibres or little Strings, and together with other Juices leasurely and by Parts be cast out by the *Pylorus*. But truly because they either do more severely haul the Fibres of the Ventricle, or adhere more pertinaciously to them, or do aggravate it by their motion, and distend it, presently the fleshy Fibres prepare for excretory Convulsions, and then by the instinct of Nature, they are rather contracted after that manner, by which they may send forth a doors that which troubles them with the greater force, and by the shortest *Exit*. How the fleshy Fibres are moved in order to Purging, we shall declare hereafter.

Emeticks which are either gentler or stronger.

2. As to what respects the distinction of Emeticks, and the divers reasons of their working, they are commonly understood to be twofold, *viz.* more gentle and more strong; the former of which do bring into open view their emetick Force, and bring forth their irritative Power by manifest Marks: as when the Decoction of Hyssop or Carduus, or the infusion of Sea Onyon or Radish Roots, or a solution of Vitriol, warm Water or honied Wine or such like be plentifully drank; which even at first sight move the Stomach with the tast, they are forced to a striving to Vomit: those being exhibited, that Vomiting might follow, oftentimes an irritation of the Palat or Throat is fain to be supplied, secondly the more strong Emeticks, (and which more properly belong to this Class) are Medicines of that sort, that if they be taken in due qnantity they stir up Vomiting almost in all persons: of which are first of all white Hellebore, *Nux vomica*, Vitriol, as also the various preparations of Mercurie, which although proper enough

enough for the use of a Physitian, yea although they are indeed very necessary, yet as to their Nature and Forces, in which the emetick Power consists, they seem to differ little from Poysons; wherefore if they be given in too great a dose, they do not rarely cause Death. By what course and after what manner of affecting, these do operate in the Ventricle and on the other parts of the humane Body, now indeed remains to be inquired into; we will first of all add the most notable *Phænomena* which do chiefly occur in this kind of Evacuation.

Part I.

The more strong differ little from Poysons.

Antimonial Emeticks and other more strong being taken into the Stomach, are not wont presently (unless in such who before-hand loth them) to irritate, or to give a sense of their trouble; but afterwards sometimes sooner sometimes later, a nauseousness and perturbation is perceived, then a contraction of the Stomach, and ascending, with an opening of its Orifice and a leaping up of the *Oesophagus* towards the Throat follows; and presently after Vomiting; this being done, these *Viscera* sink down, and for a little time are quiet: but a little while after the inquietude of the Stomach, and nauseousness and the ascension of that, and of the Throat returns with Vomiting, and so the force of Vomiting, and ceasing from it, are often repeated by turns, until this operation ceases, the strength of the Medicine being wholly worn out.

By what means they operate in the Ventricle.

At the beginning of Vomiting the Ventricle seems only to be contracted upwards, and not to be hugely provoked. Afterwards, its Convulsions are more vehement, and unfold themselves more largely, so that the *Duodenum* by an inverted motion, directs its contractions upwards, and whatsoever is contained in the Stomach (which is the intent of the emetick irritation) pours forth: if the irritation be yet further stretch'd, there not only follows Convulsions, but often times distentions, and puffings up, and the more dangerous Convulsions of the Ventricle, to wit, a yexing or hickcock: and truly by reason of the animal Spirits being disturbed in their whole *Systasit*, and sometimes too much dissipated or excited, frequent Swoonings, cold Sweats, and not seldom deadly Convulsions of the Members or of the whole Body happen.

And by what rite or manner they affect it.

A stronger Emetick being taken, when the Stomach begins to cast, first of all is cast out that which fluctuates in its Cavity, next whatsoever of viscous Flegm that sticks to its hairy Scurf or is hid in its Folds. If the Vellication persevere, the serous Humours are pressed forth of the little Mouths of the Arteries and Nerves; then the Convulsion being communicated to the *Duodenum* by its Pipes, the Choler and pancreatick juice being extorted from the Passages, they are carried forth and spread into the Ventricle. Hence the bilious matter for the most part is cast forth last of all, and then not seldom mere Bile is copiously vomited forth: which if it so happens, upon every turn of excretion, Pains being excited a little below the Ventricle on the right side do creep upwards; which without doubt proceeds from the Biles being thrust out into the *Duodenum* and from thence spread abroad within the *Pylorus* by reason of the convulsive Motion, and inversion of the Intestines. If that the irritation doth not yet cease, the Arteries (their little Mouths being highly irritated) do pour forth the Humours to be purged out, from the whole mass of the Blood.

What several sorts of matter, and of what kind, are cast out by Vomits.

From this History of Vomiting it may be lawful to conjecture, how and by what means an emetick Medicine doth operate, *viz.* this being immersed in the Ventricle, mingling it self with the Humour which is conteined in that place, and impressing its Tincture, by little and little is received by the hairy Crust covering the inward Superficies: from thence the nervous Fibres, framing the interior Coat, and sustaining this Crust, leasurely imbibe this virulent Tincture; with which when they are in part filled, they begin by reason of the incongruity of the Juice, to grow into Wrinkles, and to be greatly unquiet, from whence the overlying fleshy Fibres, being irritated because of the grief received from the nervous Fibres, they begin here and there up and down, the first lighter Convulsions; from whence comes a nauseousness and perturbation of the Stomach; and by and by the Spirits inhabiting all those of either interior order grow highly angry, and thrusting themselves forth they cause very strong and emetick Contractions, whereby that grief shook off from the nervous Fibres might be cast forth by Vomit: and when by this means these Fibres are freed from the medicinal Juice which they had drunk in, the endeavour to Vomit Ceases for a while; until being again imbued with a new provision of the Virulent Tincture, which

The reason of vomitory Medicines and the manner of their working described.

Part I.

they had then drawn from the hairy Cruſt they are provoked into the like trouble and emetick Irritation: and ſo often the force of Vomiting is repeated until the matter of the poyſonous Tincture, be alſo cleanſed from the hairy Cruſt and that it be at length wholly caſt out a doors, and that the nervous Fibres of the interior Coat do not imbibe any more of that Poyſon.

Wherefore Emeticks operate by turns and intervals.

But indeed it doth not always follow that Vomiting doth therefore ceaſe, although the Medicine be wholly caſt out, and none of its Contagion left behind, for notwithſtanding thoſe Spirits of the Stomach oftentimes, being too much provoked they very hardly lay aſide their Furie; ſo that they are irritated by any other Juice which the nervous Fibres drink in, and are agitated into emetick Convulſions, and alſo repeat them by frequent Fitts: wherefore then, that Vomiting might ceaſe, there ſhould nothing either of nouriſhing or of cordial Drink be taken into the Ventricle, but it muſt be appeaſed by ſleep, and the application of an outward fomentation.

Wherefore Vomiting is eaſily quieted.

The Humours being expreſſed into the Ventricle oftentimes increaſe the operation of the Medicine.

Further ſometimes other Humours being expreſſed out of the Veſſels, and poured into the Ventricle eſpecially from the paſſage of the Bile, doth not only add ſtrength to the Vomitory Medicine, but its operation being ended, they continue, to provoke the Stomach further, and to urge it into excretorie Contractions: yea its nervous Fibres drink in that yellow Poyſon, not leſs troubleſom than the emetick Tincture, excite Convulſions, and continue beyond the force of the Medicine, theſe frequent fits of Vomiting, for the thruſting away that grief. For this reaſon, when that Choler abounds, upon every light occaſion it is ſent into the Stomach: and very often by the moſt gentle Medicine a cruel Vomiting with horrid Symptoms is excited, for the appeaſing of which it is convenient to exhibit an aſſwaging Gliſter, whereby the turgencie of the choler may be ſolicited towards the inferior parts.

Wherefore Vomitory Medicines work in ſome ſooner or preſently.

But that ſometimes Vomiting immediately follows the emetick being taken, when, to wit, the Medicine is ſcarce got to the bottom of the Ventricle, nor yet entred deeply into its Fibres, the cauſe is, either that the hairy Cruſt being in ſome part worn out (as it is wont in Gluttons, and great Drinkers) the nervous Fibres being naked are quickly and eaſily irritated, or becauſe the phantaſie, being averſe to the Medicine, it firſt of all brings in a nauſeouſneſs, or laſtly becauſe the Stomach being much burthened with the putrefaction of the excrementitious matter, it was before hand prone of its own accord to Vomit. As to what appertaines to the nervous Fibres which drinking in the emetick Tincture conceive a Senſe of the Grief, whereby the fleſhy Fibres are irritated into contractive Convulſions; they are indeed the ſame, which cauſe very much the hunger or barking of the Stomach, being emptie, and being dry, thirſt; and being ſatisfied by the grateful Juice of the aliments, they communicate a complacency to the Ventricle, and a refection beſides to the whole Body.

Vomitorie Medicines in ſolid forms work.

It is obvious enough to be underſtood when as they are wont to adminiſter Emetick Medicines in a liquid or a ſolid form, how the former do come to an irritative plenitude. But yet as to the latter it is doubted by ſome and that deſervedly, even by which way a very little Powder, as of Antimony or of the Flowers of Antimony, being taken in weight but three or four Grains, ſhould cauſe ſo very great Vomiting; when from ſo ſmall a Medicine, and not eaſilie penetrating, it ſhould ſeem that theſe Fibres ſcarce in any part ſhould be imbued, at leaſt not ſo much as might ſuffice for an emetick irritation. For this we ſay that that Medicine given in a dry ſubſtance, is preſently diſſolved, and doth impregnate the Humour great enough in the Ventricle, ſo as by an Infuſion made even of *Crocus Metellorum*, the Stomachal Fibres imbibe the diſſolved particles of the antimonial Sulphur, and from thence are irritated into emetick Convulſions.

Vomitory Medicines do not operate alike in every doſe.

What is aſſerted by ſome that a vomitory Medicine given in how great a doſe ſoever doth not operate more ſtrongly, than if it had been taken only in a leſſer quantity, is very far from the truth, and the experiment of this thing is not to be made without danger; for that if there be more particles of the Medicine, they alſo imbue the more Fibres, and entring more deeply into them, they more grievouſly provoke them, ſo that more cruel and frequent Convulſions muſt neceſſarily follow.

Vomitory Medicines are not indued with a ſpecific Vertue.

As to the vulgar opinion, that Vomitory Medicines do agitate the Humours upwards and ſift them out through the upper parts by a certain ſpecifick propertie, it

ſeems

ſeems to be meerly frivolous; for of what ſort that Virtue ſhould be, none hath been able to explicate, nor indeed to prove that there is in truth any ſuch thing. In the mean time for the underſtanding of the Emetologie it will be enough to conceive that the particles of a Medicine very infeſtous to Nature being imbibed by the nervous Fibres of the interior Coat of the Stomach, do induce a great trouble to them; from thence that that Juice might ſuddenly and the neareſt way be expelled again, the fleſhy Fibres of the other Coat are irritated, and inſtigated into Emetic Convulſions. But that indeed is urged by ſome, that white Hellebore applyed to the Navel, and an infuſion of *Crocus Metallorum* given gliſterways doth move to Vomit, haveing often made the experiment I cannot find to be true. But if it ſhould be ſo ſometimes, why ſhould not a violent irritation inflicted on the Inteſtines, at the ſame time ſtir up Convulſions and inverted Contractions, and afterwards ſecondarily and by conſent Vomiting in the Ventricle? (by the like way indeed, this affection of the Ventricle, comes oftentimes in the colick, and in the Iliac Paſſion) one time, I injected into the jugular Vein of a ſtrong Dog about ſix ounces of Wine impregnated with an infuſion of Antimony; about five or ſix minutes after he began to reel, and faulter in his going and afterwards to Vomit extreamly. But we may ſuppoſe this effect to have been cauſed from the Medicine aſſaulting the Brain rather then the Stomach, when the like Vomiting follows after a Liniment or a Fomentation of the Juice or decoction of Tobacco applyed to the Head.

Part I.

They operate not on peculiar Humours.

Neither is that opinion built upon leſs trifling Foundations and as we judge, as far from the truth, which affirms certain vomitory Medicines to work upon choler, others on Flegm and others on Melancholy, and to bring away this or that Humour, ſearch'd out and as it were whole from the reſt. But about the choice to be made in Emeticks, the cheif regard of the difference to be obſerved is, that in ſome griefs the more gentle are to be adminiſtred, which diſturb nothing beyond the Ventricle, and do gently bring away only thoſe things which flow about its Cavity, or adhere to its Coats: in other caſes more ſtrong are convenient, that by a Convulſion communicated alſo to other *viſcera*, whatſoever excrements overflows in them, or is heaped up any where elſe, may be moved out of the Mine, and preſently caſt forth a doors either upwards or downwards. And for that ſometimes a viſcous Matter and as it were Phlegmatic is cheifly ſifted forth, the cauſe is, for that the ballaſt of the Ventricle, the receptacle of the bilious Humour being unſhaken, is almoſt only purged out, but when the choler-carrying Veſſels are cleanſed, the excretion comes forth the moſt part bilious. The Vomiting of a black Humour depends very much upon the Tincture of the Medicine, for vitriolated Medicines infect the out caſt Matter with blackneſs.

From whence that vulgar Error aroſe.

The emetick Evacuation if it be convenient is more Efficacious than any other.

Evacuation by Vomit as it is more violent than by Stool, ſo if there be ſtrength to bear it, in ſome diſeaſes it is more profitable or helps more than ten purgations. For by this means heavie Phlegm growing in the Folds of the Stomach, which all the other Catharticks ſlide beſides, is purged away or cleanſed as with a Broom, beſides the neighbouring parts, the Pancreas, Meſenterie, Spleen, and Liver it ſelf are moved by its ſtrong Convulſion, ſo that obſtructions made in them alſo, whatever ſtagnations there be of the Blood and Humours, are eaſily removed by this kind of Remedy. The extraneous Ferments begot every where in the Body, and alſo the more ſecret Seeds of Diſeaſes are rarely extirpated without the applying of vomitory Medicines; but chiefly in the Diſeaſes of the Brain and Nerves the uſe of Emeticks is eſteemed very helpful, for by this kind of evacuation, not only the Filth of the Stomach and the Inwards, which pollutes the Chyle and Blood, is plentifully cleanſed away, but alſo the Glandulas, which are the emunctories of the Blood, and nervous Juice, being placed in the *viſcera* are ſqueeſed. the Choler-leading Veſſels, and other receptacles of the Excrements are copiouſly evacuated, for that the ſame being emptied they more readily receive the *Serum* and other Purges of either Humour, and the ſuperfluities otherwiſe apt to reſtagnate into the Head: moreover, when as the innumerable little Mouths of the Arteries under the hairy Cruſt do open into the Ventricle, this being by a vomitory Medicine notably hauled, they pour forth what vitious or malignant Humours are abounding in the Blood, and there by Vomit they are ſifted forth, and therefore it is chiefly for this reaſon difficult diſeaſes are beſt cured by Emeticks, and ſcarcely without them. For truly theſe Medicines ſhould be of an untamable and active

Part I.

Nature, and not only ſqueez forth the ſuperfluous Humours from the maſs of the Blood by pulling and hauling the Arteries, but ſcatter abroad the Blood, by entring into the Pipes of the Veins, which there do gape and are innumerable, and do precipitate its ſeroſities and other excrements and cauſe them to ſeparate. But in the mean time this emetic Evacuation ought not to be uſed indifferently by all; For that in ſome the tone of the Ventricle is too lax and weak, and the conſtitution ſo tender that the Spirits immediately become faint with vomitory Medicines, and looſe their ſtrength: others again have *Viſcera* of an immoderate and pertinacious Senſation, that although they are very difficult to Vomit, yet having once begun Vomiting it is not eaſily allayed, but with the very often endeavouring to vomit, they are brought to a great loſs of their ſtrength and to a failing of their Spirits.

But more Dangerous.

The Indication of the vomitory Medicine.

Wherefore that the vomitory Medicine may be rightly exhibited, we ought to weigh, what are its Indications or Signs of the need of it, to whom to be permitted, and to whom to be prohibited. Emeticks ſeem to be needed, when the bilious and bitteriſh Humour fluctuates in the Ventricle, that from thence a nauſeouſneſs, an ingrateful ſavour, or ſhort Headach do ariſe, alſo if the Stomach be burthened with a clammy Phlegm, as in the long diſeaſe of Maids, and in Men after Surfeting, and inordinate Eating. In moſt caſes when with difficulty of Breathing the Ventricle being full is affected with a Queaſineſs or Nauſeouſneſs, evacuation by purging is wont to be uſed. Further when the Stomach is preſſed with an extraneous ferment that what ſoever is put into it is preſently caſt back again by Vomit, alſo by reaſon of far diſtant parts, Vomiting is not ſeldom uſed ſuccesfully: for by this means the Choler-carying Veſſels are very greatly emptied, that the Choler being plentifully powred forth from the Blood its feveriſh dyſcraſie may be taken away. Furthermore, for as much as the ſuperfluities or ſtagnations of the nervous Humour are moſt eaſily cured by the means of this evacuation; in the Gout, *Aſthma*, Epilepſie, Madneſs, and very many other Diſeaſes, which are accounted great and difficult, the uſe of Emeticks comes to be no ſmall means of curing.

2. To whom permitted.

Secondly they permit the taking of this Remedie, where there is ſtrength of the *Viſcera* and firm conſtitution of Body, and chiefly to theſe who have a more ſhort Breaſt and Neck, and whoſe Mouth and Ventricle are not far diſtant: alſo the Laxity of the Matter to be purged forth, a ready ſeparation, alſo an appeaſing of Nature, and an intention or leaſure to this work make for the facility of Vomiting.

3. To whom prohibited.

Thirdly they prohibit an Emetick where there is a difficulty of Vomiting or an unaptneſs found by a former experience, a tender and ſoft conſtitution of Body, a tall, and ſlender Stature, infirm Inwards, and breifly where there is a conſumptive diſpoſition, with an Ulcer of the Lungs, or ſpitting of Blood: alſo a too great Cachexie or evil diſpoſition of Body in which there is danger, leſt the Humours ſhould be preſſed forth from the whole Body into the Ventricle: alſo they exclude altogether this kind of Evacuation where there is an unwonted effervescency of the Blood, the Paroxyſms of Feavors, and the expectation of the Criſis.

The Diviſion of Emeticks.

The Medicaments whcih are called Vomits are wont to be diſtinguiſhed according to the force of their operating into gentle, mean, and ſtrong: as to the matter out of which they are taken or prepared, it is out of the parts of Minerals, Vegetables and Animals: as to the ſavour they are very ingrateful to the Palate, as Vitriol, Tabacco, Roots of Bryonie *&c.* or grateful enough in Savour; as the Fruit of Mezereon, Indian Nut, the Spawn of the Barbel or Mullet, or elſe almoſt inſipid, as the Flowers of Antimony, *Crocus Metallorum*, *Mercurius Vitæ &c.*

Chap. II.

Part I.

Chap. II.

Prescriptions of Vomits, and the declaration of the Reasons of some of them as to their preperations and Chymical Analysis.

Take of Oxymel of Squills ℥iß *of Wine of Squills* ℥iß, *mingle them and make a Vomitorie.*

Take from 6 *to* 9 *of the fresh Leaves of Asara bacca, Bruise them and put them into* ℥iij *of white Wine, squeese them forth, and take it with care.*

Take of the Powder of the Roots of Asarabacca, ʒj *to* ℈iiij *of Oxymel of Squills* ℥iß *mingle them and take it in a draught of Posset-drink.*

Take of the Salt of Vitriol from ℈j *to* ℈ij *or* ʒj *let it be taken in a draught of Posset-drink.*

Take of the infusion of Crocus Metallorum ℥ß *to* [redacted] *or* ℥iß *let it be taken in a draught of Posset-drink with governance.*

℞ *Of the infusion of Crocus Metallorum* ʒvj *of the Wine of Squills* ℥iß *of the Syrup of Vinegar simple* ℥ß *mingle them and make a Vomitorie.*

℞ *Of the Sulphur of Antimony* gr. vj *to* viij *of the Cream of Tartar* ℈j *mingle them, let it be given in the Pap of an Apple, or in a stew'd Prune or a spoonful of Grewel.*

℞ *Of Mercurius Vitæ* gr. iij *to* vj *take it after the same manner: so likewise are taken the Flowers of Antimony, or Aurum Vitæ or Præcipitatum Solare, and Turbith Minerale.*

The Chymical Emeticks which are cheifly known are prepared first out of Vitriol, secondly out of Antimony, thirdly out of Mercurie.

Salt of Vitriol.

Vitriolated Emeticks.

THe Salt of Vitriol is prescribed after divers manners, *viz.* from elixiviated Colcothar, out of blew Vitriol calcined, and washed according to *Angelus Sala*, and out of white Vitriol purified by many Solutions and Coagulations, which Medicine is commonly called the *Gilla* of *Theophrastus*, it is the safest and most easily prepared of them all; but the two first Medicines are notably Styptick, and as often as they have passed the Fire yet some Corosiveness remains: but the last is gentle enough, it pulls the Fibres of the Stomach softly and makes it somewhat to wrinkle it self, so that, at last, that they might shake off the Grief, they fall into Convulsions and endeavouring to Vomit, which notwithstanding quickly pass off, and the perturbation of the Ventricle is presently appeased.

The Gilla of Theophrastus.

Its use.

The Salt of Vitriol is therefore the more esteemed, because that it very rarely moves beyond the Stomach, neither like Stibiated Medicines causes the Convulsions of the Inwards and inordination of the Blood, or failing of the Spirits, but yet it hath a fault that it operates slowly, and sometimes scarce at all, wherefore when Vitriol is taken, there is need oftentimes of drinking good store of Posset-drink, to provoke Vomiting by a Feather put down the Throat, or to help it with Carduus Posset or Oxymel of Squills.

2. Antimonial Emeticks.

Crude Antimony, the whole mixture remaining, works neither by Vomit nor by

Part I.

by Stool, the reason of which is because that the saline and sulphureous particles from whence the Emetick Virtue proceeds, being bound up in it, and being involved with others, they cannot put forth themselves; notwithstanding this Concrete being unlocked by a certain preparation, and somewhat loosned, those Particles being freed they are rendred ready for Action. But if it be inquired into whether the vomitive Faculty depends on the Sulphureous, or on the Saline Corpuscles? it seems to be of neither apart, but of both combined together: for when that those are given apart from these, as in the Tincture of Antimony, or these from those, as in its Cerus, no Vomiting follows. We have elsewhere taken notice that mere sulphureous or saline Particles tasted and smelt scarcely move, but both together conjoyned do strongly affect these Senses. In like manner we judge it to be with the peculiar Sense of the Ventricle, that even it doth receive great pleasure, and trouble from sulphureous Salts, and that in their grateful or displeasing Compositions both Cordials and Vomits do consist. *Stibium*, that it may be made an active Medicine, is wont to be prepared either by it self, as it is done in the Glass, and Flowers of Antimony, or with Salts and that either with Salt Nitre, as its Crocus, or with fixed Salt, as its Sulphur, or with acid Salt, as its Butter, and that which is made out of it *Mercurius Vitæ*. There are more emetick Preparations of Antimony, but these aforesaid are of chiefest Note, and are most commonly used. Care is first of all to be taken that the Antimony, by which both these Medicines or any others are rightly prepared, be chosen pure and unmixed with Lead. As to that, besides the brightness and firmness of its Streaks, the most certain way of tryal is, that a little piece of the corrected Mass be Calcined with an equal part of Nitre, it is a sign of its Goodness, if it shall run into Liver and Dross, for otherways a part of it melts into pure Lead. By this means sometimes I have gotten out of one Pound of Antimony two Ounces of Lead.

Crude Antimony is no Emetick.

In what the Emetick Virtue of Antimony consists.

By what means its particles are made Emetick.

1. *Glass of Antimony.*

The Glass of Antimony.

℞ Of the Powder of Choice Antimony as much as will suffice, let it be calcined in an Earthen vessel, work it till it hath left off smoking, and acquires an ash or grey Colour; the matter being taken away and enough subdued in the Crucible, let it be poured forth on a Table or on a Skin, growing stiff into a clear Glass, it goes into a purplish Colour. The Dose of this Powder is from *gr.* iiij to vj, of the infusion in Wine the Dose is ʒvj to x: it works strongly.

The Reason of its preparation.

The reason of the aforesaid preparation (as I think) is this. Antimony in the Calcining of it is so long agitated, that whilst the Sulphureous particles do copiously evaporate, the saline Particles, being apt to vitrifie may run together more thickly; which afterwards, whilst the Mass is melted by a strong fire, laying hold on the attenuated earthly particles, they easily grow together into Glass: which by reason of some sulphureous Particles yet remaining growes red and becomes an Emetick. For indeed the *Stibium* is in a great part or altogether deprived of its Sulphur, to be disposed into Glass, as it manifestly appears by this, for that the *Calx* or the *Caput Mortuum* that is left of the distillation of the Butter of Antimony, melts by fusion into Glass; which notwithstanding is White and voyd of an emetick Virtue, for that all the Sulphureous Particles ascending had altogether left that Mass.

2. *The Flowers of Antimony.*

The Flowers of Antimony.

Take of Select Antimony and powder'd what you will, let it be sublimed in a Cucurbit with an Alembick or an earthen Vessel fit for this Work with a moderate Fire, either by it self or with Sand, or the Powder of Bricks, or Calcined Tartar mixt with it: the Flowers ascend Yellow, Citron Colour, and White, of which those that are White are Collected, and reserved for Use.

The reason of its preparation.

In this preparation the Saline and Sulphureous Particles of the Antimony ascend, the wateriſh and earthie being shaken out, and combine together; wherefore, when both the mineral Body is very much opened, and chiefly the active little Bodies

Bodies (the more heavy, which did blunt them being put away) are joyned together, this becomes a strongly Vomitive Medicine, and not very safe. Its Dose is *gr.* ij, iij, iiij. Part I.

3. *The* Crocus Metallorum.

Take of picked Antimony and of the most pure Nitre alike ℥iiij, pounded asunder, and carefully mixed in a brasen Morter, and by flinging in a live Coal set it on fire, and it will burn with ratling Noyse: at length the Mass being left somewhat reddish (which by reason of the Colour is commonly called the Liver of Antimony) is separated from the dross partly black partly white lying about it, and reserved for use. The Liver is given in substance to *gr.* iij, iiij or v; the Wine of its infusion from ℥ß to ℥j or ℥jß. This works well enough, and is the most used Emetick. *The preparation of the Crocus of Metals.*

The reason of this Process is, that the Nitre be pounded, and mixt with Antimony as it were with common Sulphur, that both the mixtures might be easily fired, for that both the Particles, to wit, the nitrous and sulphureous being requisit to or fitted for ny accension or burning do copiously and intimately come together or agree. By this conflagration the mineral Body is sufficiently opened, and its Particles loosned one from another, and although a certain proportion of the Sulphur flyes away, there is however enough left that combined with the Salt doth produce a rubie Colour, and emetick Virtue. In this preparation if that the Nitre be mingled in a greater proportion, the Antimony will be too much calcined, and the remaining Mass after its burning, being imbued with less Sulphur, becomes no more red, but yellow or citron Colour, and less Vomitive. *The account of the reason of it.*

4. *Sulphur of Antimony.*

Take of the Salt of Tartar or of Wormwood ℥viij, let it be melted in a Crucible set into a Wind Furnace, then cast in one Spoonful after another ℥vj of crude Antimony pulverised, let it flow for a quarter of an Hour, then pour it forth into a silver or brasen Vessel, and let the Mass of a saffron or yellow Colour be edulcorated by often washing it. The Dose is from *gr.* v to x: it works much gentler and kindlier than any other preparation besides. *The preparation of the Sulphur of Antimony.*

In this preparation the fixed Salt being made to flow by the Fire unlocks the Body of the Antimony which is chiefly composed of Sulphur, and an acid Salt, for whilst that the Salts are so combined, the sulphureous Particles are the more loosened, and the saline Bitings become less sharp; wherefore though it may be highly red, yet it doth not greatly or violently irritate the Stomach: further by reason that the Sulphur is more loosened and the Salt more at liberty, its Powder easily communicates its Tincture to the Spirit of Wine; which, when that it hath quite forsaken the saline Particles, it looses its emetick force, and becomes a notable Comfortative. *The reason of it.*

That indeed Antimony, and common Sulphur, and perhaps many others of the same nature, consist of an acid Salt and Sulphur combined together, may be made evident by very many experiments: for besides that the Concretes of the same kind are easily unlocked by fixed Salt, further if at any time they are dissolved by a sulphureous *Menstruum*, as Oyl of Turpentine, Juniper or Linseed, their Sulphureous Particles being imbibed by the Solvent, the remaining saline Particles (which distilled, run into an acid Liquor) do easily grow into Crystals: This is most evidently plain in the preparation of the Balsam of Sulphur. But if an acid *Stagma*, to wit, *Aqua Fortis* or *Aqua Regia*, be poured upon pulverised Antimony, and distilled with a strong fire, a citron coloured Sulphur hardly to be discerned from the common Sulphur will be sublimed in great quantity; it being certainly an assured mark that the common Sulphur consists cheifly of sulphureous little Bodyes compacted with an acid Salt. Out of the Sulphur of Antimony prepared as it is above described, I make a Liquor of an oyly form, which *The Syntheſis of Antimony and common Sulphur.* *Their Analyſis.*

Part I.

which very pure Sulphur of Antimony will guild Silver at the first smearing over, and is of excellent use in Medicine.

Mercurius Vitæ.

Take of Choice Antimony and Mercurie sublimate alike ℥vj let them be pounded together, and being well mixt distilled in a glass Retort in Sand, a gummie Liquor will ascend like Ice exceeding corrosive, which adhering to the Neck of the Retort melts if you apply Fire to it, and falls down into the receiver. This being cleansed by rectification or by flinging therein spring Water it will be precipitated into a most white Powder, the Water in the mean time getting a sharp taste like the Spirit of Vitriol. This Pouder being edulcorated and dryed is, commonly called the Mercury of Life and *Mercurius Vitæ*, but not truly, when as it contains nothing at all of Mercurie in it, and unless it be cautiously given, it is oftner the Author of Death than of Life. Its Dose is from *gr.* iij to vj.

The reason of this preparation. In this operation the Spirits of the acid Vitriol and Nitre, being combined first of all with the Mercury in the Subliming, when they are loosned by the Fire, deserting that first guest, they more lovingly embrace the little Bodies of the Antimony, and when being elevated by the force of the Fire, they grow together into an icy-form substance, which consists of the whole Sulphur of the Antimony with a little of its Salt, and also of the sharp *stagma* of the Nitre and Vitriol, by reason of the saline Particles it grows stiff like Ice, and because of the sulphureous Particles it is melted by the Fire. This matter, Water being poured thereon, is precipitated into a white Powder, which consists meerly of antimonial Bodies, like to the Flowers of Antimony; in the mean time the sharp Salts being loosned in the *Menstruum*, they make it sharp like the Spirits of Vitriol. But that notwithstanding, this Powder hath nothing of Mercury in it, it is clear, because this being deprived of its congelative Salts, it resumes its ancient species of Quicksilver, and the whole is collected in the retort. And truly those Salts are eatily taken away from Mercury, and of their own accord desert it, as often as they find another Body more friendly: hence if that you boyl sublimate with iron Plates in ordinary Water, by and by the Salts embracing the Iron, the Mercury revives.

The correction of this Medicine. This too cruelly vomitive Powder if it be brused with calcined Sea Salt, and sweetned by often washings, becomes much gentler, and safe enough, for that the sharp pricking Salts of the Medicine are consumed, or overcome by the Salts of another disposition. Further if it be put to fusion with Nitre in a Crucible, the sulphureous Particles being wholy taken away, it forthwith looses its emetick Force, and even becomes pure Diaphoretick Antimony.

How antimonial Vomitories operate in our Bodies. So much concerning antimonial Vomitories whose Particles being dissolved in the Stomach give it a sulphureous-saline Tincture, which its Fibres Imbibing, are so notably hauled that a Convulsion being there excited on every side through its whole Cavity, as also reaching to its near adjoyning *Viscera*, to wit, the *Duodenum*, the Choler-bringing Pore, the Passage of the *Pancreas*, it causes what is contained in them all to be squeesed forth, and to be emptied into the Ventricle, yea the serous Humours to be drawn from the little Mouths of the Arteries, so that cruel Vomitings and Vexations follow for a long time after. It is also probable that some of its emetick Tincture is likewise received into the Veins, which by means of the running together of the Salts is delated thorow the whole sanguineous Mass, and induces struglings and combinations, Precipitations and Excretions of a certain matter: wherefore the Diseases of parts at a great distance, to wit, cutaneous Diseases, Leprosies, and Gouts, are sometimes cured by antimonial Medicines.

How Mercurials. But yet Mercurial Medicines (of which we shall speak next) do effect this much more powerfully; for that they stir up not only Vellications and vomitive Excretions in the Stomach, but moreover by their more active Particles communicated to the Blood, they cause its divers manners of Fluxions, and also dissipations, precipitations, and separations of the Serous and of other Humours; by which means besides Vomiting and Purging, evacuation by Urine, by Sweat, and sometimes Salivation

tion is procured, wherefore in inveterate and contumacious Diseases they run to the use of these as to the last refuge.

Part I.

Mercury or Quicksilver if it be taken simple and by it self, like Antimony, works neither by Vomit nor by Stool; and stirs up almost no perturbation in mans body. But if by a dissolving mixture, its active Particles being set at liberty, it be reduced to powder; it becomes an highly purging Medicine. Though there be very many ways of fixing this versatile and fugitive *Proteus*, and of preparing it for medicinal use, these two chiefly are insisted on, that is to say; it is either sublimated or reduced into a precipitate. Its preparations of the first kind do not properly belong to the Class of Emeticks, but for the latter almost every one of them ought to be referred hither. But as to our purpose it will be sufficient briefly to touch upon here a few of them and which are of chiefest Note. Therefore first of all we shall inform you, that Mercury is either precipitated by it self, or with Metals alone, or with Salts alone, or with Metals and Salts together.

Mercury or Quicksilver is no Cathartic of it self.

By what means it is made operative.

1. *Mercury precipitate by it self.*

Mercury precipitated by it self.

Take of the best purified Mercury ℥iij, let it be put into a Glass fit for this use (which is coming something near to the form of an Hour-glass, with a double bottom like a Top, let it be broad and plain at either end, and strait in the middle, having a Beak with a very small Orifice reaching from the bottom of the one into the belly of the other) which Vessel being equally placed in a sand Furnace; put thereto fire at first gently, afterwards more strongly until part of the Mercury be elevated in a greyish Powder, and the other stick like Quicksilver in the upper bottom: Then turning the Vessel let the upper part be put into the Sand, and so turn the Glass so often till all the Mercury goes into Powder, which breaking the Glass, is to be collected, and to be washed with sweet water: The Dose is *gr.* iiij to 5 or 6. it for the most part moves to vomiting, and doth not work by salivation.

The reason of the Process seems to be this, that the *Effluvia* of a constant Fire do first of all loosen the Concretion of the Mercury, and dissolve by little and little its particles, and then draw them one from another, so that they fall away one from the other; and as it were, broken into bits, may remain distinct. Hence those most active little Bodies, being of their own nature Saline and Sulphureous, stir up mighty perturbations in the Humane Body, by pulling the Fibres, and by heating them with their Salts: But yet this Precipitate works less upon the Salts inhabiting the Blood, than Mercury precipitate with Salts, because a Salivation is easily excited by this, never by that. Even as Mercury, so certain other Mineral Bodies, as Lead, Tin, Antimony, Iron, are wont by the force of a constant Fire to be Calcined to Powder or *Crocus*.

The shewing of the Reason of the process.

2. *Mercury precipitate Solar.*

Mercury precipitated with Metals of the Sun.

Take of Gold purg'd with Antimony, and exactly purified, ℥j. of the very best depurated Quicksilver or drawn forth of Cinnaber and Sublimate ℥viij. make an *amalgama* in a Crucible, by casting in the Gold, being made hot, to the Mercury while it is melting: This being well washed with Salt and Vinegar, and wrung thorow a Cloth into such a Glass, prepared like that for the Mercury, precipitated by it self; let it be digested in sand, until it be reduced into a red Powder: Then let it be edulcorated with Cordial waters. The Dose is from *gr.* iij to vj. it operates only by Vomit for the most part, and moves not as the saline precipitate, to Salivation. After the same manner may the Lunary, and Jovial precipitates be prepared.

The reason of this Process is as the former, to wit, the little Atoms of Fire, as so many little Pestles beat the Mineral Body into small parcels, and break them so for the time, that they cannot easily cohere and grow together again. Further, this *Amalgama* by reason of the Bodies of the Mercury and the Gold being first opened by themselves, doth much easier become precipitated, than the Mercury by it self.

The reason of the preparation.

Part I.

3. *The Common Mercury precipitate.*

Mercury precipitate with Corrosive Liquors.

1. with Aqua fortis.

Take of the best purged Mercury ℥ij. of *Aqua fortis* ℥iiij. make a solution, which being put into an Earthen Vessel glaz'd, let it evaporate first with a gentle heat to consume its moisture, then by increasing the fire till the Vessel glow again, let it be calcined, stirring it about with an Iron Rod till it acquires a red Colour. The matter being taken forth and powder'd, first by often washings with sweet water; then the burning it being reiterated, let it be edulcorated by the affusion of spirits of Wine, and so kept for use. The Dose is *gr.* iij to v or vj. it operates violently enough by Vomit, and provokes by Salivation more certainly than any other preparation of Mercury whatsoever.

The reason of the preparation.

If the reason of this Chymical Preparation be enquired into, we say that the Mercury is dissolved by the *Aqua fortis*, for as much as the saline Particles of the *Menstruum* running to meet the Salts of the metal, they presently snatch them to themselves, and then the bond of the mixture being loosened; all the other Particles are set at liberty, and hide themselves on every side within the pores of the *Menstruum*: Then after that the Humidity is taken away, the saline Particles being left and brought into view, they forthwith strike upon the included Mercurial Particles and are mixed together every where. But as Mercury precipitated after this manner with *Aqua fortis* or *Aqua regis* grows red, otherwise than it doth prepared with Oyl of Sulphur or Spirit of Vitriol; the reason is partly from the Nitre always causing a flamy colour which enters into that *Menstruum* and not into these, and partly from the Mercury it self, whose loosened Particles, whilst at liberty and not hidden by others, of their own nature are red, as may be perceived in Mercury precipitated by it self, and in its solution, which, to wit the Mercury, loses its red powder, being infused in the Oyl of Tartar.

Its precipitaton with Oyl of Sulphur or Spirit of Vitriol.

How Mercurial Medicines operate in the Ventricle.

This Medicine consisting very much of Corrosive Salts, and also of equal loosened Mercurial Particles, for as much as it highly irritates the Fibres of the Ventricle, stirs up most violent Vomiting, so that for this purpose 'tis seldom given alone.

But if when it is taken, and that at last having gone into the Ventricle and passed the first passages; it be carried into the mass of the blood, for as much as its implanted Salts are thereby very much fermented, and that the Mercurial Particles being plentifully infused, and intimately mixed with them are so intangled; that they cannot by any way more commodious be thrust forth again (as we shew in another place) than by the salival passages, for that reason this Medicine moves spitting more than many others.

4. *The Turbith Minerale.*

Mineral Turbith.

Take of purified Quicksilver, Oyl of Vitriol (or of Sulphur *per Campanam*) dephlegmed, alike equal parts, being put in to a Glass retort; let them be distill'd, the Fire being increased by degrees until all the humidity be drawn away, there remaining in the bottom a white Mass: Which, spring water being poured thereon presently becomes yellow, this by often washing and firing of the Spirit of wine being edulcorated and dryed, may be given from *gr.* iiij to vj or vij. It works by Vomit somewhat gentler than Common precipitate, and sometimes also it procures salivation.

The reason of the preparation.

The process of this as to the precipitation of the Mercury, hath the same reason as the former, but the remaining Calx does not grow red as the former; partly for the absence of the Nitre, and partly because the Mercury being less subdued does not suffer so intense a Calcination; that the Salts being in a great part blown away, it should shew its own proper Colour, to wit, a Crimson Colour: But if for that end it should be urged with a violent fire; it will fly quite away: Therefore the white Colour proceeds from the Salts which stick to the Particles of the Mercury, which being afterwards something washed away, the yellowness succeeds.

Further in as much as the Mercurial Particles are not so strictly combined with the Salts, and therefore are not by them introduced in so great plenty into the sanguineous mass, a salivation is not so promptly and surely excited by this Medicine.

This

This Medicine may be prepared after this manner more compendiously, and not less effectual.

Take purified Quicksilver, Oyl of Vitriol or of Sulphur alike ℥ij, being put into a Crucible first let all the humidity with a gentle fire evaporate away, then let it be urged with a stronger, that the calcined matter may be better fixed.

5. Aurum Vitæ.

5. *Gold of Life.*

Take of purified Mercury ℥v, of excellently purified Gold ℥ß: Let each of them be dissolved in their proper *Menstruums*, and the solutions put together, and all its humidity be done away by distillation in a Retort; let the remaining *Calx* be Calcined upon red hot Steel Plates, that the Salts may in a great part be done away, let the remaining matter be sweetned by washing with fair water, and Ascension of the Spirit of Wine.

6. *The* Hercules *of* Bovius.

The Hercules of Bovius.

This Medicine will be better prepared, if both the Metallick Bodies be dissolved in the same *Menstruum*, which by the Prescription of *Thomas Bovius* may be effected after this manner.

Take of calcined Vitriol, and of Nitre alike one pound, let them be distill'd in a reverberating Furnace, the Liquor being distill'd pour into the Glass Retort one pound of Sea Salt calcined, and draw it off by a gentle heat in sand, for it will very easily ascend; one part of this dissolves Mercury and the other Gold; then let both the solutions be drawn off together, and by frequent Cohobations adding every time about the third part of the same *Menstruum*, let the distillation be repeated until the matter be enough fixed, which being sweetned after the aforesaid manner keep it for use. The Dose is from *gr.* iij to vj or vij. (or)

Take of purged Mercury ℥iiij, of cleansed Gold ℥ß. make an *Amalgama* as is above shewed, to which being washed and put into a Retort, pour the aforesaid *Menstruum* of *Bovius*, let it be drawn off in a Sand Furnace, and with often Cohobations adding every time a third part of the same *Menstruum*; let the distillation be repeated until the matter be enough fixed, which calcine upon red hot Plates of Iron, and let it be sweetned by frequent washings and ascension of the Spirit of Wine. The Dose *gr.* iij to vj. It operates by Vomit not very violently, and for as much as it operates beyond the *Viscera* into the mass of Blood, it oftentimes gives help in very great Diseases.

The Reason of both the preparations.

As to what belongs to the Ætiology of this Chymical process, we say, whilst these two Champions striving together do mutually lay hold of and bruise one another, a third (and sometimes a fourth) coming upon them, binds them: Whereby they are more strictly complicated, and broken more minutely. But truly both the Gold by the Mercury, and both of them by the *Menstruums*, are dissolved and torn into little bits: then the Humidity being abstracted, the saline Particles of the Metals are combined with the Salts of the *Menstruum*. In the mean time the remaining metallick little bodies being cast between and shut up within the pores of the Salts. But yet this Combination is not so strict, but that the Metals by themselves or either of them by Solution and Coagulation with its proper *Menstruum*, may be reduced into precipitate: For indeed since that both the metallick Particles and the saline *Menstruums* in that prepared Precipitate, are so many and so diverse, all of them cannot be absolutely united. Wherefore that matter (as I have often observed) is not but very hardly fixed, and to be reduced into a *Calx* proper for Medicine; for if for the drawing off the *Menstruum*, too strong a heat be applied; the Mercury will ascend, and the remaining Gold resume its proper Species: But if the Fire be more remiss than it ought, the Combination of the Salts with the metallick Particles will not be strict enough, but that it will be taken away with mere ablution; so that common Water being poured on the Precipitate, it shall wholly dissolve it, and drink up the whole matter into it self, and then the whole Work must be well nigh reiterated for to make the Medicine.

Part I.

The ground of this Medicine is Mercury, by whose means it is expected, that its Particles should ferment all the Juices of mans body, and remove the separations of every heterogeneous heap both in the *Viscera* and in the Vessels. The Gold seems to be added for the taming the Mercury, and for breaking its too fierce and untamable Particles. Further, the Salts of the *Menstruum* break either of the bodies into small bits, and carry them more readily into the bloody Mass, and into these more inward recesses.

The Reason of the Hercules of Bovius.

In the distillation of this *Menstruum* of both kinds described by *Bovius*, (by which both Metals are dissolved) there happens notable encounters and decertations of the Salts as it were for Life and Death: For when the *Aqua fortis* is poured upon the prepared Sea Salt, it possesses its Earth and takes possession, as it were, of its own soil, driving away from thence the Spirit of the Salt as it were set at liberty. This more clearly appears, if at any time the Spirit of Vitriol, being poured upon the Calcined Sea Salt, it be distilled, for that by a very small heat of the Sand Bath; even the very pure Spirit of the Salt ascends as an Exile, the Vitriolick *Stagma* invading its habitation. In truth these Salts are too little of kin, that they should be combined together: Wherefore being put into too streit a habitation; when they can neither be united nor cohabit; the stronger usurping the Dominion expells the weaker out of doors.

The Reason of the Epicene Menstruum of Bovius.

Chap. III.

Of the Remedy of too much Vomiting, also of Antiemetick Medicines, or such as stop Vomiting.

NAture being incited to a violent motion, oftentimes goes beyond its bounds, and runs forth beyond measure, so that there is sometimes need of a stop or *remora*, whereby its violence might be stayed. This is plainly discerned in vomiting, if at any time it be immoderate, through the operation of a medicine, or for any other occasions; it therefore belongs as much to Medicine to allay this fury of the Stomach as to stir it up. How many ways, and for what causes Vomiting is wont to happen without taking an Emetick, we have already declared: Besides it is obvious to common observation, that this evacuation provoked by Medicine is sometimes so violent and so long, that unless it be stopped by the help of Art, Life it self will be in manifest danger. Therefore as in the practice of Physick Emetick medicines are of necessary use; so sometimes for the stopping that Excretion (as often as it shall be too much or preternatural) Remedies contrary to the former, or Antidotes for Vomiting are made known. We will therefore in the first place, shew how excessive Vomitings caused by an Emetick are cured: And then Secondly, by what means and remedies preternatural Vomiting, raised by reason of other Causes, may be helped.

Immoderate Vomiting proceeds either from an Emetick Medicine or from other Causes.

As to the first, Vomiting raised by a medicine becomes more vehement and continues longer, because the animal Spirits being irritated beyond measure and growing angry; their disorders are not easily or presently remitted, but that they thrusting forth themselves do by frequent fits stir up violent Emetick Convulsions, and often repeat them. Moreover that explosive Force begun in the Ventricle, is not seldom propagated to the Spirits inhabiting the neighbouring parts, and from thence to others, and at last sometimes to their whole *Systasis*, in so much that Torments and Convulsions in the *Viscera*, afterwards in the Midriff, and lastly in the whole Body with manifest danger of Life follow Vomiting.

The Reasons of the former are unfolded.

The Spirits are above measure irritated, either from the Medicine only by reason of the disproportion of quality or quantity to them; or else from the other humours, as the like sharp *serum*, and others being poured into the Ventricle in the time of Vomiting. Besides in some the animal Spirits are so tender and Elastick,

that

that from every Emetick irritation though very light, both those inhabiting the Ventricle, and those also which are near about are excited into Convulsive Explosions. Hence many enquiring from the Vomitory about the Milt, Paunch, and other inwards, impute the whole business to the Vapours stirred up by the Medicine, when indeed it happens altogether by reason of the Animal Spirits being readily too much moved, and hardly to be appeased. Part II.

If this overworking be caused by the Medicine, let the Patient, being presently put to Bed, make use of both external and internal remedies: And first of all that the Lodgers in the Ventricle may be quieted; let there be administred either a fomentation warm, of the Decoction of Pontick Wormwood, Mint, and Spices in red Wine, or a Cake of a piece of bread toasted, and dipped in Claret Wine warmed, applied thereto. Let there be a Glister given of Milk with Treacle dissolved therein: Let also warm Frictions of the members be used, and strong Ligatures above the Knees which may drive away the Convulsions from those parts. Let the Ventricle in the mean time be kept empty, unless swooning follows: But as soon as he may be able to take any thing of food or medicine, let him have some Cordial water or warm burnt wine. In very great perturbation, if the Pulse admit it, Treacle Andromick, or *Diascordium*, also sometimes a solution of *Laudanum* or Opiatick Tinctures are convenient. *Its Cure.*

In preternatural Vomiting stirred up from other Causes, we must consider whether it be Critick or Judicial, or Symptomatick Signal. In the former there is nothing to be done suddenly or rashly: that superfluity whilst they have strength, may not be stop'd, but the going forth of the matter to be expelled is either to be facilitated or haſtned, or to be carried forth by some other way. Hence being urged by a nauseousness and striving to vomit; it is convenient to give Posset-drink simple or with the leaves of *Carduus* boyled therein, also sometimes *Oxymel*, and wine of Squills or Antimonial Wine. Sometimes Glysters are used, and sometimes also a gentle purge carries away the matter, boyling in the Stomach by a more easie way of exclusion through the Intestines. *Vomiting from other Causes is either Critick or Symptomatick.*

(2.) In Symptomatick Vomiting a conjunct cause (as we have already intimated) either subsisting in the Ventricle, produces that Idiopathick or proper Affection; or fixed in other parts stirs up their Convulsions, and a Communication being made by the Nerves, the Emetick perturbations in the Ventricle, as in the Nephritick Paroxysms, Colicks, Hysterick passions, Vertigo and many others use to happen, the healing of which sort of Sympathick Vomiting, depends upon the cure of the primary Disease. *The latter is either Idiopathick or Sympathick.*

When the Stomach is primarily affected, the Cause is, that the Nervous Fibres irritated above measure, provoke the other motricious Fibres into excretory Convulsions. But these are irritated from an improportionate Object, *viz.* In as much as they are not able to thrust forth to the Intestines or to overcome, or to digest rightly a certain matter which lies upon them, but are necessitated by exciting Vomiting to cast it the soonest way out of doors. That Matter beomes so incongruous or untamable by its own proper viciousness, for as much as offending in quality or quantity it provokes the Nervous Fibres; or by the fault of the Stomach it self, because that its tone is lax, and its Fibres becomes so weak, that they cannot be able to overcome or tolerate the Chyle it self, much less the excrementitious humours, but that being impatient of its burthen, they cast forth whatsoever is contained within by Vomiting. As there are various causes of either of these, and manners of affecting, we will here shew some of the chief of them, together with the Remedies and the reasons of the Cure. *When the Stomach is primarily affected what method to be used.*

The Emetick matter subsisting in the Ventricle is either poured into it from another place, or is begot there by reason of its depravity or want of Concoction: in either respect the present Ballast is first of all to be carried forth, then its more fruitful increase must be cut away, or provided against.

Therefore that the filthy *Colluvies* of the viscous matter may be cleansed out of the Ventricle, let there be prescrib'd a gentle Vomit, of *Carduus* Posset-drink, or of *Oxymel* or Wine of Squills or of the decoction of the Flowers of Camomil, or of the Roots of Agrimony with the solution of the Salt of Vitriol or such like, then the Reliques may be gently carried off by Glysters or Catharticks either by the Pills of Mastich: Stomach Pills with Gumms, or sacred Tincture or with the Infusion of Rhubarb. Moreover when the impure rank Blood heaping

Part. I.

heaping up anon a new proviſion of incongruous Matter oftentimes flowing into the Ventricle either through the Arteries, or the Choler-carrying Veſſels, brings in an emetick Diſpoſition. Blood letting doth not rarely give help, and therefore the Vomitings of great bellied Women are frequently cured by this kind of Remedy. Beſides thoſe things are convenient which may attemper the Blood, whereby the leſs aduſt Excrements may be therein generated. Hence it is that Whey, the drinking of medicinal Waters, the Juice of Herbs, *Sal Prunellæ* and ſuch like for as much as they ſcatter the Blood, and carry its Excrements to another place, they often take away the Vomitive Diſpoſition. Theſe kinds of remedies are likewiſe uſed if that frequent and daily Vomiting, proceeds (according to the opinion of ſome) from the meeting and wreſtling of the biliary and pancreatick Humours, and their regurgitation into the Ventricle.

The frequent Vomiting and the hardeſt to be cured is that which proceeds from an incongruous Matter begot within the Ventricle, and from thence becomes Emetick, for as much certainly as by reaſon of the vitiated Ferment of this *Viſcus*, whatſoever is eaten, degenerates into an irritative putrefaction. Wherefore in this caſe. after that the filth of the Stomach is cleanſed by a gentle Evacuation, they are wont to make uſe of remedies commonly called Digeſtive, which, even as the fermental Juice of the Ventricle, being very much of a ſaltiſh diſpoſition and ſometimes alſo of a ſulphureous, ſhall be in a various ſtate of Fixation, flowing or aduſtion, conſiſt after a divers manner, and are rather helpful now this way now that way.

The Vomiting proceeding from the Ventricles being Vitiated how to be cured.

In Belching, and acid Vomiting, theſe following Medicines may be tryed, and the Rule of the Method to be relyed upon may be choſen out of the things that bring help.

Remedies againſt the too much acidneſs of its Ferment.

Take of the Powder of *Ari Compoſ.* ʒiſs, of the Salt of Wormwood ʒij, of the Sugar of Roſes ʒiij, make a Powder, give of it in the Morning and at five a clock in the afternoon, ʒj in a little draught of Ale boyled with Mace and a Cruſt of Bread or in diſtilled Water or Tincture of Roman Wormwood.

Take of the Powder of Ivory, the Eyes of Crabs, of red Coral alike of each ʒij, of calcined Coral ʒj, of red Sanders, Cinnamon *ana* ʒß make a Powder, Doſe ʒß after the ſame manner.

Take of *Lignum Aloes* of yellow Sanders, of the Bark of Mint, of each ʒij, of white Chalk ʒvj, Sugar candy ʒß, of the ſolution of Tragacant, of the Water of Mints, make a Paſt, and let them be formed into Troches of ʒß weight, let him eat iij or iiij thrice or oftner in a Day.

2, Againſt its Ferment being too ſour.

Take of the Tincture of the Salt of Tartar ʒj, the Doſe is ℈j to ʒß, twice a Day in ſome proper diſtilled Water.

2. In ſour Vomiting, Medicines endued with a warm, ſharp, vitriolick Salt are more convenient,

That famous one of *Riverius* in this caſe is the chief.

Take of the Salt of Wormwood ℈j given in a ſpoonful of the Juice of Limons.

Take of prepared Coral ʒij, of the Salt of Wormwood ʒiſs, of the Juice of Limons ʒiiij let them ſtand in a larg Glaſs, add to them of the ſtrong Water of Cinnamon ʒij. The Doſe is a Spoonful or two twice a Day, the Glaſs being firſt ſhaken.

Take of Ivory, Coral, of each ʒij pouder, of the Vitriol of Steel ʒj, of Sugar-candie ʒj mingle them, and divide them into 6 or 8 Parts, of which take one part twice in a Day in ſome convenient Vehicle.

3. Againſt the Stomach being to bitter.

In this caſe purging mineral Waters which have much Nitre in them, alſo your Iron tinged Waters and indeed our artificial Chalybeates are wont to give notable help.

If at any time the Stomach perverting the moſt part of what is put into it to a bilious and bitter Rottenneſs (as it often is wont) and for that reaſon is prone to frequent Vomitings, then both ſharp, and alſo bitter remedies are convenient.

Take of *Elixir Proprietatis* ʒj, the Doſe ℈j twice in a day in ſome fit Vehicle.

Take of Rhubarb Powder *gr.* xxv, of the Salt of Wormwood ℈j, of the Water of Cinnamon ʒß, of the Juice of Lemons ʒj, mingle them, take of it by it ſelf or mixt with ſome other Liquor.

Take

Take Powder of *Ari Compos.* ʒiſß, of Tartar Cryſtalized ʒiij, of the Vitriol of Steel ʒj, of Sugar ʒß, make a powder; the doſe is ʒß, or ℈ij every Morning drinking after it a draught of the tincture of Pontic Wormword or Coffee. Part I.

Take of the Powder of Crabbs Eyes ʒß, of the Chalybeate Tartar ʒij, of Sugar-Candie ʒj, make a Powder; the Doſe ʒß in a fit Vehicle twice in a day.

Vomiting from the debility of the Ventricle.

Oftentimes the cauſe of a frequent and habitual Vomiting is not ſo much the matter irritating the Ventricle, as the debility of its nervous Fibres, and their too great propenſity to irritation; for that they are ſo tender or infirm that they are not able neither to Concoct what is taken in, nor to ſuffer the weight or burthen of them, but that they are preſently irritated by any thing lying upon them, and therefore to expel what is ſo troubleſome, they provoke the fleſhy Fibres into Emetick Convulſions.

Of which there are two cauſes.

There are two principal Cauſes of this kind of Affection; *viz.* either the debility of the Stomach is in the Fibers themſelves contracted by inordinate paſſions, as ſurfeiting too often, and immoderate drinking by too frequent taking of Wine or ſtrong Waters, and by other inordinacies of eating and drinking, ſo that theſe Fibres, for as much as they are beyond meaſure diſtended, or made too hot and as it were roaſted, are not able to admit or contain the animal Spirits in enough plentiful abundance: Or ſecondly theſe Fibres although they may be well enough of themſelves, yet for that the Nerves are in ſome other place obſtructed, they are deſtitute of the due afflux of Spirits, and from thence being languid and flaccid, they are not able to bear what is taken in, but preſently being aggravated, they endeavour to caſt it forth by Vomiting: ſo I have known many without any impurity of the Ventricle, or *Languor* contracted through irregularities, affected with a certain kind of palſie of that *Viſcus*, to have wanted appetite, and to have been obnoxious to aſſiduous Vomiting.

Or the tone of the Fibres is decay'd.

2. Or there is a defect of Spirits by reaſon the Nerves are obſtructed.

The cure of the former affection.

In the former Diſeaſe thoſe kind of remedies are preſcribed, which may cauſe the too much diſtended and tenuated Fibres to wrinkle themſelves and to be contracted into a ſhorter Space; alſo ſuch as may allure thither more copiouſly the Spirits by their grateful uſage, and cheriſh the Languid.

Take of the Elixir of Vitriol of *Mynſichtus* ʒj; the Doſe is from 10 drops to 15 twice or thrice in a Day in a ſpoonful of diſtilled Water, drinking 7 or 8 ſpoonfuls of the ſame after it.

Take the tops of Cypreſs vj handfuls; of the Leaves of Clary iiij handfulls of exterior Barks of Orange 12, Cinnamon, Mace of each ʒj, of the Roots of Galingal the leſs, and of Cypreſs of each ʒß; being ſliced and bruiſed let them be put into viij ℔ of *Brunſwick* Beer and diſtilled in an ordinary Still.

Take of the Tincture of Tolutan Balſom wtih the Tincture of the Salt of Tartar extracted ʒj, Doſe 20 *gr.* with the ſame Vehicle, the Tincture of Wormwood prepared with the ſame *Menſtruum* may be tryed.

Take of the Powder of the Flowers of Wormwood, of Mirtle dryed in the hot Sun, of each ʒij, Cinamon, Flowers of red Roſes of each ʒj, Cubebs, Roots of Galingal the leſs of each ʒß, of red Coral broken ʒj, make of them all a ſubtle Powder, then with ʒvj of the whiteſt Sugar diſſolved in Cinamon Water and boyled up to a Conſiſtency make of them all Tablets each weighing ʒß, eat one or two as often in a Day as you pleaſe.

Take of the Conſerve of red Roſes vitriolated ʒiiij candied Myrabolans ʒij, Ginger candied in the Indies ʒß, *Species* of Hyacynth ʒiß, of the reddeſt *Crocus* of Steel ʒj, Syrrop of Coral what will ſuffice, make thereof an Electuary the Doſe ʒj, twice in a Day drinking after it a little draught of diſtilled Water,

How the Palſie of the Ventricle is to be cured.

2. In the debility or reſolution of the Ventricle by reaſon of the Nerves being ſomewhere obſtructed, Antiparalytick Remedies joyned with Stomachalls are of chiefeſt uſe.

Take of the *Elix. Proprietatis Tart.* ʒj, the Doſe ℈j, twice in a Day with

Part I.

with the Water above preſcribed, The Tincture of the Salt of Tartar, of Coral, of Antimony, may be made uſe of after the ſame manner. In this caſe alſo the ſweet Spirits of Salt, the Spirit of *Sal* Armoniac or its Flowers do give notable help. Beſides Vomitories and Purges, and even Diaphoreticks are oftentimes ſucceſsfully adminiſtred. I have known this Diſeaſe ſometimes happily cured by bathing in our Baths of *Bathe*.

SECT. III.

SECT. III.

CHAP. I.

Of Purging and of purging Medicines.

PUrging ſeems to be an Affection contrary to Vomiting, or rather inverted; for truly in this and in that, they run from the Priſons of the ſame Ventricle, to a divers Goal. For even as in Vomiting the interior fleſhy Fibres of the Stomach being inflated by the ſudden running in of the Spirits into their left Ends, and ſo being contracted they make its bottom and ſides to be drawn together, and to be brought upwards towards the left Orifice, to the end that its Contents may be carried forth above: ſo in purging, the ſame fleſhy Fibres being in like manner inflated at their right ends, and contracted, they cauſe the whole circumference of the Stomach to be gathered together, and to be inclined towards the *Pylorus*, that the Excrement may paſs away by the inferior Parts. As the excretory Motion begun from the Ventricle is continued by the *Oeſophagus*, ſo it is in purging by the Inteſtines, and either of them is propagated by the fleſhy Fibres from part to part to the end. In either affection the motion of the Stomach is violent, and after a manner convulſive, ſo that ſometimes either is changed into the other. For purging being too much haſtned from a ſharp Provocative, oftentimes cauſes Vomiting: in like manner purging of the Belly follows from an emetick Medicine: the reaſon of which is, becauſe the animal Spirits being vehemently irritated, and thruſt forth, they leap diverſely ſometimes into theſe and ſometimes into thoſe ends of the fleſhy Fibres; almoſt after the ſame manner as if you ſhould too much urge a generous Horſe with your Spurrs, you will force him ſometimes to run forward, and ſometimes to leap backward.

Purging in an affection contrary or inverſe to Vomiting.

Therefore Purging is an excretorie Motion in the Ventricle, and in the Inteſtines, by reaſon of their fleſhy Fibres being ſwiftly and orderly contracted quicker and faſter whereby the Chyle and its *Faces*, both the recrements of the Humours, or the Corruptions there begotten, or pour'd in from another Part, may be thruſt on from one part unto another until they be caſt forth a doors at the Fundament as thorow a Sink. For the Ventricle being irritated by the prickings of the Cathartick, contracting it ſelf quicker and more ſtraitly towards the *Pylorus*, pours forth whatſoever it cheriſhes in its Boſom, into the *Duodenum*; and the Inteſtines being pulled together, they reiterate greater and more frequent excretorie Spaſms, by which moſt of the Contents before heaped up in their Cavities, or attracted, or expreſſed at that time, are excluded. Alſo Purging is that ſort of violent and conſtrained Excretion, which Nature being quiet performs at leaſure and at times; in ſuch Nature being provoked, acts not without tumult and a certain perturbation. Therefore for the more perfect knowledge of Purgation it ſeems requiſite, that firſt of all we ſhould ſhew what are the Contents of the Ventricle aud the Inteſtines, both their proper, and thoſe ſuggeſted from another place, which are wont to be ſent forth by Stool. Then theſe being effected, it will be reaſon to explicate by what means, and by what ſtrife purging Medicines do perform their Operations.

Its Deſcription.

1. As to the firſt, the chief Contents of the Ventricle and Inteſtines are the Chylous Maſs, and its remaining *Faces* after the diſtribution of the nutricious Juice, the filth of theſe Inwards ſmeering the hairy Cruſt, and Water ſticking in

The Contents of the Ventricle and the Inteſtines which purging Medicines carry forth.

Part I.

in its Glandulaes; with which go a ſerous water flowing from the mouths of the Arteries, as alſo the Recrements of the blood and humours, which by the Choler carrying Veſſels, the Pipe of the *Pancreas*, the mouths of the Arteries, and alſo by the extremities of the nervous Fibres, and by other ways perhaps, are poured into their interior Cavities. For thorow the inteſtinal Pipes, as it were through a ſink, the whole impurity of the Body is wont not ſeldom to be purged forth; which indeed if reſtagnating within, they either puff up through their plenty, or being imbued with ſharpneſs, by making ſlippery, or by ſtimulating the Belly they provoke to very frequent and plentiful Stools.

The chylous maſs, the remaining fæces, muck, water, and ſerum abounding in the Glandulaes and Arteries.

Beſides theſe kind of Contents there is yet another reſulting from theſe, *viz.* Winds, which are wont to be ſtirred up within the Stomach, and the Cavities of the Inteſtines more than in any other part of the whole Body, and ſeem to be produced after this manner: Whilſt that the Aliments being conſtrained in the Bowels, and digeſted, are diſſolved by their ferments and heat, very many *Effluvia* come from them, which if they might obtain an open and free ſpace, would vaniſh away going into the Air, but they being ſhut up within a membrane, and gathered together; they conſtitute an heap of Vapours as it were wind: which oftentimes blows up and diſtends the Inteſtines, and which, way being given, ruſhing out, moves along with it excretions: But being ſhut up creates torments, and not rarely an inflation of the belly. Winds ariſing from the diſſolving of the Aliments in the Bowels, are begot after ſuch like manner, as when Pearls, Corals, or other Concretes being put into a Matrace are diſſolved by their *Menſtrua*: For very many vapours ariſe from their ſolutions, which if they are ſtraitly kept in, will enforce the Veſſel that contains them to fly or break to pieces. In like manner from the diſſolution or concoction, or fermentation of the Aliment within the firſt paſſages, very copious *Effluvia* ariſe; which being gathered together and ſhut up within the Membranes become wind: to whoſe more plentiful increaſe ſome other cauſes do contribute. For the colluctation and effervescency of Juices not rightly mixed do notably perform this: For that whilſt the adventitious humours, or heterogeneous things heaped together, and chiefly Medicaments do ferment with the other contents of the Inteſtines, from the mutual refraction of Particles very many little bodies proceeding, they are gathered together into a Vapour. Moreover from the blood it ſelf bubling up, when as a copious breath every where flows out, ſome part of it breaking forth from the Arteries into the cavities of the *Viſcera* doth there increaſe the produced heap of Blaſts. But further yet, the extenſions of the *Viſcera*, and their Convulſive Intumeſcencies, add to the more plentiful heap of Winds: For whilſt the Membranes by reaſon of the exploſions of the Spirits, and their inordinate excurſions, are very much diſtended; the internal Cavity as a blown up bladder is much enlarged, by reaſon that a portion of the included humour within that vacuity, as it were a Cucurbit after the fire is out, is rarefied into wind; which afterwards when the ſtiffneſs of the Membrane gives way, breaks forth with a force, or paſſes through the neareſt windings of the Inteſtines tumultuouſly. For this reaſon, when any part of the Inteſtine by an inflammation, or falling down of ſharp humours, ſhall be obnoxious to convulſive ſtretchings forth, alſo Winds continually brought forth become very troubleſom. When I have opened the dead bodies of many dying of an inflammation in the *Colon*; I found in all of them their whole Inteſtines diſtended to the utmoſt, and as it were blown up with Wind: Which without doubt happened, not becauſe the Wind firſt begotten had diſtended thoſe *Viſcera*; but when from the ſpirits of the Membrane greatly irritated, and thruſt forth among their Fibres, they ſhould be very much diſtended; therefore thoſe Blaſts were begotten to fill up the *Vacuum*, and ſo by conſequence ſecondarily. From this cauſe we have formerly intimated the Tympany to ariſe, as, in another place, perhaps we ſhall ſometime or other more largely declare. As therefore there is wont to be a very plentiful ſtore of Winds in the Stone or Gravel, in the Colical, Hypocondriacal, and Hyſterical paſſions, they are not, as 'tis commonly thought, the cauſes of thoſe Diſeaſes, but only the effects. Indeed whilſt by the Paroxyſms of thoſe Membranes the irregular extenſive Affections ariſe, and that the hollow *Viſcera* do ſwell up by the Spirits violently running forth, from hence preſently, that the empty ſpace may be filled, a certain humidity being ſhut up, is reſolved into vapours, from which the blaſts ariſe. Wherefore when the diſtention of the affected part is relaxed,

2. *Wind.*

How winds are begotten within the Cavities of the Bowels.

Blaſts are ſometimes the Cauſe and ſometimes effects of the Extenſions in the Viſcera.

After what manner the winds in Cramps are wont to be begotten.

laxed, the Wind ſo ſuddenly produced is driven to ſome other place, by the falling down of the Membranes. So much concerning the Contents of the Ventricle and Inteſtines, which are the objects of cathartick Evacuation. Now, which next belongs to the ſame ſubject, let us enquire what the motion is of thoſe *Viſcera*, whereby theſe Contents being either leiſurely carried along, are ſent forth at their due times; or elſe being haſtily thruſt on, they are caſt out by heaps. Part I.

Becauſe for the conſervation of Life living Creatures ought to be repaired by often and plentiful feeding; there is a neceſſity therefore that the Aliment ſupply with nutricious juice the continual decays, and that the Reliques be timely removed, ſo that the old leavings of the Chyme may give place for new Proviſion. For after that a portion of the Chyle (in which the Elements being perfectly looſened, are freed from the bond of mixture) more pure and elaborate is preſſed forth into the Chyle-carrying Pipes, what remains participating with the pricking Salt of a more thick Sulphur, contracts a moſt grievous ſtink: Wherefore it ought to be removed from the vicinity of the freſh chylous Maſs, into the thicker Inteſtines, and at length wholly out of the Body. Whereby theſe things may be the better affected, Nature gives to the Inteſtines an almoſt conſtant, and as it were, ſolemn excretory motion, aud conſtitutes various incitements or provocatives to that motion. *How the natural excretory motion of the Inteſtines is made.*

1. As to the firſt, the excretory motion of the Inteſtines, as of the Ventricle, is effected altogether by the fleſhy Fibres, compoſing the middle Coat of either of the *Viſcera*, and we have taken notice of a double order or *ſeries* of them in the whole paſſage of the Chyle, to wit, from the *Oeſophagus* to the ſtreight Inteſtine. The exterior order indeed of the inteſtinal Fibres, are ſtretched in length through all thoſe *Viſcera*, and ſtrait upon the whole ſuperficies; but the interior *ſeries* or order, conſiſts in circular Fibres compaſſing about on every ſide, as it were ſet thick with little Rings, the pipes of the Inteſtines; as it is repreſented in the third figure of the ſame Table. The Fibres of either kind being contracted together, do ſtraiten the Cavities of thoſe Inteſtines through all their dimenſions: which whilſt it is done ſucceſſively and by one order after another, and as it were by jumps, there is a neceſſity that whatſoever is therein contained, ſhould gently and even creepingly be carried along, the forepart being even thruſt forward by the following part. This ſort of motion of the Inteſtines is commonly called Vermicular, becauſe it is continued from one part to another as in a creeping Worm; and is continually acted according to the uſe and needs of Nature more or leſs, without alſo our knowing of it; becauſe indeed theſe *Viſcera* ought to move away their burthen very leiſurely: But leſt that ſometimes they ſhould, being idle, deſiſt from this task, they are urged as occaſion ſerves by divers provocatives. *By what Fibres it is effected.*

For in the firſt place the heap it ſelf of the Chyle and the *Faces*; aggravating and ſo irritating with its weight the nervous Fibres of the interior Coat upon which it leans, impreſſes upon them a certain ſenſe of the trouble, and thence preſently as ſoon as they are filled with the nutricious Juice, and now growing weary of the reſt of the Burthen, they inſtigate the fleſhy Fibres to vermicular Contractions, for the further moving away the Contents. When by this means the Contents of the Belly being leiſurely one part after another thruſt forward, do deſcend near to the end of the *Colon*, becauſe then the muſculous part of the right Inteſtine feels a preſſing; therefore the voluntary comes in the room of the natural Motion, whereby the *Sphincter* of the Arſe-hole being opened, and the Muſcles of the *Abdomen* being compreſſed, the Excrements are caſt forth of the doors. Moreover the Organs of Reſpiration do contribute ſomething to this excretory motion of the Inteſtines, for that indeed they perpetually drawing here and there up and down the inferior Belly, whilſt they ſo ſhake its contents, they make them to move gently forward. *By what provocatives the natural excretory motion is urged.* 1. *By the burthen and trouble of the faces.*

Beſides the aforeſaid irritation, by which the fleſhy Fibres by the inſtinct of Nature, and by an ordinary way are provoked into frequent and almoſt continual Vermiculations, there happen yet ſome other provocatives and various incitements, which conſtrain or haſten as occaſion is offered, thoſe excretory Contractions, and not ſeldom compel them into compulſive; ſo that the Belly is forced to caſt out its contents haſtily and impetuouſly, as if they were provoked by a Cathartick. But theſe intrinſick irritaments of the Belly are in the firſt place incon-

Part I.

gruous or immoderate food, Corruptions of degenerate Chyle, plentiful excrements of the Blood and nervous Juice, or ſharp overflowings out of the Glandula's and other Emunctories of the *Viſcera*, and chiefly from the receptacle of the Gall and Pipe of the Pancreas, as alſo ſeroſities, or ſuperfluous humours or incongruous flowing from the Blood and from the ſtock of the Nerves, and from the inward diſpoſition of the Body. Concerning the chief of theſe, becauſe they ariſe oftentimes in purging, and do intend the operation of the Medicine, we will ſpeak ſpecially and briefly.

To which happen many accidents of other things.

Incongruous food or depraved in the Concoction.

In the firſt place therefore, Aliments, if at any time they are perverted in their concretion, or will not be overcome, they do not ſeldom cauſe a *Diarrhœa* or lask, as it often happens in a ſurfeit, inordinate feeding, from unagreeable meats and other errors in Diet, or from the depravations of the ferment of the Stomach. Yea by reaſon of want of digeſtion, ſometimes alſo through obſtructions in the Meſentery or inteſtinal Pipe, by reaſon of too much viſcouſneſs ſticking upon the glaudulous Coat or mouths of the Veſſels, that hinders the diſtribution of the nutricious Juice, and therefore the whole matter almoſt of things eaten, being retained in the firſt paſſages, produces frequent and plentiful Stools.

2. Choler and the pancreatick juice.

2. The excrements of the Blood and of the nervous Juice, being heaped together in the glandula's of the *Viſcera*, the bag of the Gall, the pipe of the Pancreas, and perhaps in other receptacles; if at any time they flow over through plenitude or irritation; they are abundantly thruſt down into the cavities of the Inteſtines, and in as much as they there pull or hawl the nervous Fibres, and with other Juices grow hot, they oftentimes produce a *Diarrhœa*. It ſeems the yellow Choler is as it were a kind of natural Cathartick, which plentifully flowing forth of the Choler-carrying Veſſels moves a ſpontaneous purging.

3. Humours from Blood, nervous juice from their Viſcera, and habit of the Body being tranſlated to the Inteſtins are carried away by Stool.

3. An excremental matter from a yet more remote Region, to wit, either from the maſs of the Blood, or from the nervous Liquor and its emunctories; or from the whole habit of the Body, being ſometimes tranſmitted to the Inteſtines, irritates their nervous Fibres, and from thence ſtirs up the fleſhy Fibres into excretory Convulſions. For in the aforeſaid parts and places, and chiefly in the bloody Maſs, the degenerate or ſuperfluous humours ariſing up, when they are not eaſily or ſufficiently to be ſent away by evaporation or piſſing, ofttimes a *Metaſtaſis* being made within; they overflow thickly every where from the gaping mouths of the inteſtinal Veſſels, cauſing very frequent and watry Stools. And truly ſometimes the Blood it ſelf, being vitiated into a thickneſs and apt to coagulate; when it cannot be circulated readily through theſe ſmall Veſſels, frequently breaks forth in great abundance, and cauſes a dyſentery or bloody Flux. But it is to be obſerved, when the exterior Pores are ſhut up by cold, or the skinny tumours do ſuddenly vaniſh, a flux of the Belly ſucceeds. I have known many obnoxious to a conſtipation of the Belly, to have been cured by this kind of Remedy only; to wit, that they aroſe from Bed betimes in the morning, an hour ſooner than they were wont. For how much the accuſtomed perſpiration is leſſened, ſo much is added to make ſlippery the Belly. Theſe things being thus premiſed concerning the various Contents of the Inteſtines, both thoſe inbred and acceſſory; and alſo concerning the excretory motion of theſe Inwards, both natural and ordinary and both violent and conſtrain'd, alſo concerning the various provocatives or irritations, by which the Belly by the accord of Nature is wont to be moderately looſed or more inordinately diſturbed: It will be eaſie to ſhew by what means, and by what kind of ſtrife purging Medicines do move the Ventricle and Inteſtines to excretions, and cauſe their contents to be carried forth, now theſe, now thoſe apart, and ſometimes many together.

How Cathartick's bring away the Contents of the ſame Viſcera.

When purging Medicines are taken in a liquid form, they are already enough prepared for the work, but if they conſiſt of a ſolid ſubſtance, being taken into the Ventricle and diſſolved by its ferment and imbued; they make, as it were, a tincture which becomes a Cathartick; purging after the ſame manner as the Liquor, according to the following means and reaſon. It ſeems that this kind of liquor, being firſt of all ſhut up in the Ventricle, and afterwards in the Inteſtines, by and by imbues the hairy filaments of the interior Coat with the Glandula's, and whilſt it adheres cloſely to them, its Particles enter into the nervous Fibres, and both ſanguiferous and Chyliferous Veſſels, and irritate every one of theſe and alſo the Choler-bearing Pore and pipe of the Pancreas to make them render their Contents,

By what means theſe do work in a liquid form and how in a ſolid.

By what order now on theſe parts now on thoſe.

Contents, and as it were to ſpue them forth. In the mean time the nervous Fibres of the interior Coat are hauled partly by the imbibed Medicine, and partly by the Humours preſſed forth into its Cavity, the fleſhy Fibres of the ſuperior Coat begin the Excretorie Convulſions, whereby that which is troubleſom might be removed. By what means theſe are done firſt in the Ventricle, and then ſucceſſively in the parts and in what parts of the Inteſtines, and what ſort of Humours are picked forth in the whole Paſſage, we will a little more accurately conſider. Part 1.

1. As to the Stomach it ſeems to be done after this manner following, *viz.* The Cathartick Tincture being diffuſed within the Stomach, it firſt of all imbues the hairy Raggs of the inward Coat, and adhering very cloſely to them, from thence it is delivered to the nervous Fibres, entring into which and quickly filling them even to ſaturity, at length it begins to irritate them; who therefore preſently wringling themſelves endeavour to put away the imbibed Liquor together with its proper Juice, and the viſcous Phlegm laid up in the folds of the Stomach. Further certain other Particles of the ſame Medicine, while it ſtays in the Stomach, enter into the Mouths of the Veſſels, and *Glandulas*, and pull them, and cauſe the Seroſities in them and other Humours to be wrung forth, and emulged. And whilſt that the Bottom of the Stomach and the nervous Fibres are ſo grieved and provoked by theſe kind of troubleſom Contents, the fleſhy Fibres being ſtirred up into excretory Contractions, they draw together the bottom and ſides of the Stomach upwards and incline them towards the *Pylorus*; that its loading with the medicinal Tincture might be caſt forth adoors, and be tranſmitted to the Inteſtines. After that the Stomach for a little while obtains a ſedation and quiet reſt, until that the nervous Fibres drinking in a new proviſion from part of the ſame Tincture ſticking ſtill to the hary Filaments are again irritated; and ſo as a new loading is moved and expreſſed into the hollowneſs of the Stomach, the fleſhy Fibres repeat again the excretory Convulſions for its caſting forth, and this is ſo acted by turns until the Poyſon of the Medicine be wholly purged, and wiped clean away from the hairie Raggs, and that the Spirits inhabiting the Fibres lay aſide their angers; which ſometimes quickly and eaſily ſucceeds, ſo that after an Hour or two the Stomach is free from any trouble impreſſed by the Medicine, the remaining perturbation being altogether tranſlated to the Inteſtinal Region. But yet it very often happens, from a Cathartick being taken, that ſhort but very ſharp Vomitings are excited, and nevertheleſs though the Medicine be caſt up, that a Purging plentiful enough follows. The reaſon of which is, for that too great and violent an irritation being made at the beginning, it ſtirr'd up more ſtrong, that is, emetick Convulſions; then after that the force of that irritament was leſſened or broken, the contractions became more gentle and Cathartick. For truly, the Virtue of a purging Medicine and of a Vomit, and the manner of their Working, differ not ſo much as to their ſpecifick qualities, as chiefly in this reſpect, that the trouble given by the irritation of that is more eaſily and longer to be tollerated, that it may at length be tranſmitted to the Inteſtines, but not that which is excited by an Emetick. But that ſometimes Vomiting ariſes, after the operation plentifully made by Stool, the cauſe ſeems to be, that the Tincture of the Medicine, being more deeply imbibed by the hairy Coat, is not eaſily wiped off; wherefore after very many purgative Endeavours had in vain, at length an Emetick Convulſion is ſtirred up for the thorowly ſhaking it off. It is a uſual thing for the Stomach before it be emptied by a Medicine, to be ſtirred up to Vomit by things taken in with notable nauſeouſneſs and trouble, becauſe indeed the Chyle by reaſon of an hindred or depraved Concoction degenerates into an incongruous and irritative putrefaction. But that the moſt part of the purging Medicine ſlides away too ſoon out of the Ventricle, and without clenſing away its ſliths, ſpending its greateſt ſtrength within the inteſtinal Pipes: by what means this is done we will ſee next.

1. what their action is within the Ventricle.

To wit, in the firſt place they move the nervous Fibres into a Senſe of the Trouble, then the moving Fibres into Excretory Convulſions.

whence the frequent change of theſe Motions proceed.

The Cathartick Tincture being thruſt forth of the Stomach, and carying with it from thence a certain excrementitious matter, ſlides into the Inteſtines, where it imbues preſently in the paſſage of the *Duodenum* and the ſuperior *Ilion*, the Filaments or Raggs of the hairy Coat, and ſticks cloſely to them: then the

The operation of the Carhartick within the Duodenum *and ſmall Guts.*

Part. I.

the medicamental Particles being plentifully pouted upon the nervous Fibres, they alſo enter into the Pipes of the Glandulaes and of other Veſſels, and irritate the Spirits inhabiting them, and when they begin to wax hot with the Humours there abounding, they compell them as it were to be milked or preſſed forth from thence, and ſo they ſtir up a great perturbation in them all; wherefore the fleſhy Fibres being inflated and contracted by the irritated Spirits, and agitating into Exploſions, fall into excretory Convulſions, for the ſhaking off that trouble. Hence when the ſuperior Region of the Inteſtinal Pipe is provoked into frequent and ſtrong Vermiculations, whereby the Contents might be driven further off, that motion of Excretion being begun is propagated to the reſt of the Inteſtines, and thoſe together being ſtimulated by the Contents of the Superior being thruſt forth into their Cavities, fall into excretory Convulſions one after another, untill the *Faces* of the Belly which ſtay laſt of all be thruſt forth of Door, others and then others coming in their places. The Cathartick Tincture as if infeſted with Spirits, irritates the nervous Fibres (as it hath been ſhown) into Corrugations, and dolorous extenſions oftentimes, and the fleſhy Fibres into Excretory Convulſions: then for as much as the ſame begins to ferment with the Humours, and the Contents of the Inteſtines, an Ebullition being made within their Cavities, and Blaſts ſtirred up, it variouſly blows up, and diſtends the conteining Membranes, and ſo cauſes the unloading of the Belly with wringing pains and with a noyſe.

The action of the Cathartick on the biliarie and pancreatick Pore.

Whilſt that the nervous and fleſhy Fibres are provoked into ſuch ſenſible trouble by reaſon of the Spirits being irritated by the cathartick Tincture, and into excretory Convulſions, alſo the biliarie and pancreatick Pores being pulled and ſhaken, put forth their Humours, and as it were ſpew them forth out into the Cavities of the Inteſtines: both of which being poured abroad and eſpecially more copiouſly from the Bile, the membranes being irritated as much as by the Medicine it ſelf, they are urged into frequenter and ſtronger Excretions; and ſo when the ſtools are tinged by the yellowneſs of that Humour, it is ſaid commonly (though falſly) that the yellow Choler is pick'd forth and peculiarly brought away by the Medicine. If that the Humours poured forth from theſe Pipes do mutually grow hot, and as ſome think do ſtruggle one with another with a notable Orgaſm or violent Appetite; for that a yet greater perturbation with a turgency of Humours, and Blaſt of wind within the Cavities of the Inteſtines, will be ſtirred up.

Alſo what it is on the Glandulaes and Mouths of the Arteries.

Not only Choler and the pancreatick Juice are preſſed forth by the Cathartick into the inteſtinal Pipes, but further the ſerous Humours are as it were milked forth from the Glandulaes of the interior Coat, being ſtraitned by reaſon of the Vellication, and the Mouths of the Arteries rubbed, and opened, which do waſh more the Contents of the Belly, and both by making ſlippery, and by irritating move forward the Excrements. But the inteſtinal muck it ſelf beſmeering the hairy Cruſt is indeed waſhed out by the ſerous Humours wrung forth, and by reaſon of the nervous Fibres being wrinkled, and ſhaken, is wiped away, goes to the purgings of the Belly, and increaſes their heap. Truly ſometimes this muck being very much wiped off, and the Mouths of the Veſſels notably pulled and as it were ſhaven, meer Blood flowing out cauſes the Stools to be bloody.

The Energie of the Cathartick is extended upon the Blood, nervous Juice and ſolid Parts.

Purging Medicines, for that they irritate the Spirits, and ferment with the Humours, do after this manner perform their Operations within the Cavities of the Stomach and Inteſtines. But from what kind of Particles or Elements of the Medicine both this irritative Force and fermentative Virtue proceeds, we will anon inquire: In the mean time, we may obſerve that the Energie of the Cathartick is extended a great way beyond the firſt Paſſages, to wit, into the bloody Maſs, and nervous Liquor, and ſo conſequently ſomewhat to the Brain, *Præcordia*, and other Parts, or *Viſcera*.

What its operation is in the Blood.

1. As to the Blood, it appears from hence that the Particles of the Cathartick is received into its Maſs, and circulated with it, becauſe by ſome, the Urine changes it Smell and Colour. Becauſe the Milk of a Nurſe taking Phyſick purges the Infant. Some Medicines evacuate the Waters of Hydropical Perſons by Stool. The Reſine of Jalap is wont to purge the lixivial *Serum* of the Smell of the Urine. Beſides by the common obſervation, both of the Ancients

cients and of those of latter Days, a carthatick opportunely given in the declination of a Feaver, brings away the feavouriſh matter firſt made ripe, and apt to be ſeparated. Wherefore it is beyond all doubt, that certain little Bodies of the Purging Medicine are admitted into the Blood, and ſpread abroad thorow its whole Liquor. And indeed there is no long ſearch to be made concerning the ways of its entrance, for that there is a neceſſity that ſome Particles of the Medicine, being thorowly mixed with the nouriſhing Juice, do creep thorow the milkie Veſſels. Further when as certain of the Veins as a moſt thick Wood are every where inſerted into the interior Coat of all the inward Parts of digeſtion, it will be obvious enough to conceive, that ſome Particles of the Medicine, as well as of the Aliment are carried into the Blood by theſe Pipes, which being difflated in a great abundance firſt within the Veins, and afterwards alſo within the Arteries (whilſt that they are altogether heterogeneous and untameable) do agitate its Maſs, and variouſly ſcatter it, and provokes an excluſion of it ſelf together with other excrements of the Blood. But the Blood ſo ſcattered abroad, and ſtirred up into excretory fermentation, thruſts down the Particles of the Medicine, together with other recrements to be purged forth by the little Paſſages of the Inteſtinal Arteries at that time alſo pulled and opened by the Medicine, into the Cavities of their *Viſcera*, from whence by and by they are ſent away by Stool. After this manner, the ſerous Filth, and Superfluities or Corruptions of the Blood are purged forth, from the Maſs being ſent together with the Cathartick Tincture to the Inteſtines. Moreover when as Sanguiferous Veſſels being by this means to be filled, other ſuperfluous or recrementitious Humours being firſt depoſited about the *Viſcera*, *Præcordia*, Brain, or habit of the Body, are ſwallowed up into the bloody Maſs, and preſently from thence, during its Excretory Effervencie, being ſnatch'd rowards the Inteſtines which way is then open, are caſt forth adoors; and ſo after this manner Cathartick Medicines operate on the whole Body, and carry away from the Parts howſoever remote the Incongruous, and to be exempted Matter.

Part I.

This is performed partly by fermentation, partly by irritation.

As we have already noted three degrees of the humoral *Diarrhœa* or natural Cathartick, ſo now it ſeems beſt, that we conſtitute ſo many ſpecies or Claſſes of medicinal Purgation. The firſt of theſe is when by reaſon that the nervous Fibres of the Inteſtines being gently provoked, the fleſhy Fibres being contracted more ſtraitly and more often a little above their wonted manner, they move forward their more looſe Contents, more ſwiftly from one part to another, and at length gently caſt them out of Doors. In the ſecond ſpecies of Purgation, ſome Humours beſides, being wrung forth from the biliarie Pore, the Pipe of the *Pancreas* and the Mouths of Veſſels hauled by the Medicine, are thruſt forth together with the *Fæces* of the Belly. In the third theſe Pipes being more vehemently provoked, they pour forth into the Cavities of the Inteſtines a great plenty of every kind of Humour, and further a recrementitious matter both from the Blood, ſcattered, and precipitated by reaſon of the admitted Particles of the Medicine, and by conſequence alſo from the nervous Juice, and other Parts, is purged forth being carried by the Arteries to the Inteſtines.

Three degrees of Cathartick Operation.

I think it appears plain enough by theſe that a Cathartick acts only by irritation, fermentation and expulſion and not (as is commonly ſaid) by Attraction; nor does it indeed become a reaſonable Philoſopher nor any that hath the uſe of ratiocination to affirm any Medicines by reaſon of ſimilitude of Subſtance, or I know not what Specifick Virtues to act upon any determinate Humour and to carry it whole and by it ſelf out a Doors. But that ſometimes Choler, Phlegm, Matter, *Serum* or Melancholy is judged to be ſeparated apart one from another, that ſeems to be ſo done, either becauſe Medicines do irritate in the *Viſcera* after a diverſe manner, or they ferment with the Blood and other Humours by various means, or laſtly they put the Tincture in the Stools themſelves. It will be worth our while that we ſhew ſome reaſons and inſtances of every one of theſe.

Cathartick do not operate by Attraction or Election.

Firſt therefore, Medicines do irritate within the Cavities of the *Viſcera* after a divers manner according as they contain more volatile or fixed Particles, more gentle, or more eager, more ſoft or more aſper, and for that cauſe ſtir up now in theſe places now in thoſe ſooner and rather more light or ſtronger Excretory Convulſions. Of theſe kinds are Roſes, Violets, Caſſia, Manna and others

The difference and reaſon of the operations of Cathartick.

Part I.

others the like, which are of ſubtil parts and very tenuous, and for the moſt part do not diſturb the Ventricle; but being come to the *Pylorus*, they begin to irritate the more exquiſitely ſenſible nervous Coat of of the *Duodenum*, and before they go any further they there ſpend almoſt all their whole Strength; and ſo as the biliary Pore is ſhaken by the pulling and corrugation of that Coat, bilious Stools follow.

1. *For as much as they irritate after a diverſe manner in the* Viſcera.

On the contrary others, as Gumm Ammoniack, *Opopanax*, *Sagapenum*, Turbith and the like, which conſiſt of a thicker and more viſcous matter, and more obtuſe Particles, are not of ſo prompt an operation, that they ſhould preſently irritate; but being diſſolved within the Ventricle, and thence ſliding into the Inteſtines, and being brought into them not preſently, but after ſome time, and after that they have for a while adhered to their Coats, they begin their Vellications beneath the biliary Pore, wherefore they ſhave and wipe away beſides the *fæces* of the belly, and certain ſeroſities preſſed from the mouths of the Veſſels, the filth beſmearing the Inteſtines, and therefore they cauſe the appearances of pituitous Stools.

2. *For as much as they ferment variouſly with the blood.*

2. For as much as Medicines indued with Particles of a diverſe kind, do ferment after a diverſe manner with the Blood and other juices; therefore follow now ſerous now bilious Stools, or elſe of another kind. For ſome, as chiefly Aloes and Rheubarb, becauſe they contain in themſelves Particles as it were of an aduſt matter, they beget ſuch in the Blood; and ſo alſo ſtir up its aduſt excrements into motion, and force more plentifully into the choler carrying Pipes: And for this reaſon when the Bile more copiouſly heaped together, flows from its receptacles into the Inteſtines; the Stools become more bilious. I have known ſome accuſtomed to be purged by by drinking two pints of ſimple raw Milk, to caſt out by Stool nothing but yellow choler: The reaſon of which is, for that Milk it ſelf goes into choler, as may be inferred from the bitter belching, and the heat of the Blood (as it were ſwelling bile) being quickly ſtirred up. Further, other Catharticks as *Jalap*, *Colocynthida*, *Elaterium* and certain preparations of Mercury conſiſt of more ſharp and not ſeldom as it were maturating Particles; wherefore the which being received by the Inteſtines, and from thence tranſmitted to the Blood, notably diſperſe its Maſs, and precipitate it very much into ſeroſity: Yea ſometimes they as it were poyſon and corrupt its *Craſis*, or natural Complexion. Then indeed at the ſame time in which the Blood is ſcattered abroad, there is a vellication in the Inteſtines, and the ſerous excrements of the Blood, and its corruptions and melted fats are ſpewed forth into the cavities of thoſe *Viſcera*, from the mouths of the Arteries there opened; and ſo they induce very watry Stools. If that after the Blood ſo ſcattered abroad by the Medicine, and hurt in its natural Complexion, a little or no plentiful evacuation follows by Stool; the Blood being even more depraved by the incongruous mixture and corruptions, acquires from thence either a notable Dyſcraſie, or pouring forth its recrements and corruptions into the habit of the Body, cauſes puſtula's and watry bladders to break forth in the skin. For ſo from a greatly uſed Evacuation inconveniently made, oftentimes great evils follow: Neither is it for nothing that the common people are ſo afraid, if at any time the Medicine ſhould work but little, leſt the Virulency contracted and left from thence, ſhould lye hid a long time after in the Body, and at length produce malignant Diſeaſes: For ſometimes from ſuch an occaſion as it were leprous paſſions or alterations of the ſenſes are ſtirred up; ſo not long ſince when as a Cathartick Powder (and as it ſeems Mercurial) was exhibited by an Emperick to two Sons of a certain Oxfordian, one of them was purged in the ſpace of forty eight hours a hundred times at leaſt, with great torment and ſwooning away of the Spirits: In the mean time the other being a little older had no Stool, but within a few days his Hair fell off, his Nails grew black, and moreover in a ſhort time after watry Puſtulaes broke forth through his whole Body, which growing hard into a cruſty Scab, and then falling off, preſently new ones ſprung up again: This kind of Diſeaſe, by reaſon of the complexion of the Blood highly vitiated, and as it were, poyſoned, yielding to no remedies, exerciſed moſt grievouſly this poor Wretch, above two years before it could be perfectly cured. Not only from Mercurial Medicines, but ſometimes from other Catharticks taken from the family of Vegetables, the Maſs of the Blood is ſo depraved, that it cannot be reſtored or renewed but in a long time after: So that *Helmont* doth not altogether vndeſervedly calumniate, ſaying cathartick Medicines do not always or only bring away the humours

The evils of Elaterian or ſtronger Purging.

Shown in a notable Hiſtory.

humours firſt exiſting in the Body, but by their corrupt power cauſe them to be depraved.

Part I.

3. The error of elective Purgation carries its Roots yet more deep, for that when ſometimes the liquids thruſt forth through the Belly, change their Colours from the Medicine; 'tis falſely believed the bilous and melancholy firſt exiſting to be brought away apart from the other humours, there is nothing more uſual than from Rhubarb, Aloes, the roots of *Cucurma*, and certain other medicinals being taken, as the Urines ſo the Stools to be tinged with a yellowneſs: In like manner the infuſion of *Senna*, alſo Catharticks in which Chalybeats or Vitriolicks are mixed, dye the fæces of the Belly which they evacuate with blackneſs. Further the diverſe conſtitution of the Body, and diſpoſition of humours produces divers appearances of Excrements. Becauſe when the Choler-carrying Veſſels ſwell with Byle in theſe, the Salts of the vitriolick Tincture in theſe, being black Parents are houſed in the firſt paſſages; and in other places through the ill means of living, very many ſeroſities are heaped up in the whole Body; wherefore when theſe kind of Stools follow from any medicine whatſoever, if that theſe humours commonly called Cholerick or derived from the Choler, thoſe from the heat of melancholy or theſe watry happen to be purged, ſuch are affirmed to be picked forth by the elective Medicament. What therefore belongs to the choice to be had in purging Medicines, notwithſtanding that thoſe cryed up claſſes of Medicines appropriated to this or that juice, do not pleaſe; yet we think that any Catharticks in all caſes are not indifferently to be uſurped, but that it is the work of the judgment of a prudent Phyſician, and of a ſagacious diſcerning, that according to the ſtrength, temperament, the ability or tenuity of the *Viſcera*, bearing, cuſtom and imagination of the Patients; yea, according to the nature, time, and condition of the Diſeaſe, that a purgation gentler or ſtronger, from hot or temperate things gentle or more ſharp, in ſolid ſubſtance or liquid, or ſome other of another kind or form, be preſcribed.

Whence the error of elective Purgation begun.

The more ancient Phyſicians, with whom alſo many Neotericks agree, did ordain a previous preparation of the humours for elective Purgation, as neceſſary to it: Wherefore in their practical Books as often as cathartick Evacuation is preſcribed, a long *ſeries* of deſtinated preparations for every humour, in a ſolemn manner as it were with a certain pomp is propoſed; the uſe of which though ſpecious enough ſeems not to be profitable; becauſe in truth there are no ſuch humours, as we ſhall ſhew clearly in another place. But truly as a purge is not convenient at any time, nor in any ſtate of Body, that you may go about it rightly; both opportunity and a certain preparation is required, and both theſe reſpect the firſt paſſages and the ſanguinious Maſs.

The preparation of the humours not neceſſary to purging.

What preparation is required for purging.

As to the firſt, if at any time the Stomach is burthened, either with the loading of a viſcous Phlegm, or is troubled with an Æſtuation of turgid Bile, a Cathartick is very often uſed in vain or unhappily, unleſs theſe Contents are firſt of all bruſhed out by a Vomitory, or their aggravation and efferveſcency mended by Digeſtives.

1. *In reſpect of the Stomach.*

But as to what belongs to the Blood, Purging is oftentimes unſeaſonable, and ſometimes alſo incongruous; but in neither of theſe caſes are the ordinary preparations convenient, but only Alteratives: Becauſe not theſe imaginary humours are to be diſpoſed for evacuation, but the Blood it ſelf ought to be reduced either from its troubled and confuſed ſtate, to a quiet Condition; or from a Debility or Dyſcraſie to a ſtrong and equal temperament. Whilſt that the Blood feavouriſhly boyling is diſturbed in its mixture, a Purge is always conceived to be hurtful; and therefore condemned by *Hippocrates* and the Ancients: No leſs are thoſe Evacuations forbid whilſt its Maſs being languid and weak, doth not ariſe to due fermentation. Further, when the Blood is above meaſure bilous or watry, or is too much inclined either to Coagulations or Fuſions, Purgings and ſuch kind of drainings, do not move away its depravation, but oftentimes augment it. But in theſe caſes alterative Remedies are rather preſcribed, which may deſtroy the wicked Combinations or elſe the Separations of the Salts, Sulphur, and *Serum*, and take away their enormities: But concerning theſe Medicines of cathartick Evacuation, either previous, or which is often better, theſe ſupplying its turn, *viz.* Digeſtives and Alteratives, we ſpeak of them ſpecially hereafter.

2. *In reſpect of the Blood.*

There do not occur many more things to be ſpoken concerning the Theory

Part I.

of purging Medicines, beſides truly (as appears by what has been already ſaid) Catharticks irritate both the Spirits inhabiting the ſplanchnick Fibres, to wit, theſe into troubleſome Senſions or Feelings, and therefore the others into excretory Contractions, further ferment both the humours and the Blood, and compel them into various fuſions and ſeparations of Parts: It reſts that we enquire upon what kind of Particles, whether elementary or ſecondary, and (as I may ſo ſay) Qualitative, this double Virtue both irritative and fermentative depends. Concerning theſe in general we obſerve, which afterwards ſhall be confirmed by inſtances, the irritative force which uſes to ſhew it ſelf in the *Viſcera*, and by whoſe inſtinct the cathartick Convulſions are provoked by no means to proceed from the principles of the Medicine either ſpiritual, watry, or earthly Particles, neither from the Saline or Sulphureous alone by themſelves, but to ariſe from them always combined, and ſometimes with others joyned to them. For although Salt and Sulphur are the chief Inſtruments of cathartick Irritation, yet neither of them ſimple uſes to be ſo infeſtous to the *Viſcera*, as that it ſhould ſtir up the moving Fibres into Excretory Convulſions, but they conjoyned together, do mutually exalt one another, and inforce into little prickings, yea acquire an inimical, and indeed an untameable diſpoſition to our Body. The tincture of Antimony, alſo its Ceruſs brings no trouble to the Stomach, but are rather grateful, and Cordials. But the Crocus of Metals, *Stibium*, the butter of Antimony, and others prepared out of Sulphur and ſalt conjoyned become Emeticks or great and ſtrong Catharticks. In like manner we ſomewhere obſerve the ſaline and ſulphureous Particles ſeparated one from another, and by themſelves, to be grateful enough in ſmell and taſte, but thoſe being intimately commixt preſently to attract a Fetor and rammiſhneſs.

A double faculty or virtue of a Cathartick; irritative and fermentative.

By what elementary Particles either of them depends.

The irritative doth not proceed from Spirit, Water or Earth.

Nor from Salt or Sulphur alone.

But from them combined together.

But as to what reſpects the Cathartick Fermentation, it doth not ſo plainly appear whether indeed the ſame Particles which irritate the Spirits into Excretory Convulſions, do alſo ſcatter the blood, and make it to ſeparate into parts, ſo that they may caſt forth its Excrements into the Cavities of the *Viſcera* from the mouths of the Arteries. Truly the Blood even as milk is for the moſt part ſcattered and precipitated into ſeroſities only by acid things; as ſhall be hereafter largely declared by experiments and reaſons. The Alcale ſalts fixed and volatile and alſo Nitrous do not diſſolve the Mixtion of the Blood, but rather preſerves it whole, and being ſoluted reſtore it; and in like manner do the Spirits of Wine and other moſt pure Sulphureans: But let the acid ſalt only be wanting to promote the Cathartick, the purging force of Medicines may be broken, or wholly taken away by nothing more.

On what kind of Particles the fermentative virtue depends.

Therefore that we may give our judgement concerning purging Medicines, examination being made by the ſenſe, it ſeems moſt likely, that they imbued (being for the moſt part of a ſharp taſte and ſomewhat pungitive) with a certain volatile and ſharp ſalt, together with Sulphur, (which ſalt in the more ſtrong is as it were Septick or Putrefactive) but theſe their ſulphureous ſaline particles do not ſcatter the Blood by means of the acid or other precipitatory ſalts, for as much as whilſt they embrace more intimately and friendly certain parts of it, they ſnatch them away from their other companions, and bind them to themſelves; but on the contrary the Cathartick Particles being incongruous to the whole bloody Maſs, and to all its Particles, and as they are immiſcible and untameable, they agitate all thoſe with their confuſion, and ſtir them up to an expurgative effervency; which, there being preſently received a more quick pulſe of the Heart, is not quieted before all Heterogeneous Bodies be caſt out of doors, a certain portion of the ſerous Humour wherewith they are mixed being expulſed with them and ſometimes other excrements of the blood. The bloody Maſs being infected after the like manner by the Particles of a ſtrong Cathartick growes hot, even as generous Wines, heterogeneous things being caſt into the But, are ſaid to ferment anew, for the excluſion of that incongruous thing, ſo that ſometimes they boyl up within the Cask, until that either the Veſſel be broken, or that their Complexion be thorowly vitiated. But this doth not ſo frequently happen to the bloody Liquor, becauſe both the incongruous Particles of the Cathartick, and others of the Blood vitiated and ſeparated by them, caſt out by the Arteries and ſcattered on every ſide, and eſpecially more widely opening, into the Cavities of the Inteſtines. However ſometimes the more vehement purgers greatly pervert the Temperament of the Blood, and as it were poyſon it. But truly ſome of them planely putrefactive, and corruptive, do work by

The Cathartick force of a Medicine from Sulphur, we call a latile Salt, and as it were putrefactive.

The more ſtrong catharticks work by ſtool even as Canthárides *by the urine.*

by ſtool after the like manner, as Cantharides by urine; to wit, they melt and corrupt in part the ſanguinious Liquor, then its meltings being rejected with the particles of the Medicine, for their ſharpneſs, they very much irritate the parts which they paſs thorow, and often corrode them. Wherefore they who have a care of their health or life, muſt ſhun Empiricks, uſing for the moſt part only Mercurial or Elaterian evacuation, more than a Dog or a Snake.

Part I.

Chap. II.

The Kinds and Forms of Purging Medicines and the Reaſons of their Compoſitions.

Scarce any Cathartick out of minerals.

Minerals do not contribute much to the Claſs of Catharticks; although the more celebrated Vomitories and Diaphoreticks are chiefly taken out of its ſtore: But Purgers for that they are of a middle vertue and of a diverſe Operation, will not be made out of thoſe impure and hard Concretes. For if that any elaterian force be left, how correct ſoever it be, as it were ſome ſharp prickings in the mixture, whatſoever of irritation proceeds from thence in the Ventricle, induces vomiting, but if thoſe be wholly taken away, no Excretion is ſtirred up in the *Viſcera*, but by reaſon of ſome reliques of the alchale Salts, of all it forces runs into ſweating. For indeed emetick Medicines ſeem to be of that ſort, which, when they can by no means be ſubdued in the Ventricle, and tamed, and are indued with more ſharp and as it were pricklie, to wit, ſulphureous ſaline Particles, provoke the ſtomachal Fibres violently into excretory Convulſions, whereby they might be thence exterminated in a moment by the ſhorteſt way, to wit, by Vomit: on the contrary Diaphoreticks, though they cannot be overcome and tamed, yet indeed their Stimulaes or Prickles being taken away, their Particles are broken into ſmall as it were globulary or round bits, and free from Prickles, do not irritate the Stomach, but paſſing into the Maſs of blood, ferment that, being immiſcible, and not to be tamed, and ſtir up an univerſal effervency, whereby they may evaporate with the ſerous juice, and other excrements of the Blood. But purging Medicines being indued with incongruous, but yet more blunt and weaker Particles, do not preſently or vehemently irritate the ſtomachal Fibres; but yet after they have entered them a little more deeply, they firſt move a troubleſome ſenſe, then that they may caſt forth a doors what is troubleſome, without much perturbation; they cauſe the wonted and ordinary excretory motions, to wit, by the inteſtinal Pipes to be increaſed and multiplied.

The chief Emeticks and Diaphoreticks are taken out of that ſtore.

The reaſon of this difference inquired into.

Some purging Medicines not properly ſo called out of Minerals.

But yet ſome from Minerals as *Mercurius dulcis*, *Lapis Lazuli*, the Armenian ſtone, and ſome others though improperly are numbred with Catharticks, for they are not of a truſty or certain operation, therefore ſhould be rarely given by themſelves for that end, but with other purgers are given not without benefit.

Very many Catharticks and of various Kinds from vegetables.

But deſcending to Vegetables, we here enter into a large field, and thick beſet with Catharticks: which, for that they are many, are wont to be numbred, and diſtributed in various manners; to wit into more gentle, more moderate, and more vehement, alſo into ſuch as carry away Choler, ſuch as carry away Melancholy, ſuch as carry away Phlegm, and into ſuch as carry away Water: further into purgative minoratives or leſſeners and eradicatives or rooters up. It is not for us to inſiſt upon every one of theſe Tribes, but we ſhall reduce the whole Cathartick ſtore to three kinds only, to wit, in the firſt place to be reckoned thoſe which cauſe a light irritation in the *Viſcera*, and only a gentle fermentation in the blood and humours: of which kind are Violets, Caſſia, Tamarinds, Roſes, Rhubarb, Senna, Myrobalans, *Epithymum*, *Carthamus*, Agarick, Aloes, and the like. In the ſecond place ſuch as ſtir up both a vellication in the *Viſcera*, and an effervescency in the humours more ſtrongly, for as much as by theſe, great perturbations, and ſometimes feavouriſh, by thoſe convulſions with pains though not very great are excited: in which Cenſe are placed Scammony, Turbith, Hermodactyls,

A numbring of Purgers.

Part I.

dactyls, Mechoacan, Jalap, Danewort, Elder, Opopanax, *Sagapenum*. Laſtly are placed ſuch as cruelly pull and tear the Ventricle and Inteſtines, yea thorowly agitate, diffuſe, and ſeparate the blood and other humours in their mixtion, with a certain ſeptick or putrefying force: ſuch are Hellebore, *Elaterium*, *Soldanella*, *Euphorbium*, Spurge, *Colocynthida*. &c.

Vegetable Catharticks do not want much chymical Preparation.

Vegetables have not always as minerals, need of a long preparation to unlock their cloſe-joynted Powers; for theſe oftentimes, whilſt that the mixtion is whole (but of thoſe we have obſerved otherways) do operate more ſtrongly. For the vertue of theſe conſiſts in a ſubtil and fugacious *Syſtaſis*, and need not to be reduced by great labour and chymical preparation into Extracts, Magiſterials or Quinteſſences, but very many of them as Rhubarb, Manna, Caſſia, Senna, Myrobalans, *&c.* being reduced into little pills or powders, or infuſed in a fit liquor or decocted, work both better and eaſilier; which if vexed by too much artifice, either they wholly caſt away their purgative force, or they exerciſe it ſlowly and with trouble. It is an uſual thing for the drawing forth the Tinctures of Vegetables, to impregnate the liquor into which they are put with the ſalt of Tartar or of Wormwood, for ſo they obtain a deep colour. Although I do not diſallow this way, for as much as the fixed ſalts of the herbs do boyl up with the acid juices of the Ventricle and Inteſtines, yet the deceit lying in it ought to be done away: for that the ſalts do not draw forth that tincture, but make it appear. For if you add the ſalt of Tartar to the infuſion of Rhubarb, Senna or other Vegetables already made, and ſtrained, forthwith its Tincture or Colour becomes much more deep: the reaſon of which is, for that the fixed ſaline Particles being ſomething blunt do fill up the pores of the liquor, ſo that the beams of the light are very much broken in paſſing thorow them: for which reaſon every Tincture is made deeper becauſe of the ſalt of Tartar, by the ſpirit of Vitriol being infuſed therein, whoſe Particles are ſharp poynted, without the precipitation of any matter becomes preſently more clear and thin.

Some of them are made better by extraction.

What the Salt of Tartar contributes to the extraction of purging tinctures.

Chymical preparation for reſinous and ſaline extracts very uſeful.

But truly ſome of the vegetable Catharticks are likewiſe mended by a Chymical preparation: for from ſome filled with Salt and Sulphur the active and benign Particles may be picked forth from the remaining more dull and malignant, and reduced into reſinous Extracts or ſome other compendious things of another kind; the Analyſis and ſhort compoſition of theſe is certainly inſtituted, with very good profit. Wherefore for the rightly preparing certain Catharticks we draw forth with the ſpirit of Wine, the ſulphureous and ſomething the ſaltiſh part, as in the Magiſteries of the Reſin of Jalap, Scammony, Mechoacan *&c.* For others we uſe Saline *Menſtruums*, to wit, diſtilled vinegar, or waters exacuated or made ſharp with the ſpirit of Vitriol or ſalt of Tartar: and that for a double reſpect; to wit, either that the active Particles being ſeparated from the terreſtrial matter, the Medicine may be compoſed in a leſſer heap and more elegant form; or that all the fierce or virulent mixt qualities may be taken away or ſubdued.

The chief Forms of purging Medicines are noted.

It would be a buſineſs of infinite and tedious labour, to recount here all the ſimple Catharticks, their preparations, diſpenſations, and doſes ſingly: what is enough for our purpoſe, as the chief compoſitions of purging medecines, are Potions, Powders, Boles, Electuaries, Morſels or Tablets, and medicated Ale or Wine, we ſhall ſhew the more ſelect preſcriptions of every one of theſe, and thoſe of a threefold kind, according to which the operation of the Medicine ought to be gentle, moderate or ſtrong; to which fourthly are added Receits of eaſily prepared Medicines for poor people.

Potions gentle.

I. Gentle Potions. ℞ Rhubarb ſliced ʒiij, yellow ſanders ʒß, ſalt of Tartar ℈j, put them all night into cold water of Chicory and white Wine ʒijß, to ʒiij ſtrain'd, add of Syrup of Chicory and Rhubarb ʒß, water of Cinamon ʒij: make a potion.

Moderate.

2. Moderate. Take of the beſt Senna ʒiij, of Rhabarb, Thoches of Agarick of each ʒjß, yellow Sanders ℈ij, of the ſalt of Tartar ʒß, of Coriander ſeeds ʒj, infuſe them cloſe all night in ſpring water and white-wine warmed of each ʒiij, of it ſtrained ʒiiij, add to it ſyrup of purging Apples ʒj, water of *Mirabolans* ʒij, make a Potion, or take of the decoction of *Sen*, *Gereonis* ʒiiij, of the ſyrup of Roſes Solut ʒj, of the Cream of Tartar ʒß, Cinamon water ʒij, make a Potion.

Take of the beſt Caſſia Fiſtula, of Tamarinds of each ʒß, Coriander ſeeds ʒij, boyl them in ʒx, of ſpring water till a third part be conſumed, take it, clarify it with the white of an Egg, ſtrain it and add thereto of ſyrup of Pippins ʒj, and the Potion is made.

3. Strong

3. Strong. Take of the Decoction of *Sen. Gereonis* (with the addition of the Strings of black Hellebore and Agarick of each ʒiſs) ℥vj. Of the Syrup of Roſes Solut. or the Flowers of Peaches ℥j. of Water of Mirabolans ʒij or. Part I.

Take of the beſt *Senna* ℥ſs, of the extremities of black Hellebore and Turbith of each ʒij, of red Sanders ʒj, of coriander Seeds ʒiſs, of the Salt of Tartar ʒſs, make a cloſe Infuſion and warm of white Wine ℥viij, all night, of the clear ſtraining ℥v, add to it of the Electuarie of the Juice of Roſes ʒiij, of the Syrup of the purging Thorn ʒvj, Cinnamon Water ʒij, the Potion is made. *Strong.*

4. Potions eaſie to be made for the Poor. Take of purging Line one handful, of ſweet Fenil Seeds ʒij, boyl them in as much ſpring Water as will ſuffice to ℥vj, adding thereto of white Wine ℥ij, the Potion is made. After the ſame manner may be prepared a purging draught of the Flowers of Damask Roſes, alſo of Peach Leaves, alſo of the Roots of the *Eupatorium* of *Avicenna* or Agrimony. *Eaſily prepared.*

2. Pills. Firſt of eaſie operation. Take of Stomach Pills with Gumms ℈j, to ʒſs, of Tartar vitrioled *gr.* ij, of the Balſom of *Peru* what will ſuffice make thereof 3 or 4 Pills. After the ſame manner may be made Pills out of the maſs of Pill, *Ruffi*, Maſtick, *de Succino* or Amber, alſo of our Extract Solut. the deſcription of which may be had in the Tract of the Scurvie. 2. *Gentle Pills.*

2. Moderate. Take of Stomach Pills with Gumms ʒſs, of the reſign of Jalap *gr.* iiij to x, of Tartar Vitriolat. *gr.* vj, Gumm Ammoniack diſſolv'd as much as will ſuffice, make Pil. iiij. After the ſame manner may be made Pills out of the maſs of Pil. *de Succino: Tart. Quercetan.* Alſo in the place of Reſine of Jalap may be put of Sulphur of Scammonie *gr.* vj to xij, or of the Reſine of Scammonie *gr.* viij to xiiij, or take Pil. Stom. with Gums, ana ℈j of the Reſine of Jalap *gr.* vj to xij, as much of the Balſam of *Peru* as will ſuffice make Pil. iiij. *Moderate.*

3. Stronger. Take of Pil. *Rud.* ij ʒſs of the Reſine of Jalap *gr.* viij to xij, of the Balſom of *Peru* what will ſuffice, make Pills iiij to be taken with governance. After the like manner they may be made out of the maſs of Pill Cochiæ: *de Sagapeno.* Take of Pil *ex Duobus* ℈ to ʒſs. *Calomelanos* ℈j make iiij, to be taken with governance. *Stronger.*

4. Eaſie to be made and of leſſer price. Take of the choice Pouder of Jalap ʒij, of Diagridium ʒj, of Cloves and Ginger, of each ℈j, Ammoniac Solut. what will ſuffice, make a maſs, the Doſe is ʒſs. *Eaſie to be had.*

3. Pouders. Firſt the more gentle. Take of Rhubarb the Pouder ʒſs, of the Salt of Wormwood ℈ſs, of Cloves *gr.* ij, make a Pouder, let it be given in a ſpoonful of ſmall Cinnamon water, or in a draught of Broth. 3. *Pouders gentle.*

Take of the Pouder of the greater compoſition of Sena ʒſs to ʒj, in a draught of Poſſet drink.

Take of the Pouder of the Leaves of Sena ℈j, *Calomel. gr.* xvij, yellow Sanders ℈ſs, make a Pouder, let it be given in a ſpoonful of Panada.

2. Moderate. Take of the Pouder of Diaſen. ʒj, of Creme of Tartar ℈j, make a Pouder, let it be given in a draught of Broth. *Moderate.*

Take of the Reſin of Jalap *gr.* x, Calamel ℈j, Cloves *gr.* vj, make a powder taken after the like manner.

Take of the Species of Diaturbith with Rhubarb ʒſs to ʒj, of Creme of Tartar ℈j to ʒſs.

3. More ſtrong. Take of Turbith, Hermodactyles ana ʒiij, Diagridium ʒj, Ginger ℈j, make a Powder, the Doſe ʒſs to ʒj. 3. *Stronger.*

Take of the Powder of *Cornachini* ʒj. After the ſame manner may be given the Powder *Hermodactyl. Compoſit.* alſo the Powder Hydrotick of *Riverius.*

4. Cheap and Eaſie to be got. Take of the Powder of the Roots of ſelect Jalap ʒj, of Ginger ℈j, let it be given in a draught of white Wine. In like manner the Powder of the Roots of Mechoacan, alſo the Leaves of Sena to ʒj may be taken in any Liquor. *Eaſie to be got.*

4. Boles and Electuaries. Firſt ſuch as work gently. 4. *Boles and Electuaries.*

Take of Electuary Lenitive ʒſs, of the Cream of Tartar ʒſs, Syrup of Roſes *q. ſ.* make a Bolus. Take freſh Caſſia ℥ſs, Powder of Rhubarb ʒſs, Cream of Tartar ℈j, Syrup of Roſes what will ſuffice, let a Bole be made.

2. Moderate. Take of Elect. Lenitive ℥ſs, of Cream of Tartar ʒſs, of Reſine of Jalap *gr.* vj, Syrup of Roſes what will ſuffice to make a Bole. *Moderate.*

Take

Part I.

Take of electuary *Diaphœnici* ʒʃʃ, powder of Hermodactyls compounded ʒʃ, Syrup of Elder what will ſerve: Let a Bole be made.

Stronger. 3. Stronger. Take of Electuary of the Juice of Roſes ʒʃ, Reſine of Jalap *gr.* x, Cream of Tartar ʒʃ, Syrup of Elder as much as will make a Bole.

Electuaries are compounded out of the ſame Compoſitions in a greater quantity, by adding conſerves of Damask Roſes or of Peach Flowers: The doſe to be taken betimes every morning, or twice or thrice a week, is the quantity of a Cheſnut.

Eaſie to be had. 4. Boles and Electuaries eaſie to be gotten. Take of the Powders of the Roots of Jalap ʒj, of *Mechoacan* ʒʃ, of Ginger ʒij, of Cloves ʒj, of Cream of Tartar ʒiij, of the ſalt of Wormwood ʒj, of Sugar ʒij, Syrup of Roſes ſolutive what ſhall ſuffice: Let an Electuary be made. The doſe is the quantity of a Walnut.

Solutive Confections and laxing Sweetmeats, the *Diaprunum* of *Sylvius* in the thirtieth Page of the practice of Phyſick.

Morſels or Tablets. 5. Morſels or Tablets of moderate operation. Take of the powder of *Mechoacan*, Turbith Gummous, of each ʒʃ, of Scammony ſulphurated ʒij, of the Reſine of Jalap ʒj, Red Sanders ʒj, Cream of Tartar ʒij, Conſerves of Violets ʒj, of Sugar diſſolved in Roſe-water and boyled up to a conſiſtence, j pound and an half, make Tablets weighing ʒj. The doſe j or ij of the purging Tablets; Page 18. of the Praxis of Phyſick, *Sylvius*.

Medicinal Wines and Ale. 6. Medicated Wines and Ale or moderate Purgers. Take of the leaves of Senna ʒiʃ, of Turbith, of *Mechoacan*, of each ʒvj; of the ſtrings of black Hellebore ʒiij, Cubebs, Galingal Roots, Cinnamon bruiſed, of each ʒij: Let them be put into a large Glaſs with 4 Pints of Rheniſh Wine, of ſalt of Tartar ʒiʃ; let them ſtand cool and covered for ſix days, add to it Sugar Candy ʒiij, and paſs it thorow the ſleeve of *Hippocrates*: The doſe is ʒiij or iiij.

Take of the leaves of Senna ʒiij, of the Roots of *Polypodium* of the Oak, and of ſharp pointed Dock prepared of each ʒij, of Turbith, of *Mechoacan*, of each ʒiʃ, of *Epithymum*, Red Sanders, of each ʒj, Coriander ſeeds ʒiʃ, let them be ſliced and bruiſed, and let a bag be prepared according to Art for 4 Gallons of Ale. The doſe ʒxij to a Pint every morning, or twice or thrice in a week.

The Reaſons of ſome Chymical Preparations.

Mercurius Dulcis.

Mercurius dulcis. Take of the corroſive Mercury ſublimate ʒvj, of the beſt purged Quickſilver ʒiiijʃ, let them be bruiſed together in a glaſs Mortar to a perfect mixture, then let them be ſublimed in a ſand Furnace, with a fire increaſed by degrees to the height for 12 hours: Let the ſublimation be repeated again and again, adding the Mercury which becomes crude in the ſubliming. At length, the matter being perfectly ſublimated pure and white, let it be gathered together and the excrements done away, and kept for uſe. The doſe is from *gr.* xv to xxx, by it ſelf, or with Catharticks added to it, which may carry down the Mercury quickly by Stool, without danger of Salivation.

The ſublimate Corroſive Mercury, out of which Mercurius Dulcis *is made.*

The corroſive ſublimate Mercury. Take of Calcined Vitriol ℔j, of Sea Salt calcined, of the beſt Nitre, each ℔ʃ, of purged Mercury ℔j; let them be beaten in a glaſs Mortar or Wooden, to a perfect mixtion, by adding a little of *Aqua fortis* or ſpirit of Vinegar; let them be ſublimed

ſublimed in a ſand furnace, by a fire gradually increaſed to the height: Let the work be repeated if need be, that the matter ſublimed to the ſides of the Veſſel, may obtain a Snow white colour. This work proceeds much more eaſily, if the Quickſilver be diſſolved in *Aqua fortis*, diſtilled out of the aforeſaid Minerals: then let the matter, the humidity being abſtracted, be ſublimed with an intenſe fire.

The reaſon of both.

As to what reſpects the Ætiology of the aforementioned Medicine, firſt concerning the Corroſive Sublimate, it is plain enough that the Mercury is diſſolved by the Salts (whether they lye hid in the Minerals themſelves, or in the *Aqua fortis*;) and coagulated as it were with them, is carried on high by the ſtrength of Fire. Further, that from the ſame Salts congealing the ſaline Particles of the Mercury, and hiding themſelves within its other Pores, the colour like Snow is produced, and together that by reaſon of the little ſuperficies of the ſame Salts being highly ſharpned, the Corroſive Force doth proceed. Then that by a repeated ſublimated Sublimation afterwards, the Quickſilver being added and incorporated almoſt in an equal Quantity, that acritude may be taken away; the reaſon is for that the ſaline Particles are ſo bruiſed and broken by the Mercurial Particles, being increaſed in abundance, and every where growing to them; that they do not dig and lance the ſenſible Fibres as before: Beſides the powder of this Sublimate being bruiſed in a Mortar grows yellow, by reaſon of the plenty of the Mercury, as it were, emerging. But that the common precipitate, in which the mercurial Particles are greater than the congealed Salts, is highly corroſive, the reaſon is, becauſe the little Bodies of the Fire make ſharp all mineral Particles, in as much as they take away all their ſoftneſſes, and ſtick cloſe to them with their exceeding ſharp pricking Bodies.

2. *The Reſine of Jalap.*

The Reſine of Jalap.

Take of the roots of *Jalap*, the moſt weighty, black and ſhining, bruiſed groſsly ℔j, of the ſpirits of Wine ℔iij, let them digeſt being cloſe ſhut and warm for two or three days: Let then the tinged Spirit, being poured forth into a Glaſs cucurbit, be taken away, the fourth part remaining, to which let it be inſtilled with cold water; the Reſine will be precipitated to the bottom of the Veſſel, which being waſhed from its filth and dried may be kept for uſe. The doſe of its Powder is *gr.* vj to xij or xiiij.

The reaſon of its preparation.

In this Preparation the ſpirit of Wine draws out the ſulphureous Particles of that Concrete, and that the more eaſily, for as much as theſe in the mixtion were before ſeparated of themſelves and gathered together, as might be gathered from its reſinous and bright ſhining Veins; whilſt that the ſulphureous part is drawn forth, ſome of the ſaline Stems alſo joyned with it: Wherefore this Reſine ſtinking, and ſharp in taſte, purges ſtrongly and becomes eaſily inflammable. This works in a leſſer quantity, and ſtronger than in the whole mixture it ſelf, for as much as all the active Particles, the blunt ones being done away, do grow together.

3. *The Reſine of Scammony.*

Reſine of Scammony.

This is prepared after the ſame manner as the Reſine of Jalap, but in this Medicine, becauſe that the ſaline Particles in the diſſolving become more, nor are gathered altogether in the Reſine with the ſulphureous Particles, the operation is gentler and weaker than in its whole mixture: For although a great plenty of Sulphur be in the Scammony, yet its operation depends very much upon the ſaline Particles; Wherefore when that its Powder is fumigated by enflamed Sulphur, the purging force is much broken, becauſe that the acid Salts emitted with the fume of that Concrete do enter into or fix the Saline Particles of another kind. The extracted Reſines out of Turbith and Mechoacan, are gotten after the ſame manner of preparation, as from Jalap and Scammony.

4. *The*

Part I.

The extract of black Hellebore.

4. *The Extract of Black Hellebore.*

Take of the Fibres of black Hellebore ℔ß, bruise them a while grosly in a stone Mortar, sprinkling them with the best spirit of Salt ʒiij: Afterwards being put into a Matrace, pour thereon of the smaller spirits of Wine, impregnated to a yellowness with salt of Tartar ℔iij, adding of *Lignum* Aloes and of Cloves bruised of each ʒij: Let them be digested, close shut and in warm sand three or four days, then filter the whole liquor, and let it be drawn off by a gentle warm Bath, to the consistency of an Extract. The Dose ϑj to ʒj.

This Medicine, because that the active and benign Particles being separated, both from the more dull and virulent, and further more fixed by the Salts of the *Menstruum*, and brought under; they are reduced by themselves into a Mass, operates more gently and in lesser abundance than the Powder of the Root: Moreover by reason of the adjoyned Salts, which grow hot with the Salts of the *Viscera*, and humours of our Body, becomes the more efficacious.

So much concerning Medicines which direct their operations upon things laid up in the Ventricle almost altogether by plain aud open ways, as it were the high Road, to wit, upwards or downwards, by the *Oesophagus* towards the Mouth, or by the Intestines towards the Arse. There remain many others, which either way treading the path to which they were destinated, do make known their actions upon the Blood, and System of Nerves with a various respect to the Heart, Brain, Reins, and other *Viscera*, or on the habit of the whole Body. Concerning which we will speak at length methodically, after that we shall have added some things concerning the Remedy of too much Purging, and especially for the *London* Dysentery.

Chap III.

Concerning the Remedy of excessive Purging, or of Medicines stopping too great Purgation or Diarrhœa. *Also concerning the* London *Dysentery, the knowledge or Theory of which, and the Method of Curing it is inquired into.*

THere is equally need of a Bridle as well as of Spurs no less about the right ordering of Purging than of Vomiting: For as sometimes Cathartick Medicines are of necessary use to make slippery the Belly, or to cause plentiful going to the Stool; so if that evacuation be immoderate, or shall not be easily tollerable, opposite Remedies or Antidotes of the *Diarrhœa* or Dysenterick Affection are to be prescribed. By what means and after what manner of affecting purgers do perform their operations, also for what causes besides, and occasions, spontaneous Purgings do frequently happen, is already shown. It shall be our present business in every of these cases, to wit, both in the medicamental *Hypercatharsis* or excessive Purging, also in the *Diarrhœa* and dysenterick Affections to propose the means of curing them, together with select prescriptions or forms of Remedies.

The reason of the Medicinal Hypercatharsis.

A purging Medicine being improportionate either in quality or quantity, works more strongly and longer, and for as much as by irritating too much the nervous Fibres,

Fibres, the animal Spirits are agitated into excandeſcencies or angers not eaſily to be allayed, and for as much as it ſcatters the blood and the humours, and as it were melts them, therefore that their liquifications might be thruſt down into the cavities of the *Viſcera*, yet greater excretory irritations are made. Part I.

The Therapeutick Method hath reſpect both to the precaution or prevention and curation of the *Hypercatharſis* or exceſſive Purging. As to the firſt there is need of conſideration and caution before evacuation in its operation, and after its operation. For in the firſt place, it very much behoves to weigh both the conſtitution, ſtrength, and cuſtom of the Body to be purged, as alſo the nature, doſe, manner of working, and ordinary effects of the Medicine to be given; then to proportionate by collected marks the vertue of the Agent according to the bearing of the patient. Secondly whilſt that the Medicine operates, the *Viſcera* of diſgeſtion, the Blood and animal Spirits ſhould be kept free from any other perturbation. Wherefore in that time neither any groſs aliments, nor viſcous, nor many which may trouble the Belly, ſhould be taken in; all External Cold whereby the Pores of the Body are ſhut up, ſhould be carefully ſhunned; laſtly the Mind ſhould be pleaſing, even and ſerene, and free from Cares, and more hard Studies. Thirdly the operation of the Medicine being finiſhed, the Excandeſcency of the animal Spirits ought to be quieted, and the Effervеſcencie of the Blood and Humours to be appeaſed; for which end an anodine Medicine, or a gentle Hypnotick or cauſing reſt is given according to the following Forms.

Its precaution.
1. *Before Evacuation.*
2. *In its operation.*
3. *Afterwards.*

Take of the Water of Cowſlip Flowers ℥ij of Barly Cinnamon water, Syrop of Poppies, of each ℥ß, of Pearls ℈ß, make a draught to be taken going to reſt. or

Take of Conſerve of red Roſes Vitriolate ℈ij, of Diaſcordium ʒß, of Pearls ℈ß, of Diacordium what will ſuffice, make a *Bolus* to be taken going to ſleep.

Diacodium vallat

If that theſe things being omitted, or notwithſtanding all this Caution, that an exceſſive purging by reaſon of the Medicine ſhould happen, preſently let the patient be put into a warm Bed and handled after this following Method. In the firſt place let there be applyed to the Ventricle and to the region of the whole *Epigaſtrium* or Belly, a plaiſter made out of the Treacle, or foment it with warm Linnen ſtoops dipped in the Decoction of Wormwood, Mints, with Spices and red Wine, and ſo wrung out: then let him take a Bole of Treacle Andromach. or it being diſſolved in Cinnamon water. Moreover let him drink now and then a ſpoonful or two of burnt Wine with Mint water therein. If troubled with the wringing of the Gutts, let a Gliſter of warm Milk with Treacle diſſolved therein, be given: and ſometimes they ought to apply warm frictions to the exterior Members, and Ligatures, where by the Blood may be brought outward, and be detained from too great a Colliquation, and effuſion into the Cavities of the *Viſcera*: then in the evening, if that there be ſtrength and that the Pulſe appears robuſt enough, let a doſe of *Diacodium*, or *Laudanum* in ſome fit Vehicle be taken.

The Cure of Exceſſive purging.

As to the other kinds of too much Purging, which, without a Cathartick being given are wont to ariſe from various Cauſes and occaſions, they require a Medicine; I ſay for the moſt part they be merely Symptomaticks of and depend upon other Diſeaſes, and the Method of their cure is the ſame as of thoſe Diſeaſes themſelves from whence they ſpring. So indeed in the Scorbute and Phthiſick it is uſual for the Diſeaſed to be troubled with a frequent Flux of the Belly: the Method of curing doth not reſpect this Symptom, but the cauſe of the primarie ſickneſs to be done away. But yet ſometimes the Flux of the Belly (which is wont to be called the *Diarrhœa*, or Dyſenterie) ſeems a diſeaſe of it ſelf; and truly in this City of London, ſince this kind of Diſeaſe is wont to reign almoſt every Year, and is commonly eſteemed peculiar to the place, this place will be very fit, to inquire a little further into its Nature, Cauſes, and method of curing it.

What is to be done in the Symptomes of the Diarrhœa.

Although the word *Dyſenteria* in common acceptation denotes the bloody Flux of the Belly as well as the humoral Lask. I yet ſaving the Etymologie, it is lawful to apply this Name to the *London* Diſeaſe alſo when it is not bloody. For I have often, and for a long while, obſerved this kind of Flux, which is wont to infeſt us every Year about Autumn for the moſt part, commonly called the wringing of the Belly or (according to our Speech) the Griping of the Gutts, to be of two far different kinds; in the one the Stools are watry, and as it were clear with a ſudden failing of ſtrength, but the other bloody, yet they are tollerable;

The London *Dyſenteric.*

Two kinds of it viz. watry and bloody.

Part I.

in the mean time bilous or phlegmatick Stools (whilſt either of the diſeaſes raged) very rarely happen, and denote the Diſeaſe to be not of ſo ill a condition. By which, both theſe Dyſenterical Diſeaſes are known clearly one from another, as to their Differences, Cauſes, and formal Reaſons, it will be to the purpoſe to ſhew here Examples of either of theſe, obſerved then by me, and plainly deſcribed in thoſe years when they were peculiar.

A deſcription of the former.

In the Year 1670 about the *Autumnal Æquinox* very many laboured with the unbloody Dyſenterie, but very cruel and very dangerous. The diſeaſe invading ſuddenly and frequently without any manifeſt occaſion, did reduce thoſe labouring with it, by great Vomiting, frequent and watry Stools, quickly to a very great debility, to horrid failure of the Spirits, and loſs of all their ſtrength. I knew ſome the day before well enough and very ſtrong, in twelve hours ſpace ſo miſerably caſt down by the Tyranny of this Diſeaſe, that with a weak and ſmall Pulſe, cold Sweat, ſhort and quick Breath, they ſeemed juſt ready to dye: and truly not a few to whom fit Remedies or opportunity of cure were wanting, were ſuddenly killed by it. This ſickneſs raging for a whole month began to decreaſe about the middle of *October*, and before the beginning of *November* was almoſt wholly vaniſhed. Very few in that time had bloody ſtools, and not many Bilous but very many had Vomits, and watrie, almoſt clear and plentiful Stools, whilſt that popular Dyſenterie raged ſo cruelly in the City, in the Country or at leaſt three miles beyond the City, almoſt none was ſick of it. Beſides here, although very many were ſick, the diſeaſe did not ſeem to be propagated by Contagion, but to affect thoſe only that were prediſpoſed. For it did not take thoſe who were converſant in the ſame Family with the ſick any ſooner, than thoſe who ſhun'd their Houſes.

Its Cure.

For the Cure of this Diſeaſe no Evacuation did help, yea Phlebotomie, Vomiting, and purging ſometimes did hurt; but for the moſt part, the remedies were only Cordials, and thoſe the moſt hot, to wit, abounding in Spirits, and Sulphur or volatile Salt, that were beneficial; inſomuch as the Spirits of Wine with Sugar a little burnt became as it were the epidemical popular remedy, and in ſuch a Dyſenterie for the moſt part profitable, although in the other bloody Flux, indifferently uſed, oftentimes was found hurtful. The method of curing which I happily adminiſtred to very many then, and alſo am wont ſtill in the like Caſe, was according to the following manner.

Bole.

Take of Treacle Andromach. ʒj, or ʒiß, in your Bed drink after it of the following Julep 7 or 8 Spoonfuls, and repeat it every third, fourth or fifth hour.

Juleps

Take of Mint water, Cinnamon barly Water, of each ʒiij. of ſtrong Cinnamon Water, Treacle Water, Plague Water: of each ʒiij, Powder of Pearls ʒj of Cryſtals of Sugar ʒß, mingle them and make a Julep: at the ſame time let there be applyed warm to the Ventricle a little piece of Bread toſted and done over with Treacle dipped in warm water or red Wine, and by and by changed.

Opiates.

In the Evening if the Pulſe and breathing ſhall be ſtrong enough give him to drink in a little draught of Plague Water, of liquid *Laudanum* prepared with Juice of Quinces, *gr.* xx.

Take of the *Diaſcordium* ʒj, of liquid *Laudanum* ϑß, Powder of Crabs Claws Compounded ϑj, of Cinnamon Water what will ſuffice: make a Bole to be taken going to ſleep.

To ſuch as Treacle and Mithridate are nauſeous or not agreeable, let there be given a doſe of the following Powder or of the Spirit of Treacle every third hour with the Julep.

Take of the Powder of Crabs Claws compound, of the Roots of *Contrayerva*, of *Serpentaria Virgin.* of each ʒj, of Cinnamon, of Tormentile Roots, of each ʒß, of Saffron, of Cocheneel of each ϑj, make a Pouder: the Doſe is ʒß to ϑij.

Spirits.

Take of the Spirit of Treacle prepared with Armoniac. ʒiij. the Doſe is ϑj, with the Julep every fourth hour. After the ſame manner the Spirits of Harts Horn, or of Soot may be given. Let his drink be Ale boyled with a Cruſt of Bread, Mace, and Cinnamon, and ſweetened, or burnt Wine diluted with Mint Water. Let his food be Broth of a Pullet, or Gruel, or Panada with the ſhavings of Harts Horn, Ivory, Scorzonera Roots *&c.* boyled in it.

The reaſon of this Diſeaſe.

Let us enquire now concerning the reaſon of this particular Diſeaſe, what is its chief conjunct Cauſe, to wit, what kind of peccant Humour that is to be purged

ed out, that ſhould ſo infeſt the *Viſcera*, and ſhould irritate them into excretory Convulſions with torments, Perturbation of the whole Body, and ſudden failure of all their ſtrength. Certainly none will think this, Choler, or pancreatick Juice, or what elſe you will to be begotten within the inteſtinal Pipes: neither do we believe it indeed from the meer Blood,(as ſometimes happens in the *Criſis* of Fevours poured forth into the *Viſcera*. But rather we ſuſpect (as by the ſudden Languor and ſoon falling down of the Spirits, and enervation of all the parts it will be lawful to conjecture) in this diſeaſe the more noble Juices of the Body, to wit, the nervous and nutricious placed in the ſolid parts to be wholly vitiated from their natural Complexion; and diſſolved and ſpread abroad as it were a ſtream, and to overflow into the bloody Maſs; then preſently from it (they being indeed incongruous and immiſcible,and unapt to be ſent away by urine or by tranſpiration) to be transferred towards the Stomach,and Inteſtines by the Celiack Veſſels,and there flowing forth from the thick planted little mouths of the Arteries, to ſtir up theſe horrid dyſenterical Symptoms. Further it ſeems that together the Blood it ſelf being ſcattered abroad by the flood of the other humours,is melted with them,and being looſened in its complexion, its meltings do burſt forth with the other excrements into the Cavities of the *Viſcera*.

Part I.

Certainly all the moving Fibres with the fainting away of the whole Soul on a ſudden can proceed from no other Cauſe, but that the humour actuating them,and in which the animal Spirits dwell,leaving them wholly, doth flow forth; and indeed we ſuppoſe it to flow forth, for as much as it being vitiated in its complexion, and growing ſower like milk doth moleſt the conteining Parts,and irritate them into wrinkles whereby it may be ſhaken off. Beſides we take notice that this Diſeaſe always or for the moſt part began with Cold,to which nevertheleſs heat and a feavouriſh burning did not ſucceed, becauſe the Blood,although but little vitiated in it ſelf,nevertheleſs being wholly overturned by the flood of another invading juice, could not emerge or recollect it ſelf,that it might grow fevoriſhly hot as in the *Criſis*. Hence it was that Cordials, except very ſtrong and hot, as hot waters and Spirits, Treacle, Mithridate and the like, did not help, whoſe highly active Particles,whilſt they eaſily entered into the mouths of the ſplanchnical Veſſels did repel the out flowing humours,and further inſinuating themſelves by degrees into the bloody Maſs, they did invigorate it,and ſtir it up into fermentation,and into the motion of evaporation; whereby it might be able to recover its former diſpoſition,and to caſt back into the habit of the Body whatſoever incongruous thing had entred into it.

It ariſes chiefly from the vitiouſneſs of the nervous Liquor.

So much for the conjunct or next cauſe of this Diſeaſe,the more remote are preceding or antecedent,and manifeſt or evident; thoſe denote from what occaſion or proviſion this kind of morbid and epidemical *Diatheſis* or diſpoſition proceeds; and theſe for what occaſions it rather breaks forth into a dyſenterick Affection. As to the former, that this diſeaſe rages more frequently in Autumn,it is aſcribed by many,to the immoderate or rather autumnal eating of the Summer Fruits; which indeed we ſhould eaſily admit to be a part of the cauſe of the bloody Flux,and alſo we may deſervedly ſuſpect the aforſaid diſeaſe to have ſome certain riſe from thence. But truly this cauſe of the Diſeaſe does not appear to be from hence true and equal, becauſe that many inhabitants of this City abſtaining from fruit,or uſing them ſparingly,every where laboured with this unbloody Flux whilſt it was general;and others who are fruit eaters in the neighbouring Villages altogether free from it were affected with other Fevours without any gripings of the Belly or Flux. For truly I have often obſerved (which alſo hapned this Year) after an exceeding hot and dry Summer,in the Autumn Epidemick and irregular Fevours to have hapned in many places of *England*,and at the ſame time very few Londoners to have fallen ſick of that Fevour, but very many of the dyſenterick Diſeaſe: the reaſon of which ſeems to be, that when our Bodies by reaſon of the foregoing Intemperateneſs of the Summer, are diſpoſed to autumnal Fevours,they are rather determined, in this thick and ſmoaky Air into this kind of Diſeaſe.Becauſe that tranſpiration being hindred,the corruptions of the degenerate humours, being unable to be carried forth thorow the Pores of the skin, overflow within, and there burſting forth from all the Arteries together,they cauſe theſe horrid affections of the *Viſcera*.

Its more remote Cauſes.

Wherefore Autumnal and Epidemical.

Its antecedent Cauſes are 1. *The thickneſs of the* London *Air.*

Further, the ſummer ſeaſon, according as it is more or leſs, hot or cold and moiſt,

2. The intemperateneſs of the Year.

Part I.

moiſt, or dry, makes great alteration in the humours of our Bodies, and even alſo in ſome fermentative juices; and perverts them oftentimes from their genuine Complexion into a bitter, or ſharp, or aduſt Nature. Beſides in ſome years this mutation is impreſſed chiefly on the Blood, and in others rather upon the nervous Liquor. By reaſon of the former, for the moſt part autumnal or ſharp continual, or cruel intermitting Fevours do follow; in reſpect of the other irregular Fevours, and if an ill condition do ariſe; in which without any great incaleſcency of the Blood, or *criſis* of the Diſeaſe, very dangerous affections of the Brain and nervous ſtock do happen. Moreover in theſe kinds of affections, either the excrements of the nervous liquor growing degenerate by degrees, being of a ſlow motion, leaſurely and by little and little heaped up without any critick turgeſcency, and remaining a long while within the containing parts, bring forth nervous Fevours, with numneſs and cold; (ſuch as we have deſcribed iu our *Spaſmologie*) or elſe the corruptions of that juice very much, and ſuddenly changed in its complexion, are carried forth more, and growing active do ariſe up with certain overflowings, and flow back on all ſides into the maſs of Blood, from the Fibres, and from the Nerves, and from the ſolid Parts, and from thence preſently running over into the cavities of the *Viſcera*, produce this ſort of unbloody Flux which we have now deſcribed; and hence it further appears that this watry flux of the Belly ariſes rather from the depravation and colliquation of the nervous and nutritious juice, than of the blood it ſelf, by reaſon of the ſudden and and great dejections of the ſpirits (which ſuch an effuſion of the mere blood could not bring forth) becauſe that thoſe labouring with this Diſeaſe, are not troubled with the heat or ardor of the juices, or ſcabritiouſneſs of the Tongue, but do very well bear the hotteſt Medicines; and aſſoon as an inverſion of the peccant humour and a retorſion of it into the habit of the Body, by theſe things taken, is procured, they eaſily grow well without a fevour, watchings and other conſequences of corrupted Blood.

Its evident Cauſes.

We have not much to ſay of the evident cauſes of this Diſeaſe, when there is ſuch a conſtitution of the year, that by reaſon of the evil influence of the air or Heaven, the juices procreated from the blood, to wit, the nervous and nutritious do degenerate from their due temperament or *craſis* into a ſtrange infectious Nature, and as it ſeems ſower, and for that cauſe dyſenterick. Errors in living at that time permitted, with other non-naturals do cheriſh, increaſe, and ſooner bring on this ſort of depraved diſpoſition into an Eccathartick turgeſcency: it will not be worth our while here particularly to explicate all the manifeſt cauſes and occaſions, by which they are made, but rather let us paſs them over, to exhibit the knowledge of the other, to wit, bloody dyſentery.

Of the bloody Dyſentery.

An Example of it deſcribed.

A winter exeteamly cold, ſuch as ſcarce any one living had known, followed the Autumn of the Year, 1670. noted for the unbloody Flux but now deſcribed: the following Summer had no leſs a ſhare of the other extream, to wit, moſt hot and dry, after this upon the approaching Equinox an epidemical Fevour aroſe which raged almoſt thorow all *England*. This, keeping the form of an intermitting Fevour, had Paroxyſms or fits now every day, now every third day, with none or but very little cold only, but with a very ſtrong heat, which, for many hours, and not ſeldom protracted beyond the ſpace of a night and a day, hardly paſſed into ſweat, and that but partial, and often interrupted, no fevouriſh heat ſucceeding. The ſick were preſently affected with an unwonted *Languor*, watching, *Vertigo*, and frequently with a cruel Headache; and the diſeaſe rarely or never to be judged by a perfect *Criſis* did ſorely vex for a long while, or fixing an incurable evil to the breaſt did end in a ſtupifying, or Pthiſical, and oftentimes deadly affection. We have formerly in our *Pyretologie* deſcribed a Feavour like to this, together with the Theory and method of curing it, the like conſtitution of the year preceding it.

An irregular Fever was wont to be contemporary to this in other places of England.

Whilſt that this Fevour in the Country did wander up and down almoſt every where thorow the villages and Towns, at *London* a Dyſentery truly bloody as one may ſay, both full of blood and cruel, greatly raging did precipitate very many into

to

to the grave. From the firſt invaſion of this Diſeaſe, Blood copiouſly and often was caſt forth, and for the moſt part with grief, and pains of the belly; pertinacious watchings with a fevour, and huge thirſt were wont to trouble them, notwithſtanding their ſtrength remained indifferently, ſo as the diſeaſed, after being about a week ſick, and going almoſt twenty times a day to ſtool were able to riſe out of their Beds. Theſe bloody ſtools although they ſeemed terrible, yet the ſick did not quickly die, but did perſiſt many weeks, yea ſometimes months daily voyding blood, and in a great abundance; and at length, if the diſeaſe growing worſe and worſe did tend towards an ill end, before death, other ſymptoms, and chiefly wakings, a ſcurf of the mouth and Tongue, thirſt and ſometimes deadly ulcerations did appear, yea theſe ſymptoms breaking forth ſooner than the unruly flux; and ſooner than its due reſtraint did ſhew a great danger of death. The poor by the ill means of living, of a long time before uſed, alſo thoſe whoſe cure was pretermitted, or unluckily adminiſtred, did frequently die; on the contrary thoſe indued with a better ſtate of body, and truſting to fit and timely medicines very often eſcaped. Moreover the diſeaſe it ſelf, though epidimecal, yet was not alike malignant in all, but ſeemed gentler in ſome, and crueller in others *viz.* the Flux of the Belly was in the beginning ſometimes gentle and not unlike a *Diarrhœa*, of which, although their ſtools were frequent, yet without pain or much blood, they were eaſily and ſometimes quickly cured, ſometimes this diſeaſe appeared exceeding rigorous and horrid, to wit, in which Blood was poured forth in abundance and with mighty torments, and moſt ſharp anguiſh. But in ſome more liquid, and ſtained with diluted blood, as it were the waſhing of fleſh, in others more thick and deep dyed with thick blood, and waxing white with muck, and alſo ſometimes ſtuft with gobbets of membranes. The ſeat of the grief was now higher, now lower, in theſe the ſmall Guts, in thoſe the thick Inteſtines, ſhewed to be more affected. Part I.

The method of curing it, with the Remedies, which I found to bring help to many, was according to this following manner. In the firſt place for the ſtopping a little, or moderating the Flux. *The method of curing it.*

Take of Treacle *Andromach* ʒj, of liquid *Laudanum* Cydoniat. *gr. xx*: make a Bole to be taken going to reſt.

Take of Conſerve of red Roſes vitriolated ʒj, of Treacle *Androm.* ʒj, the pow- *Electuary.*
of Tormentil Roots, *Contrayerva*, Pearl, Coral broken, of each ʒj, ſyrup of dryed Roſes what will ſuffice; make an Electuary to be taken every fourth or fifth hour. the quantity of a Cheſtnut, drinking after it of the following Julep ʒiij.

Take of Mint water, of Baulm water with Cinamon of each ʒiiij, of Treacle *Julap.*
and plague water of each ʒij, of pearl ʒj, of ſugar ʒj, mingle them and make a Julep.

After a day or two let there be adminiſtred a purging and aſtrictory potion. *A gentle Purge.*

Take of ſliced Rhubarb ʒij, of the yellow mirobalans ſliced ʒjß, red ſanders, Cinamon of each ℈j, let an infuſion be made all night in Plantane water, Cinamon, barly water of each ʒijß, let it be ſtrongly wrung forth, to which add of ſtrong Cinamon water ʒijß, make a draught.

I was wont every evening, and in ſome caſes in the day time, to give a good *Opiates.*
doſe of *Landanum*, neither have I ever known this medicine to have been hurtful to any dyſenterick perſon, either that the Narcotick force of the medicine might be overcome by the more acid juice of the Ventricle, and as it were made tame, or rather, that its Particles tranſmitted to the blood, were again from thence quickly caſt forth with the bloody ſtools, whereby they did leſs affect the Brain.

To whom the above Confection ſhall be either nauſeous or leſs fit or agreable, this following Powder may be given in its place.

Take of the powder of red Cloth ʒj, of the roots of *Contrayerva* ʒß, make a *A Powder.*
powder, divide it into 3 parts, take it in what liquor you pleaſe, or

Take of Bole Armenack, Alexiterion (that is impregnated with the juices of the leaves of Tormentil, Biſtort, red Roſes &c. and dried in the ſun) of the Roots of *Contrayerva* of each ʒj, of Pearl, of red Corall, of the whiteſt Amber of each ʒß, make a powder, the doſe is ℈ij, to ʒj.

Take of Roots of Clove-gilliflowers, *Scorzonera* of each ʒj, of Tormentil, *Apozem.*
Biſtort, *Contrayerva* of each ʒijß, of Harts horn burnt ʒiij, of the ſhavings of Ivory and of Harts horn each ʒij, Coccinel ʒß, red roſe buds ʒij, let them be boyled

Part I.

boyled in as much ſpring water as will ſuffice to ℔ ij, towards the end add of Conſerve of red Roſes ʒiij, to the clarified Colature add of plague water ʒiiij, the doſe is ʒiij.

For the quieting the torments of the Inteſtines, and healing their gnawings gliſters are wont to be often uſed.

Take of the tops of St. *John* wort, with ſheeps feet or chaudern ʒviij, or xij, of Treacle *Androm.* ʒij, oyl of *Hypericum* ʒjſs; make a Gliſter.

I omit here many other forms of Medicines, which are every where extant in Books of the practice of Phyſick, and which every one may preſcribe, as he ought according as the thing ſhall require. It now remaines that we inquire a little into the Ætiologie of this Epidemick or rather peculiar Diſeaſe.

Shewing the reaſon of this diſeaſe.

It appears plain enough, by what hath been ſaid, that as the unbloody dyſentery doth not, ſo neither doth the bloody flux proceed from the mere more ſharp contents of the Inteſtine. Further as that other diſeaſe ſeems to have had its original from the flood of the degenerate nervous Liquor, and nervous juice; ſo this chiefly from the corruption and vice of the Blood; and therefore even as of that, a nervous ſickneſs in another place was contemporary with the peculiar evill of this place, ſo when the bloody dyſentery afflicted the Londoners, an intermitting tertian Fevour (as it is deſcribed by the Phyſicians) infeſted in like manner the reſt of *England*. And indeed, tis plane to be conceived that, when as the blood being roaſted with the Summer heats, therefore would be apt about Autumn for immoderate fevouriſh effervescencies, and like wines made warm, for fermentations whereby they might be purged, if it cannot ſend away its degenerate and to be purged Particles by reaſon of the perſpiration being hindred in the more thick Air, the ordinary way by evaporation, for that it is yet hot, it transfers them towards the Inteſtines, and indeavours to caſt them out there by the more open mouths of the thick ſet Arteries. But indeed the incongruous excrements of the degenerate Blood, or the *Morboſum inquinamentum* being more thorowly boyled into it, and intimately confuſed, not eaſily to be extricated or ſifted forth, wherefore it being big and burthened with this loading, whilſt in its circulating it paſſes thorow the ſmaller veſſels, it becomes very much ſtraitned, and therefore, about the internal ſuperficies of the Inteſtines where the Coats of the Arteries are thinner, the blood there ſwelling up, together by reaſon of the heterogeneous Particles with which it is full, being made thick and apt to coagulate, it eaſily breaks forth; and when it cannot ſift out and put off its Excrements alone; pours forth with them greatly infeſtous and portions of it ſelf.

Three things concur to the conſtituting this diſeaſe.

Therefore for the exciting this popular dyſentery, theſe three things muſt concur: *viz.* there muſt be a dyſcraſy or evil diſpoſition of the ſanguineous Maſs, ariſen thorow the intemperateneſs of the year whereby it is very prone to fall into feavouriſh effervescencies, of its own accord or occaſionally. Wherefore whilſt this Diſeaſe is wont to rage at *London*, an irregular Fevour did the like in moſt other places. Secondly the Excrements and corruptions of the ſo boyling blood and degenerate in its complexion, are ſo confounded, and intimately boyled into it, that they cannot neither be eaſily ſifted forth, nor ſuddenly caſt out either by ſweat or urine. Wherefore we have obſerved the Fevour contemporary and even continual with this dyſentery to have been moſt difficult to paſs judgement on, and its Paroxyſms ſcarce ever to have ended in a fevouriſh diſtemper. Thirdly, a conſtipation of the Pores is to be added to theſe (which determinate the aforeſaid diſpoſitions into the bloody Flux) being cauſed by a ſmoaky, thick conſtitution of the Air: For this directs the effervescency of the Blood toward the Inteſtines, where when its Filth or excrements cannot be ſifted forth, and not eaſily ſeparate from the remaining Maſs of Liquor, the Blood ſpontaneouſly flows forth it ſelf, in highly infected portions, and therefore apt to run.

This Diſeaſe is either gentle or malignant.

By reaſon of this kind of Proviſion the ordiuary *London* dyſentery, and not very malignant, is wont to ariſe; which, although in reſpect of its bloody ſtools it becomes preſently horrid, and for the moſt part of long continuance, yet it is not very contagious or more often deadly. But moreover this Diſeaſe ſometimes virulent and as it were peſtilential, kills many, and largely ſhews its miaſm or defilement by contagion. Further, in ſuch a condition the portions of the Blood, being touched with a certain malignity begin to be broken as in the peſt, and which ought to be ſifted forth and caſt out, from the remaining Maſs, leſt the whole be preſently over-

overpowred; which indeed being more thick and therefore apt to be purged forth rather by the Belly than by the habit of the Body or by Urine, they are carried into the Coats of the Inteſtines by the Pipe of the Meſenterick and Cæliack Artery; where when they cannot eaſily go away from the remaining Blood, breaking forth partly from the Veſſels, they cauſe bloody ſtools, and partly being fixed in the membrane of the Inteſtines they bring forth in them a Phlegmon or inflammation of the blood or ulcerous diſpoſition, and ſometimes alſo a ſphacelous or mortified ulceration, and quickly killing. Part I.

So much for the bloody dyſentery ſuch as uſes to be the peculiar Diſeaſe of this place about Autumn, with the Cauſes both conjunct and antecedent: as to what reſpects the manifeſt cauſes or occaſions which bring into act the morbous diſpoſition: Firſt there ought to be referred hither the ill means of living, and the pravity of the inſpired Air, wherefore it is familiar in every region, by reaſon of Filthineſs and vitious aliments in the Camps of Soldiers and in the priſons of Captives; beſides many other errors in the non Naturals may belong to this Cenſe, concerning which we ſhall neither have leiſure, nor will it be worth our pains here more particularly to diſcourſe.

The Therapeutick Indications into which the method of curing or the *Praxis* above repreſented may be reſolved, are chiefly or primarily four, to wit, two in reſpect of the Blood, and as many in reſpect of the *Viſcera*. In the firſt place as to the Blood, it behoveth to drive forward both Excrements and corruptions budding within, outwardly towards the habit of the Body, then to diſſolve its Coagulations, and to reſtore its complexion as much and as ſoon as may be: The firſt of theſe is performed by Diaphoreticks, and the other by proper *Alexipharmicks* or Preſervatives. Secondly as to what has reſpect to the *Viſcera*, the troubleſome ſenſe of the nervous Fibres, and the ſtirring up of the fleſhy to Excretory convulſions ought to be appeaſed, and the mouths of the Veſſels, leſt they power forth the blood and humour into the inteſtinal Pipes, ought to be ſhut up. The firſt of theſe Opiates, and the other Styptick or binding remedies uſe to affect: Beſides theſe it is behoveful to heal the greatly urging Symptoms and evil Affections that are wont to happen to this diſeaſe, the chief of which are a Fevour, with Thirſt, and wakings, torments of the Inteſtines, and ſometimes gnawing, inflammation and ulcers of them.

Curatorie Indications.

Two in reſpect of the Blood.

Two alſo in reſpect of the Viſcera.

I ſhall not inſiſt upon theſe primary Indications ſingly and ſucceſſively, but I ſhall contract them together, and ſpeak of them at once. Wherefore the Forms of the Medicines ought to comprehend Remedies of divers kinds, to wit, Alexiterick or preſervative, Styptick or binding, Diaphoretick or evaporating & Opiatick or cauſing ſleep or ſtupifying. Becauſe it will not be eaſy to reduce theſe into a certain method, and Rules which may be convenient for many, therefore I have rather choſe to lay before you now examples of Cures of the Dyſentery done in the Autumn of the year 1671, when this Diſeaſe cruelly raged.

The firſt Hiſtory.

An illuſtrious young Man about 25 years of Age, of a ſanguine Complexion and of a former healthful Conſtitution, about the beginning of *October* without auy manifeſt cauſe, fell into a Dyſentery; and although preſently from the firſt day the ſtools were plentiful and bloody with pains, yet being ſtrong, and his ſtrength continuing, he forbore taking Phyſick till the third day, at which time being ſent for late at night I preſcribed this following *Bolus*.

Take of Treacle Andromach. ʒj, liquid *Laudanum* Cydoniat. ℈j, mingle them drinking after it a little draught of the following Julep.

Take of the water of Tormentile mints, and cinamon barly water of each ℥iiij, of Treacle, and Plague water of each ℥ij, of Pearl ʒj, of Sugar ʒj, make a Julep. Beſides he took every third hour of the following Electuary about ʒjſs, with the ſame Julep.

By theſe Remedies the fierceneſs of the diſeaſe was ſoon leſſened, that in the ſpace of 24 hours he had ſcarce above 6 or 7 ſtools, which alſo were not ſo bloody as the former, but appeared full of little bits of fleſh, and membranes, which without doubt were ſome certain gnawn off Portions of the jaggy or hairy Coat: he took every evening Opiates with *Laudanum*.

On the fifth day of his ſickneſs he took this following draught.

A Purge.

Take of ſliced Rhubarb ʒij, Citrons, Myrabolans ʒjſs: yellow Sanders ʒſs powder of Cinamon ℈j, ſalt of Wormwood ℈ſs, make an infuſion all night in plantane and cinamon

Part I.

Cinamon barly water of each ʒiſſß, add to it being ſtrained of ſtrong Cinamon water ʒij.

It purged him 3 or 4 times and gave him eaſe, and the next day, he was better his feavour being abated, ſo that ſeeming to grow well he eat fleſh; but he then preſently relapſed, ſo that the Dyſentery returning with the Fevour, it was more cruel that at the beginning: then becauſe the former medicines began to grow nauſeous, I preſcribed after the following manner.

A Powder. Take of the powder of Tormentil Roots, *Contrayerva*, of Bolus Alexiterion: of each ʒj, of Pearls, of red Coral broken, white Amber of each ʒß, make a powder, the doſe is ʒß, in diſtilled water ʒiij.

Deſtilled water. Take of the tops of Cyprus, Mirtle of each iiij handfuls, of the leaves of Meadowſweet, Pimpernel, *St. John* wort and Clovegilliflowers of each iij M: of the roots of Tormentil & Biſtort ʒvj, red Roſe flowers iiij M: of the Berries or grains of Kermes ʒiiij, of Cinamon and Mace each ʒj, let them be ſliced and bruiſed altogether and put into red *Florence* Wine and red roſe water of each iiij ℔, let them be diſtilled in an ordinary ſtill, let the whole liquor be mingled, and when it is taken ſweetened with Syrup of Coral. Alſo he took of the following decoction ʒiij, or iiij, three or four times a day.

Apozem. Take of the Roots of Avens or herb Bennet of *Scorzonera*, of each ʒj, of Tormentil ʒij, of Harts Horn burnt and powdered ʒvj, of the ſhavings of Ivory and of Harts Horn, of each ʒij, the tops of *Hypericum* Mj, of red Roſes and Pomegranate flowers of eage 1. P, let them be boyled in ℔ iij, of ſpring Water till it comes to ℔ ij, adding thereto towards the end, of red *Liſbon* Wine ʒiij, Conſerves of red Roſes ʒiiij: let them be kept hot, cloſe ſhut for an hour and then ſtrained through an *Hyppocrates* ſleeve.

Every Night he took of liquid *Laudanum* ϑj, in the Dyſentrick Water, juſt now deſcribed with Syrup of Clove Julyflowers ʒiij.

A decoction for the ordinary drink. For the ordinary drink make a decoction of Harts Horn burnt, with Barly, a cruſt of Bread, Mace, Cinnamon, to a Pint and an half of which add a Pint of new Milk.

He took the purging Infuſion again, by the uſe of which and former things, within 10 Days his fevour leaving him the Dyſenterie became much gentler, which though it were without pains or much Blood, yet it continued ſtill with Caruncles, Gobbets of the Membranes, and bloody Phlegm or Gelly, in his excrements. Therefore for corroborating and healing the Inteſtines, theſe following things were adminiſtred.

A Clyſter. Take of the tops of the Cypreſs Tree, of the leaves of Periwincle, and of Mouſe-ear each Mj, Red-Roſe Flowers pug. ij: Let them be boyled in broth made of a Sheeps Gathers, of the liquor ſtrained ℔j, add to it of the Oyl of St. *John*'s-Wort ʒij, honey of Roſes ʒiſß, mingle them for two Clyſters, one of which he took in the morning, and the other at five a Clock in the afternoon. *A Plaiſter.* A Plaiſter of red Lead and *Paracelſus*, was laid upon his Belly: he took beſides twice a day of the juice of Plantan with water of *Scordium* or Germander, and Plague water ʒiij; alſo he eat every day a Quince roſted in the Aſhes, being made hollow and filled with the Powder of *Olibanum*, Maſtick, and Tolutan Balſom.

By the conſtant uſe of theſe Remedies, he grew perfectly well within a Month.

The ſecond Hiſtory. About the ſame time another ſtrong young man fell into a terrible Dyſentery: From the firſt day preſently frequent Stools, and very bloody with pain and gripings brake forth, beſides a ſtrong Fever with cruel vomiting, thirſt and wakings moleſted him. When theſe Symptomes were a little mitigated by opiates which he took, by and by he was affected with a *Delirium* and *Vertigo*, with an intermitting Pulſe and horrible ſhakings, for as much as the malignant matter being reſtrained within did forthwith flow back upon the Brain and Nerves, which nevertheleſs preſently was allayed, as often as the flux of the Belly and Vomiting returned. On the fifth day Vomiting forth bloody matter, he complained of a great pain and grief as if it were ulcerous in his ſtomach, that I did indeed ſuſpect there had been there a Phlegmon or Ulcer, as uſes to begin about the Inteſtines, but by emolliating Broths and Milk diet adminiſtred; his Vomiting and pains of his Stomach ſoon ceaſed, but in the mean time the flux of his Belly increaſed. He took that night of *Diacodium* ʒj, with Cowſlip water and Cinamon water of each ʒiſß,

by

by which remedy he was ſo much eaſed, that in a night and a days ſpace, he remained without vomiting or pains, and with a few Stools only, with a laudable pulſe with often and moderate ſlumbering: But in the following night, although the ſame Opiates were repeated, a very frequent flux of the Belly, and bloody, returned. The next day he took an infuſion of Rhubarb with *Mirabolans*, red Sanders and Cinamon, he voided uſually bilous, highly ſharp and generally bloody Stools; then in the Evening he took of liquid *Laudanum Cydoniat.* drops xxv, in a ſpoonful of Cinamon Barly water, he had moderate and pleaſing ſleeps. Afterwards abhorring any more Medicines, he took only an Opiate every evening, now this, now that, and in a ſhort time he grew well.

Part I.

Part I.

SECT. IV.

CHAP. I.

Of the Diureſis *or Evacuation by Urine, and of Diuretick Medicines.*

The near kin of the Diureſis *and the* Diaphoreſis *with one another.*

WE have ſome time ſince largely enough ſet forth the Original of the Urine, and its compoſition whilſt it was either a part or an excrement of the Blood, its Offices and manner of Separation. But we ſhall here further note, that this hath a certain affinity with ſweat, that, and not ſeldom, they change their courſes, and the matter of the one is conveyed forth adoors by the emunctories of the other: For that the cutaneous Emanations if they are ſtrong and impetuous; ſnatch along with them much of the ſerous liquor deſtinated for the Reins, and transfer it into ſweat: Alſo on the other ſide, when by a copious afflux the *ſerum* is caſt forth by the Reins, it brings inwardly very many little bodies that are wont to exhale by the Skin, and involving them in its torrent, ſends them away by the urinary paſſages. Hence it comes to paſs, that Diaphoretick and Diuretick Medicines, are of a very near alike uſe, and ſometimes reciprocal: By either of them being taken, the maſs of the Blood is ſcattered abroad or precipitated, at leaſt it is compelled to ſeparate into parts, for that the *ſerum* drawn away from the reſt of the Blood, may be driven forth adoors by the more eaſie way which ſhall be granted.

What the matter of the urine is, and from whence it comes.

It is threefold.

Although the immediate matter of the Urine flows only from the Blood, and is carried by the only paſſage of the emulging Arteries to the Ureters, yet oftentimes mediately that is wont to have manifold ſprings, and indeed divers, which for the moſt part may be diſtinguiſhed by a threefold conſideration, *viz.* It is ſtale or mere excrement, and is the watry part of the Blood growing ſtale, which being circulated with it for ſome time, acquires from the incocted ſaline and ſulphureous Particles a lixivial Tincture. Or Secondly, it is that *Dilutum* or ſteeped Liquor, of the yet crude Chyle, which indeed is poured abroad or ſuffuſed in great abundance with the Blood, and being ſeparated again from it before it is dyed with the Tincture, cauſes an Urine plainly limpid, or clear. Thirdly and laſtly, the matter of the Urine oftentimes is a certain water, for the moſt part ſuffuſed or poured abroad from the Blood, or as it were diſtilled into the ſolid parts, glandula's and Pipes of the *Lymphæ* or water carriers, which being plentifully laid up together, and then of its own accord or ſome occaſion being given, gathering together a Flood, and dropping forth from its receptacles by the limphæducts, it is carried back into the veins; from whence by a ſwift paſſage, paſſing through the Blood untouched; it is thruſt down by the Arteries into the Reins; and for that the Particles of Salt and Sulphur are not incocted or boyled into this, by reaſon of its ſhort ſtay in the Blood, from thence a Urine alſo limpid or clear is produced. The Urine of men in health, for the moſt part does participate after a ſort of each of theſe, and according as the matter exceeds in this or that together, the Urine appears more or leſs or not at all tinged. The *ſerum* coming from every part, and being mixed with the Blood, is ſeparated again from it in the circulation in divers places but chiefly in the Reins: For that the Blood bubling up within the Arteries, and being very much rarefied, whereby being ſeparated from thence it might paſs into the Veins; there is a neceſſity that it ſhould put off its ſeroſities and divert them to ſome other place.

As

As this is performed every where through the whole body, ſo more copiouſly and after a certain peculiar manner in the Reins.

Part I.

But though it be commonly enough known that the ſeparation of the *ſerum* is made in this place, yet it is very much controverted by what means it is done, whilſt theſe affirm the ſerous liquor to be drawn to the Reins, to be there only ſtrained thorow; and others believe a certain ferment to be eſtabliſhed in the Reins, by whoſe inſpiration the *ſerum* of the Blood, as that of Milk, is ſcattered and precipitated by a ſharp coagulation; and the odor, and the rank and ungrateful ſavour of this *Viſcus* ſeems after a ſort to argue that the thing is ſo. Before that we can certainly determine any thing of the virtues of Medicines which provoke Urine, and their manner of operating; it will be neceſſary to unfold this doubt; what is performed in the Reins by the accuſtomed means of Nature, and what in the ſanguineous Maſs, for the ſeparation of the *ſerum*.

How the ſerum *is ſeparated from the Blood within the Reins.*

And firſt of all there is no need of proving the *ſerum* not to be drawn to the Reins among Philoſophers, when that of late ſimilar attraction has begun to be wholly exploded by moſt *Virtuoſo*'s, and all local motion is affirmed to be made only by impulſe. And indeed, what has regard to the preſent buſineſs, by whatſoever things the circulation of the Blood is made known, it alſo plainly appears, that as the Blood ſo the *ſerum* being an inſeparable Companion within its Veſſels, is driven forward by the mere motion or impulſe of the Heart to the Reins. But whether it be there ſeparated by percolation or ſtraining only, or alſo by a certain precipitation, we muſt, that it may plainly appear, a little more accurately inquire or ſearch into the Anatomy and uſe of the Reins.

The ſerum *is not drawn to the Reins.*

Concerning the ſtructure and uſe of the Reins, as divers both ancient and modern Authors have publiſhed various things, the moſt famous *Bellinus* hath the moſt accurately ſhewed their Anatomy. Indeed every one hath ſhewed plainly the Blood to be carried to the Reins by the emulgent Arteries, and to be carried back again by the Veins: This the Laws and Inſpection of ſanguineous Circulation manifeſtly declare, but in what places, through what Pipes, and by what workmanſhip the *ſerum* in the Reins is ſeparated from the Blood, and thruſt away into the Receiver; lay hid a long while from the moſt diligent ſearchers, until the aforeſaid Author by an happy invention, diſcovered the ſubſtance of the Reins to be neither Parenchymous, (clotted or congealed bloody ſubſtance) as the Liver and Spleen or Milt; nor fleſhy Fibres, as the Heart and Bodies of the Muſcles, but an heap of membraneous little hollow Pipes, and by theſe ſo very ſmall paſſages the *ſerum* being delated from the circumference of the Reins towards their Centre, to be diſtilled forth into the Receiver: For as much as the emulgent Artery being divided into greater Branches, then into leſſer, and at length into very ſmall ſhoots, conveys the Blood on every ſide to the utmoſt ſuperficies of the Reins; but here when growing hot and rarefied, it ſweats forth from the mouths of the Veſſels, whilſt the bloody part is received by the Veins to be returned back, the ſerous part is inſinuated into the very narrow pores of the little hollow Pipes impervious to the Blood, and flowing through their Pipes on every ſide towards the Receiver, it is thruſt down into a papillary ſubſtance, out of which it leiſurely diſtills into the Receiver.

The Structure of the Reins and uſe.

By this it appears that the *ſerum* is ſeparated from the Blood, by a certain percolation in the Reins: Indeed after the like manner as when the ſame is thruſt forth of the Arteries every where into the Glandula's, for the matter of Tears, of Spittle, of the droppings of the Noſe, and of other Excretions. But further, it is to be thought, that this alſo is done as it were by the fuſion of the Blood, for that the Blood being of its own nature clammy, and apt to be coagulated whilſt that it paſſes through the Reins, it is very much ſcattered and attenuated by a lixivial ferment of this part; becauſe that the ſerous water may ſeparate more eaſily from it: For indeed Piſs or Stale being imbued with ſaltneſs, whilſt that it continually waſhes thorow the paſſages of the Reins, affixes to them ſaline Particles, and from thence infects it with a ſtrong ſmell or with a certain lixivial beſmearing, whereby whilſt the Blood paſſing through thoſe *Viſcera* is inſpired, it is preſerved continually fluid from curdling, and apt to ſeparate into parts in the ſtraining, even as alſo Milk is defended from Coagulation by ſalt of Tartar infuſed. Yea Blood it ſelf when ſent forth from its Veſſel, is wont preſently to curdle and to be coagulated, by reaſon of a ſolution of ſalt of Tartar or Armoniack being thereon poured,

The ſerum *is ſeparated from the Blood by a ſtraining within the Reins.*

The Reins are ſtrong as it were with ferment.

Part I.

remains fluid: Therefore a real Ferment doth not, as is commonly beleeved, precipitate the Blood, but defends it from ſuch a condition, whereby it may be it ſelf more freely circulated, and its *Serum* may be ſeparated in due quantity by ſtraining. And truly it is plane enough, that the Reins are imbued with ſuch a lixivial ferment in eating them being cook'd, which are by reaſon thereof of a very rank and ungrateful both taſt and ſmell.

Part of the nutricious juice is ſent away together with the ſerum thorow the Reins.

Whilſt that the *Serum* is ſeparated after this manner in the Reins partly by percolation and partly by fuſion, not only the bloody part, but alſo the nutritious as to the greateſt portion of it, paſſing thorow the very narrow Pores of that ſtrainer, is carried back with the Blood by the Veins; in the mean time the ſerous liquor, being imbued with a ſaltneſs both in the ſanguinious Maſs, and by the ferment of the Reins, perpetually ſlides down by the urinary Pipes into the Receiver, and waſhes away, and carries with it a certain tenuous and more elaborated part of the nouriſhing juice, which is the *Hypoſtaſis* or reſidence of healthful urine.

The matter of urine proceeds chiefly from the Blood.

But truly Stale or the matter of Urine as to its ſubſtance, quantity, and quality, proceeds chiefly from the bloody Maſs. For that, as this, hath three chief offices, as we have ſhewn elſe where, to wit, an accenſion or inkindling for to ſuſtain the vital flame, an Inſtillation of the animal ſpirits into the Brain, and a diſtribution of the nutriment unto all pars; by reaſon of all and each of thoſe, there is a neceſſity that it ſhould be moiſtned with a great deal of watry humour, and ſhould be continually rinſed with freſh, and the old ſtill ſhould be ſent away, and that this ſhould be done in a due and conſtant manner, is of great moment for the conſervation of Health.

The ſerum is ſeparated from the blood ſometimes too hardly, ſometimes too eaſily.

The freſh ſerous Liquor is introduced into the Blood, together with the nouriſhing juice by an eaſie labour, and is for the moſt part thorowly mingled with it without any obſtacle; but yet the old doth not always ſo readily and truly go away from it as need requires; but is wanting after divers ways about its excretion, and from thence the occaſion of very many diſeaſes ariſe. For truly the *Serum* ſometimes ſticks more unſeaſonably to the Blood, and will not extricate it ſelf from its embraces, as in Fevours evilly, and not thorowly as 'tis judged, alſo in the phlegmatick Dropſie, and Cacochymy or ill digeſtion. But that ſometimes although expulſed by the Blood, the reins relinquiſhing it (which is its chief way of excretion) is diverted to ſome other place, as in Catarrh's, gouty or ſcorbutical fluxions, alſo in every dropſie: Sometimes alſo on the contrary, the *ſerum* paſſing away too ſoon from the fellowſhip of the Blood, before it hath performed its task flies away, and ſupping up the portions of the more profitable humours, ſnatches them away with it ſelf, as in the *Diabetes* or piſſing Evil, and in great floods of Urine which ſometimes happen, and by and by ceaſe again. In theſe kind of caſes as often as the quantity of Urine is either too much defective or too much abounds, the Reins are not always or chiefly in the fault, but the Brain, and rather the Blood, for that its Maſs now too ſtrict and compacted, does not eaſily ſend away the *ſerum*, and other contents to be purged forth, now to lax and apt to be ſcattered abroad, doth not contain long enough both the *ſerum* and nouriſhing juice: Concerning which cauſes and the means whereby ſuch irregularities happen, we will a little further inquire.

The reaſon of this is beſt unfolded by the fuſion, coagulation and reduction of Milk.

And indeed the analogy of the Blood with milk, (which we have in another place more largely unfolded, and ſhall here briefly touch upon) conduces very much to the ſolving of this knot. You muſt know that Milk whilſt that its mixture is kept whole, although it be warm or boyl upon the Fire; all its Particles being promiſcuouſly temperated, do keep the Liquor uniform: But if any acid thing be put thereto hot, preſently the more thick Particles grow thicker into coagulation, and in the mean time the watry with many ſaline Particles, are ſcattered into a tenuous and copious water. Yea it is a well known and vulgar obſervation, that Milk kept ſo long that it begins to grow ſower, if it be ſet over the fire, will be coagulated of it ſelf without any ſharp thing being put into it. Moreover on the contrary, if that Milk be impregnated with any Salt of divers condition from acid Salt, as to wit, fixed, nitrous, or volatile, being firſt diſſolved therein, it will not then be coagulated by any acid thing therein infuſed whilſt it boyls upon the fire: For I have often try'd this with the ſalt of Tartar and of Wormwood, with mineral Cryſtal, with Flowers of Salt Armoniack, Spirit of Harts-horn, and others of the ſame kind. Further, which ſeems more wonderful, if any of theſe Salts or any

ſolution

Part I.

ſolution of them be inſtilled to milk boyling on the fire, and coagulated by ſome infuſed acid thing, the coagulation before made for the moſt part is taken away, and the white, hard, thick matter vaniſhes, and the liquor at length is rendred thin and almoſt limpid, although it doth not wholly reſume the lactiform and homogeneous kind. And indeed I have ſufficiently learned by often made experiments that theſe kind of mutations do conſtantly happen, *viz.* if Beer, Whitewine, Cyder, Vinegar, or any acid juice whatſoever, be dropped into Milk hot over the fire, preſently leaving the whole form of Milk it goes into a white thick matter, and a diluted *ſerum*. Then if to all this yet warm, the ſalt of Tartar, Wormwood, or any other deliquated vegetable whatſoever, or a ſolution of Salt Nitre, or Armoniack, yea the Flowers or Spirits of theſe, as alſo the ſpirits of Harts-horn, of Soot, and ſuch like be poured in, and the mixture be a little agitated, almoſt the whole Craſſament doth vaniſh quite away, only ſome ſmall portions, and certain little coagulated bits remaining, which will ſwim diſperſed up and down thorow the whole Liquor. Further yet on the contrary, if that fixed or nitrous Salt, or Flowers, or Spirits of Salt Armoniack, or alſo Spirits of Harts-horn, or of Soot, be caſt into boyling Milk, and then if you ſhould pour into the hot Liquor, Ale or Whitewine, Cyder or any other ſharp Liquor you pleaſe, no fuſion or coagulation of the Milk ſhall follow thereupon. It will be worth our labour to conſider here from what cauſes each of theſe are made, and what analogy they bear with the fuſion, or inextricability or diſintanglement of the *ſerum* in the ſanguinious Maſs.

By what means the coagulation of Milk may be inhibited or taken away.

By the anatomy of Milk it plainly appears, that there is in it fewer ſpirituous Particles, very many watry, ſulphureous and terreſtrial indifferent, and in like manner ſaline, which are partly volatile and partly fixed: Therefore whilſt that the mixtion is kept whole, the ſaline Particles ſticking to the ſulphureous, divide them one from another, and alſo hinder them that they flee not away, or be combined with the Terreſtrial. In the mean time, the ſerous coming between the reſt ſo equally intermixt, fill up all the vacuities and make the Liquor as it were homogeneous; but then that there ſhould preſently follow a fuſion and coagulation of the Liquor upon ſome ſharp thing being poured to it, the reaſon is becauſe the fluid Particles of the Salt in the acid thing, take hold of whatſoever others ſaline, to wit, both fixed and violatile, are in the Milk; to which whilſt they are ſtrictly united, the ſulphureous Particles ſliding from the embraces of the acid Salts do come together, and ſo being combined mutually among themſelves, and with the terreſtrial, they cauſe that thick ſubſtance ſeparating from the reſt of the Liquor: In the mean time, the watry Liquor having its pores almoſt emptied of its Sulphur and Earth, and almoſt only impregnated with the combinations of the Salts, by and by it becomes thin and diluted. That the thing is ſo, it plainly appears by the even now cited experiments, for as much as this coagulation of the Milk is hindred or taken away, by the caſting in of Salt either fixed, nitrous, or volatile; for every one of theſe Salts lays hold on the acid Salt of the infuſed Curd, and ſo prevents or breaks off its combinations with the ſaline Particles implanted in the Milk: But that the coagulation of the Milk being done away, it is not reſtored to its priſtine form; the reaſon is, becauſe the extraneous Particles of the adjected Salts remaining ſtill in the mixtion, do hinder the redintegration of the ſame mixture; but if they could be taken forth again, certainly the firſt mixture and lactiform would return again: Wherefore it may be thought of the Blood, that it being at any time depraved, although by fuſion or coagulation, becauſe it is wont to exterminate from it ſelf all the heterogeneus Particles, it may recover its due and priſtine mixtion.

The reaſons of them are ſhewed.

But that Milk being long kept and growing ſower, ſhould coagulate upon the fire of its own accord without any acid thing being infuſed; the reaſon is, becauſe in that Liquor then tending to putrefaction, the volatile ſaline Particles (as the manner is) being depreſſed into the *fluor* or ſtream, they become acid: Wherefore theſe, the pores of the Milk being opened in the boyling, ſnatch hold of their fellow ſaline-fixed Particles, to which whilſt they adhere, the ſulphureous ſlide away from them, and being mutually combined between themſelves, and with the terreſtrial, they make the white thick ſubſtance, the *ſerum* together with the combinations of the Salts, being fuſed or melted into an *aquoſitie*. Cold Milk neither of its own accord, nor by any ſharp thing being poured into it

is

Part I.

is coagulated, becauſe, whilſt that the Pores are ſhut, the inteſtine Particles howſoever diſpoſed ſo as they may be ready for new marriages or divorces, do not eaſily unlooſe themſelves, but the Paſſages being opened by the heat they preſently enter into private Combinations, and Schiſms or Separations, as occaſion ſerves.

What Analogie there is in the Blood to the Coagulation of Milk, and of the Inhibition or reduction of this.

Theſe things being admitted thus concerning the Fuſion and Coagulation of Milk, and Inhibition and reduction from that condition, let us now conſider whether in theſe any like or analogical thing is correſpondent to the Blood, and indeed although it be granted that Blood being let forth of its Veſſel, will not, as milk boyling over the fire, reſolve into Conſtitutive parts, or variouſly ſcatter or coagulate, and then be again reduced from that Condition, by the affuſion of Salts, becauſe indeed the Conſiſtencie of the Blood is thicker than of Milk, and is more apt to cloder, moreover this flame or its life being extinct, it is altered very much from what it was in the Veſſels: but yet I have found by frequent tryal, which the experiments of others confirm, that the ſame Liquors, which do fuſe a precipitate Milk, as diſtilled Vinegar, Spirits of Vitriol, a Dilute of Salt or Nitre, and other Acids alſo being poured upon warm Blood, do preſently coagulate it, and ſo diſcolour it, that it grows black in the whole Maſs, one portion goes into a clottie Cake and the other into a watry and thin *Serum*.

What alterations Chymical Liquors produce being poured upon warm Blood.

Beſides theſe, which inhibit, or take away the Coagulation of Milk, as Oyl of Tartar, fixed Salts of Herbs, a ſolution of Salt Nitre, of quick Lime, Spirits of Salt Armoniack, Harts Horn and the like being poured upon warm Blood, doth amend, or conſerve its mixtion whole, as may be argued from its ſhining and red ſparkling Colour, and its Conſiſtencie remaining alike for a long time; wherefore as it eaſily follows from hence, it appears that Blood, although in an unlike proportion, is made up of the ſame kind of Elementary Particles, as Milk. Indeed there are in this more plenty of Spirit, Sulphur, Salt, and Earth; and leſs *Serum* than in Milk. From whence it may be concluded that the Blood being rightly diſpoſed, to wit, more thick, and too apt to grow together or to clodder, is leſs able to be fuſed, and to be looſned into much ſeroſitie, notwithſtanding whilſt that it paſſes thorow the Reins in the Circulation, the ſuperfluous aquoſities, partly by the ſtrainer of the Reins, and partly by their ferment, keeping the Blood from too much Coagulation, by degrees are ſeparated and ſent away. But when the Blood is vitiated in its complexion, there is a failing both as to its Conſtitution, and about the manifold ſeparation of the *Serum*. As to the former, the Blood is now too hot and ſharp, now too thick and feculent, and ſometimes alſo above meaſure, thin and watry: and according to its degenerate ſort of ſtate various ſickneſſes ariſe, of which we ſhall not particularly treat in this place. But yet for as much as the Blood is amiſs in its *Craſis* or Conſiſtence, though its *Serum* be ſeparated in due meaſure and manner, no very great healthful Condition doth therefore preſently follow. But the Origin of very many Diſeaſes do happen, by reaſon of the ſeparation of the *Serum* not being rightly performed. But as to this, as there may be divers manner of failings, the fault may be very much in the Defect, or in the Exceſs. For ſometimes the Serous *Latex* ſticks too pertinaciouſly in the Boſome of the Blood, and on the contrary, ſometimes ſlides away too ſoon, and in this reſpect the Blood, not containing the *Serum* ſpews it forth by the little Paſſages of the Arteries, in very many places, and almoſt every where; and ſo thruſting it down into the *Viſcera* or habit of the Body, produces an *Aſcites* or watrie Dropſie thorow the whole Body, and now ſending it away immoderately to the Reins, inforces a *Diabetes* or exceſſive Piſſing. The Blood too much retaining the *Serum*, being very much heated as in a Fevour, hath its body too ſtrict, with complicated and more thick particles boyled together, ſo that the more tenuous particles cannot eaſily break forth; or it being ſtuffed with Scorbutick Salt and Sulphur, becomes very viſcid and tenacious, ſo that the ſeroſities very hardly ſlide from the embraces of the reſt. As thus the departure of the ſerous Liquor from the blood is after a divers manner hindred, or perverted, there are alſo Diuretick Medicines of a diverſe diſpoſition and operation, which notwithſtanding may be diſtinguiſhed: and firſt as to the end, according to which they have a regard to the Maſs of Blood, or the Reins, or to both together. Secondly as to the matter, in which reſpects they are either Sulphureous or Saline, and theſe again

That the Blood may rightly put away the Serum it ought to be preſerved or reduced both from too much growing thick, or too much fuſion.

Of the Separation.

1. The ſeparation of the Serum offending in exceſs.

Alſo in defect.

The Diſtribution of the Diuretick.

1. As to the End.

2. As to the Matter.

gain are various, according as the Saline Particles are in a condition of fixedneſs, of flowing, or of Volatility, or further as they are Nitrous, or Alchaliſate. In the third place as to the form, theſe Medicines may be had in a divers manner, but for the moſt part their Compoſitions, as to their Species, are Drinks, or Powders, or Boles, or Pills, or Chymical Liquors, concerning which we ſhall particularly ſpeak anon. In the mean time allthough it ſeems to belong rather to Pathologie or the treating of the Paſſions than to the Pharmaceuticks or Curing by Medicines, to explicate the ſingle ſcopes or ends of Diureticks, yet I think it will be to the purpoſe to deſign or draw forth briefly the cheif of them here. And then in the ſecond place to diſtinguiſh the diuretick Medicines as to the matter, which is almoſt in all of them only Saline, into certain Claſſes, and laſtly, to add thereto the more ſelect forms of preſcriptions in every Kind.

Part I.

3. *As to the Form.*

First therefore when the Blood becomes ſo craſs and tenacious by a fixed Salt with Sulphur and Earth incocted together and mutually combined, that the watrie Particles do not eaſily ſeparate from the reſt; Diureticks of that kind are behoveful, which may make laxe its cloſe joynting, and ſcatter abroad the *Serum*, which are rich in volatile or acid Salt: for ſuch Particles do chiefly diſſolve the Combinations enterd into by the fixed Salt. For as much as this diſpoſition is common both to the Fevour and the Scurvie in the former Diſeaſe, diureticks are chiefly proper, both the acid temperates of Vegetables, alſo of ſalt Nitre, of the Spirits of ſea Salt, of Vitriol *&c.* Alſo ſuch as are indued with volatile Salt, as the ſpirits of Harts Horn, of ſalt Armoniack, ſalt of Amber, of Vipers and of others of that kind which we reherſed before in the Claſs of Diureticks. In the ſcorbutick Diſpoſition when the Urine is both little and thick, the Juices of Herbs, and preparation both ſower and acid are of egregious uſe, alſo ſalt and ſpirit of Urine, of *Sal* Armoniack, Tartar *&c.*

1. *Saline diureticks.*

1. *What are requiſite in the too ſtrict joynting of the Blood.*

Secondly ſometimes the Blood does not retain long enough the *Serum* within its cloſe enfolding, but being obnoxious even to Fluxions or rather Coagulations, putting it away here and there plentifully in great abundance, ſtirs up Catarrhs or tumors in divers places; or elſe the Blood being habitually weak and alſo in ill diſpoſition, to wit, inclining to ſowerneſs, ſo far as that it is apt to coagulate its more thick Particles; therefore as the more thin are every where ſent away in the Circulating, and falling down upon the weaker parts, they cauſe now Cephalick Diſeaſes or Thoracious, now an *Aſcites* or *Anaſarca*. Moreover from a like cauſe the *Diabetes* doth ariſe as ſhall be declared by and by. But truly very many difficult Diſeaſes, which are imputed wrongfully to the Dyſcraſie of the *Viſcera*, do ariſe from this Cauſe; to wit, that the Blood being evilly tempered, and obnoxious to Coagulations, when it cannot continue the whole thred of Circulation; it puts away the *Serum*, too readily apt to go away, in divers places. In theſe caſes the Diureticks to be given ſhould be of that kind which does not ſcatter the Blood, but take away its Coagulations, as they are which are indued with fixed, volatile atd alchaliſate Salt, beſides ſuch as ſtrengthen or reſtore the ferment of the Reins as ſome ſulphureals and ſpirituals. To theſe Ends are Diureticks, Sulphureous and Mixt Salts, the Lixivials of Herbs, the Pouders of Shells, Salt and Spirit of Urine and *Millipedes* or hog Lice, horſe Raddiſh Roots, Parſly Seed, Nutmegs, Turpentine and its preparations, Spirits of Wine, the Virtue of all which is not to fuſe the Blood, and to precipitate the Seroſities out of its Maſs (acids do that chiefly, and in thoſe caſes more often hinder the *Diureſis*) but to diſſolve the Coagulations of the Blood, for the end that its cloſe joyning together recovering a whole intire mixtion, and being more expeditiouſly circulated thorow the Veſſels, it might ſup up again the *Serum* any where gone out of the Veſſels, or diſpoſed, and at length may deliver it to be ſent away by the Reins: by which means, according to both theſe allmoſt oppoſite ends of Healing, the Diureticks of every kind ſhould operate, and chiefly under what Forms they ſhould be diſpenſed, we ſhall now ſhew next.

Secondly what in the too lax.

CHAP. II.

Part I.

CHAP. II.

The Kinds and Forms of Diureticks, also the Ætiology of the Chymical Preparations of them.

The divers states of Salts.

First therefore, what belongs to the Saline Diureticks, ought to be referred hither, as we have often told you that Salts of whatsoever divers condition being commixed together, do mutually lay hold of one another, and by and by are joyned close together; and while they are so combined, other Particles, being loosned from the mixture do separate or fly away into Parts. This is planely perceived when the fluid or acid Salt is mixed together with the fixed or Alchalisate, also when the fluid or fixed with the Volatile or sharp. In truth all the business of all sorts of solutions and precipitations depends upon this only affection of Salts. Wherefore as the Blood and the Humours of our Body, abounds very much in Salt, and being wont to be variously changed by it from one State to another and for that cause a morbid Disposition to accrue, and moreover as divers sorts of Saline Diurericks are full of fixed, fluid, nitrous, volatile or Alchalisate Salt, there will be always need of great Discretion and Judgment of the Physitian, that the Saline Particles in the Medicine may differ from those in our Body. By what means this may be done, we shall declare by running thorow every kind of Diuretick Salts.

Their various affections.

Diureticks repleniſhed with acid Salt.

Among the Diureticks imbued with acid Salt, the spirit of Salt or Nitre, also the Juice of Limons and Sorrel, white Wine, Rhenish Wine and Cyder, are chiefly and commonly noted, and very often perform that intention: for these do only fuse the Blood, and precipitate it into serosities, even as sharp things dropped into warm Milk. Notwithstanding this does not happen to all alike, nor to every one indifferently. In a healthful constitution or not very far from it, the Salt of the Blood is partly fixed and partly Nitrous, and partly Volatile; also in some Scorbutical and Hydropical People it becomes for the most part fixed. Wherefore in all these cases Diureticks indued with acid Salt are administred with success: but in Catarrhous affections, and in some Hydropical and Scorbutical, when the Saline fixed Particles of the Blood are carried into the Form of a stream, and the Volatile are depressed (as it often happens) sharp acetous Remedies do rather hurt than good; for as much as they do more pervert the Blood degenerated from its right Disposition, but rather in these cases, Medicines indued with a fixed or Volatile Salt, are of Use.

For whom Convenient.

Forms and Diureticks which have an acid Salt for their Foundation.

Powders.

Take of Choice white Tartar pulverised of *Lapis Prunellæ* of each ʒiſs, of the Pouder of Crabs Eyes ʒj. The Dose is from ʒß to ℈ij, in a fit Vehicle, repeated every sixth or eighth Hour.

Take of Vitriolated or Nitrated Tartar ʒij, Pouder of Egg-shells ʒiſs, Parsly Seeds or wild Carrot Seeds ʒß, make a Pouder, the Dose ʒß, after the same manner.

Take of the best Spirit of Salt ʒij, of Harts Horn burnt and poudered what will suffice to drink it up, make a Pouder, Dose ℈j to ʒß,

Drinks.

Take of the Juice of Limons ʒij, of Water of Raddish Compositi. ʒiſs, of Syrup of the five Roots ʒiij, make a potion,

Take of the Juice of Sorrel ʒij, of white Wine ʒvj, mingle them and make a Potion.

Take of compounded Water of Raddish ʒij; of Pellitory of the Wall ʒiiij,

of

of the ſpirits of Salt ℈j, fifteen drops of the Salt of Tartar, fifteen grains of the ſyrup of Violets ʒß, make a Potion.

Part I.

2. Medicines indued with a fixed or lixivial Salt, are wont to be adminiſtred to move Urine, and it appears manifeſtly enough by the vulgar and empirical Medicines for healing dropſical people: For it is uſual in an *Anaſarca* and ſometimes in an *Aſcites* when the *Viſcera* or fleſhy parts do very much ſwell up by the aggeſtion of waters, to drink a *Lixivium* made of the Aſhes of Wormwood, or of Broom, or of Bean ſtalks with white Wine; from whence it frequently happens a very great plenty of making water to follow, and the Diſeaſe to be taken away. However I have obſerved that Medicine to have been not at all Diuretick to ſome, and rather to have encreaſed, than healed the Hydropick *Diatheſis*: If the reaſon of which be inquired into, it appears by what hath been formerly ſaid, that lixivial Salts do not fuſe or precipitate neither Milk nor Blood, and therefore they are not by their proper virtue Diuretick; but notwithſtanding that effect ſometimes follows, for as much as fixed ſalt being copiouſly taken, deſtroys the Energie of the acid or coagulative Salt being mighty in the Blood; becauſe that the Blood, when before, incontinent of the *Serum* and too apt to be fuſed did extrude it in divers places, by the coming of the fixed Salt might recover its due conſiſtance, and therefore drinking up again the extravaſated *Serum*, and carrying it continually to the Reins, cauſed a plentiful *Diureſis* or evacuation by Urine.

Diuretick s indued with fixed Salt.

For whom convenient.

2. *Forms of Diuretick s which have a fixed Salt for their* Baſis.

Their forms.

Take of the ſalt of Tartar or of Wormood ʒij, of Coral calcined white ʒjß, of Nutmegs ʒß, make a Pouder, the Doſe is ʒß to ℈ij.

Take of the Tincture of the ſalt of Tartar ʒjß to ʒj, Rhadiſh water *Compoſit.* ʒjß, mingle them and let it be given in a draught of poſſet drink with the roots and ſeeds of the great Burdock boiled in it.

Take of the *Deliquium* of the ſalt of Tartar (whilſt the tincture is extracted) flowing under, and of Wine impregnated with Sulphur ℈ij to ʒjß, of white Wine ʒiiij to vj, of the ſyrup of the five Roots ʒß, mingle them and make a draught to be repeated twice or thrice in a day.

Take of the Aſhes of the twigs or buddings of the white Muſcadine Grape ℔ß, Nutmegs ʒij, pour them into ℔ijß, of Wine or Rheniſh Wine, let it ſtand warm and cloſe ſhut for a days ſpace, then ſtrain it and keep it for uſe. The doſe is ʒvj, twice or thrice a day.

Flints made hot in the fire and quenched in white Wine or ſtale *March* Beer: Drink of the Liquor vj or ʒviij, twice a day.

Take of the water of quick Lime ʒiiij to vj, of the Tincture of the ſalt of Tartar ʒj to ʒjß, make a draught to be taken twice or thrice a day.

3. For the ſame reaſon as fixed Salt, ſometimes alſo volatile Salt is adminiſtred with ſucceſs to move urine in a ſharp Dyſcraſy of the Blood *viz.* for that its Particles being admitted into the Blood do deſtroy the prepollency of the fluid Salt in it; becauſe that the blood recovering a due mixture being made free from coagulation and Catarrhs it reſorbs or ſucks up again whatſoever of the *Serum* is gone forth of the Veſſels, and delivers what is ſuperfluous to the Reins to be ſent away by the Ureters. But notwithſtanding in the mean time Medicines prepared out of volatile Salt, becauſe they have Particles ſomewhat fierce and elaſtick, when they amend the diſpoſition of the Blood they diſpoſe what is ſuperfluous of the *Serum* ſometimes to be purged away as much by a *Diaphoreſis* or evaporation by ſweat as by a *Diureſis* or evacuation by Urine. To this Claſs of diureticks not only the pure unmixt volatile Salt drawn forth of the Animals or Minerals by diſtillation, but the integral parts of the living Creatures and Vegetables (of which ſort are the powders and extracts of inſects and ſharp vegetables) ought to be referred.

Diuretick s indued with volatile Salt.

Wherefore they help.

Part I.

Their Forms.

3. *Forms of Medicines which have volatile Salt for their* Baſis.

Powders. Take of the ſalt of Amber, of the ſalt of the pureſt Nitre of each ʒij, make a powder, the Doſe is from ϑj to ʒß, in a fit Vehicle.

Take of the flowers of ſalt Armoniack, of mineral Cryſtal of each ʒij, mix them the Doſe ϑj, to ʒß, in a ſpoonful of Compounded Radiſh water. The Salt of urine is given after the ſame manner.

Take of the powder of Bees ϑj, of Lovage ſeeds ϑß, make a Powder, let it be given in a ſpoonful of diſtilled Water.

Potions. Take of the ſpirits of Urine ϑj to ʒß, of the water of Radiſh Compoſit. ʒj to ʒjß, of the water of Juniper ʒiij, mix them, make a draught. Spirits of Tartar are exhibited after the ſame manner in a double Quantity.

Pills. Take of *Millepedes* prepared ʒij, of the flowers of ſalt Armoniack ʒß, of Nutmeg powdered ʒß, of Venice Turpentine what ſhall ſuffice, take four Pills twice in a day.

Take of the powder of Bur-dock ſeeds ʒij, of wild *Daucus* ʒj, of the ſalt of Amber ʒj, of the oyl of Nutmegs ϑß, of *Capivius* Balſom what will ſuffice, make a Maſs, form it into little Pills, of which take in the evening, and in the morning iiij.

Apozem. Take of the Roots of Chervil, Parſly, Fenil, *Eringo*, Cammock or Reſtharrow of each ʒj, of the leaves of Saxifrage, of Clivers, or gooſe Graſs, of each j M, of Cummin ſeed, of ſtone Crop, of each M ß: of Juniper Berries ʒvj, boyl them in Spring water ℔ iiij, till half is conſumed, add to it of Rheniſh Wine ℔j, of the beſt Hony ʒij, make an Apozem the Doſe ʒvj, twice a day.

Diſtilled water. Take of freſh *Millipedes* or Hoglice ℔ij, of the leaves of Cleavers, Chervil, Saxifrage, golden Rod, of each Mij, of wild radiſh roots ʒvj, of Nutmegs ʒj, of Juniper berries, wild Carrot ſeeds, of each ʒij, being cut and bruſed pour them into the Whey or *Serum* of milk made with white Wine ℔viiij, diſtil it in the common Stills and let the whole liquor be mixed together. The Doſe ʒiiij, twice or thrice in a day.

Expreſſions. Take of freſh *Millipedes* waſhed to the number of 40 or 60 of Nutmeg ϑß, let them be bruſed together and put them iuto the diſtilled water of Saxifrage ʒiiij, make an expreſſion and let it be drunk.

Take of the Leaves of Chervil, of Parſly, Alexanders, of each M iij, let them be bruſed together and put into white Wine ℔jß, ſqueeſe it forth very hard, let it be kept in a Glaſs, the Doſe ʒiiij, twice in a day.

Tinctures. In like manner the Tincture of *Millipedes*, of Bees, of Graſhoppers, or of *Cantharides* dryed, the Tincture of ſalt of Tartar: given from 15 or 20 to 30 Drops in a fit Vehicle.

Diuretick̃s indued with a nitrous Salt, 'Tis plane from the Figure, Colour, Taſt, and other properties, and accidents, that Nitre is a certain *genus* of Salt. However it is divers from any other Salt or the condition of ſaline Particles, and is neither acid, nor fixed, or volatile, but a ſtate as it were in the middle between them. For ſo much it participates of volatile Salt, as whilſt it is made, it muſt be joyned to the lixivial and fixed ſalt with the Aſhes, that it might obtain a certain concretion, further when it is melted, by ſome Sulphur caſt in it, by and by it is inflamed and flies away: But it ſo much communicates with fixed Salt, as being melted in the Crucible, it ſuffers a continual fuſion, and perhaps perpetual, without any great loſs of Parts or Particles. In truth Nitre is that whereby all the Plants do flouriſh, all living Creatures live and breath, and the flame or all ſublunary Fire is enkindled and ſuſtained, as we have ſhewed more largely in another Tract, which it will not be needful to repeat here.

The reaſon of its effects. But as to our preſent purpoſe, it is commonly enough known that the ſalt of Nitre doth refrigerate the Blood, and ſtrongly move Urine: but yet the Reaſon of either effect doth not ſo clearly appear, becauſe Nitre is ſo far from containing cold carrying Particles in it ſelf, that on the contrary nothing can be more igniferous

igniferous, as may be perceived in Gunpowder, and if it be diſtilled, flame, rather than vapour or fume will ſeem to come into the Recipient: yea the diſtilled *Stagma* like actual Fire burns or corrodes all bodies whatſoever which are put to it. Neither is it leſs to be wondered at how this, whoſe nature is ſo fiery, ſhould ſo moiſten the Blood, and fuſe it into aquoſities, for the provoking evacuation by Urine. Part I.

That I may propoſe our Conjectures concerning theſe things, I ſay that Nitre does help to produce theſe effects in a twofold reſpect; *viz.* for as much as it is a Salt ſomewhat a kin both to the fixed, and to the volatile, and for as much as it is a fire exciter: As to the firſt we have obſerved Nitre (even as alſo fixed and volatile Salts) being put into Milk, to hinder or take away its coagulation; in like manner alſo warm blood being poured to this as well as to thoſe is preſerved from coagulation and diſcolouration. Wherefore indeed the Particles of Nitre, being taken inwardly; keeps whole or reſtore the mixtion of the Blood; becauſe truly they will hinder or take away its fuſions and coagulations, from which heats and the *Iſchuria* or ſtoppage of the paſſage of the Urine, do very often ariſe.

But moreover Nitre, as much as it is fiery, being taken inwardly refrigerates the heated Blood and moves Urine: for that (as we have formerly hinted) enkindling more by its coming the flame of the Blood, before troubled, and intermixed with fumes, it renders it more clear and pure, and for that cauſe more gentle; and ſo as the Blood, before troubled, whilſt that it burns more clearly by reaſon of the Nitre, is more laxed in its cloſe joynting; the ſerous Particles are more eaſily extricated from the more thick, and more plentifully go away.

4. *Forms of Diureticks which have Nitre for their* Baſis.

Take of prepared Nitre ʒij, of Barly water with Knotgraſs roots, and candied *Eringo* roots boyled in it ℔ij, of the ſyrup of Violets ʒij, mingle them. The doſe is ʒiiij, twice a day. *Powders.*

Take of *Sal Prunellæ* ʒij, of ſugar Candy ʒj, make a powder to be divided into ſix parts, take one in ſome convenient liquor thrice in a day.

Take of *Sal Prunellæ* ʒiij, of ſalt of Amber ʒij, make a powder, Doſe ʒß, thrice in a day.

Take of *Sal Prunellæ*, of Crabs eyes, of ſalt of Wormwood, of each ʒij, mingle them, the doſe ʒß, thrice a day.

5. It is vulgarly enough known alſo that teſtaceous or ſhelly, and ſome ſtony powders indued with an Alchalizate or petrifying Salt do ſometime promote an evacuation by Urine or the *Diureſis*. For that in great ſtoppages of the water, the powder of Egs ſhells, of the claws or eyes of Crabs is a preſent remedy to ſome. If the manner and reaſon of whoſe working be inquired into, it may eaſily be manifeſted that theſe Medicines do not fuſe or ſcatter, nor ſenſibly precipitate the Blood. Therefore it may be ſaid that theſe are ſometimes Diuretick in an acetous dyſcraſy of the blood and humours, for as much as they bind and reſtrain the acid Salts by their combination, to the end that the Blood, being free from fluxions and coagulations, might ſup up the extravaſated *Serum*, and transfer it to the Reins. *Diureticks indued with Alchalizate Salts.*

5. *The Forms of diuretical Medicines whoſe* Baſis *is an Alcaliſate Salt.* *Their Forms.*

Take of Egſhels powder'd ʒß to ʒj, let it be given in a draught of white Wine or poſſet drink or of diuretick decoction twice in a day. *Powders.*

Take of the powder of Crabs claws or Crabs eyes ʒij, of the ſalt of Amber, of Nitre of each ʒj, of Nutmegs ʒß, make a powder, the Doſe ʒß to ℈j, in a fit Vehicle.

Or the aforeſaid powder with as much Venice Turpentine as will ſuffice to make little Pills, the doſe iij or iiij, morning and evening. *Pills.*

Part I.

Sulphureous and ſpirituous Diureticks.

Not only ſaline but alſo ſome ſulphureous and ſpirituous Medicines, are rightly placed in the company of Diureticks, for as much as they produce that effect. Very many reſinous Gums as chiefly Turpentine, and preparations out of them, oyles of Juniper, of Nutmegs, of Wax, and drops of other fat things being taken inwardly for the moſt part provoke abundance of Urine, and imbued with a ſmell like Violets. I have known that in ſome Hydropical, and Scorbutick people ſpirit of Wine, and hot waters, yea and good Wine plentifully drunk hath provoked a *Diureſis*: the reaſon of all which is, becauſe that the Blood being weak or waxing ſower, or by reaſon of the defect of its fermentation, or through the power of the acid and coagulative Salt, if not lively enough nor equally circulated, as that it may contain within it ſelf the ſuperfluous *Serum*, even till it may deliver it over to the Reins, the aforeſaid remedies for as much as they keep whole the mixtion of the Blood, or reſtore its weakneſs, they conduce to the promoting the *Diureſis*.

Forms of them.

Diſtilled waters.

Take of the Berries of Ivy, Juniper, and Laurel freſh gathered of each ℔ß, of wild Carrot ſeeds ʒiiij, of Nutmegs ʒij, let them be all bruſed and put into a glaſs retort, with the beſt Venice Turpentine ℔j, ſpirits of Wine rectified ℔iiij, let them be diſtilled in a Sand furnace with a moderate heat till they are dry, having a care of an *Empereuma* or letting them taſt of the fire, and you will have a Spirit, and a yellow Oyl, either of them egregiouſly Diuretick: the Doſe of the Spirit ʒj to ʒij or ʒij, of the Oyl ℈ß to ℈j, in a fit vehicle.

Tinctures.

To the *Amalgama* remaining in the retort, pour of the Tincture of ſalt of Tartar ℔j, let them digeſt for many days cloſe ſhut in the ſand Furnace, that a red tincture may be drawn forth. The doſe of which is ℈j to ℈ij or ʒj in a convenient vehicle.

Spirit and Oyl.

Take of *Millipedes* prepared ʒiiij, of Nutmegs ʒj, pour on them of the pureſt ſpirit of Turpentine, and of the tincture of the ſalt of Tartar of each ʒvj, diſtil them in *Balneo* with a gentle fire, and you ſhall have a Spirit, Oyl, and *Deliquium* of ſalt of Tartar, every one of them notably endued with a diuretick Virtue.

The Reaſons of ſome certain Preparations.

1. Sal Prunellæ *or Mineral Cryſtal, which is only purified Nitre.*

Sal Prunellæ.

TAke of ſelect Nitre what you pleaſe, diſſolve it in ſpring water or rain water, boyl it a little, and put it into a deep glaſs Veſſel in ſome cold place to be Cryſtallized: Let the whiteſt only and pureſt Cryſtals be ſelected, which muſt be reduced to the higheſt purity by frequent Solutions and Cryſtallizations, which at laſt being fuſed in a Crucible, and poured forth into a ſilver Veſſel, becomes a moſt white ſtone. This being pulveriſed, the Doſe is ℈j to ʒß or ℈ij. It cools the Blood being hot, and moves Urine.

The reaſon of it.

This preparation is made for that end, as the nitrous Particles may be ſeparated as much as may be, and be pure and clear from the fixed Salt, and may be concreted by themſelves into Chryſtals; for that when Nitre is firſt made and elixiviated from the Earth, its Particles are unable to grow together or to be Cryſtallized ſo, which makes a neceſſity, that the nitrous *Lixivium* ſhould be largely lixiviated with Aſhes, and impregnated with fixed Salt, whereby the nitrous Particles being partly united with the lixivials, and partly by the intervention of theſe; the waters extruded from the Pores, acquire a certain concretion or growing together: Wherefore when the Body of ſalt Nitre is formed by this means, the Particles of the fixed Salt are to be waſhed away from it as much as may

may be, by frequent ſolutions and Cryſtallizations, whereby it may be rendred more pure for the uſe of Medicine. Part I.

2. *Spirit of* Nitre.

Take of the pureſt Nitre ℔j, pouder of Bricks ℔ij, let them be well beaten and mixed together, and put into a Glaſs or earthen retort made faſt and defenced and diſtilled in a reverberating Furnace by a fire gradually increaſed. The red fumes make the receiver to ſhine as it were with a certain flamy colour, and being condenſed, they make an acid and highly corroſive *Stagma*. The Doſe is drops iiij to vj in a fit Vehicle. *Spirit of Nitre.*

Although Nitre being mixed with Sulphur, is fixed preſently by any inkindling, and breaks forth into flames; yet being deſtitute of that, it may be melted in a Crucible, or diſtilled in a Retort without any deflagration. The powder of Bricks is added, that when the Salts are fuſed by the Fire, they may not mutually lay hold of one another and link themſelves together, but being divided and drawn one from another, they may be driven forth from their ſubject by the force of Fire. *Its Ætiology.*

The melted Nitre retains its inflammable virtue, but the Liquor being diſtilled, will rather put out the fire than kindle it: For if it be mixed with Sulphur, that mixture will hardly be made to burn, or leſs than Sulphur by it ſelf. The reaſon of which is, becauſe the nitrous Salt having ſuffered a fluor or flux, is altogether altered from its firſt ſtate, and gets almoſt a like acetous diſpoſition, as other Salts ſuffering a Flux; yet an acid *Stagma* is drawn out of the Sulphur, which rather deſtroys the Fire, than that it ſhould be inflamed by it.

3. *Spirit of Sea Salt.*

Take of Sea Salt fuſed and powdered ℔j, of Bricks groſly powdered ℔iij, beat them together and mingle them; then add of greater pieces of Bricks to ℔ß, let them be well mixed and ſet faſt in a Retort, and diſtilled in a Reverbatory, with a moſt ſtrong Fire for twenty four hours: Rectifie the diſtilled Liquor in a glaſs Cucurbite by the heat of Sand, drawing off the phlegm or watry part. The Spirit will remain in the bottom of a yellow or little greeniſh colour; and of a very grateful ſmell and taſte. *Spirit of Sea Salt.*

This Salt is very difficultly driven into an acetous Liquor, becauſe its Particles being more Saline than any other minerals, to wit, Vitriol, Nitre, Alume, and moſt ſtrictly combined together, and are not eaſily diſſociated one from another by themſelves, or may be pulled away from the embraces of the Earth; leſt they ſhould flow together, the powder of Bricks is mixed with it in a three fold quantity: and moreover greater pieces of Bricks is thought good to be interpoſed, that the Maſs to be diſtilled being made hollow as it were with holes, it might be every where pervious to the Fire. Nevertheleſs in the diſtilling, the Salts being fuſed by the fire moſt often flow together, that afterwards they cannot be driven forth by any force of fire. *The Reaſon.*

The thing appears to be ſo, becauſe if by an applied Artifice this Cohæſion of the Salt among themſelves and with the Earth is broken off, they may by a very eaſy work be forced into an acid *Stagma:* for example.

Take of the ſpirit of Vitriol not rectified ℔j, pour this into the glaſs Retort to the Sea ſalt calcined and pulveriſed, and by and by diſtil it in Sand: the ſpirit of the Salt as it were driven away from the other moſt eaſily aſcends, the ſpirit of Vitriol poſſeſſing its ſeat, *viz.* this being more heavy and ſtrong, and being at once deprived, and greedy of a terrene habitation, drives the other from its ſeats, and invades them. *A more compendious manner of it.*

4. *Spirit*

Part I.

4. *Spirit of Urine.*

Spirit of urine. Take of the Urine of a ſound man that drinks Wine, what you pleaſe, place it in a Cucurbit with a blind Head that it may putrefie in Dung for a Month, then diſtill it in ſand: The diſtilled Liquor being rectified in a deeper Cucurbit, exhibits a Spirit and volatile Salt. This operation is more compendiouſly performed, if the freſh Urine be evaporated to the fourth part remaining, to wit, that the ſaline Particles, the phlegm exhaling, may be agglomerated more thickly with the ſulphureous and terreſtrial. To this ſettlement ſet faſt in a Cucurbit, let there be poured a *lixivium* of Aſhes, or of the Salt of Tartar, or a ſolution of quick Lime, then being put in an Alembick; diſtill it in a ſand Furnace, by a very eaſie work you will have the Spirit and volatile Salt, which are depurated and ſeparated by rectification.

The Ætiology. The Reaſon of theſe proceſſes is this: For that the Urine conſiſts of a twofold Salt, *ſcil.* both nitrous and volatile, together with a great deal of Sulphur and Earth, the Particles of the volatile Salt (whilſt that the mixtion is whole) are ſo entangled and ſtrictly combined with the other Salts, and the other more thick elements, that the Spirits cannot break forth, nor be pulled aſunder or ſeparated by the force of Fire, notwithſtanding after that by a long putrefaction, the mixture of the Liquor is laxed, the ſaline volatile Particles at length extricating themſelves from the reſt, do firſt of all aſcend in the diſtilling. Moreover the ſame effect alſo more eaſily ſucceeds, when the fixed Salt being diverſe from the nitrous, is poured in; becauſe whilſt the Particles of this infuſion are laid hold on by thoſe of the other, the volatile Salt being ſlipped forth from its Chains eaſily goes away. Hither may be referred what we adverti ſe hereafter, concerning the diſtillation of *Sal* Armoniack.

5. *The Tincture of Tartar.*

Tincture of Tartar. Take of the pureſt ſalt of Tartar ℥vj, let it be melted, and let it flow in a Crucible, until it acquires a blewiſh or almoſt greeniſh Colour, then pour to the ſame being pulveriſed while it is hot, and placed in a firm Matrace with a long neck; the rectified ſpirit of Wine till it is covered iij or iiij fingers breadth, and let it be digeſted in a ſand Furnace with a ſomewhat ſtrong Fire for many days, until the Tincture is extracted. Becauſe that by long digeſtion the ſpirit of the Wine acquires a red colour, it is for as much as the Particles of the fixed Salt, being after a ſort exalted, are united to the vinous Sulphur. In the mean time, the remaining ſalt of Tartar being diluted by the phlegm of the Wine ſubſiding below into a *deliquium*, and flowing from beneath, goeth away by it ſelf; which is far better than the common oyl of Tartar, for as much as it participates of the Wine, Sulphur, and in ſome caſes where there is need of a diuretick Lixivial, it is a very laudable remedy. The Doſe is ℈j to ℈ij or ʒj. The Tincture is given from ʒj to ʒjß, or ʒij.

The Reaſon. The Tincture of the ſalt of Tartar by reaſon of the conjunction of the Salt and Winy Sulphur, is imbued with a moſt fragrant taſte and odor. If you ſhall diſtil the Liquor to the midſt, the remaining part retains more of the Salt and Sulphur in it ſelf, but leſs of the vinous Spirit; but the Spirit being drawn off and poured upon freſh ſalt of Tartar, if it be digeſted, for as much as it is wanting of the Sulphur when it is united with the Salt, it does not eaſily acquire a Tincture.

Truly that there is in the ſpirit of Wine a ſulphureous part, diſtinct from the ſpirituous, I learned from this Experiment.

Sulphur or Oyl of Wine: Take of the ſharpeſt ſpirit of Vitriol ℔ß, of the rectified ſpirit of Wine ℔j, mingle them in a glaſs retort, and diſtil them in a ſand Furnace; until the Liquor (which firſt ſeems homogeneous) being drawn off, a copious black thick ſettlement remains in the bottom: Let this Spirit be again poured back upon the *Caput mortuum*, and let the diſtillation be repeated with two or three Cohobations; at length you ſhall have two diſtinct immiſcible Liquors, *viz.* one an acid-ſpirituous ſubſiding below, and the other a moſt clear oyly ſwimming above it; which without

without doubt is the moſt pure unmixed ſulphureous part of the Wine, ſeparated and remaining by it ſelf, whilſt the ſpirituous part is wedded to the acid Salt. Part I.

6. *Salt of Amber.*

Take of the whiteſt Amber pulverized ℔ß, let it be diſtilled in a Glaſs Retort, either with a moſt ſtrong heat of Sand, or a light Reverbatory: Firſt, there will aſcend a phlegm and yellow Oyl with a little ſpirit; then the volatile Salt will be ſublimed into the neck of the Retort, and ſides of the Receiver: And laſtly a black Oyl will come forth before it aſcends. This ought to be taken away, and the Receiver to be changed, leſt the Oyl be polluted by it.

At firſt, white Salt of a very grateful odor and ſavour, unleſs it be kept in a Veſſel very cloſely ſhut, in a ſhort time becomes yellow, and then red with a very ſtinking ſmell: The cauſe of which is, for that this Medicine contains much of Sulphur in it ſelf, whoſe Particles whilſt the Salt hath dominion, being ſubjugated and involved with others; are altogether obſcured, but afterwards being laxed they emerging from their binding mixture, and overtopping the others; they for the moſt part ſhew their excellency to our Senſes. Its Doſe is ℈ß to ℈j, the beſt way of keeping and of giving the ſalt of Amber, is to mix it with double the quantity of the pureſt ſalt of Nitre. *The Reaſon.*

Chap III.

Of the too much Evacuation by Urine, and its Remedy; and eſpecially of the Diabetes *or Piſſing Evil, whoſe Theory and Method of Curing, is inquired into.*

THe *Diabetes* was a Diſeaſe ſo rare among the Ancients, that many famous Phyſicians made no mention of it; and *Galen* knew only two ſick of it: But in our Age given to good fellowſhip and guſling down chiefly of unallayed Wine; we meet with examples and inſtances enough, I may ſay daily, of this Diſeaſe. But yet as familiar as it is, and though it be known as to its Type, its cauſes and formal reaſon notwithſtanding, is almoſt altogether unknown. That I may be ſo bold to Philoſophize, or rather to conjecture concerning theſe; we will firſt of all give you a deſcription of this Diſeaſe, as to all or the chief *Phænomena* of it: Then we will endeavour diligently to find out from the fault, of what part or humour every of them ſingle do ariſe. *The Diabetes formerly rarely and not yet well known.*

Diabetes is called ſo from διαβαίνω *Tranſeo*, or paſſing through too ſwift a paſſage of the matter that is drunk, alſo a *profluvium* or thorow-flux of Urine. Thoſe labouring with this Diſeaſe, piſs a great deal more than they drink, or take of any liquid aliment; and moreover they have always joyned with it continual thirſt, and a gentle, and as it were hectick Fever. But that as many Authors affirm the drink to be little or nothing changed, is very far from truth; becauſe the Urine in all (that I have known who hath hapned to have it, and I believe to be ſo in all) very much differing both from the drink taken in, and alſo from any humour that is wont to be begot in our Body, was wonderfully ſweet as it were imbued with Honey or Sugar. The occaſion of the foreſaid error (as I ſuppoſe) was the colour *Its deſcription.*

Part 1.

colour of the Urine, which always appears crude, and watry as of thoſe labouring with the *Pica* or with the Dropſie. That we may carefully ſearch out the reaſons of theſe Symptoms, we muſt firſt inquire from whence ſo quick and copious an excretion of Urine comes, and then we will proceed to the ſhewing of the remaining Reaſon of this Diſeaſe.

Its cauſe is not the attraction of the Reins.

It no way pleaſes us what ſome do aſſign for the cauſe of the *Diabetes*, the attracting force of the Reins: becauſe the Blood is not drawn to the Reins but driven thither by the motion of the Heart. Further neither doth the *Serum* ſeem to be drawn or emulged from the Blood waſhing thorow them, but to be ſeparated (as we have already more clearly ſhewed) partly by ſtraining, and partly by fuſion or a certain kind of precipitation: wherefore we believe the *Diabetes* to be rather and more immediately an affection of the Blood than of the Reins, and to take from thence its origin, for as much as the maſs of Blood is as it were melted, and is too copiouſly fuſed into ſeroſity: which eaſily appears truly from the quantity of the Urine increaſed into ſo great immenſity, which cannot proceed but from a melting and conſumption of the Blood. Wherefore alſo the remaining Blood, its *Serum* going away ſo plentifully, becomes more craſs or thick, and more apt to be coagulated, as may be argued from the ſwift working Pulſe: for the Heart is therefore more rapidouſly moved, that whilſt it exagitates the Blood more than uſual, it might preſerve it from Coagulation. Further that the fluidity of this, apt to be dangerous by reaſon of the too great loſs of the ſerous Liquor, might be continued, potulent matter is moſt plentifully taken in an huge thirſt provoking to it, and beſides the Humours that are within the ſolid parts are ſupped up from the Blood, yea their fillings are melted for the reparation of this; hence it is that thoſe labouring with this Diſeaſe are exceeding thirſty, and quickly grow lean.

But rather a Deliquium of the Blood.

The Conjunct Cauſe is chiefly in the Blood.

Therefore, that I may endeavour to ſhew the conjunct cauſe and formal Reaſon of the *Diabetes*, I am led to believe the *Craſis* or mixtion of the Blood to be ſo laxed and as it were diſſolved that the watry Particles cannot be contained by the more thick, bat that they quickly ſliding from their embraces, and being imbued with ſaline Particles, do run forth thorow the moſt open Paſſages of the Reins. But in the mean time other humours both from without and from within for the moyſtning the Blood, and hindring it from coagulation, are conveyed into it; and the *præcordia* are urged even with a mighty force into a more rapid motion.

Sometimes partly in the Reins.

But beſides we think the Reins ſometimes to be ſome part of the conjunct Cauſe, for that their ferment is wont ſometimes to be ſo vitiated, that it doth not preſerve the Blood by any influx of lixivial Salt, in due mixtion, and fluidity, for the cauſe that the *Serum* might be ſeparated from it by percolation only; but ſometimes it happens from an acid Salt laid up in the Reins, that the Blood is precipitated whilſt it paſſes thorow them, as it were by a certain Coagulation or runnet into a copious ſeroſity, which is by and by ſent away by the Ureters. Hence it is to be obſerved that a plentiful and limpid Urine is made by moſt of thoſe obnoxious to the *Nephritis* or Gravel, in a violent paroxyſm or fit. The cauſe of which is, that the acid Humour, delated thither by the nervous Pipes, (as we have ſomewhere ſhewen) and exciting Pain, doth firſt fuſe the Blood ſliding into the Reins, and cauſes the going away of a more plentiful *ſerum* from it.

But it is not improbable but that a plentiful διάβρωσις or exceſſive evacuation by Urine, may in a ſort proceed from an evil conformation of the Reins, for as much as their lympathick little hollow *Tubuli* being too ample, and open, they receive too readily the ſerous Liquor, and tranſmit it too ſwiftly without any *Remora*, ſo that therefore its greateſt quantity runs forth into Urine. But in truth as I may grant theſe little Tubes ſometimes and chiefly in thoſe troubled with the Stone or gravel, to be too open, yet for that cauſe there ſhould be rather purged forth a bloody then a copious Water. And indeed we think a bloody Urine cheifly to proceed from ſome ſuch Cauſe. Moreover when a copious and bloody Urine comes together, we judge a dyſcraſie of the Blood to concur with an evil Conformation of the Reins, as ſhall be declared by and by in a notable caſe, of a certain ſick perſon.

In the mean time as it is not to be doubted that the cheif and moſt frequent cauſe

cauſe of the *Diabetes* conſiſts in the Mixtion of Blood being too diſſolute and lax; ſo alſo by the like Reaſon, the ſmall *Diureſis* or leſſer than ought to be alſo very often depends upon the too ſtrict, and as it were cloſe joynting of the Blood. Moreover we may opportunely inquire whether that the total ſuppreſſion of the Urine dos not ſometimes proceed from ſuch a cauſe? For though it is commonly enough known, that the cauſe of the *Iſchuria* or more ſtrong and pertinacious ſtopping of the urinal Paſſages, being moſt often placed below the Reins, depends altogether upon the urinarie pipes being wholly ſtopped, and when I my ſelf have opened many dead by the Urines being wholly ſuppreſſed, I found in all the invincible cauſe of Death to have been an obſtruction of the only Ureter a little before open (the other being long time ſhut up) by a Stone newly got in. Yet the moſt learned Doctor *Riverius* ſhews two caſes of ſick people in whom the *Iſchuria* or total ſuppreſſion of Urine, and that for many Days was cured by Phlebotomie only; and therefore he aſcribes the Cauſe of the Diſeaſe to the Emulging Veins being above meaſure diſtended, ſo that they could not contract themſelves for the expulſion of the *Serum*, even as it may be obſerved every where in the urinal Bladder, which being very full, is not eaſily compoſed to the making of Water. But indeed as we give belief (as 'tis likely) to theſe Hiſtories, yet we ought not to aſſent to the Ætiology. Becauſe that is not the office of the Emulging Veins, which that famous man hath aſſigned them, for not the Veins, but the Arteries conſtantly convey the *Serum* together with the Blood, without any danger of hardneſs or plenitude of Urine; but as the *Serum* does not quickly run forth into the open Paſſages, the reaſon ſeems to be, that the Maſs of the Blood being too ſtrict, and compacted hardly lets go out of its Boſome the watry liquor intimately mixed with it.

Part I.

As this diſeaſe often ariſes from the cloſe joynting of the Blood being too diſſolute;

So the ſuppreſſion of the urine ſometimes is from the too ſtrict joynting of the Blood.

Hither may be referred the Anatomical Obſervation lately made on the dead Body of the Reverend Biſhop of *Cheſter* when as that moſt illuſtrious Lord, being a long while troubled with the Stone, at laſt by a continual ſuppreſſion of Urine had yeilded to Death, preſently all did preſume, the cauſe of Death to have been the Ureters being wholy ſtopped up by a Stone or gravelly matter, but by a diſquiſition made through a moſt accurate Anatomie, not any obſtruction at all in thoſe Pipes, or impediment of the Urine could be found. The like anatomical obſervation was related to me by that moſt learned man, Doctor *Lower* not long before made by himſelf, where the *Iſchuria* being deadly had not left any ſigns of it about the urinary Veſſels: Hence it is eaſy to divine, for beſides the reins were whole and ſound, that the cauſe of this diſeaſe was altogether in the too great Concretion and Compaction of the Blood.

This is confirm'd by anatomical Obſervations.

But to return from this diverſion after having unfolded the conjunct cauſe, and the Reaſon of the *Diabetes*, we will proceed to the ſearching out its procatarctick or more remote cauſes. Therefore if it be inquired into, from whence the joynting or compaction of the Blood becomes ſo looſe and lax, and apt to melt into ſeroſities; we ſay of this even as of Milk, that its fuſion proceeds frum this, for that as in its Maſs Salts of a divers nature do agree, or are aſſociated, the other particles (which ſeparated themſelves from them of courſe, and are conteined in the mixtion) being freed from the Saline, preſently go away into Parts. If that it ſhall be further inquired into, from whence thoſe Salts come, by whoſe private combination we ſuppoſe the mixtion of the Blood to be looſed, and its fuſion introduced; we need no long ſearch for them: for it planely appears, that there is naturally in the bloody Maſs, fixed and volatile ſaline Particles, to which if at any time an acid Salt doth plentifully come, or obtains a flux, it will eaſily excite the aforeſaid Affection. Hence it is that Rheniſh Wine, Cyder, and acid Liquors being drunk provoke a more plentiful *Diureſis* or Evacuation by Urine; therefore alſo in ſome ſickly People whoſe Blood abounds in an acid Salt, Medicines indued with a fixed or volatile Salt are wont to move the Urine. Neither doth this Affection ſtill happen only from things taken, but from the humours produced within. It is obſerved that many obnoxious to Convulſive affections, before or after the paroxyſms do make a great plenty of limpid, or clear watry Urine, the cauſe of which certainly is, for that the recrements or ſuperfluities of the Blood and nervous Juice being heaped up in the ſolid parts, whenſoever they being degenerated into a ſowerneſs, ſhall ſwell up and flow back again upon the Blood, they induce its fuſion, and for that reaſon a flux of Urine.

The procatartick Cauſes of the Diabetes.

They are firſt acid humors happening to the Blood, and fuſing or precipitating it after the manner of Milk.

Part I.

Wherefore when there is ſuch a conſtant, and habitual profuſion of Urine, nothing can be more likely ſaid than that the excrementitious humours being ſent away into the ſolid parts, and from thence after they had there contracted a ſowerneſs being returned into the Blood, they fuſe or melt its Liquor into too much ſeroſity, and for that reaſon provoke ſo continual, and immenſe excretion.

The ſame kind of acid Humour chiefly from the nerves and nervous Stock.

But we deſervedly aſcribe the chiefeſt part of this evil to the Nervous Juice, for as much as whenſoever this departs from a right *Craſis* or diſpoſition, as we have elſe where ſhown, it becomes very malignant and deadly both to the other Humours and to the ſolid Parts; wherefore by this being depraved the mixture of the Blood alſo is chiefly in danger to be perverted. But we may well argue that the nervous Juice is depraved, becauſe in the *Diabetes* the animal Spirits do very much languiſh, and preſently all nutrition is fruſtrated.

Hence ſpaſmodick Affections oftentimes preceed the Diabetes.

Further, which may notably confirm this opinion, I have obſerved in many obnoxious to this Diſeaſe by intervals, that a little before they have fallen into a flux of Urine, they have ſuffered wandring pains, and corrugations of the nervous parts in the whole Body, ſometimes with ſtupor or ſenſe of pricking, ſometimes with frequent Convulſions, and little leapings of the tendons, and other perturbations and inquietudes of the Spirits: being indeed a manifeſt ſign, that the Liquor watering the nervous Fibres degenerating from its *Craſis*, and being full of feculencies doth irritate the Spirits, and drive them into irregularities. Then afterwards when the recrements and ſuperfluities of the nervous juice overflowing into the Maſs of Blood from an ariſen Flux cauſe a *Diabetes*, the aforeſaid ſymptoms ceaſe, but with a languor of the Spirits, and a failing of ſtrength ſucceeding.

How the Diabetes *and the Dropſy differ.*

The *Diabetes* is commonly called the Chamber-pot Dropſy, and ſome affirm either the Diſeaſe to be indeed the ſame, and to have the ſame cauſes, and formal Reaſon, and the ſymptoms only to be varied as to the manner of the ſerous excretion; to wit, that the Blood in either being alike affected not able to contain the *Serum*, and being conſtrained to ſpue it forth from the Arteries, in the one pours it forth into the habit it ſelf of the Body, and Cavities of the *Viſcera*, and in the other, puts it aſide in the Reins abundantly to be carried away by the Ureters. But truly if the buſineſs be more narrowly conſidered, there will be found a notable difference between theſe two Diſeaſes. For the *Anaſarca* takes its original for the moſt part firſtly from hence, becauſe the Blood being imbecill, and too frigid is not enough enkindled, and heated, that it might continually concoct the Chyle that is carried to it, and aſſimilate it, and ſo volatilize it, as thereby it might be conteined in its boſome in the Circulation; but there is a neceſſity to ſpue this forth in all places together with the ſerous juice, and to leave it neer the *Interſtitia* of the Veſſels: then afterwards the Diſeaſe growing grievous the blood is not only made weak by Crudities, but becoming degenerate in its complexion is obnoxious to fluxions, and to Coagulations, and for that cauſe begets ſerous humours more plentifully, and pours them forth upon the undue parts, more impetuouſly. But on the contrary in the *Diabetes* the Blood is enough, yea to the utmoſt hot, and too much enkindled and concocts ſwiftly, and beyond meaſure the Chyle is carried to it: yea it melts the ſolid Parts, and ſups up their meltings, carries them about with it thorow the Veſſels, and boyls or cooks it more then enough; but when as by reaſon of the meeting of Salts the *Compages* or conſiſtence of the Blood is thorowly diſſolved, and fuſed into ſeroſities, portions being ſeparated within the reins, whatſoever are able to break away, run forth by the Ureters. If any Diſeaſe like, but inverſe to the *Diabetes* (to wit, in which the Blood being diſſolved into ſeroſities, did pour forth its liquids thorow the whole Body) did ever happen, without doubt it was ſometime the epidemical Fevour called the Engliſh Sweat, where the Blood melting into aquoſities did pour forth all the humours both profitable and unprofitable, even to the expence of the vital food, into the pores of the Body to be ſent away by Sweat.

The evident cauſes of the Diabetes.

So much concerning the formal Reaſon and cauſes, to wit, the conjunct and more remote, of the Diſeaſe of the *Diabetes*, as to the evident, cauſes to wit, the occaſions by which the acid juices, which excite the fuſion to coagulation of the Blood, are begot in our Body, theſe are of a various kind and original. An ill manner of living, and chiefly an aſſiduous and immoderate drinking of Cider, Beer,

Beer, or ſharp Wines; ſometimes ſadneſs, long grief, alſo convulſive affections, and other inordinations and depreſſions of the animal ſpirits are wont to beget and cheriſh this morbid Diſpoſition. I knew one uſing Rheniſh Wine for his ordinary drink twenty days together, that contracted an incurable *Diabetes*, of of which he dyed within a month, notwithſtanding all the remedies and councels of a great many famous Phyſitians. I remember two Women obnoxious to convulſive and hypochondriack Affections, to whom accrued from thence a great flood of Urine with languor, and waſting away of the Fleſh. Part I.

The Theory of this Diſeaſe being now explicated, there remains yet for us to ſhew the reaſons of the known ſymptoms, I ſuppoſe ſome of them to be manifeſt enough out of the premiſes, to wit, wherefore there is ſo ſwift and copious an excretion of urine in the *Diabetes*: But that the ſick are fevouriſh, and very thirſty, the reaſon is partly, becauſe the humours and the juices by which both the Blood and the ſolid parts are moyſtned and refreſhed, are by a too continual expenſe drawn forth by the *Diureſis*, or urinary evacuation, wherefore the throat is dry, and the *Præcordia* are greatly heated: and partly becauſe the Heart by the urgent inſtinct of Nature, and the Lungs are provoked into a more rapid motion, that the Blood being deprived of the moyſtning *Serum*, might be hindred from coagulation or concretion or growing together, and might be continued in its due Circulation.

The explication of notable Symptoms in the Diabetes.

From whence the often and copious piſſing.

From whence the Fevour with thirſt and languiſhing.

But it ſeems more hard to unfold, wherefore the Urine of the ſick is ſo wonderfully ſweet, or hath an honied taſte; when rather on the contrary if according to our *Hypotheſis* the fuſion of the Blood and (which therefore follows) the profuſion of the Urine happens by reaſon of the combinations of Salts, the Liquor certainly impregnated with theſe ſhould be rather ſalt then ſweet. But it is eaſy to unfold this in declaring firſt of all that the urine is deprived of its ſalt taſte, for as much as many Salts that are of divers Nature are combined in it. For this appears by a manifold experiment in Chymiſtry, that if Salts that are of a divers Nature, as fixed and volatile, be mixed with an acid thing, the acrimony of either is diminiſhed or loſt; wherefore we need not wonder that the urine of thoſe labouring with the *Diabetes* is not ſalt. But why that it is wonderfully ſweet like Sugar or hony, this difficulty is worthy of explanation.

Wherefore the urine of the ſick is ſweet like hony.

Some would think this effect to ariſe from this, that together with the Blood running forth thorow the Reins, both the recent nutritious Liquor, and the meltings of the ſolid parts are ſent away, wherefore it ſhould ſeem not improbable that this ſweetneſs ſhould be procured from theſe fat juices being mixed with Stale. But indeed from that mixture only a ſoft taſte like milk or broth of fleſh, pleaſingly ſoft, but not ſweet like hony ſhould ariſe, yea but to this which is not only grateful but in a manner pricking, Saline ſpiculas or little ſtingings together with ſulphureous ſweetnings (as I have elſe where ſhewed) ought to concur. Wherefore as we have ſhewed Sugar and Hony to be made ſweet deſervedly by the concretions of ſaline Sulphurs, ſo it may be ſuſpected of the Urine in the *Diabetes*, that with the ſalts combined in the *Serum* ſulphureous Particles picked forth of the Colliquation of the ſolid parts, do grow together.

The honied taſte is not from the nutritious juice, but from the combinations of Salts with Sulphur.

As to the fore-knowledge, this Diſeaſe at firſt is often eaſily cured, but being confirmed moſt rarely or with difficulty. For as much as the diſpoſition of the Blood being but a little laxed, is reduced without great trouble, but that being very much looſed ſo that very many parts ſeparate the one from the other, it ſcarce or never can be reſtored.

Prognoſticks of the Diſeaſe.

As to what belongs to the Cure, it ſeems a moſt hard thing in this Diſeaſe to draw true propoſitions of curing, for that its cauſe lies ſo deeply hid, and hath its origine ſo deep and remote. For, what is commonly thought, that the Reins, and the other ſolid parts, containing or tranſmitting the *Serum* and the Blood are in the fault, becauſe that they ſend away too haſtily their contents, and for that cauſe aſtringing Medicines are chiefly and altogether to be inſiſted on: I ſay both reaſon and experience doth contradict both this *Hypotheſis* and practice, for that few or none are cured by this Method: and it is highly improbable (if I may not ſay impoſſible) for that *Diureſis* to proceed from ſuch a cauſe.

Three Indications of the curing Part.

Therefore in this Diſeaſe as in moſt others there are three chief therapeutick Indications. *viz.* Curatory, Preſervatory, and Vital. The firſt of thoſe reſpecting the Diſeaſe, and endeavouring to reſtrain the exceſſive *Diureſis* or urina-

Part I.

ry evacuation, cannot be done without the Second, which aiming at the cauſe of the Diſeaſe endeavors to preſerve, and to reſtore, the mixture of the Blood or its due Complexion. Wherefore the chief Intentions of healing as to the medicinal Cure of this Diſeaſe are to take care there be no fuſion of the Blood, and if any be made to take it away. In the Firſt place the fuſion of the Blood is inhibited whilſt that its more craſs parts, and watry do continue themſelves, and are contained together, neither the one go away from the other ſo continually and very haſtily; which indeed is effected by thickning Remedies commonly ſo called; whoſe viſcous and very glutinous bodies being admitted into the bloody Maſs do pertinaciouſly ſtick cloſe to its active Particles, and ſo ſeparate them one from another, and hinder them, leſt they ſhould be mutually combined among themſelves by an ariſen flood or with ſuffuſed ſaline Particles from another place. For this end Rice, white Starch, alſo Gums, and ſome Reſins are wont to be helpful in this Diſeaſe. In the ſecond place, that the fuſion of the Blood being already made, may be taken away, thoſe ſorts of Remedies have been made known which diſſolve the concretions of the Salts, ſo that all the implanted elementary Particles, being at laſt made of their own kind, may recover their former State, and ſo make whole again the ancient complexion or *Craſis* of the Blood. Of this ſort are ſuch as have an effect on coagulated Milk, fixed, volatile, and nitrous Salts, alſo ſpirits of Harts horn, of *Sal* Armoniack and ſuch like, as we have ſhew'd before. The reaſon of which is (as we have in the ſame place intimated) that whilſt the ſaline, fixed, volatile or nitrous Particles, being in a ſufficient quantity put into the Milk, do meet with the acid or precipitatory Particles, and are combined with them, the remaining ſaline Particles which are bound, being now freed and diffuſed thorow the Maſs of the Liquor do diſſociate the ſulphureous terreſtrial combined among themſelves, and diſperſe them on every ſide, becauſe that all the Particles being equally mixed again, they might mutually contain themſelves, and be contained. So alſo by theſe the anology of the Blood is altered by reaſon of the ſaline Stag maspowred thereto being warm, we have there ſhewn by received experiments. But yet for curing the *Diabetes*, becauſe that ſaline Medicaments are for the moſt part eſteemed to be always Diuretick, we muſt not eaſily or raſhly give them, although in the mean time, as neither reaſon ſo neither experience is contrary to this Method. For I have often preſcribed in this Diſeaſe the tincture of Antimony with good ſucceſs, alſo a water of a ſolution of quick Lime with ſhavings of Saſſaphras, Anis ſeeds, Raiſins and Liquoriſh, according to the vulgar Receipt, is very much commended by ſome.

The chief Intentions of healing.

To hinder the fuſion of the Blood.

2. To take it away being made.

which is probable to be effected by Salines of a divers Nature.

An Hiſtory.

A certain noble Earl, noble both by the ſplendor of his Birth, and for thoſe known excellencies of his mind, of a ſanguineous temper, of a freſh Countenance, and in the ſtrength of his Age, it being uncertain by what cauſes became too prone to a *Diureſis*; and ſo as for many months, he was wont to ſuffer oftentimes a *Profluvium* or flux of Urine, at length (as it ſeems) he fell into a confirmed, and deplorable *Diabetes*. For beſides that in the ſpace of a day and a night, he voyded almoſt a gallon and half of limpid Urine, wonderfully ſweet, and as it were honied, he was alſo affected with an huge thirſt, and a Fevour as it were hectick, with great languor of the Spirits, the failing of Strength, and Conſumption of the whole Body. When at this time I was ſent for to conſult with the famous Phyſitians Doctor *Micklethwait* and Doctor *Witherly*, theſe following remedies (by the uſe of which he was ſeen ſhortly to grow well) were preſcribed.

Example of the Cure.

Take the tops of the Cypreſs tree Mviij, of the whites of Egs beaten ij, of Cinamon ʒß, being cut ſmall pour them into new Milk ℔viij, diſtill it with ordinary Stills, taking care it taſte not of the fire: Let him take ʒvj, thrice in a day.

Take Gum Arabick and Gum Tragacanth of each ʒvj, of penid. Sugar ʒj, make a powder. Let him take about ʒj or ʒjß, twice in a day with the diſtilled Water ʒiij or ʒiiij.

Take of powder of Rhubarb 15 *gr*: of Cinamon vj *gr*: make a powder to be taken n the morning repeating it in ſix or ſeven days.

Take of Couſlip water ʒiij, of Cinamon Barly water ʒij, Syrup of *Diacodium* ʒß, make a draught to be taken every evening.

His Diet was only of Milk which he took now crude, and diluted with diſtilled water or elſe with Barly water, ſometimes boiled with white Bread, or with Barly oftentimes in a day. When by the uſe of theſe he grew better every day,

within

within a months time he ſeemed to be quite well: When he began to be indifferent well, the inſipid Urine was not much more than the quantity of the liquids that he took, and then it was ſomething ſaltiſh, and leſs than what he drank: Then after a little while growing ſtrong, with his wonted order of Spirits, he returned to his former Diet. Part I.

But yet the diſpoſition to this Diſeaſe did not ſo thorowly ceaſe, but that afterwards being apt to relapſe by frequent fits, by reaſon of any diſorders of living, and perhaps by reaſon of changes about the times of the year; he at firſt made his Water more plentifully, and then limpid and ſweet, with a feveriſh thirſt and languiſhing of Spirits: But by the uſe of the ſame Medicines it was wont to go away again in a ſhort time. Not long ſince after a long interval of health, a little before he began to fall into a flux of Urine, he ſuffered great enormities and defects in the nervous Stock; *viz.* a numneſs or torpor and vertigo in the Brain, ſudden Convulſions in the Members, little leaping of the tendons, and felt various runnings about as it were of a wind creeping here and there: Then when by the uſe of fit remedies, the aforeſaid ſymptoms ſeemed to be cured; the *Diabetes* after its wonted manner (the matter flowing forth of the Fibers and ſolid parts into the Blood, and from thence to the Reins and urinary paſſages) returned afreſh. *A Relapſe of the ſame diſeaſe.*

At this time the aforeſaid Phyſicians being called to Council, they adviſed the ſame method, and almoſt the ſame Remedies as had been formerly uſed, by the uſe of which when within a few days he began to find himſelf better; it was thought good to be preſcribed for him, water of quick Lime to be taken thrice a day about ℥v or ℥vj: By which Remedy having uſed it four days, he made his water in a moderate quantity, well tinged and coloured and ſomewhat ſalt, and as to the reſt, he ſeemed almoſt whole, as he had been in times paſt.

Chap. IV.

The Kinds and Forms of Iſchuretical Medicines, or ſuch as help to ſtop the Urine in Exceſs.

Astringent Medicines properly called, to wit, Auſtere, Bitter and Styptick, which by corrugating the Fibres of the *Viſcera*, and by contracting them into a ſhorter ſpace, do ſtop their expulſive and excretory Force, and for that cauſe do hinder an exceſſive *Catharſis* upwards and downwards, although they are wont vulgarly to be preſcribed, do effect little or nothing to the reſtraining the *Diureſis*, becauſe the vertue of theſe hath no power upon the bloody Maſs, and doth not reach to the Reins and Bladder. Wherefore in the *Diabetes* it is in vain, that the Barks and Flowers of Granates, Medlers, Tormentil Roots, and the like are preſcribed; as Reaſon tells us, ſo Experience confirms this to us. But the Remedies which are taken to help chiefly in the *Diabetes*, and do exactly quadrate with our *Hypotheſis*, as we have before hinted, are of a double kind, *viz.* the firſt which do hinder the combinations of the Salts, and conſequently the fuſion of the Blood, of which ſort are thoſe which are ſaid to be thickners, and have viſcous and glutinous Particles, which being admitted into the maſs of Blood, do pertinaciouſly adhere to its active Particles and diſſociate them, and do hinder that they may not be combined mutually among themſelves, nor with ſaline Particles poured forth from another place. Secondly, which diſſolve the accretions of the Salts, that they may reſtore the mixtion of the Blood, of which ſort are the Salts of another nature, that are apt to cohere to the acid Salt, and to draw away *Aſtringents do not help in the* Diabetes; *Three chief Intentions of Curing.*

Part I.

away that from the combinations ſo begun in the Blood, as chiefly thoſe Medicines endued with a fixed, as alſo with a volatile and alchaliſate Salt. Beſides theſe two chief kinds of Iſchureticks, there remains another ſecondary, *viz.* Hypnotick, or cauſing reſt; which by putting a ſtop or ſtay to the animal œconomy, makes the vital *Regimen* or Governance to be much more quietly performed, and for that reaſon with a leſſer fuſion of the Blood, or precipitation of the ſerous and nutritious humour. It reſts now that we add ſome ſelect Forms of every kind of theſe Medicines.

1. The thickning of the Blood.

1. The firſt ſcope of curing by which we endeavour by thickning the Blood, to take away its fuſion or to hinder it, is performed by theſe following.

Powders.

Take of Gum Arabick, Tragacanth powdered, of each ʒj, of Sugar'd Pellets ʒß, make a Powder and divide it into ſixteen parts: Take one part thrice a day, diſſolving it in diſtilled water, or in a decoction of the Roots of Comphry, in Spring Water, or Milk.

Electuary.

Take of reſumtive Electuary ʒiij, of the ſpecies of Diatragacanth frigid ʒj, of Red Coral broken ʒij, Confection *de Hyacint.* ʒjß, gelly of Vipers Fleſh what will ſuffice: Make an Electuary, of which take three times a day the quantity of a Walnut.

Take of white Amber, Maſtick, and *Olibanum* powdered, of each ʒj, the powder of *Haly* ʒij, of Balſom of *Tolu* ʒß: Make a ſubtle Powder, the Doſe ʒß three or four times in a day.

Decoction.

Take of the Roots of the greateſt Comfry, of water Lillies, of each ʒiij, of ſliced Dates ʒij, of the ſeeds of Mallows, of ſilk Worms, Plantane, and Flea-wort, of each ʒß, boyl them in Spring Water ℔iiij, till half be conſumed: Add to the ſtraining of the Syrup of water Lillies ʒij: The Doſe is ʒiiij thrice a day.

Emulſion.

Take of the decoction of Barly with water Lilly Roots ℔jß, of ſweet Almonds bruiſed ʒjß, of the ſeeds of white Poppy, of Purſlain, of Lettice, of each ʒß: Make an Emulſion according to Art. The Doſe ʒiiij thrice a day.

A diſtilled water.

Take of the tops of Cypreſs Mvj, of the leaves of Clary Miiij, of the Flowers of blind Nettles, Comfry, and water Lillies, of each Miiij, of the Roots of water Lillies, and Comfry, of each ℔ß, of Mace ʒj: All of them being cut ſmall, put them into new Milk ℔viij, diſtil them with an ordinary Still. The Doſe ʒiiij thrice in a day, with the Powder or the Electucry above preſcribed.

2. The reduction or fixing of the Blood.

In the ſecond place, Although ſaline Medicines of every kind are accounted Diuretick, and every one of them in ſome Caſes, for as much as they fuſe the Blood, and make its ſeroſities to go away more copiouſly, they are in a meaſure Diuretick: Wherefore the uſe of them may be well ſuſpected in the *Diabetes*, yet for the reaſon above cited, to wit, that by meeting with the acid Salt (when it predominates in the Blood) they take away and hinder its fuſion and deliqueſcency. I do not at all doubt but they may be adminiſtred ſometimes with ſucceſs, for the curing of the Fluxes of the Urine; and as ſoon as an opportunity ſhall be given, I have reſolved to find out the truth of this, by cautiouſly trying it: And indeed it appears, that this may be ſafely enough experimented; becauſe I have heard for certain, that one labouring with the *Diabetes*, was cured by an infuſion of quick Lime. But for that the ſaline Medicines, (which take away the dominion of the acid Salt, and as we ſuppoſe, bind it, as it were, with Chains) are endued with either a fixed, or a volatile, or an Alchaliſate Salt, I will recite ſome forms of Iſchureticks, in which each of theſe are the *Baſis*.

1. Medicines endued with a fixed Salt.

In the firſt place therefore, when the fixed Salt by it ſelf, or joyned with Sulphur, is required for the ground.

Tinctures.

Take of the Tincture of the ſalt of Tartar, or of its *deliquium*, what will ſuffice, let it be given in a little draught of ſome decoction or diſtilled water, but now deſcribed, thrice in a day.

Take

Take of the Tincture of Antimony, let it be taken after the same manner thrice in a day, the use of this I have by frequent experience learned to be very profitable in this Disease. Part I.

Take of salt of Coral ℈j, let it be taken after the same manner.

Take of the infusion of quick Lime ℔j, the Dose ʒiiij or ʒiij thrice in a day, taking before a dose of the Electuary or Powder above prescribed. *Electuary.*

Take of Conserves of the Flowers of blind Nettles, and of the greater Comfry ʒiiij, of the reddest *Crocus* of Steel ʒß, of Coral calcined to a whiteness ʒij, Syrup of Comfry what will suffice to make an Electuary. The Dose ʒij thrice in a day.

Take of *lapis specularis* calcined ʒj, the dose ʒß to ʒj, twice or thrice in a day. Countrymen with this Medicine happily cure their Cattle that make a bloody water. *Powder.*

Take of Coral calcined white and powdered ʒiij, powder of Gum Arabick, Tragacanth, of each ʒj, make a Powder, divide it into ten parts: Take one three times a day in a convenient Vehicle, to wit, boyled or distilled water.

Take of *Crocus Martis* the reddest ʒvj, of Gum *lac* powdered ʒß, red Sanders ʒj. Make a Powder, divide it into twenty parts, of which take one three times a day.

Take of Harts Horn burnt and powdered ʒß, let it be boyled in water of the Smiths Forge ℔iiij till half be consumed, adding towards the end a Crust of Bread, of the Roots of the greater Comfry, of water Lillies dryed, of each ʒjß, to the straining add of Sugar, Lozenges perled ʒij, take of it ʒiiij thrice a day. *Decoction.*

2. Medicines endued with an Alchalisate Salt, of which sort are Corals, Pearls, Cuttle Bone, Harts Horn, Ivory, powders of Shells, and such like, as they are commonly used against Rheumatick Diseases, so also for the *Diabetes:* And indeed according to our *Hypothesis*, for as much as they receive the acid Salt abounding in the Blood, and for that reason preserve the bloody Mass from fusion, a benefit is oftentimes not vainly expected from them. *2. Remedies endued with Alchalisate Salt.*

Take of the reddest Coral made very thin, of Cutttle Bone, of each ʒß, of Harts Horn philosophically calcined ʒiij, of Pearls, of Ivory, of Crabs Eyes, of each ʒj, mingle them and make a Powder: The dose ʒß, thrice in a day in a fit Vehicle. *Powder.*

Take of the same Powder ʒiij, of the Species of Diatragacanth frigid ʒij, of Sugar-Candy ʒij, make a Powder with what will suffice of the solution of Gum Arabick, make a paste: Let it be made into Troches weighing ʒß, take iij or iiij thrice or oftner in a day. *Electuary.*

Take of the same Powder ʒij, of Electuary resumptive ʒiiij, conserves of flowers of water Lillies ʒiij, of the same Syrup what will suffice: Make an Electuary, take thereof the quantity of a Chesnut thrice in a day, drinking after it a draught of the Apozem, or distilled Water above prescribed.

3. For the same Reason that Medicines endued with a fixed and alchalisate Salt, so also those with a volatile, seem convenient for the curing the *Diabetes*: For these as well as they receive the acid Salt (by which the Blood is fused and melted into serosity) and draw it off, so that its liquor might recover its due complexion. *3. Remedies endued with a volatile Salt.*

Take of Tincture *solar* with *sal* Armoniack, (as I was wont easily) prepared ʒj: The dose is twenty drops thrice in a day. Spirits of Blood, of Soot, of Harts Horn also may be tryed in this disease. *A Tincture.*

Take of Salt of Amber ʒj, of the reddest *Crocus Martis* ʒij, mingle them and divide it into twelve parts: The dose is one part three times in a day. *Powder.*

What belongs to the third kind of Remedies in the *Diabetes*, *viz.* Hypnotick, which by stopping the animal Spirits retard the course of the Blood, and so hinder something its effervescency and fusion: I am wont *Hypnotick.*

to

Part I.

to preſcribe to ſome to take every Evening *Diacodium*, and if that does not do, liquid *Laudanum*, or quinced or tartariſated, and to give it ſucceſsfully now every night, now every other night.

Take of the decoction of Barly, with the dryed Roots of Comfry ℥ß ℥vj, of the Seeds of white Poppy ʒij, of ſweet Almonds blanched number vj: Make an Emulſion according to Art, to be taken every Night going to Sleep.

Take of the magiſterial diſtilled Water above preſcribed ℥iij, of the ſolution of Tragacanth ʒij, of *Diacodium* ℥ß to ʒvj, to be taken going to Sleep.

Take of the conſerve of water Lilly flowers ʒij, of tartariſated or quinced *Laudanum* ϑj, of the Tincture of Steel, drops vj: Make a *Bolus* to be taken going to Sleep.

Sect.

SECT. V.

CHAP. I.

Of Sweating and Hydrotick Medicines, or Evacuating by Sweat.

THe Aliments for the nouriſhing of the Bodies of Animals, are taken in at one paſſage only, to wit, by the Mouth: But Nature provident enough, hath formed a manifold going forth or many ways of Evacuation, whereby the ſuperfluities of the nouriſhing matter, or all the incongruous Particles either taken from ſome other place, or begotten within, might be caſt forth adoors: Whatſoever of Food there is occaſion for, it ought to enter always in at the ſame door, for that it might be ſufficiently known and examined, for poyſons would eaſily creep in through more, or poſtern doors opening inwards together with the Aliments; that if any hoſtile matter for all the watch of this ſingle door ſhould enter in, or ſhould be begotten by the fault of an internal governance, this might be able to lye hid in no lurking place or corner, but that there might be in the ſame place doors opened for its excluſion: For if any Heterogeneous thing ſhould ſubſiſt in the firſt paſſages, it is purged forth by vomit or purging; if that going farther it ſhould mingle it ſelf with the Blood or nervous Juice, or ſtick cloſe to the ſolid parts, by and by it is caſt forth by tranſpiration and ſweat, or elſe by Urine. But if that Nature for that it is ſlothful, or hindred, cannot either quickly or ſufficiently ſend forth of its own accord, the extraneous matters by theſe paſſages, Medicine muſt ſupply with convenient Remedies, whereby every defect or fault about the manner and ways of Excretions may be helped. Therefore as we reaſoning of Vomiting, Purging, and Evacuation by Urine, have more largely ſhewed already, what ſort of Medicines deſtinated to thoſe ends do produce their operations on the affections both of the Humours, of the Spirits, and of the *Viſcera*; ſo now there remains in this place to be unfolded by what way and by what Medicines, a more plentiful *Diaphoreſis* (or evacuation by ſweat) or ſweating, if at any time needful, is wont to be provoked. That theſe may be the better known, it is behooful in the firſt place to declare what the matter of Sweat is, and its formal reaſon, and in what, and by how many ways plentiful ſweating very often happens without evacuation, by reaſon of external accidents, or by an inteſtine Orgaſm of humors or ſpirits.

One only way of Ingeſtion, many of Egeſtion lye open.

The reaſon of this is hinted.

How Medicine helps its defects by Evacuation, by Sweat, and likewiſe by other Excretions.

In the *Diaphoreſis* or evacuation by Sweat contrary to Purging, the motion of excretion tends from the firſt paſſages, and as it were from the moſt inward Center of the Body to the Circumference: In both theſe the Arteries do carry more to the places of Evacuation, than the Veins do carry back; at other times the Veins do render back from the places which are oppoſite to them, more than the Arteries do force away. In purging, a greater load is impoſed to be carried by the ſplanchnical Arteries, together with the Veins reſpecting the habit of the body: But it is quite contrary in evacuation by Sweat, becauſe in this whilſt the Arteries do convey more than ordinary towards the circuit of the Body, the Meſaraick Veins do carry away a greater proviſion from the *Viſcera* of concoction, than the Arteries do bring thither. In like manner in the other evacuation, whilſt the ſplanchnick Arteries do pour forth into the *Viſcera* more than is due, the extrinſick Veins carry back more from the habit of the Body, than the Arteries carry thither. Wherefore as either evacuation is procured by many ways, ſo alſo this way not the leaſt, *viz.* whilſt the Arteries reſpecting either the *Viſcera* or the habit of the Body are urged into more rapid motions, a greater load of humours is preſſed into the Veins

How Evacuation by Sweat differs from Purging.

Part I.

which are of an oppoſite power. By what means Diaphoreticks do perform both theſe intentions ſhall be declared anon: In the mean time, we will take notice about the *Diaphoreſis* in its kind, that ſweating in reſpect of the ordinary perſpiration is eſteemed even as a *Diarrhœa* to the natural emptying of the Belly, to wit, that is only a quicker, and more intenſe tranſpiration. For as often as the Blood growing more hot than ordinary and as it were flaming forth, emits more copiouſly its hot *Effluvias*, theſe carrying with them many Particles of the *Serum*, make Sweat.

The matter of Sweat is either Elementary or Humoral.

The matter of ſweat may be called either elementary or humoral; as to the firſt, this in like manner as urine conſiſts of Spirit, Salt, and Sulphur moderate, of more copious *Serum* and a very little of Earth. That it is ſo, is eaſily gathered from the expence of the Spirits in ſweating, the watry ſubſtance, ſalt taſte, unctuoſity and feculency of this Excrement: For indeed whilſt the Blood for the prolonging the Life of living Creatures is continually enkindled in the Lungs, and from thence flaming forth is conveyed from the Heart by the Arteries into all parts, certain ſubtil, to wit, ſpirituous and ſulphury Particles, being moſt fit to fly away, do copiouſly proceed from its enkindled and rarefied Liquor; which flowing forth thorow the Pores of the Body, ſnatch with them forth adoors very many little bodies of the *Serum*, and ſomewhat of the reſt alſo. If that theſe kind of *Effluvias* be few, they fly away leiſurely, and exhaling moderately, they vaniſh away almoſt undiſcernable, but if theſe *Effluvias* being more heaped up do break forth thickly, whilſt they can ſcarce pierce thorow the pores of the Skin, they are condenſed into water, even as in like manner vapours being ſent forth from boyling water, make wet the cover of the Pot that lies over them.

1. *What the Particles of the former are.*

2. *Of what the latter conſiſts.*

The ordinary humoral matter of the ſweat is ſcarce any thing elſe but the *Serum* of the Blood, to which ſometimes are joyned, if indeed that excretion be inordinate, portions of the nutritious and nervous Liquor, and other humours from the *Viſcera*, *Glandulas*, and lymphick Veſſels, being forced away, yea farciments or meltings of the ſolid Parts: But this, whatſoever it be, is chiefly caſt forth from the Arteries, although we cannot deny that ſomething beſides doth ſweat forth alſo from the Nerves; moreover ſomething of Humour is attenuated into vapour by the force of heat, from the Fibres and ſolid Parts, which growes again into dew about the Skin. But indeed it is the Blood it ſelf only, which by its heat makes every humour evaporate, and emits the cheifeſt part of what it ſweats forth from its own boſom.

Three things required to ſweating.

That ſweat may copiouſly and eaſily break forth, theſe three things are required, *viz.* That the blood growing more hot then ordinary be more rapidly circulated, Secondly, that its *latex* or water, with very many watry Particles, and thoſe ſoluted, that is, to be ſeparated from the remaining Liquor, and apt to be reſolved into vapour, may abundantly flow over. Thirdly and laſtly, that the Pores of the whole Body may be ſufficiently unlocked and lying open.

The firſt condition is that the blood may be more rapidly circulated.

1. The reaſon of the firſt condition ſeems manifeſt enough, for unleſs the blood being rapidly circulated, is carried in ſo great plenty through the Arteries, that the reſidue cannot be all received in its reduction by the venoſe Artery, by the lymphick Veſſels or inſenſibly exhaled by perſpiration, there would be nothing ſuperfluous, that might iſſue forth by ſweat: for this *Latex* or water is out of the ſuperfluous or rejected matter of thoſe Pipes. But the Blood for the ſtirring up the more plentiful ſweat is circulated more rapidly, for as much as it is driven about with a great force by reaſon of the more often and more vehement *Syſtoles* or Pulſes of the heart. Of the effect of which as there are many evident cauſes, they may all of them or at leaſt the chief of them be reduced to the two following kinds.

which depends partly on the blood, and partly on the animal Spirits.

The efficient cauſe both for actuating and alſo variouſly altering the motion of the Heart, are the animal Spirits flowing from the Cerebell or little Brain; but the final cauſe is the circulation of the Blood: for, as its primitive motion is inſtituted for its ſake, ſo accordingly as the blood ought to be circulated by reaſon of many occaſions, either quicker, or ſlower, vehemently, or leiſurely, or after other ways, for that end alſo the Beating or Pulſe of the heart is diverſly varied. How often ſoever therefore it is ſo intended that it might ſtir up ſweat, it comes to be ſo done either by the neceſſity or need of the Blood, or by the Inſtigation of the animal Spirits.

How this Cauſe is from the bloods part.

Whenſoever the Blood growes more hot than it ought or is enkindled, leſt it ſhould be choaked within the boſom of the Heart, it ought to be turned about more ra-

Part 1.

rapidouſly. But of ſuch an efferveſcency or enkindling there are too many cauſes, and pretexts. For ſometimes the Blood being too much carried forth by its proper Sulphur, after the manner of Vines, ſwells up of its own accord. Further that, from hot things taken in at the mouth, by reaſon of an ambient or outward heat, a more quick motion of the Body, the ſhutting up of the Pores, and many occaſions being heated or agitated above meaſure, and more than uſually inkindled, requires to be ſo circumagitated or turned about, for that ſweating might follow.

And how from the part of the animal Spirits.

2. Sometimes the Blood being quiet of it ſelf is moved into an hydrotick efferveſcency, by the Inſtigation of the animal Spirits. For indeed in acute griefs, violent paſſions, in great impediments of the natural and vital functions, in the Agony it ſelf of Death, and in other faintings or affections of the Spirits, when the health of the body is greatly in danger, the ſenſitive Soul, that it might conſerve the vital flame of the Blood from expiring, inſtigates the Heart into a moſt rapid motion, whereby, whilſt the Blood is driven about more impetuouſly, for the moſt part alſo ſweat is ſtirred up.

2. *Of the* Ephidroſis.

The ſecond Condition is that the joyntings of the blood be laxed and looſned.

The ſecond thing requiſite for the ſtirring up of ſweat is, that whilſt the Blood growes exceeding hot, or is inflamed more than its wont, and emits plentiful *Effluvias*, its *Latex* or water in the ſerous humour which is apt to go away and to be exhaled from its remaining Maſs, abundantly overflowes; for otherwiſe a dry evaporation alone as from boyled oyl, alſo urged by a fevouriſh or any other intenſe heat breaks forth, and no ſweat. Thoſe whoſe blood is full of *Serum*, and have it ſomewhat ſoluted and lax, upon very light occaſions fall into ſweating. But if that the *Serum* be deficient, or be too much compacted by the Blood, or being very much thickned by reaſon of incocted feculencies, it is not eaſily ſeparated; and if the burning heat of a continual burning fevour doth trouble one, and that moſt ſtrong Diaphoreticks be adminiſtred, ſcarce any ſweat at all follows.

3. *The third Condition of ſweating that the Pores be open enough.*

Thirdly, it is required for the right procuring of ſweating that whilſt the Blood grows hot, and is ſufficiently moiſtned by a watry and eaſily ſeparable humour, the Pores alſo of the skin ſhould be unlocked and lye open; for unleſs the Body be perſpirable, it will be in vain to endeavour a *Diaphoreſis* or ſweating. Some have ſo very thick skins and almoſt not to be pierced thorow, that if helpt too by winter cold, thou mayeſt oftentimes wring out water ſooner from a Pumice Stone than out of their hides.

The cauſes of too much ſweating are hinted.

So much for the chief things neceſſary for the ſtirring up of the *Ephidroſis* or ſweating, which for that ſometimes they may be in ſome part defective, may be the cauſe that ſweat hardly or not at all ſucceeds, ſo ſometimes by reaſon of the exceſs of theſe, or ſome other irregularities about the humours or habit of the Body, too often and too plentiful ſweating is wont to infeſt ſome; ſo much that the nutritious Juice is no ſooner conveyed to the Blood, but the whole preſently, with the ſerous water ſweating out at the Pores of the skin, is ſpent in moiſture. If we ſhall inquire into the Reaſons of this, theſe three do chiefly occur, in ſome of which or in all together they ſeem to conſiſt.

1. *The firſt of which is Dyſcraſy or debility or a more ſparing inkindling of the Blood.*

1. A too great propenſion therefore to ſweating ariſes, becauſe the Blood is vitiated in its *Craſis*, and being made weaker doth not aſſimilate the nutritious Juice which it receives from the Chyle; wherefore, as a Stomach of a broken and unſound tone, it is compelled to vomit forth the infuſed humour, as ſoon as it is filled with it. Hence it is that nocturnal ſweatings and very grievous do ſo very much follow in continual Fevours; for as much as in theſe the Maſs of the blood (like ſower milk, which being made hot over the fire, is fuſed of its own accord without the addition of any coagulating thing, and precipitated into ſeroſity) is of ſo looſe joynting, that it is upon every light occaſion looſned in the mixtion. To which it may happen that the blood being impoveriſhed is not fully inkindled, wherefore there is a neceſſity for it that the crude juices, that are but little waſted by efflagration, ſhould whilſt the blood is incited break forth more plentifully into ſweat.

2. *The Evacuation of the Serum by other wonted ways being prohibited.*

Secondly, It is not improbable that the too great propenſion to ſweat does in ſome meaſure proceed from this cauſe, *viz.* that either the Reins or the Lymphæducts do not every where ſufficiently perform their offices. For if by chance the ſuperfluous ſeroſities of the arterious blood are not ſent away by this or that way,

Part I.

way, there will be a neceſſity that they muſt be ſomewhere ſtored up, hinder the circulation of the blood, aud not ſeldom cauſe the Dropſy.

The third the openeſs of the Pores.

Thirdly, If at any time for the aforeſaid Reaſons the ſweating diſpoſition ſhall affect one, the ſame may be further increaſed, and more often and more copious ſweats may diſtill forth of the Pores of the skin, and paſſages ſhall be more open than ordinary; which kind of affection is ſometimes from nature, and ſometimes from ſome accident. I have known the Bodies of ſome to be ſo cribroſe or full of holes that they were not able to ſuffer the leaſt breath of air, who alſo by every more quick motion, or by the heat of the Sun, the fire, or of the Bed, would be forthwith diſſolved into moiſture.

The formal Reaſon and conjunct Cauſe of Sweat.

From theſe which are required to the full provoking of ἐφίδρωσιν or Sudation, and that too much cauſe it, thus laid down, it will be eaſie to gather, what both the formal Reaſon and conjunct Cauſe of ſweat may be; for either conſiſts in this, that the blood abounding in *Serum*, and lying ſomewhat looſned in its joynting, whilſt that by a more quick pulſe of the heart it is circulated more rapidouſly, and ſo more carried thorow the Arteries, than can be preſently the bloody part returned back by the Veins, and the ſerous part ſent away by the Reins and Lymphæducts; therefore there will be a neceſſity that whatſoever of the *Serum* is ſuperfluous imbued alſo with other Particles, muſt ſweat out thorow the ſuffiiently open pores of the skin.

Its more remote cauſes.

What belongs to the other cauſes, of ſweating, *viz.* Procatarctick and evident, they which are of the former kind reſpect either the Maſs of blood, ot the animal ſpirits. For theſe (as we have already hinted) being obnoxious to convulſive, and other irregular Affections, ſometimes either of their own accord or occaſionally fall into exploſive and inordinate motions; by which alſo the *Præcordia* being hugely agitated, they impetuouſly drive about the Blood, and cauſe it by that means to be looſned into ſweats. But truly the antecedent cauſe of ſpontaneous *Ephidroſis* or ſweating more often lies hid in the bloody Maſs: for if at any time heterogeneous Particles, and wholly incongruous, are heaped together to a fulneſs in its boſom, that, at length being burthened growes hot or works with an ariſen Flux, that, what is burthenſom together with the ſerous water might be ſeparated and caſt forth adoors by ſweat; which ſort of ſweat according to the eaſy, difficult, or impoſſible excretion of the offending matter is called either Critick (which is moreover more or leſs perfect) or Symptomatick. We have largely enough diſcourſed concerning theſe in our *Puretology*, ſo that there is no need to ſay any more of it here.

The evident cauſes of Sudation.

2. The evident cauſes of ſudation to wit, which very much provoke by themſelves a wonted *Ephidroſis* or Sudation without a *Procatarxis*, or medical Indication, as they are various, and divers, *viz.* things taken in at the mouth, or outwardly applyed, too great a commotion of the Mind, or Body with many others, it will be here convenient to note briefly the chief of them together with the diſtinct Reaſons of their affecting: By which rightly underſtood will be better known by what means and with what diverſity Medicines deſtinated to this buſineſs do move the *Diaphoreſis* with ſweat.

1. Agitation of the Body.

1. In the firſt place therefore, ſweat is wont to be provoked by a more quick motion of the Body, as may be well perceived in running, leaping, carrying of burthens, pulling or drawing and ſuch like. The reaſon of which is, becauſe the Muſcles of the Body being vehemently exerciſed, they preſs together the interpoſing Veſſels, and ſo thorowly agitate the Blood, and drive it too and fro ſtrongly; and as by this means the Veins are very much ſtrained, the Blood more eaſily ſlides forth, and creeps much more ſwiftly towards the heart thorow their Pipes being more and more opened; and ſo as it is more copiouſly laid up together within its right boſom, it oppreſſes it, or almoſt choaks it, and the Heart and Lungs, for the more rapid driving about of the blood do diligently labour by quicker and ſtronger endeavours: hence at length as that is more inkindled within the *Præcordia*, and by that means rarefied, and made looſe in its joynting, it exhales far more little bodies of heat, that is, of Spirit and Sulphur; which carrying forth adoors with them the ſeroſities (whilſt all the Veſſels do ſo ſwell up) unable to be reduced, cauſe ſweat. And as of the Body, ſo alſo the immoderate exerciſes of the Mind move ſweats.

To which are alſo added the paſſion of the Mind.

2. The

Part I.

2, The ambient heat as that of the Sun, Fire, a Bath, Hot houſe, or ſuch like, is apt to provoke ſweat; becauſe hot *Effluvias* being ſent from without into our Bodies, and entring ſomewhat into the skin, unlock both its Pores, and paſſages, and alſo make hot the Blood, and compel it as water over a fire to boyl up; and ſo as being looſned from its joynting together, and rarefied, the ſudorifick vapours more copiouſly are exhaled. Neither doth the meer extrinſick Heat move ſweat only, but alſo that proper heat being detained about the compaſs of the Body from whence it did exhale. For there is nothing more uſual than that any one lying in Bed, whilſt he is covered with many bed-cloaths ſhould fall into ſweat. The reaſon of which is clear enough, for the breathings forth already departed, and being reſtrained about the ſuperficies of the body hath the nature of a dry Bath. *2. Ambient heat.*

Sometimes the reſtraint of uſual tranſpiration cauſes Sweat; the reaſon of which is becauſe the Blood being prohibited from a more free breathing forth, as Muſt or new Wine being too ſtrait ſhut up in a Cask, more impetuouſly ferments; and thence being more rarefied and conſequently being agitated in a more rapid circuit, there is a neceſſity for it to be diſſolvid into ſweat. In times paſt it was a cuſtom among the Iriſh, if any one were ſick of a Fevour, to roll him up in woollen cloths wetted with cold water, by which means a plentiful ſweat ſucceeding the diſeaſe was often broken. The like experiment I have heard to be try'd with our Countrymen with good ſucceſs. *3. The hindrance of wonted tranſpiration.*

4. Hot aliments being taken, eſpecially Salt, Pepper, and candied Spices, alſo drinks of ſtrong Waters, ſtrong Beer, and generous Wines, for as much as they imbue either the Blood with active Particles or with provokatives, as it were a certain ſting or fury, or that they miniſter to it being very hot and burning, ſulphureous and inflamable nouriſhments, as it were oyl to a Lamp, they ſtir up a more plentiful *Diapneon* of halituous or breathy matter, and for that cauſe greater ſweatings forth of the abounding *Serum*. *4. Hot things taken inwardly.*

So much for the Nature of Sweat, and of both the conjunct and manifeſt cauſes. As to what belongs to its differences, it is wont to be diſtinguiſhed many ways, to wit, that it was ſpontaneous or forced, or partial or univerſal, or critick or ſymptomatick, the reaſons of all which are clearly enough made known by what hath been already ſaid. Moreover ſweat is either hot, of which we have diſcourſed hitherto, or cold in the Act, which ſort is frequently excited by a panick fear, a very acute grief, ſwooning, and in every ſudden failing of the Spirits, and the agony of Death. The cauſe of this ſeems to be, that from a huge and ſudden paſſion, the whole ſoul ſinking down contract its compaſs, and therefore the Spirits being ſcatter'd, and the Blood with the heat being drawn back towards the Heart, the outmoſt *Effluvias* paſſing forth thorow the skin being left by the following, and deſtitute of Heat, therefore they are condenſed into a cold Vapour, even as by the like Reaſon it is wont to happen in diſtilling. For if you ſuddenly repreſs or extinguiſh the fire, preſently the warm exhalation filling the Alembick is reſolved into a dew. *The differences of Sweat.* *The cauſes of cold Sweat.*

From theſe things thus premiſed and ſhown, which are chiefly requiſite to the provoking of Sweat, and by which occaſions chiefly, and ordinary accidents it is wont to be ſtirred up, it will not be difficult to ſhew with what powers and Particles Diaphoretick Medicines ought to be enricht, and by what means they produce their effects And firſt of all, as to what belong to their Properties or Virtues. Hydroticks or ſweating Medicines that are to be taken inwardly ought to be of that kind which may make the blood to be more hot than ordinary, and by conſequence to evaporate; alſo which may after a ſort unlock and fuſe its Maſs oftentimes too much compacted, and thickned, that from thence its ſeroſities may more eaſily be ſeparated and go away, and at the ſame time diſpoſe them ſo ſeparated, rather to be caſt forth by a *Diaphoreſis* or ſweating than by Urine or Siege. Theſe are the two primary requiſits or Indicancies to the *Ephidroſis*, by the right accompliſhing of which the Diaphoreticks of a various kind and energy are wont to be adminiſtred. As to what belongs to the three things requiſite (which we made mention of before) *viz.* the apertion of the Pores, this is effected for the moſt part only by external Applications, but yet by what means and after what manner it is wont to be done, ſhall be ſhewn hereafter. In the mean time that we may ſpeak of ſweating Medicines that are to be taken in at the mouth, it behoves us in the firſt place to ſhew by what general means thoſe do operate; then by what difference, *Of what ſort Diaphoretick Medicines ought to be.*

Part I.

difference, and particular manner of affecting, and lastly with what virtue every kind, to wit, those wholly mixed or of one of the elements, *viz.* of Spirit, Sulphur, or Salt, being insigned, do exercise their Power both in the *Viscera* and in the Humours about the provoking of Sweat.

The general reason of their Energy.

1. As to the first concerning Diaphoretick Medicines in general, we note them to be such whose Particles are friendly enough to the Ventricle and Intestines, and do not provoke to any convulsion or excretory motion; moreover that they are in no wise to be overcome by them or to be assimilated like to Aliments; but that being taken into the Stomach they forthwith dispose both the animal Spirits, and also the Blood to yeild to an *Ephidrosis* or sweating. But indeed some of them being immersed in the Ventricle, and dissolved, by and by they stir up, and recreate the animal Spirits every where abounding in the nervous Fibres (of which the interior Coat is made) for the end that the *Hypostasis* of the whole sensitive Soul being presently erected, and stretched forth into a greater compass, they might make the *Præcordia* to be more lively actuated, and so the blood being rarefied and more inkindled, to be carried about more rapidously, and so to be driven into a *Diaphoresis* or sweating. Further, in the mean time the Particles of the same Medicine do pour themselves into the blood which waters the stomachal Vessels (which most thickly cover the nervous Coat) and whilst that they by and by ferment it, and make it to grow hot, they compel it to be forced thorow the veins more rapidly than it is wont towards the *Præcordia*; to which when it is more impetuously brought, presently the Pulse of the heart being increased the whole Mass of blood rarefied, and more inkindled, and by the Particles of the Medicine most intimately mixed with it, agitated, it is carried along more quick thorow the Arteries to all the exterior parts; where when all its water is not able to be carried back, or received by the Veins or other leading Pipes, there is a very great necessity for much of the serous humour to be resolved into Sweat. But the Particles of the sweating Medicine, being admitted according to the aforesaid manner into the Blood, do not only ferment and agitate its Liquor, but oftentimes they so loosen, and unlock its mistion, that its *Serum* and other excrements may be more easily separated and sent away. But for as much as this may happen to be done by a divers means according both to the divers constitution of the blood, and the Nature or preparation of the Medicine; it will here be worth our while briefly to explicate the chief Indications about moving a *Diaphoresis* or sweating, and the various ways of prosecuting it, together with the Reasons of them. But it is further to be noted in the first place that Hydrotick or sweating Medicines as to their ways of working and operations, have a great affinity with most Cordials commonly so called, in so much that many things of either kind are of common use or reciprocal, and as they so differ chiefly as to their greater or lesser efficacy, as often as it is behoveful to pass from one kind to another, there is need almost only to augment or diminish the Dose, and chiefly to choose fit times for administring.

Sweating Medicines are neer a kin to most Cardiacks or Cordials.

The matters of sweating Medicines are either integral parts of the mixture.

As to what belongs therefore both to the various kind, and preparation of the matter out of which Hydrotick Medicines are taken; they are for the most part the whole parts or elementary of every mixture. To wit, they are either natural concretes in their whole substance, or simples, or extracts which are given, as when the Leaves, Roots, or Seeds of *Carduus*, *Contrayerva*, *Angelica*, or the like are taken in Powder, Decoction, Conserves, or Magistery: or Diaphoreticks that consist in Particles of this or that element, to wit, spirituous, sulphureous, or saline, or in simples, or any other very excellent things; as if that Salt, or Spirit, or Oyl, are drawn out of *Carduus* or any other vegetable body, mineral or animal, and are reduced either by themselves or with other prepared things into the form of a Medicine, we will briefly touch of all or at least the chief of these kinds.

Or Elementary.

1. Which are of the former kinds.

1. Diaphoreticks, whose virtue consists in the integral Particles of the whole Concrete, are inequally mixed, although they seem to excell in one certain element (*viz.* saline) more then in the rest of the Elements, and to own its virtue chiefly to it: But that salt, upon which the sweating force depends, offers it self in a double condition: For in some concretes it is volatile, and sharp or bitter, and in others Alchalisate, and as it were fixed.

1. In the first rank are very many vegetables, esteemed by the Ancients for Antidotes,

tidotes, as the leaves of *Scordium*, *Carduus*, Scabious Poyſon-reſiſter, the flowers of *Caltha*, Camomil, the Roots of Butter-bur, Zodoary, Galingal, *&c.* Alſo the confections of Mithridate, Treacle, *Diaſcordium*, alſo decoctions of *Guaicum*, Box, and ſuch like. The Medicines of which being put into the Ventricle and diſſolved, they make a Tincture, whoſe Particles ſeeing that they are more hot and exotick, do awaken the animal Spirits, from whence the *præcordia* being more lively actuated, drive about the Blood more rapidly. But alſo they go in and ferment the blood, abounding in the ſtomachal Veſſels, and ſo whilſt they make it to be carried back quicker towards the heart, they are alſo a Cauſe, that it is vehemently and ſweatingly driven forward through the Arteries into the habit of the Body. 2. The other ſpecies of Diaphoreticks, which whilſt they conſiſt of integral parts mixed, have a moſt excellent alchal Salt; are Stones, and bony and ſhelly parts of Animals and Vegetables, as *Bezoar*, Pearls, Eyes and Claws of Crabs, and ſuch like, whoſe Diaphoretick Virtue proceeds chiefly from the Alchal Salt; for as much as its Particles ſometimes meeting with an acid Salt, both in the *Viſcera* and alſo in the Blood, and growing hot or fermenting with it, by that means cauſe the ſanguinious Maſs to be fuſed, and its ſeroſities to be ſeparated, and reſolved into ſweat.

Part I.

By what means they operate.

2. Hydrotick Medicines, which after the ſpagyrick *Analyſis* owe their vertue, either to theſe or to thoſe elementary Particles, being formed from various ſubjects, and with a diverſe manner of preparation, are chiefly either ſpirituous or ſaline, or either combined one with the other, or with ſome ſulphureous Particles. For ſuch as are merely, or for the greateſt part ſulphureous, are leſs fit for this intention, becauſe ſuch being very infeſtous to the *Viſcera*, oftentimes provoke a nauſeouſneſs, and not ſeldom vomiting: Moreover ſuch as are Oily by reaſon of abundance of Sulphur and Fat, are not ſo ready to inſinuate their Particles into the maſs of Blood. We will make a ſpecial ſearch by what means or by what affection of the Spirits or Blood, theſe other do move ſweat.

2. Hydroticks whoſe Particles are elementary, of what ſort, and how many they are.

1. And in the firſt place to the ſpirituous ſubſtance we refer Hot Waters and Liquors endued with any vinous Spirit, of which ſort are abundance from the fruits of Vegetables, or from dry things maturated by fermentation, or reſolved by putrefaction, diſtilled by the chymical Art, as are the ſpirits of Wine, of Cyder, of Beer, of Juniper Berries, of Elder Berries, of black Cherries, with many others which are commonly called Spirits; and are taken either ſimple or limpid by themſelves, or impregnated by the infuſion of other ſimples, are diſtilled again or given under the form of a Tincture. Theſe kind of winy Liquors being taken inwardly, for as much as they both ſet up the animal Spirits and provoke them into a greater expanſion, (whereby in like manner the motion of the Heart is increaſed) and for as much as they agitate the Blood, and (as by the acceſs of Oyl to flame) cauſe it to be more inkindled; they move ſweat. For the ſame reaſon and means of affecting, whereby theſe are wont to be called Diaphoreticks, they may be alſo Cardiacks or Cordials, if they be given in a leſſer doſe.

1. Spirituous.

To the provoking of Sweat, prepared Salines of a various kind and diverſe condition, uſe to be preſcribed, and indeed with good ſucceſs; which notwithſtanding do not exagitate the blood, as Particles of the whole mixture, or merely ſpirituous, either by reaſon of their heterogeneity, or inkindle an inflammability, but only by forcing into its ſaline Particles, which whilſt they ſnatch them into their embraces, they pull them away from their too ſtrict combination with others, ſo that the joynting together of the Blood being laxed, and the Pulſe increaſed, the ſuperfluous ſeroſities and other excrements, may be more eaſily ſeparated and ſent away by ſweat. To this Cenſe or Rank (as in like manner we have ſhewed above to be in Diureticks, and as alſo will afterwards appear in Cardiacks) Salts almoſt of every condition ought to be referred, eſpecially volatile, fluid, fixed, and nitrous Salt, out of which ſingle or compounded among themſelves Diaphoreticks of the chiefeſt note are gathered, which being inwardly taken and meeting with other Salts both in the *Viſcera*, and alſo thoſe abounding in the maſs of Blood, and drawing them away from the embraces of other Particles, unlock the Blood and rarefie it, and ſo diſpoſe it to a *Diaphoreſis*. The chief kinds of theſe, and their manner of working, we will unfold anon; in the mean time notwithſtanding, as theſe ſaline Medicines which are wont to move to ſweats, are alſo given to move Urine, and ſometimes alſo for Cordials, it behoves us to ſhew by what preparation,

2. Salines.

By what means they operate.

In how manifold a condition their ſaline Particles are.

Part I.

preparation, and beſides with what requiſites, whilſt we give the ſame Medicines, we may be able to proſecute the *Diaphoreſis* apart from thoſe other Intentions.

With what preparation and manner of adminiſtration Diaphoreticks are to be given.

And indeed we take notice that ſudorificks inwardly taken, ſeldom or never operate of their own accord, as Emeticks, Catharticks, or Diureticks, but rather there is always need of a Rule to actuate the Medicine, and to determinate it to that energie: Wherefore a Diaphoretick being given, preſently the Patient is to be handled after that manner, that both the Pores of the Body may be opened, and that the Pulſe of the Heart may be much inforced. For theſe ends he is to be kept either in Bed, or a Bath, or in the heat of a hot-houſe, or elſe exerciſed with a more quick or hard motion of the Body, which that they may the better ſucceed in ſtirring up of Sweat, both the moſt fit time and ſubject, as often as it is in our power, is to be choſen; to wit, when the Blood has obtained a laudable *Criſis* or not very malignant, then when it abounds with much ſerous humour, and when as to its Particles it is not too much confuſed or diſturbed, but is apt to be eaſily unlocked, and to be ſeparated and fuſed into parts: For in a bilous Temperament in a lean and dry conſtitution, in the midſt of a burning Ague fit, when all things are diſturbed and indigeſted; oftentimes Diaphoreticks prove in vain or to ill purpoſe. Moreover, as often as they may ſeem to be of uſe, it is not convenient to give any of them indifferently, but the condition of the Salts, and alſo appropriated Medicines are to be choſen, according to the various condition of the Blood, and the diverſe manner of powers in it, now of this Element now of that. Concerning theſe with what choice, and in what kind of Forms they ought to be preſcribed, we will ſpeak in the following Section.

Both a fit ſubject and time to ſweat is to be choſen.

Chap. II.

The Kinds and Forms of Diaphoreticks, alſo the Reaſons of ſome of their Chymical Preparations.

The diſpoſing of Diaphoretical Medicines.

And Forms.

Sudorifick Medicines, for as much as they are manifold and divers, and to be ordained in a various reſpect, are wont to be reduced into Claſſes; therefore I think good firſt of all to diſtinguiſh and recenſe them here, both as to the Form or manner of Conſtitution, and as to the Matter out of which they are made. Their moſt uſual forms are 1. Powders, 2. Chymical Liquors, 3. Potions, 4. *Bolus*, 5. Diet Drinks. The matter of every one of theſe are either the integral parts of the whole mixture, or they are ſome elementary parts of ſome mixture reſolved or looſened by Chymiſtry, and they are either more ſimple, *viz.* either ſpirituous or ſaline, which latter again are either volatile or fixed, or alſo acetous or nitrous; or laſtly the ſudorifick Particles ſo divided and ſeparated by the Art of Chymiſtry, are Elementaries compounded among themſelves, *viz.* ſpirituous Salines, or ſaline Sulphurs. Whilſt we run through all theſe kinds in order, we will make ready for you the more ſelect forms of preſcriptions of every kind of matter.

1. which have for their baſis the integral parts of the mixture.

1. Diaphoreticks whoſe Baſes are the integral parts of the mixture, in which likewiſe a ſharp or volatile Salt is moſt potent, oftentimes help to the provoking of Sweat for this reaſon, for as much as their Particles being admitted into the Blood, as they are immiſcible and alſo indomitable or not to be overcome, they very much agitate and divide its Maſs, and as it were draw it into ſmall pieces, ſo that at length as the joynting together of the Blood being much laxed, and put into an effervescency or fermenting, together with the Particles of the Medicine,

to

to be caſt forth by reaſon of their heterogeneity, the ſuperfluous ſeroſities, and the recrements and Corruptions of the Blood are caſt forth adoors, what are of this Rank are wont to be exhibited in the form of Pouder, *Bolus*, Potion and Diet-Drink, according to the following Forms of Preſcriptions. Part I. *Their Forms.*

Take of the Powder of the Roots of *Contrayerva*, of Virginian Dragon Wort, of Butter-burr, of each ʒj, of Coccinel, of Saffron, of each ʒß, make a Pouder, the Doſe is ʒß, with ſome fit Vehicle. 1. *Pouders.*

Take of the Pouder of Vipers ʒj, let it be given in a convenient Liquor.

Take of the Pouder of Toads prepared from ʒß to ʒj.

When Diaphoreticks ought to excel in a ſingular Alchal Salt, or mixed with the former.

Take Oriental *Bezoar* ϑß to ʒß, let it be given in a ſpoonful of diſtilled Water or other Vehicle.

Take of Pouder of Claws Compounded ϑj to ʒß, let it be given after the ſame manner. The Bezoartick Pouder is made after this manner.

Take of the Powder of the Roots of *Contrayerva*, of Crabs Claws ſimple of each ℥ij, of Pearls, of both Corals, of the whiteſt Amber, of Crabs Eyes, of Harts Horn, of Cryſtal prepared of each ℥j, of the weſtern Bezoar, of Lemnian Earth of each ℥ß, of the Ceruſs of Antimony ℥ij, of Coccinel ℥ß, Ambergrieſe ʒiß, muſk ʒß, make a ſubtil Pouder, which may be formed into little round Pills with the gelly of the Skins of Vipers. The Doſe ϑj to ʒj.

Take of the Pouder of this Bezoart ϑj, of Toads prepared vj *gr.* make a Pouder, let it be given in a ſpoonful of Treacle Water.

2. Boles whoſe *Baſis* is the integral parts of the mixture are reduced into the form of a Confection, Extract, and Conſerve. 2. *Boluſes.*

Take of Mithridate ʒß to ʒj, of the Bezoartick Pouder ϑj to ʒß, of the Syrup of the Juice of Citrons what will ſuffice, make a *Bolus*; in the place of Mithridate may be put Treacle or *Diaſcordium* or Confection *Liberans* of *Hyacynt*: alſo *Bezoar* poudered or the Pouder of the Roots of *Contrayerva* or, others ſuch like may ſupply the place of the Bezoartick Pouder.

Take of the Extract of Treacle ʒß to ʒj, of Bezoartick Pouder ϑj, make a *Bolus*.

Take Extract of *Carduus* ʒß, of Bezoartick Pouder ϑj, Salt of Wormwood *gr.* xv, with what will ſuffice of the Syrup of the Juice of Citrons make a *Bolus*.

3. Ptoions whoſe *Baſes* are the common Decoctions or Infuſions and Tinctures of Vegetables. 3. *Potions.*

Take of the Roots of Butter-bur ℥j, of the ſeeds of the ſame ʒij, the roots of condite *Eringo* ʒvj, of *Carduus* Seeds ʒij, let them be boyled in Spring Water ℔j to ℔ß diſſolve in the Colature of Mithridate ʒß or ϑij, let it be taken warm in Bed. *Decoctions.*

After the like manner may be boyled the Leaves of *Carduus*, the Flowers of *Caltha* or of Cammomile in as much poſſet Liquor as will ſuffice, of which give ℥vj or viij hot, by it ſelf or with ſome Pouder, Confection or other Diaphoretick being added.

4. Various kinds of Diaphoretick Infuſions, and Tinctures may be prepared by Extracting the Virtues of ſimple Vegetables and of Confections with wine Vinegar or diſtilled Water, which being afterwards ſtrained, and clarified by ſetling, are given by themſelves or added to other Liquors oftentimes with ſucceſs. Hither ought to be referred Waters, Wines and Bezoartick Vinegars prepared by Infuſion, the forms of which are every where to be found among Authors. Moreover the Tincture of Vegetables very Efficacious in a little doſe are made after this manner. *Infuſions and Tinctures.*

Take of the Roots of *Contrayerva* ℔j, bruiſed and put into a Matrace, pour to them of the Spirit of Wine ℔iij, let them digeſt till the Tincture be drawn forth, which ſtrain, and let it be abſtracted in *Balneo* to the Conſiſtency of Hony. The firſt Spirit abſtracted keep by it ſelf from the reſt, pour more to the reſidence, and laſtly extract the Tincture whoſe Doſe is in a fit Vehicle from ʒß to ʒj. *Chymical Tinctures.*

Diet Drinks whoſe *Baſes* are the Decoctions of Liquors, deſigned for the cure of the Venereal Diſeaſe and of other Chronical Affections deeply rooted in the Blood and Humours. 5. *Diet-drinks.*

Part I.

For indeed a very intenſe and frequent ſudation, *viz.* for a long time, is ordinarily required for the cure of ſome Diſeaſes; *to wit*, that not only the impurities, and corruptions of the *Viſcera* and the Humours may be purged forth, but that the morbifick Tinctures deeply impreſſed in them might be wholly blotted out, and as it were extracted. For this end it will not be enough to give now and then a ſudorifick *Bolus*, but a whole Diet ought to be orderd for this purpoſe: wherefore let all the Drink be a Diaphoretick Decoction, after which Doſe taken alſo in the morning, let a plentiful ſweat be provoked further by the heat of a Bath or Stove. Then when as by this reaſon both the Pores of the Skin are unlocked, and that Nature alſo is inclined to ſweating, the whole day beſides by the uſe of the ſame Drink, the recrements of the Blood and nervous Juice ſhould evaporate by a continual breathing forth. By this method not only the Pox is moſt ſafely and for the moſt part certainly cured, but alſo other Herculean or difficult Diſeaſes are indeed happily healed.

Take of the ſhavings of *Lignum Sanctum* ℥iiij, of Sarſaparilla ℥vj, of China ℥ij, of all the Sanders of each ℥j, of ſhavings of Ivory and of Harts Horn of each ℥ß, of Antimony poudered and tyed up in a ragg ℥vj, let them be infuſed according to Art, and boyled in Spring Water ℔xvj till half be conſumed: then ſtrain it. To the remaining ingredients pour a like quantity of Water, make an infuſion, and a decoction to the conſummation of the third part, adding to it of Raiſins of the Sun ℔j, of Liquoriſh ℥j, ſtrain it, and let it be reſerved for the ordinarie Drink.

In a bilous Temperament, and a more ſharp and hot Blood, let the *Guaicum* be omitted, increaſing the Quantity of China and Sarſa.

Diaphoreticks eaſie to be got ready.

Diaphoreticks which conſiſt of the Integral parts of the whole mixture eaſily got for poor People are to be preſcribed according to the following forms.

In malignant Feavours take of conſerves of *Lujula* ℥j of Mithridate ℥iiß, mingle them, let it be taken drinking a draught of Poſſet Drink after it, with the Leaves of *Carduus* or of *Scordium*, or Cammomil, or Marigold Flowers boyled in it.

Take of the Pouder of the Roots of the Virginian Serpentary ℥ß to ℥j, let it be given in a fit Vehicle, or take of the Pouder of the Roots of Butter-bur ℥ after the ſame manner.

In ordinary Caſes let there be given of the decoction of Grummel or *Milium Solis* or of Butter-bur Roots or of Virginian Serpentary, or of the Roots and Seeds of the great Bur. In the Venereal Diſeaſe a decoction of Saponary or Sopewort or the ſhavings of Box and the like, which may ſerve inſtead of the Decoction of Woods of greater Price.

2. Forms of Chymical Diaphoreticks.

2. Sudorifick Medicines prepared out of the Elementary parts of the mixture have for their *Baſis* either a Spirit, or a Salt ſometimes ſimple, ſometimes combined with another Salt or with Sulphur. The ſpirituous are preſcribed according to theſe following Forms.

1. Which have for their ground ſpiritual Particles.

1 The Spirit of Treacle Camphorated ℥ß to ℥j or ℥iß, let it be given in a convenient Liquor. After the ſame manner many other Spirits ſtilled out of the Juices of Vegetables maturated by Fermentation and appropiated to certain Diſeaſes may be given to provoke Sweat when it is required. Of which ſort are the Spirits of black Cherries, of Elder Berries and of Juniper Berries with many others. The Spirits of Harts Horn, of Soot, of Blood and the like ought rather to be ranked in the Claſs of Salts.

2. Which have ſpiritual Particles combined with others.

2. Diaphoreticks, whoſe *Baſes* are Spirits with other combined Elementarie Particles, are preſcribed after this manner. Take of the ſimple mixture ℥j, let it be given in a convenient Vehicle. Hither are referred alſo what are of a Spirit with a fixed a Salt or Sulphur combined together. Of which ſort are the Tinctures of the Salt of Tartar and of Antimony, the Doſe of which is ℈j to ℈ij in ſome other Liquor. Moreover Diſtilled Waters, in which the ſpirituous Particles are allayed or mixed with the Waters are wont oftentimes to be given to move Sweat with good ſucceſs.

Diſtilled waters.

Take of the Roots of Butter-bur, of Valerian of each ℥ij, of Zedoary, *Contrayerva* Virgin. Serpentary of each ℥iß, of the Flowers of Butter-bur Miiij, of Saffron ℥ij being all cut and bruſed pour to them of ſpaniſh Wine ℔iiij, diſtil it according to Art, and let the whole Liquor be mixed. The Doſe ℥iiß to ℥iij,

or

or take of the Roots of *Angelica*, of *Imperatoria*, of each ʒiiij, of Zedoary, of Enula Campane, of Poyſon-reſiſter, of Gentian, of the leſſer Galingal of each ʒj, of the tops of *Carduus*, of Rue, of Angelica of each Miij, of the middle Bark of an Aſh ʒvj being cut and bruiſed, add to it of Mithridate, of Treacle *Andromach.* each ʒij, mingle them and pour upon them of the beſt wine ℔vj, of diſtilled Vinegar ℔ij, diſtill them according to art, the doſe is ʒiij. Part I.

The doſe of the aforeſaid Waters may be actuated by the addition of Chymical Liquors or Salts. Theſe ſort of Liquors indued with a wine Spirit, are cheifly and almoſt only convenient for old People, alſo for ſuch as are indued with a more cold temperament, as for thoſe that are obnoxious to the Palſie or the Dropſie; but in a hot Conſtitution, and when there is a heat of the *Viſcera* or a ſeavouriſh Effervescencie of the Blood, for as much as they torrefie, and enkindle it too much, they are wont rather to hinder than to help.

Diaphoreticks whoſe *Baſis* is ſaline, as they are of a various Nature *viz.* (according as the volatile fixed Acetous or Nitrous Salt exiſts) ſo they are of a divers uſe, and operation, hence it is that in ſome caſes theſe are better, and in others thoſe, or they are adminiſtred, as we have noted before to be in Diureticks. 2. *Whoſe* Baſis *is Saline.*

1. Fixed, and Volatile Salts are moſt convenient for thoſe whoſe Blood very much abounds in a Serous Humour. Moreover when at any time the Juice watering both the *Viſcera* and the Nervous ſtock turnes into a ſowerneſs, as it is wont to do in Dropſical and Cacochymical Perſons and in thoſe who are obnoxious to Convulſive Affections, thoſe Medicines are given to provoke the *Ephidroſis* or ſweating forth; for whilſt that they meet with the acid ſaline Particles of the Humours, and are combined with them, they unlock the joynting together of the Blood, and alſo by reaſon of an heterogeneous mixture agitate its Maſs; hence that the Seroſities may be more eaſily ſeparated, and brought outward thorow the Pores of the Skin, they are preſcribed in the form of a Pouder, *Bolus* and Liquor, 1. *Which are of a fixed or volatile Salt.*

Their Forms.

Take of the Flowers of Salt Armoniack ϑß, of mineral Cryſtal *gr.* xv, of Bezoartick Pouder ϑj, mingle them, and let it be given in a Spoonful of Sudorifick Water. 1. *Pouders.*

Take of the Salt of Tartar ϑj, of the Ceruſs of Antimony *gr.* 25, make a Pouder, let it be given after the ſame manner.

Take of the Pouder of Bezoartick mineral ϑj to ʒß, of Gaſcoins Pouder ϑj, make a Pouder, let it be given in like manner.

Take of the Ceruſs of Antimony ϑj to ʒß, of the Flowers of ſalt Armoniack ϑß, make a Pouder.

Theſe may be given in the form of a Bole by mixing the aforeſaid Doſes with Treacle, Mithridate or Diaſcordium or with the Extract of *Carduus*, Gentian, or the like. *Boles.*

Take of *Bezoarticum minerale* ϑj, of the Flowers of *Sal* Armoniack *gr.* vj, of Mithridate ʒß make a *Bolus.*

Take of the Salt of Harts Horn *gr.* viij, of Bezoartick Pouder *gr.* xv, of the extract of Treacle ϑj, make a *Bolus* or Pills iij.

3. If more convenient in a Liquid form. Take of the ſpirit of Harts Horn or of Soot or of ſalt Armoniack drops 15 to 20 in a little draught of Sudorifick Water from ʒiij to ʒiiij, let it be taken with governance, *Liquors.*

Take of *Sal* Armoniack Flowers ϑß, of the Salt of Tartar *gr.* 15 of ſudorifick Water ʒiij, mingle them and make a draught.

3 Diaphoreticks, which have for their *Baſis* nitrous Salt, are wont to help almoſt in the ſame Caſes or thoſe above made of fixed and volatile Salt; for as much as they deſtroy the Powers of the acid Salt, and ſo diſpoſe the miſtion of the Blood, that whilſt it ferments, its *Serum* and excrements may be more eaſily ſeparated and ſent away. 3. *Whoſe* Baſis *is Salt Nitre.*

Take of Cryſtal mineral ʒiij, of the Salt of Harts Horn or of Soot or of Vipers ʒj, mix them, the Doſe ϑj to ʒß in ſome fit Vehecle.

Take of *Sal Prunellæ* ʒij, Bezoart mineral or ceruſs of Antimony ʒj, make a Pouder the Doſe ϑij to ʒj.

4. Diaphoreticks whoſe *Baſis* is an acid Salt cheifly prevail againſt the Powers of fixed Salt, and Sulphur. When at any time the Maſs of Blood becomes 4. *Whoſe* Baſis *is an acid Salt.*

Part I.

too much ſhut up or bound faſt by reaſon of the ſaline fixed Particles being combined with the ſulphureous and terreſtrial, that it will not eaſily let go its ſeroſities to be ſent away by ſweat (as ſometimes is wont to be in continual Fevours and the ſcorbutick affection) the acid Salt in the given Medicine meeting with a fixed ſalt in the Body, and ſnatching it into its embraces, takes away its wicked Combinations, and ſo unlocks the fermenting blood, and diſpoſes it to an *Ephidroſis* of ſweating diſpoſition.

Powders. Take of the ſpirit of Tartar ʒß to ʒj, of ſudorifick Water ℥iij, of the flowers of *Sal* Armoniack ℈ß, mingle them.

Take of the ſimple Mixture ʒß to ℈ij, let it be given in a ſpoonful of Treacle or Bezoartick Water.

Take of Bezoartick Vinegar ℥ß to ℥j, of *Carduus* water ℥ij, of Plague ʒvj, mingle them, and make a draught.

5. Sulphureous Diaphoreticks. 5. Some things merely or for the moſt part ſulphureous, are commonly ranked in the Claſs of Diaphoreticks. As for example, ſome natural Balſoms and others made, alſo chymical Oyls, and chiefly of *Guaicum*, Box, Camphor, Hartshorn, and Soot, alſo the reſinous extract of the more ponderous Woods with many others, which although they effect little by themſelves to the provoking of Sweat, yet being conjoyned with other Salines, I think they may not be altogether unprofitable; for as much as in a frigid Conſtitution, and too phlegmatick, the ſulphureous Salines do rarefy the too watry blood no leſs than the ſpirituous, and diſpoſe it to be evaporated more freely.

Take of Opobalſom *gut.* vj, to xij. of Baulm water or ground Ivy ℥iij, of Sudorifick Water ℥ß, let it be taken every morning for many days for the provoking the *Ephidroſis* or evacuation by ſweat. It is convenient for pthiſical people and for Ulcers in the Reins.

In like manner but in a greater Doſe is given, the Peruvian Balſom, alſo the tincture of Tolutan Balſom, alſo drops of compounded Balſoms.

Pills. Take of the Reſine of *Guaicum* pouder'd ʒij, of the chymical Oyl of the ſame ℈j, of Bezoartick Mineral, and Gum *Guaicum* of each ʒjſs, of Peruvian Balſom what will ſuffice, make a maſs for Pills, Doſe ʒß to ℈ij, drinking after it a doſe of ſudorifick Water, of a decoction of Woods.

The preparation of the Bezoartick Mineral.

The Chymical Preparations of ſome Diaphoreticks, and the Reaſons of them.

Bezoarticum Minerale.

Take of the rectified Butter of Antimony ℥iij, pour to it by drops as much of the ſpirit of Nitre or Stygian Water: abſtract it with the heat of Sand, pour it on again, adding of the ſame *Menſtruum* anew ℥j, and then abſtract it again repeating it three or four times. The matter being taken away and pulverized, let it be calcined for an hour in a Crucible, then let it be edulcorated by waſhing, and likewiſe by enflaming it three or four times with the ſpirit of Wine, the Doſe ℈j to ʒj.

The Reaſon of it. It is worth our obſervation in this preparation, that, whilſt theſe moſt ſharp Liquors are put together preſently their Salts meeting one another are ſtrictly combined; in the mean time the ſulphureous Particles, which abound in a great quantity, are wholly excluded, and being ſet at liberty fly away, and carrying away with them ſome ſaline little bodies, they ſtir up heat and (as if ſomething were burnt in the Act) a very ſtinking fume; then theſe being gone away, the remaining Saline with ſome earthy Particles of the Antimony are more ſtrictly combined, and at laſt having paſſed the fire, that the emetick Sulphur may wholly exhale and the corroſive prickles of the Salts be deſtroyed, they make a renowned Diaphoretick;

phoretick; for that the divers Salts of the Medicine, do meet with the ſalts of our Bodies, with which whilſt they are united, the joynting together of the blood and humours are laxed, that there may be a way opened for the going forth of the ſerous ſuperfluity; by the very like manner as when the ſpirit of Nitre being poured upon the butter of Antimony, (as alſo the filings of Steel put into *Aqua Fortis*) ſtirs up a great ebullition with heat, and a black fume; for as much as the ſulphureous Particles, whilſt the Salts are combined, fly away in heaps as it were from an inkindled fire. And that an actual flame is not here inkindled, the reaſon is becauſe very many ſaline Particles aſcend together with the ſulphureous; from which theſe are on all ſides ſeparated, leſt that they going cloſe together they ſhould flame forth.

The *Bezoarticum minerale* may be more compendiouſly prepared after this manner. The Butter of Antimony being infuſed in Spring water, let it be precipitated into a white powder called *Mercurius Vitæ*: which being dryed, let it be leaſurely put to *Sal* Nitre fuſed in a Crucible, and ſuffer it to flow for a quarter of an hour. Afterwards it being ſoluted by the often affuſion of Spring water on the Nitre, a white and fixed *Calx* will remain, which notwithſtanding, although it be uſurpt for a Diaphoretick, is far different from the Bezoartick Mineral, becauſe in this, the ſalts of the *Menſtrua*, by which the virtue of the Medicine very much depends, are almoſt quite waſhed away: yea that comes nearer to the nature of Ceruſs of Antimony, or rather ſeems to be the ſame with it.

2. Antimonium Diaphoreticum.

2. *Diaphoretick Antimony.*

Antimony twice or thrice calcined with an equal weight of Nitre, then being melted in a Crucible, either let it fuſe for ſome time or a fire coal being flung into it ſo long as it makes a thundering noiſe, untill the Sulphur be wholly conſumed, a *Calx* conſiſting almoſt only of Salt and Earth, and imbued with fiery Particles remains: which, when ſweetned (as the manner is) by frequent ablution becomes a mere *Caput mortuum* or inſipid earth. And although it hath the name of a Diaphoretick, yet I know not to which its of Particles to attribute this virtue, and we have often in vain expected ſuch an effect from this Medicine. For the ſtopping the fluxions of the *Serum* or blood, it hath been often given with ſucceſs, for that this Earth being deprived of its proper Salts, it imbibes (which perchance it meets within our Body) acid Salts; ſuch an Energy *Crocus Martis* being prepared by a reverberating fire ſeems to obtain as we have elſewhere intimated.

The Reaſon of it.

The Ceruſs of Antimony being prepared out of its purer part, to wit, the *Regulus* being calcined with Nitre, is only its *Calx* more pure, or leſs defecate. In whoſe preparation Tartar is added, becauſe the *Regulus* is endued but with a little Sulphur (without which the Nitre will not flame) wherefore that the Calcination may be the better performed, there is need of the addition of Tartar which abounds with ſulphureous Particles.

The Ceruſs of Antimony.

3. *The Flowers of* Sal *Armoniack.*

3. *The Flowers of* Sal *Armoniack.*

Take of *Sal* Armoniack powder'd ℔j. of the filings of Iron ℥xij, being beaten together and mixed, let them be diſtilled in a Retort with a wide neck with a reverberating fire increaſed by degrees: a yellowiſh Liquor, which is the ſpirit of the Salt, will drop forth into the Receiver, and the flowers will be ſublimed partly into the neck of the Retort and partly to its ſides, which gathered together let them be kept in a glaſs, the doſe is *gr.* v to xv.

This operation is performed by mixing *Sal* Armoniack with Colcothar waſhed, alſo with the *Calx* of ſalt of Tartar, their volatile Particles being freed from their bonds may eaſily aſcend. Thirdly, that the Flowers, whilſt they aſcend, ſomething of another concrete, to wit, of Steel, Copper, or ſalt of Tartar, being carryed with them, may be impregnated with its virtue. When this ſublimation is performed with Iron, or the *Calx* of Tartar, from the *Caput mortuum* of either Tinctures are gotten of no contemptible uſe, with the ſpirit of Wine.

The variation of this preparation.

4. *Spirit*

Part I.

4 *Spirits of* Sal *Armoniack.*

4. The Spirit of Salt Armoniack.

Take of Tartar calcined with Nitre, and of *Sal* Armoniack, of each ℔ij, let them be pounded by themſelves, and then mixed and put into a large Cucurbit, pouring thereon of Spring Water ℔vj or viij, and ſo diſtilled in a ſand Furnace. The Spirit will aſcend with the leaſt heat, pure, and very penetrating without any taſt of Fire: If you rectifie this in a deeper Cucurbit, the moſt pure volatile Salt will be ſublimed into the Alembick.

The reaſon of the Proceſs.

The Reaſon of this proceſs is this, Salt Armoniack is made of a volatile Salt, out of Soot and Urine, and Sea Salt, all which when they are combined in the ſubliming, the ſaline volatile Particles, being wholly caſt off from adhering to their wonted ſulphureous, are ſo fixed to the Sea-ſaline Particles, and entred into ſuch a condition, that they cannot fly away. But as ſoon as this bond is looſed, *viz.* when this compounded Salt being diſſolved with the ſalt of Tartar in water, is intimately mingled, the Particles of the ſea Salt do ſtick to the ſaline-fixed of the Tartar, and for that cauſe the volatile being diſmiſſed from their embraces, and ready to fly, do moſt eaſily aſcend: But that the Spirit being diſtilled from the *Sal* Armoniack, hath no ſtinking ſmell as the *Stagma* of Soot or Urine, the reaſon is, becauſe in that compoſition the volatile Salt, by the intervention of the Sea Salt, is caſt off with certain ſulphureous Particles; which when Soot or Urine is diſtilled by themſelves, ſtick pertinaciouſly to the volatile Salt, which may plainly appear by either of their ſtinking Smells: Then moreover, becauſe the liquors ſtill'd forth from thoſe Concretes are at firſt limpid and clear, afterwards yellow, and at length become red and black and dark, *viz.* for that the ſulphureous Particles being firſt ſubjugated by the ſaline and hidden, leiſurely riſing up, unfold themſelves, and overcome the others.

The ſpirits of Sal *Armoniack, alſo as the ſpirit of Harts Horn and others of that ſort are cleared of their ſulphureous Particles.*

And by what Reaſon.

But that in the compoſition of *Sal* Armoniack, the Particles of the Sea Salt, of the Urine, and of the Soot, do drive away the ſulphureous part, and fix the volatile Salt, alſo by this experiment (which the famous *Zuelferus* found out for the fixing of volatile Salt) it may manifeſtly appear: As for example ſake.

Take of the volatile Salt of Vipers, Urine, or Harts Horn at your pleaſure what you will; this being put into a ſtreight Cucurbit and ſhut cloſe at the Orifice, excepting a very little hole, drop in drop by drop the ſpirit of Sea Salt, to the height of two or three fingers breadth, until all the Salt be diſſolved: Filter this ſolution, and draw it off in a Cucurbite to dryneſs, in the bottom will remain a Salt of a good Odor, ſomewhat ſharp and of a ſaline taſt; whoſe uſe is highly commended for many diſeaſes. Beſides this I have further experienced, to wit, that, if thou ſhouldſt recover thy volatile Salt, you muſt put to this, ſalt of Tartar, and ſublime them in a Vial, and the moſt pure volatile Salt will aſcend. After this manner you may ſo rectifie the ſpirits of Soot, of Harts Horn, and of Blood, that their ſulphur being wholly driven away, they may become more grateful and leſs corruptible Remedies.

How this ſpirit may be diſtilled with quick lime and a lixivium *of Aſhes.*

The ſpirit of *Sal* Armoniack alſo may be diſtilled by other means, *viz.* if at any time a ſolution of this Salt ſhould be mixed with a *lixivium* of fixed Salt or of quick Lime in equal parts; for by theſe and perhaps by certain other means, whilſt the particles of the Sea Salt do enter into new conjunctions, the former fly away. In like manner it is about the diſtillation of Urine, as is ſhewed in its proper place.

5. *Spirit of Soot, Blood, Harts Horn,* &c.

5. Spirit of Soot of Harts Horn, &c.

Take of ponderous ſoot of burnt wood, ſhining with a blackneſs like pitch, what will ſuffice, that may fill an earthen Retort above the middle; then a large recipient being made fit, let the diſtillation be performed by a reverberatory Fire increaſed by degrees to a moderate heat; ſhortly the ſpirit will aſcend in a whitiſh fume, then a yellow Oyl with a volatile Salt, and laſtly a blackiſh Oyl, let the Salt be collected by it ſelf, the remaining Liquor being ſeparated from the black Oyl by filtration, muſt be rectified by diſtilling it twice or thrice in *Balneo Mariæ* or in ſand;

ſand; alſo the volatil Salt being depurated by rectifying it in a deeper Cucurbit may be kept for uſe. The Doſe of the Spirit from drops 12 to 20: Of the Salt, from *gr.* vj to xij or xv. Part I.

Little pieces or ſcantlings of Harts Horn, may be diſtilled either after the ſame manner by a naked fire, or in a Glaſs Retort in a ſand furnace: In like manner Spirits are drawn out of Skulls, Bones, and Blood, with a volatil Salt, and a ſtinking Oyl.

6. *Spirits and Reſinous Extracts of* Guaicum, *Box, and of other ponderous Woods.*

6. Spirits of Guaicum, Box, and ſuch like.

Theſe ſorts of Woods are deſervedly ranked with Diaphoreticks, becauſe ſudoriferous Decoctions are chiefly prepared from them. Their Hydrotick or Sweat-cauſing virtue ſeems to conſiſt both in a ſaline and ſulphureous Principle; for that theſe bodies are abundantly full of Particles of either kind. Wherefore beſides the common way of preparing by Infuſion and Concoction, thoſe active principles, to wit, of Salt and Sulphur are brought forth by themſelves by a chymical preparation, and being reduced into peculiar Concretes, to wit, Spirit, Oyl, Reſine, they make elegant pleaſant and more efficacious Diaphoreticks.

1. *Spirit and Oyl are gotten after this manner.*

Take the duſt of *Guaicum* ℔ij, diſtil it with the fire of a reverberatory, or in a ſand Furnace with a ſtrong heat; a ſharp Liquor will come forth, and ſomething acid, and a yellow Oyl and black: Laſtly, ſeparate this and rectifie the reſt in a Cucurbit, you will have a clear ſpirit, and of a ſharp odour, and alſo a yellow ponderous Oyl, which will ſubſide in the bottom of the watriſh Liquor. The Doſe of the Spirit ʒß to ʒjß, of the Oyl *gut.* vj to xv in a convenient Vehicle.

Either Medicine is a Diaphoretick, and uſed with ſucceſs in the Dropſie, Scurvy, and Venereal Diſeaſe, without doubt the ſaline part of this Concrete, which is partly in the *fluor* and partly volatil; conſtitutes together with the Phlegm a ſpirit ſo called, and the ſulphureous part is the more pure yellow Oyl, which by reaſon of a portion of Salt adhering, is heavy and ſinks down; yea certainly ſulphureous Particles do ſtick cloſe to the Spirit, or acid-biting *Stagma*, and therefore it always ſtinks, and quickly forſaking its limpidity, it degenerates into yellow and red. The black Oyl conſiſts of Salt, and of a more thick ſulphur that is mixed with a portion of Earth. In *Guaicum*, the ſaline Element as to the greateſt part, is carried beyond a fixity into a ſtate of flowing and of volatility; wherefore a *lixivium* of its Aſhes ſhews but little of Salt. It is far otherwiſe with Tartar, whoſe ſaline Particles are ſome only in a flux, and ſtate of volatility; many notwithſtanding remain fixed. *The Reaſon of it.*

7. Reſine of *Guaicum* is gotten after the ſame manner as the Reſine of Scammony or Jalap, to wit, the Tincture is extracted with the Spirit of Wine, then it is abſtracted to the middle, and the water poured into a Cucurbit, the Reſine will be precipitated in great plenty, which being dryed up and powdered, it may be given from ℈j to ʒß, with other ſudorificks in a ſolid form. *7. Reſine of Guaicum.*

It thence appears that this Reſine is the ſulphureous part of the *Guaicum*, becauſe that after its extraction if you ſhall diſtil the remaining *Magma* or dregs in a Retort in hot ſand, or with a naked fire, you will have Phlegm and an acid Liquor in its wonted proportion, but the Oyls will come forth in but a very little quantity only. Wherefore it may be lawfully concluded from the ſpagyrical *Analyſis* of this Wood, that the Chymical Elements, what and how many ſoever they be, as we formerly aſſerted elſewhere, are indeed mixed; and not (as ſome ſay) to be from experiment only apparently produced. *The Reaſon of it.*

8. *Spirit*

Part I.

8. *Spirit of Tartar.*

8. Spirit of Tartar.

Take of choice white Tartar and ſhining, waſhed and dryed (or rather as *Zuelferus* preſcribes, ſoluted and at one time cryſtallized) ℔iiij, diſtil it in a Retort with a large Receiver, the Fire being increaſed by degrees, until the fumes do wholly ceaſe: You will have Phlegm, Spirit, yellow and black Oyl. This laſt being ſeparated, the remaining Liquor being put into a Glaſs Cucurbit, let it be rectified twice or thrice in hot ſand, by extracting every time a third part only. The Doſe is of the Spirit ʒß to ʒj, of the Oyl ϑß to ϑj, in a prepared Body, they move ſweat ſufficiently.

The reaſon of the Preparation.

This is no place for us to deliver fully the *Geneſis* and *Analyſis* of Tartar, worthy of much conſideration: But that we may briefly touch upon its Anatomy, this Concrete conſiſts of very much Salt, (whoſe Particles are very many in a ſtate of fixity, and ſome in flowing, and of volatility) much Sulphur, a little Spirit and Phlegm, and moderate Earth. In the diſtillation the volatile Salt aſcending with the Spirit, renders the Liquor ſomewhat biting and pricking; which moreover by reaſon of the plenty of fluid Salt and Sulphur, is a little acid and ſo notably ſtinks, that it can ſcarce get a good odor by any rectification. As to the contents of this extilled *Stagma*, it differs not much from the product of *Guaicum*, unleſs that the Spirit is leſs acid, and does not ſo readily diſſolve Coral and ſhelly things; but there is a great difference between the dead Head of this and of that, becauſe very little of fixed *Sal* is elixiviated from the aſhes of *Guaicum*, and very much of it from the *Calx* of the Tartar. The reaſon of which appears from what was ſaid before.

Chap III.

Of too great or depraved Diaphoreſis *or Sweating, and its Remedy.*

As our Life is in a continual flux, therefore as new things ought to be added and put to it, ſo old and out-worn things ought continually to be drawn and carried away from it: Wherefore that all ſuperfluous and incongruous Particles whatſoever, may be perpetually moved away; there are manifold ways of departings and excretions; in the doing of which, however Nature oftentimes knows not a meaſure, and goes either on this ſide or beyond, that which is moſt commodious. How it behoveth us to correct or moderate thoſe Evacuations, which leading inward from the circumference or exterior compaſs of the Body, do purge forth by a certain particular Sink, as often as they offend in exceſs or in defect, we have ſhewed above: The way of our method requires now, that we alſo ſhew a Remedy, if that at any time the *Diaphoreſis* or evacuation by ſweating, (which tending from the Centre towards the Circumference, is the chief general and diffuſive Excretion) ſhould be too much or depraved.

Exceſſive ſweating is a frequent Affection.

And indeed that this ſort of affection doth too often happen, is obvious enough to common obſervation; for that there is nothing more uſual, than that thoſe labouring with the Phthiſick or Scurvy, and others that are hardly recovered out of long Fevers, yea ſome without any diſeaſe or evident *prophaſis*, live obnoxious to aſſiduous, and oftentimes very great Sweats. Therefore concerning the *Ephidroſis* exceſſive, we will enquire firſt how many ways, and from what cauſes ſuch an Evacuation may ariſe: Then we will ſhew what Remedies, and what kind of

of a manner of Adminiſtrations are moſt convenient in every caſe of it.

Part I.

As to the firſt of theſe, often and immoderate Sweating is ſometimes a Symptom of ſome other preſent Diſeaſe; for this is familiar (as we ſaid but now) in the Phthiſick and Scurvie: the reaſon of which is this, to wit, that when the Blood being corrupted either by ſome impure Miaſm, or having got an evil diſpoſition, doth not rightly concoct and aſſimilate the nouriſhing Juice continually ſuffuſed into its Maſs, it ſifts out and caſts forth adoors by Sweat that do far degenerate, heaped up to a fulneſs together with other excrements. *Sometimes it is a ſymptome of another Diſeaſe.*

The Cure of this Sudation depends wholly on the healing of the Diſeaſe whoſe Symptom it is; in the mean time concerning this as much as belongs to the manner of Living, a profitable and neceſſary Indication is taken from that Symptom, to wit, that when nightly and copious Sweats happen in thoſe Diſeaſes, a Diet ſhould be preſcribed altogether of light aliments, *viz.* milk Grewel, Barly Cream and ſuch like, whoſe light and ſoft Particles the bloody Maſs may bear, and not of Fleſh, or ſtronger Meats.

2. An exceſſive *Ephidroſis* is ſometimes an effect of another paſt and gon Diſeaſe, as when it ſucceeds long Fevours: for ſo it ſtill happens that fevouriſh burnings do terminate in hydrotick Dews (as an hot Summer ends in a rainy Autumn) that ſcarce any one can recover from a long Diſeaſe with this indiſpoſition remaining; which notwithſtanding is moderate and eaſily to be cured in ſome, but in others more grievous, and not leſs infeſtous than the Diſeaſe whoſe offſpring it was. I knew a young Man, who growing well after a quartan Ague of ten Months, when he began to want his Fitts, he daily melted into ſo profuſe Sweats, that he was neceſſitated to change his Shirt and Sheets all wetted (as if they were dipped in Water) thrice every Night. By reaſon of this Evacuation continuing ſo for many Weeks, his Fleſh ſo fell away, and his ſtrength was ſo exhauſted, that he was almoſt reduced to the dryneſs of a Skeleton. He, when he had uſed a long time various Remedies without any benefit, at length by the drinking Evening and Morning of Aſſes Milk, and his other diet being ordered of Cowes Milk, grew well in a ſhort time. *2. When alſo it is an Effect.* *A notable example of exceſſive Sweating.*

In ſuch like Caſes the Blood perpetually caſting back its contents, and as it were vomiting them forth by the mouths of the Arteries, preſently caſt forth adoors not only the Chyle ſuffuſed from the *Viſcera*, but moreover ſupping up again for its Food both the nervous Juice, and the Farciments or fillings up of the ſolid parts, by and by loathing all thoſe together, with the nutritious Liquor, expells them by the Pores of the Skin. *The reaſon of it.*

The chief Cauſe of this Diſeaſe ſeems to conſiſt in the dyſcraſie and debilitie of the Blood; for as much as its Liquor like ſower Milk is apt to be continually fuſed, and precipitated into ſeroſities; wherefore both its proper meltings, and alſo the humours which are poured in from any other place that cannot indeed be aſſimilated, are forthwith ſeparated, and when the Pores of the Skin are very open, are ſent forth adoors by *Diaphoreſis* or ſweating rather than by any other way of excretion. But that the Blood is diſpoſed ſo into fuſions or fluxes, for the moſt part the cauſe is the Dominion of the fluid or acid Salts (even as in ſower Milk) in its Maſs. But ſometimes the nervous Juice degenerated into a ſowerneſs is firſt and rather the fault, for by that reaſon its Acid Excrements being chewed over again in the Blood, do fuſe its Maſs, and precipitate it into ſeroſities: further from ſuch a cauſe we do Judge the *Diabetes* and the Engliſh Sweat ſo called (becauſe it was here general) to have had their origin. *The cauſe of exceſſive Sweating.* *Partly from the vitiated* Craſis *of the Blood.*

This kind of exceſſive *Ephidroſis* is not wont only to ariſe from the vitiated *Craſis* and fermentation of the Blood, but ſometimes by reaſon of its depraved Enkindling. It hath been already ſhewn by what means the Blood breaks forth into Sweat feavouriſhly growing hot by reaſon of the exceſs of Sulphur. Moreover this Symptom ſometimes follows no leſs by reaſon of the Defect of Sulphur: for when that the Blood being impoveriſhed, and made more watrie is leſs enkindled, therefore as often as it is urged into a more rapid motion by an acquired heat, or agitation of the Body, there will be a neceſſity that its ſeroſities (becauſe they cannot be conſumed by heat, or inſenſibly exhaled) ſhould be reſolved into Sweat. Sulphur is wanting in the Blood either becauſe it is conſumed, as after long Feavours, or becauſe it is not enough generated by reaſon of lack of Suſtenance. We may obſerve this latter not only in many men who being ſtrait- *Partly from its lack of Heat.*

Part I.

ned for Food or using a Lenten Diet, presently fall into an *Ephidrosis* or sweating by a more quick running or walking, but remarkably in Beasts, who when they are fed with Grass or new Hay sweat very much, and quickly languish with any Labour.

Its Cure. As to what belongs to the Cure, hidden *Ephidrosis* or Sweating by reason of the aforesaid Causes, and *Prophasis*——the Therapeutick Intentions are chiefly these three, *viz*, First to take away, or mend the Dyscrasie or evil Disposition or the Debilitites of the Humours. Secondly a little to bind up the too open Pores of the Skin. Thirdly to derive the *Serum* of the Blood and the watry Excrements towards the Reins.

1. The first Indication. 1. The first of these is performed by these sort of Remedies which destroy the Powers of the acid Salt in the Blood or nervous Juice, also which may promote (if perchance it should be defective) the Exaltation of the Sulphur. For

To take away the evil dispositions of the Humours. which ends, *Antiscorbutes*, *Chalibeates*, also Medicines indued with a volatile, nitrous and alchalisate Salt do oftenest give help. We will shew you some forms of each of them.

Electuary. Take of the Conserves of the Flowers of Chichorie, Fumitory of each ʒij of the Pouder of Ivorie, Harts Horn, prepared Coral of each ʒj, of Pearls ʒß, Species of *Diarrhodon Abbatis* ʒj, of *Lignum Aloes*, yellow Sanders and red Sanders each ʒß, of *Sal Prunellæ* ℈iiij with what will suffice of Syrup of Fumitory, make a Confection, let them take the quantity of a Walnut in the Evening, and first in the Morning, drinking after it of the following Julep or of the Distilled Water ʒiij.

Julep. Take of Fumitory water, of simple Walnut water of each ʒvj, of Snales, of Worms, each ʒj, of Sugar ʒvj, mix them and make a Julep.

A distilled Water. Take of the Tops of the Firr Tree, Tamarisk, Cypress of each Miiij, of Mirtle Mij, of Leaves of water Cresses, Brooklime, Liverwort, *St. Johns* Wort, Harts Tongue, Betony, of each Miij, of the exterior Rinds of 12 Orenges cut and brused: pour them into *Brunswick* Beer ℔viij, distill it in ordinary Stils, mix the whole Liquor and sweeten it at your pleasure, the Dose is ʒiij twice a day.

An Expression. Take of the Leaves of Sowthistle, of water Cresses, Plantane, Brooklime, each Miij, being brused pour them into the aforesaid distilled Water ℔j and make a strong expression, the Dose ʒiij to iiij at nine a clock in the Morning and five in the afternoon.

Chalibeates. According to this Method I am wont to prescribe in the failing of strength and nightly Sweats after long Fevours, but if these remedies help not, we then must come to *Chalibeates*.

Syrup. Take of the Syrop of Steel ʒvj, let it be taken one Spoonful in the Morning and at 5 a Clock with the Water above prescribed ʒiiij.

A Pouder. Take of the Pouder of Ivory, of Coral prepared each ʒij, of the *Crocus* of Steel, of the Salt of Steel, each ʒjß, make a Pouder, the Dose ʒß, twice a day with the same distilled Water ʒiiij.

Tinctures. Take of the Tincture of the Salt of Tartar ʒj, the Dose *gut.* 20 to 30 twice a day with distilled Water. After the same manner may be given Tincture of Coral, also Tincture gotten from Gumms and Balsams. Further in these cases the Spirit of Harts Horn, of Urine or Soot are oftentimes given with success.

The second Intention consists in the alteration of the Pores. The second Intention for the Cure of excessive Sweating consisting in the due Constitution of the pores is performed for the most part only by Exterior Administrations; for which end are prescribed anoyntings of the whole Body with Oyles of Almonds, of Palm, Oyntments of Orenge Flowers and such like, yea Linnen dyed with these are worn. Sometimes Bathings in cold Water or in the River, and sometimes the change of the Air are convenient. As to the use of these (which is known commonly enough) we need not prescribe any particular Governance.

Of the Affection which is commonly called an Aptitude to catch Cold. But here it seems very opportune, to speak a few Words of a certain Affection troublesom to Sweating or at least regarding the excessive or inordinate *Diapnoe*. I have oftentimes observed some to have had the Pores of the Body (or the Organs of Transpiration) disposed in that manner that they are hurt by nothing more than by the unaccustomed Blast or Approach of the Air; in so much that when in good liking and well in flesh also as to Appetite, Sleep, and having

having the right strength of their Members, they seem sound or well, yet they were not able to bear naked the least Blast of Wind or Air, but presently there followed a great Perturbation of Spirits with a failing of all the Faculties and an indisposition of the whole Body; which kind of Irregularity so lightly Contracted they cannot either quickly or easily shake off, but hardly, and not but after a long time recover their former healthful Condition: Those proclive to this Dyspathy or Infirmity fear the Air more then others do Fire or Water. Hence some dare not go forth adoors, others living within a close Chamber suffer neither Door or Casement to be opened, and if by chance a little Breath of Air get in by some hidden chink, they presently feel it, and are hurt by it. I have known some from such a cause fixed for many Months in their Bed. I remember a Footman healthful and strong enough, who for above ten Years never went out of his Chamber, nor could be perswaded to it, nor hired at any rate to go forth: and when afterwards the House being on fire he was drawn out by force, he was very dangerously cast down by it for very many Months without any other hurt: others are affraid to stand or walk upon an Earthen Floor or Brick or Stone Pavement, for that they are wont thereby to contract great hurt very many other the like cases every where happen, to whom further this infelicity is added, that few commiserate those that are so affected, neither are they believed to be sick indeed but only in Imagination.

Part I.

Its Description.

That we may a little therefore search into the nature of this Affection, we think that it is not for nothing that they complain, but without doubt they feel a certain pain or trouble in themselves inflicted by the received Cold, or by the altered manner of transpiration, but that it may appear what it is, and in what the reason of it consists, it behoveth us in the first place to consider, by what ordinary means the Particles of the ambient Air get into the Pores of our Skin, and affect the subjects of them, to wit, the Animal Spirits diffused every where over the Superficies of the Body. For indeed as they are of a certain etherial disposition or Nature, these appear to be greatly refreshed, and to be stirred up into as it were a flattering Expansion by the neer of kin particles both of the Air and Light, whilst those come proportionate to them: and in like manner the Blood, whilst that it passes thorow in its Circuit, the exterior Border of the Body, exhales even there as in the *Precordia* by the Mouths of the Arteries its Mists or Smokes, and receives by the gapings of the Veins the sulphureous Food for the sustaining its Flame. For these benefits both of the Blood and of the animal Spirits, the Pores of the Skin are conveniently made and ought to ly open in that manner, that the Particles of the Air and Light in a moderate plenty being somewhat refracted, and with a gentle sliding to, might strike the outmost Borders of the substance of either of them. For otherwise if there should be an improportionate approach of the agent to this or that patient or to both together, presently perturbations arise in this, or that, or together in either part of the Soul. For if the out-dwelling Spirits are either weak, or infirm of themselves and quickly dissipable, or by reason of the Pores of the Skin lying too much open are exposed to the more sharp and naked air, it still comes to pass that they are forced upon every light occasion into flights and distractions; and for that cause Griefs, Convulsions or resolutions or unbindings are stirred up here and there, not only about the exterior parts of the Body; but sometimes, from taking Cold (as they use to say) a falling down of the whole Body (which is not quickly or easily raised up) succeeds. And indeed from thence the aforesaid inordinations about the *Diapnoe* do chiefly arise, for as much as the sensitive Soul, being either not strong or not munited enough, lyes too open to injuries of the external Air; and so is disturbed at its more strong approach in this or that part; or together in its whole *Hypostasis*, and is forced into irregularities not presently to be recovered. Further hence also the flamie part of the Soul is wont to be affected and moved, by consent no less then by its proper passion or Idiopathie because of an improportionate incountring of Air. For that the Fibres, and nervous Branches being carried into Corrugations and Convulsions, the Sanguiferous Vessels twining about them are by them variously straitned, that for that reason the Blood is compelled into inordinate fluctuations. Moreover the bloody Mass by it self very much purges forth its evills both as to its inkindling, and also as to the disposition of its depraved transpiration.

The reason is searched into.

By what means both the Blood and Spirits are affected by the encompassing Air.

Part 1.

ration. In respect of the former the vital flame growing about the superficies of the Body, is wont to be compelled by its more sharp or hard blowing into noddings and trepidations and various inequalities, which shake the whole Soul. Then it is commonly enough known that there is nothing more can endanger the mixture of the Blood than a vitiated *Diapnoe* or transpiration: for hence Fluxes, and precipitations in the Mass of its serosity arise, from which happen Catharrs, Coughs, Asthmatical, Nepthritick, and Arthritick Paroxysms.

From the aforesaid Affection Symptoms proceed.

From these it will be easie to draw forth the formal Reason and also the causes and cures of this Affection of which we now treat. For that any one may contract from cold, or from the incountring of the naked air any where in this or that member, pain, or numness, or Palsy, it so comes to pass because the animal Spirits flowing among the membraneous Fibres being struck and put to flight, are agitated into distractions: but if that more amply from such a cause the *Languor* of the whole body, and casting down of the strength do happen, not a private handful or Band of the Spirits but their whole *Hypostasis* or the intire sensitive Soul seems be stricken; which being strucken and so contracted into a lesser compass and made shorter, it sinks down within the Organs of the Body, and suffers its faculties to flag. Besides these, if that a tumor of a little continuance, or a *Phlegmon*, the Toothach, Cough, or Pleurisy, happen to any one unwarily exposed to the Air, or if cold, heat presently following, and feavourish burnings arise, it is a sign that the Blood is no less affected by the improportionate approach of the Air than the animal Spirits, and therefore its Liquor being disturbed in motion and enkindling is either disposed to fevourish Effervescencies, or being loosned in its mixture it is compelled into various fluxes and precipitations of the serous Juice. It would be an immense and tedious labour to describe here all the Affections or Diseases which owe their original to such a cause. Hence proceed the Headach, *Vertigo*, the sleepy Diseases, the Pose or stuffing of the Head, the Squinzy, the Inflammation of the eyes, Cough, Vomiting, Loosness, and abundance of other Diseases; in so much that the common people are wont to refer the evident causes almost of all Diseases to these two kinds, to wit, surfeting and taking cold.

The Procatarxis or predisposition of the aforesaid Disease consists.

Hitherto we have described the formal Reason, and conjunct causes of depraved transpiration. As to what respects the *Procatarxis* or predisposition, for which some sooner than others are apt to catch cold, I say this consists in the vitiousness or default of the animal Spirits, or of the Blood, or of the Pores, of one of these, or of more together.

1. Partly in the Spirits.

The Animal Spirits are sometimes in the fault, because being weak they are not able to suffer any thing that is hard or sharp which may come to them from without, but presently at the approach of the naked Air they are thrown into flights and distractions, even as many after long sickness abhor to be in the open air, and assoon as they are exposed to the Sunbeams very often fall into relapses: further sometimes the Spirits incline this evill to sweatings, for as much they being degenerate and having gotten a sharp and unquiet Disposition, they are carried by every blast of Air into irregularities, wherefore those who by reason of the spirits being so disposed do become Hypochondriacal, also obnoxious to the Affection which we have described, are troubled with cold upon every light occasion.

2. Partly in the Blood.

2. The Blood disposes to an habitude of depraved transpiration for a twofold reason, *viz.* both in respect of its temperament and of its mixture. As to this latter, oftentimes the joynting together of the Blood is so lax and loose, that upon every small cause and chiefly by reason of the approach of a cold or moyst Air, it is cast into fluxions and precipitations of its serosities, in so much as those indued with such blood dare not go forth adoors at all, yea scarce look out. But the sanguineous Mass as to its temperament being often very hot and vaporous, exhales highly sharp and penetrative *Effluvias*; by which, whilst the Pores of the skin are too much unlock'd and laid open, both the spirits and the vital flame are exposed more than they ought to the injuries of the naked Air and Winds.

3. In the evil constitution of the Pores.

Thirdly, the evil constitution of the Pores produced by sickness or by other means, or also being natural and born so, very much inclines to that habit of depraved sweating. For if those passages being too open do almost always gape wide, the Blood and Spirits in the whole or in some parts are not enough defenced against the encounter of the external Air. Such an amplitude of Pores is natural, and bred in some, as those who are indued with soft and loose flesh, have their skin for the most

Part I.

moſt part thin and very full of holes: beſides it is wont to be frequently contracted by various accidents: after a ſudorifick Diet long continued, alſo after frequent ſweatings which uſe to break forth about the declinings of Fevours, the Pores of the skin being extended and laid wide open to the utmoſt for a long time, they afterwards continually gape, and almoſt always remain more open.

Its Cure.

This Diſeaſe although it doth not threaten Death, yet becauſe it renders life very troubleſome or altogether unprofitable, it highly deſerves a Cure: for which endeavour the curatory Intentions are chiefly theſe three, *viz.* Firſt that the Debilities, or dejections or impoveriſhments both of the Spirits and of the Blood may be cured. Secondly, that the Dyſcraſies of either of them (if perchance there be any) may be taken away. Thirdly, that a due conformation of the Pores may be procured.

1. The firſt Intention, a Corroboration of the Spirits.

The chief point of this Buſineſs lies about the firſt Intention, for as much as it reſpects the ſtrengthning of the animal Spirits or the making larger of the whole ſenſitive Soul: But unleſs the Patients are perſwaded to aſſume a certain Confidence, that they may go forth adoors to exerciſe their utmoſt ſtrength, and to endeavour to accuſtom nature daily to more ſharp and hard things, all Medicine will be in vain; wherefore there will need a plentiful way of living and alacrity no leſs than of Medicine, to wit, that the plenty of animal Spirits may be daily reſtored and increaſed, and moreover thereby made more firm for bolder attempts: for which end generous Wines with good fare moderately taken are very requiſite Further Studies and Cares (whereby the Soul may be depreſſed) being omitted, the time muſt be ſpent in leaſure and recreations or moderate exerciſes. By ſuch a way of living rightly inſtituted, as the animal Spirit is comforted, ſo the decay and impoveriſhment of the blood is reſtored.

For the ſame ends alſo theſe following Medicines may be profitably adminiſtred.

Spirits.

Take of the ſpirit of Amber, Armoniack, what will ſuffice, take *gut.* 15 to 20 in the evening and in the morning firſt, in a ſpoonful of the following diſtilled water drinking after it nine ſpoonfuls of the ſame.

A diſtilled water.

Take of the leaves of Sage or Roſemary, Thyme, of Savory, of Marjoram, of Coſtmary of each M. iij, of the Roots of Angelica, of Imperatory of each ℥vj, of Zedoary, of Galingal the leſs, of the aromatick Reed, of the Floreatine *Iris*, of each ℥iß, of Cubebs ℥iß, of Nutmegs, Cloves, Cinamon, of each ℥j, of the outward Rind of twelve Oranges and of ſix Lemons, being cut and bruſed, put them into white Wine and Canary ℔iiij, and diſtill them in common ſtills, let the whole Liquor be mixed and ſweetned with refined Sugar. In the diſtilling, hang at the noſe of the Still in a little bag Amber Greaſe ℈j, Muſk ℈ß.

Tinctures.

Take of the tincture of Antimony or of Tolutan Balſom ℥j, take of them *gut.* 15 to 20, in the morning about nine a clock and five in the afternoon, in a ſpoonful of the aforeſaid preſcribed water, drinking after it ℥iij of the ſame, or rather in the morning a draught of Tea or of Coffee or of Chocolate with Sage boyled in it.

A little before dinner take a draught of Xeroeuſe Wine.

When theſe have been for ſome time uſed and that it ſeem good to intermit them, take in their place theſe following.

In the place of the Spirits take a Doſe of the following Electuary morning and evening with diſtilled Water or Viper Wine.

Electuary.

Take of wet candied Citron pill ℥iß, of candied Mirobalans ℥j, of Nutmeg and Ginger candied of each ℥ß, of *Confectio Hamech*, *Alchermes* of each ℥iij, of prepared Pearls, red Coral prepared each ℥iß, with the ſyrop or the juice of *Alchermes*, make an Electuary.

Phyſical Ale.

Let him drink for his ordinary drink Medicated Ale made after the following manner, *viz.* put into a Veſſel of four gallons this following Bag.

Take an old Cock half boyled, and cut into ſmall Pieces, of Sage and Hartstongue dryed, of each Mij, of Dates cut vj, of the ſhavings of Saſſafras ℥ij, being cut and bruſed mingle them, make up a little bag with them and put it into the Veſſel after it has worked.

2. The ſecond Intention the amending the humours.

2. The ſecond Intention undertaking the amendment of the Dyſcraſies of the depraved diſpoſitions of the Spirits, and blood, is performed by the ſame remedies which are convenient for the Hypochondriack and Melancholy Affection;

Part I.

on; wherefore those prescriptions formerly deliver'd by us for the cure of those Affections may serve here.

3. *The third intention, the alteration of the Pores.*

3. Concerning the third Intention which appoints for the right conformation of the Pores of the skin as for its due cloathing airs, fires and means of living, there is little left for a Physitian. For the deseased fearing themselves and their strength according to their own Imaginations, do so cloath themselves, shut themselves in their chamber as in a Cloyster, indulge themselves in a Bed or Fire, even as they are carried by their own *genius* harkning to no precepts of their Friends or of the Physitian. Whatsoever others counsel them about those things they reject, objecting their own experience and knowledge taken from what doth help and what doth hurt them. The means of Advice which I received from them, and is wont to help, is but one almost, that they change the Air and Soil, by which they do not seldom change also their mind. For although they are addicted to close houses or to a chamber, when as being carried to forrain parts they breath a more warm and serene air, it is scarce credible how soon they grow well. So much for perverse and depraved *Diapnoes* or transpiration. The Theory of which Affection we have therefore shewed more fully because it hath been left untouched by others: now we will return from whence we have digressed to excessive *Diaphoresis* or sweating.

Which is best performed by the change of the Air.

The third kind of sudation which is a Disease by it self.

There remains yet a third species of this Affection, to wit, immoderate sweating, which is not as the former a Symptom or effect of another present or past Disease, but is a Disease of it self or beginning from it self, or is the Parent of a morbid Affection. To the first Rank especially belongs that pestilent sweating, in time past, general among our Countrymen, known thorow the whole World by the name of the English Sweat, into the reason of which we shall by and by search. But, that we say nothing here of the bloody, black, bluish, stinking, or sweet smelling Sweat, of all which mention is made by Authors worthy to be believed, (and some of which also have fallen under our observation) we often advertise that some without any manifest cause do fall into the habit of *Ephidrosis* or of sweating, and from thence that evacuation being increased daily sometimes grows immeasurable; in so much that the humidities of the whole Body seem to be poured forth by sweat. And indeed it is no wonder that this Affection being once begun should increase daily; for those sweating much or often are very thirsty, and for that reason drink hugely, and so the more they drink the more they sweat, so that these two are reciprocally the cause and effect by turns and so produce one another in a long *Series*.

A notable story of it.

There is yet living in this Kingdom a noble Lady, famous now for many years for an immense or rather stupendious *Ephidrosis*, for that she does not only every night, moysten or thorowly wet her Linnen and Bedcloaths, but besides distills into a bason put under her thighs many ounces, yea according to common fame many pounds of mere Sweat; in the mean time there is a necessity by reason of continual thirst provoking thereto, to take more plentifully of liquid things, by which as strength is restored so the sweat is continued. I received the History of this admirable affection, both from many worthy of belief, and (although she did never consult me for the recovering of her health) from the sick Ladies own mouth. However she had taken Remedies from many Physicians, and had tryed divers ways of living and the Regiment of the six non-naturals, she had drunk almost all kinds of Waters, had tryed the Air of others Countries and especially of *France*, but for all that she could do, this notable Lady doth yet labour with this troublesome distillation. Although it will not be easy for me to shew the Reason of this case, I being ignorant of what hapned in the beginning, progress and alterations of this Disease. What was to be observed from things helpful or hurtful, and only seeing her once, speech was had of it only by the by: yet however it may be lawful to

The reason of it.

suspect that in this, as in other Instances of Nature, the *Serum* of the blood, being too apt to go away, leaving the passages thorow the Reins, Lymphæducts, *Glandulas* and other ordinary ways of excretion did affect this by the Pores of the skin occasionally begun, and afterwards facilitated by a certain habitude, and constantly to observe it; to which perhaps may be added that the potency of the fluid Salt in the Blood and the nervous Juice, might cause a continual fusion of the blood, and a more plentiful separation of the *Serum*. To the curing of this Disease, when it being confirmed by a continual habit, and the œconomy of Nature being wholly inverted by it, I know not whether any Remedy, or any Method of

curing

curing would be profitable. And certainly nothing would be proposed by me if I should by chance speak to her about it. But if that great Remedy for a vitiated *Diapnoe* or Transpiration, to wit, change of air, should be repeated, they should not go any more into *France*, but into *Denmark* or *Sweedland*. Part I.

It will be very apposite to this business to discourse a little of the English Sweat, sometimes past peculiar and very deadly to our Countrymen, both at home and abroad. But this Disease hath not been seen in an Age, and that an example of it hath been made known to us only by the writings of others, we shall not go about to raise any *Hypotheses* about its nature and causes, but after having described its History out of Authors only propose by way of commentary our conjectures. *Of the English Sweat.*

The English Sweat began in the Year 1485 about the beginning of *August* and lasted to the end of *October*; and although *Sennertus* said that this evill was familiar and continual for 40 years one after another to this Region, yet our own Countrymen both Physicians, and Historians, who then lived or neer that time, have observed that it had perfect and great intervals, and that it returned only four times in the space of 66 years, *viz.* 1506, 1517, 1528, 1551, and that it raged scarce above six months at any time, and that there was always a very wet season going before it. But in some of those years in which it raged, it made every where great slaughters, that in some places, every time of its Reign the third part of men were found wanting. So great was its malignity that so soon as it invaded any City, it took away every day five or six hundred, and scarce one hundred of all the sick would escape. *The History of the Disease.*

I think it good to insert here an example of the Disease compendiously and methodically described by *Sennertus*, and consonant to our own Authors. Those who were taken with this Disease, were presently dispatch'd without long languishing, a *Bubo*, Carbuncle, or Pimples, and grew weak in mind with a great *Languor* of strength with unquietness, palpitation of Heart, headach, frequent quick and unequal pulse, with great palpitation of the Heart; and also they flowted with abundance of sweat and perpetually, which ended not till the Disease was at an end which hapned within twenty four Hours. For those who would not be pleased with sweating, nor used Cordials, and who bore the heat more impatiently, and took cold, they all suddenly dyed within twenty four hours. Afterwards when the reason of this Disease became known that the sick were drawn to sweats, and did fortify themselves with Cordials, fewer died. *Sen. de feb. Lib* 4. *Cap* 15. Concerning its cure *Polidor Virgil* writes a little more accurately. After many experiment sand observations taken from things helpful and hurtful to the sick, by use they found out the prompteſt Remedy for every one to be after this manner. If any one were taken with this sweat in the day time, he presently went to Bed with his cloaths on, if in the night and in Bed he then rested quiet, nor moved himself from the place till twenty four hours were past; in the mean time, he cover'd himself so with cloaths that the sweat might not be provoked, but that it might still forth of its own accord softly, he took no meat if he were able to fast so long nor any more of drink he was accustomed to, and that warm, than might be just enough to extinguish thirst, in this cure the chief thing was that he did beware of taking cold, or so much as to put his hand or foot out of the Bedcloaths for a little air, for to do it was deadly. Others added that in the whole twenty four hours space he was to abstain wholly from sleep. This Disease because it was wont in so short a space to terminate in Life or Death was called by the Physitians an *Ephemera* or Fevour of a days space. Those who recovered from this pestilent Sweat, after they had sometime continued well, sometimes fell into it again, yea sometimes a third time. *An example of the Disease out of* Sennertus. *Its Cure described.* *Out of* Polidor Virgil.

That we may presume to deliver a Reason of this dire Affection from these *Phænomena*, let it first be lawful for us to suspect the formal Reason and also the conjunct Cause of this pestilent *Ephidrosis* to consist in this, that the Blood being infected with the meeting of a certain malignant or venomous matter, and for that cause being presently dissolved in its *Crasis* and fused into serosities, therefore for the most quick expulsion of this virulent Mixture it is resolved into Sweat as the most universal and most ample manner of excretion; whereby indeed if perchance it hapned by this secretion that all the venomous Particles were presently driven forth adoors, the Disease presently terminated in health; or otherwise, very frequently in Death. *The Season of it inquired into.*

But next to it ought to be inquired into whether this malignant matter is begot

Part I.

got first in the Blood, or poured into it from some other place. If it be said the former it will be supposed, the Mass of Blood to have acquired an unquiet putrefactive *Diathesis* even as in the Plague by reason of a malignant Constitution of the Year and Air; which afterwards breaks forth either of its own accord, when it is brought to a plenitude, or by contagion, as it were enkindled into a dangerous and ofttimes corruptive Turgescencie, but I cannot suspect the business so in this malignant Sweat, as this in the first place shews that no signs of a corrupt or much vitiated Blood occur before in or after the Fit. For besides that this Fevour not very intense wants Spots, Pimples, Buboes and other Marks of an envenomed or very much fermenting Blood, moreover it is terminated in a Night and a Days space, which scarce ever is wont to happen in Diseases deeply radicated within the bloody Mass.

The primarie Cause.

In the nervous Juice.

Wherefore I am rather led to believe the evil of this Disease to be primitively founded in the nervous Liquor, and from thence to be communicated to the Blood whilst it performs the Tragedy of that malignant *Ephidrosis*. For it seems that this Humour, watring all the Fibres of the whole Body, and being the Vehicle in all places of the animal Spirits, by reason of the intemperateness of the Year leaving its due *Crasis*, to wit, a volatile saline Spirit degenerates into an acetous Nature, or some more vitious and at length malignant Disposition; and as this comes to that state of Depravation, then either of its own accord by reason of plenitude or excited by reason of the Ferment of Contagion, it conceives a turgescency or Flux being shaken forth from those irritated parts, and flowing back into the sanguineous Mass, it presently impoysons the whole, and dissolves its joynting, and by and by that it might be expelled it incites into that very great eccritick Effervescency. Hence copious Sweats (because this is the next and most ample way of excretion) break forth; by which extream strugling of Nature if perchance it happens that the whole Poyson be sent forth again from the Blood into the habit of the Body, and thence cast forth every where by an universal, and for a while continual *Ephidrosis*, Health quickly shines forth as fair Weather after the Clouds are wholly discussed; but if by that fermentation, and endeavour of Secretion into which the Blood is stirred up, for the sake of expelling the malignant *Miasma*, the venomous Particles are not suddenly and wholly cast forth, the Mass of Blood both in a manner deprived of the *Serum*, and undone in its *Crasis*, not being able to be longer continued to a vital Flame, it vanishes.

The reason of the Symptomes.

From these it is not hard to give the reasons of its Empirical Cure and to assign the Causes of the Symptoms. For that the Disease being urgent, or about the beginning of its assault before the Fevour seems to be inkindled, presently an unwonted Languor, a defection of the Mind, an utter overthrow of strength, pain of the Head, Palpitation of the Heart, with a quick, frequent, and unequal pulse, and other affections of the nervous kind did infest the sick, it was a sign that the nervous Parts were affected before the Blood, and that from them that evil deduced its original.

2. As a more copious Sweat (which was sometimes both symptomatick and also critick) did arise about the beginning of the Fevour being otherwise in many others, the reason is, that the morbifick *Latex* or Water redounding from the Fibres and nervous Parts into the bloody Mass, for that cause it is presently at its first approach cast forth, nor suffered to stay any longer or to be intimately mingled with the Blood. For indeed in a state not very unhealthful, the nervous Liquor scarce ever agrees with the Blood: wherefore if at any time by certain turns that does flow back into this, it is by and by shook out again; and before it is infected with a lixivial Tincture being sent away by the Reins excites a flood of Limpid Urine, which we have informed you to happen indeed often in Convulsive Affections. But if the degenerate, or depraved nervous Liquor doth continually flow into the Blood, it produces sometimes the unbloody Dysentery, such as we have already described, sometimes the *Diabetes* as we formerly shewed. But by reason of the lesser and private restagnations of the same Humour, we have formerly shewed that cancrous, running, scirrhous, or knotty, and other Tumours of an evil kind do arise. But indeed in the Disease we now speak of, that nervous Liquor is truly so very malignant and pestilent that at the first touch it empoysons the Blood, and fuses it into serosities,

From the like case out of which this Disease springs, the unbloody Dysentrie and the Diabetes arise.

to

to be sent away quickly by Sweat; for otherwise if it were permitted to stay in the bloody Mass for a few Hours and to circulate and be thorowly mixed with it, it would wholly corrupt, and plainly mortifie it. Hence in that method of curing, there is so great Caution found by frequent experience, that from the first assault of the Disease, the Sick immediatly (not staying whilst their Cloathes may be pulled off and put into Bed) being covered with bed Cloathes are put to Sweat, and continue for 24 Hours an equal *Ephidrosis* excited in the whole Body, and are not suffered in the mean time to stir neither Hand nor Foot, nor to take food nor sleep; that is they may do nothing whereby that pestilent *Latex* may be any more, or intimately mixed with the Blood, or whereby its most quick and total exclusion might be hindred. That if this kind of quick plentiful and equal Sudation stirred up by the instinct of Nature, and regulated by Medicine may be so long continued, that the whole Poyson may exhale thorow the Pores of the Skin, the afflicted presently grow whole without any cutaneous breakings forth, gentle Feavour, long Infirmity, nightly Sweats and other Consequences of Vitiated Blood. But for as much as the nervous Liquor after its corruptions so purged forth, is apt to be depraved again after the same manner, and so being moved by reason of plenitude or contagion to redound from the nervous Parts into the Blood and in like maner to impoyson it; therefore some after they have been perfectly well have usually been taken a second time, yea sometimes a third with the same Disease. There will be no need to add any forms of Medicines in this Case, because the whole business of the Cure, almost wholly depends on the right ordering or administring of the Sick. Besides it would be very impertinent to prescribe Physick, and a method against so unwonted a Disease which we hope will never return again, and if that it should ever return hereafter, it is uncertain whether the same way of curing ought to be observed in all things.

Part I.

Why those who are recovered from this Disease are obnoxious to fall into it again.

Part I.

SECT. VI.

CHAP. I.

Of Cardiack and Alexiterian Medicines or Cordials and Antidotes againſt Poyſon.

Cordials and Antidotes againſt Poyſon were always of common uſe.

IN ancient Medicine, and alſo in our yet Vulgar and Empirical, which old Women and Quackſalvers exerciſe, Medicines called Cordials and Antidotes againſt Poyſon were always of moſt publick uſe and of a great Rank. The ſimples of theſe are moſt numerous, their Compoſitions add to the heap, and almoſt fill all the Pages in all the Diſpenſatories both Ancient and Modern. But what has reſpect to the reaſons of their Effects and the way of operating, *viz.* upon what kinds of Particles their Virtues depend, and by what affection either of the Heart, or Blood, or Spirits, or of the other Humours they exerciſe their Powers, concerning theſe I ſay, I find nothing ſaid by Phyſitians or Philoſophers which might at any time ſatisfie a Mind deſirous of Truth. For the unfolding the Virtues of Cardiacks, they do not as in the other part of medicinal Cure inſiſt upon the ſenſible and manifeſt Qualities, but they run to the Occult and Specifick, yea to the Actions of the whole ſubſtance; In the mean time if the thing be attentively conſidered, and the true and genuine Reaſons of it be ſearched out, it will eaſily appear, that the notion it ſelf of a Cardiack Remedy is very unfitly framed, and is but a vulgar Error.

Their vulgar Attributes.

The Cardiack Remedies are eſteemed to be of that ſort, which ſuccour the Heart labouring after any manner of way; wherefore it is every where ſaid in Authors theſe do notably comfort the Heart, that keeps the Heart unhurt from all putrefaction, yea others relieve the weak or oppreſſed Heart, Cure its fainting, or trembling, and preſerve it from Corruption. Moreover becauſe in the Peſt, Small Pox, and malignant Fevours, it is believed that the Heart is corrupted or beſet with Venom or malignity, therefore Remedies, which are wont to give help in thoſe ſickneſſes, are not only called ſimply Cordials but *Alexiterions* and *Alexipharmacas* that is Preſervatives or Antidotes againſt Poyſons.

From whence remedies which defend life are called Cardiacks.

This opinion both of Cardiack and Alexiterian Medicines, ſeems to have riſen from thence, for as much as in times paſt it was thought and is commonly believed, that the Heart is the beginning of all Life and Heat, and for that cauſe that our Life or Death depends upon its immediate Affection: Hence whatſoever things do refreſh the Soul and make us lively and chearful, they are believed to do that, for as much as they are benign and friendly to the Heart; and on the contrary, others to induce ſadneſs and melancholy, for as much as they are enemies and incongruous to the Heart.

Theſe do not act properly on the Heart.

But indeed when as we have ſhown more largely elſewhere, that the Heart is not the ſubject of Life, but that it is chiefly and almoſt only the Blood, and that the Soul it ſelf (upon whoſe exiſtence and action of the Body, Life depends) is founded partly in the Blood and partly in the heap of animal Spirits, it eaſily follows that the Remedies which conſerve the Life whole, or reſtore it being in danger, do reſpect theſe parts of the Soul, to wit, the Blood and the animal Spirits, rather and more immediately than the Heart: For this is not ſo noble and principal an Inward as it hath been hitherto eſteemed, but a mere Muſcle conſiſting only of Fleſh and Tendons, after the manner of the reſt, and ſerving for the driving about of the Blood: But as often as it is deficient or wanting in rightly performing this Office, this is not its proper fault, but happens by the evil either of the Blood or animal Spirits by which it is actuated. Therefore

Therefore that the reaſons and manner of working of Medicines which are called Cordials may be known, it behoves us to conſider theſe two things, *viz.* Firſt, by how many or by which ways chiefly, the Blood being amiſs as to its inkindling, or as to its mixture, and not ſeldom being in danger, requires helping Medicines, by which it may be preſerved or amended. Secondly, by what means the Heart, by reaſon of a defect or fault in the animal Regiment, is hindred or perverted from its due motion, and wherefore Medicines which plentifully increaſe, and more rightly compoſe the Spirits, are preſcribed.

Part I.

But in the Blood and animal Spirits.

As to the Firſt, the Blood in reſpect of its accenſion either is deficient or exceeds; and in either reſpect divers manner of Medicines, to wit, hot or cold, as it were, Oyl or Water are required; and therefore they are commonly called Cordials, although they affect not at all the heart: For although from theſe being taken the motion of the Heart is oftentimes altered, and for that reaſon the Pulſe becomes preſently quicker or ſlower, ſtronger or weaker. Yet this is made ſo, becauſe the motion of the Heart depending altogether upon the in-flowing of the animal Spirits (by a wonderful conſent and cooperation between either part of the Soul) is exactly proportionated according to the accenſion or inkindling of the Blood: Wherefore as the Blood intends or enlarges, or remits or leſſens by taken in Medicines its effervescency or heat; of a ſudden the animal Spirits which agitate the Heart, obſerving exactly its condition, make the Heart to ſhake quicker or ſlower, and ſo if from the ſame Medicine a *ſyſtaſis* of the animal Spirits be effected, therefore alſo a greater or leſs ſtrong or vehement Pulſe is cauſed, when as in the mean time the virtue of that Medicine reaches no more to the Heart it ſelf, than to the Hand or Foot or to any other Muſcle: Therefore that the firſt claſs of Cardiacks whereby the enormities of the Blood are healed, may be inſtituted, it will behove us to weigh by how many, and by which ways its Liquor is wont to be perverted and depraved, both as to its accenſion and as to its *Craſis*, then what kind of Remedies commonly eſteemed Cardiacks, are required for every one of its evils.

How in the Blood.

In the firſt place therefore, the Blood ſometimes is not enough inkindled, nor is circulated with vigor, as is obſerved in many languid perſons, to wit, ſuch as linger with a long egritude, or ſuch as have had great flowings of the Hemorrhoids, or other immoderate Evacuations, or broken with old Age; alſo in ſuch who are very pale and cold in their extreme parts; with a weak Pulſe and decayed ſtrength. The Reaſon of which is, for that the Blood by reaſon of the ſulphureous Particles being too much conſumed or depreſſed, becomes almoſt vapid and decayed; and from thence is ſo very ſparingly and ſmally inkindled in the Lungs: To which oftentimes is added, that the animal Regiment alſo flagging or growing weary, the Heart being deſtitute of a more full influx of Spirits, does not enough exagitate the Blood, whereby it might more lively ferment, and be inkindled.

The Blood offends as to its accenſion and Craſis.

1. When it is leſs inkindled than it ought to be.

The Remedies to be given in this caſe are generous Wines, Hot Waters, or more mild diſtilled with Spices, aromatick Powders, Species, and Confections, Chymical Oyls and Spirits, Tinctures, Elixirs, and other things endued with ſpirituons and ſulphureous Particles, which do more agitate the Blood, and render it more inflammable and turgid; and as they together raiſe up and comfort the animal ſpirits; therefore they make the Heart to beat more lively and ſtrongly. The Forms of theſe are ſet down at the end of this Chapter.

What Remedies are preſcribed.

Secondly, oftentimes the Blood by reaſon of ſulphureous Particles, too much ſoluted and conſtrained into an effervescency; is inkindled more than it ought to be, and diſperſeth too ſtrong an heat and very tronbleſome through the whole Body: Wherefore that it ſo very much rarefied and flaming forth, may be contained, and at the ſame time fanned within the Veſſels, the Heart ſtriking vehemently and ſwiftly, drives about the Blood with great labour and ſtriving: Therefore in this caſe there ought to be adminiſtred cooling and temperate Cardiack Remedies, which may quench and allay the fervor of the Blood, and alſo gently refreſh the animal Spirits whereby they may be able to be more ſtrong to perform the preſent task of Life: To which ends are wont to be uſed diſtilled waters of Burrage, Balm, of Couſlip Flowers, Marigolds, the Rinds of the whole Citron, alſo the Syrups and Conſerves of the Flowers and Leaves of the ſame kind of Vegetables, the juices of Sorrel, Citrons, Oranges, mineral Cryſtal, and ſuch like, to which Opiates are very often joyned with ſucceſs; for the force of the Heart

2. What alſo when too much inkindled.

Part I.

being ſomewhat reſtrained, the Blood more eaſily and ſooner remits its effervescency.

2. The Blood offending as to its Craſis or mixture, requires only Cardiacks in Fevers, and when

These are the more ſimple Cardiacks, which are deſigned to effect only one intention, to wit, the raiſing up or the depreſſing of the ſanguineous Flame. But moreover the Blood is not only wont to be depraved and diverſly perverted as to its inkindling, but alſo as to its mixture or *Craſis*. But yet Cordials are not preſently required to all its dyſcraſies, but only in thoſe which being excited in Fevers when they are ſudden and very great, do threaten a total corruption of the Maſs of Blood.

It is either too ſtrict in its joynting,

1. The Blood growing feveriſhly hot, is indangered as to its *Craſis* chiefly two ways, to wit, either the band of its miſtion is too ſtrict, ſo that all its Particles are complicated within themſelves, and are mutually combined ſo as the unprofitable and excrementitious cannot be extricated or ſeparated from the profitable, and the thin from the thick; as happens in ſome continual and putrid Fevers, which although they are little or nothing malignant, yet becauſe they are not able to be judged upon by ſweat or tranſpiration, they ſometimes are terminated in death: Wherefore in this caſe they are preſcribed for Cardiacks, which unlock and open this joynting together of the Blood, to the end that the ſerous *Latex* with other recrements, may abſcede and be ſent away from the concretion of the reſt.

Or too looſe.

2. The *Craſis* of the Blood is beſides in danger to be ſubverted by another and quite contrary way in Fevers, and for that reaſon other kind of Cardiack Remedies, *viz.* *Alexipharmacas* or *Alexiterians* are preſcribed: For truly it often happens that its joynting together is too much laxed, and as to its *Craſis*, torn aſunder by heterogeneous Particles, either begot within its own proper boſom, or elſe poured in thither from ſome other place, ſo that the common bond of its miſtion being looſened, it goes away every where into parts, and then portions of the coagulated or extravaſated, and ſtagnating Blood being fixed here and there, begin to putrefie and corrupt, and at length the whole ſanguineous Liquor becomes ſo much vitiated, that it is not fit any longer to continue the Flame, or for the animal Spirits diſtilling into the Brain: Wherefore there will then be a neceſſity for all its functions by degrees to flag, and laſtly, Life to be deſtroyed.

What Remedies the latter Evil requires.

Cardiacks in this caſe moſtly requiſite, conſiſt of thoſe kind of Particles, which being carried into the Blood and circulated with it, are however untameable, yet benign: Wherefore whilſt they enter into all the paſſages and pores of the bloody Maſs, they every where agitate the other malignant Particles, pull them from their concretions, and at length either overcome them, or thruſt them forth adoors. And ſo, as the Blood being freed from that empoyſoned mixtion, and alſo delivered from all the private Coagulations, is torn again into very ſmall and elementary Particles, it recovers quickly its priſtine and healthful mixture.

Viz. *Alexiterian.*

Indeed that it may better appear by what means Alexiterians do conſerve the Blood and juices of our Body from peſtiferous blaſts, or defend them being already touched by them from putrefaction; it behoves us to ſhew how other Liquors obnoxious to putrefaction, are preſerved a long time, or being corrupted may be reſtored again.

How theſe defend the Blood from putrefaction.

Therefore it is obſerved of Beer, that it being apt of its own nature to grow ſower, is made durable by the boyling therein the flowers of the Hop; yea, that common Water, when it otherwiſe quickly putrefies, being impregnated by the boyling or infuſion of bitter Vegetables, (of which ſort alſo Alexipharmacks are made) continues a long time uncorrupted: Beſides that the juices of Herbs and ſome other Liquors being already putrefied, if that they may be fumigated by the burning of Sulphur, will recover their priſtine vigor. Moreover, that Wines, Beer, and other kinds of Drinks, being almoſt vapid and dead; being anew ſtirred by a fermentation within them do often revive: The reaſon of which is, for that as the corruption of every thing conſiſts in the looſening of the elementary Particles and their going away one from another, whatſoever detains them, tending to flight and confuſion, yet in motion and perfect mixture, preſerves that Concrete whole and ſound. Further, if any thing in like manner compels together the Elements being looſened, and mutually about to go one from another, and ſtirs them up into a new fermentation, it drives away putrefaction from the

Concrete

Concrete although begun, and gives to it again a firm Conſtitution. Theſe kind of alterations and preſerving Liquors by art from Corruption, is known by every Plebean; and indeed in the Plague and malignant diſeaſes, Alexipharmacks ſeem to perform the ſame effect: For theſe being often taken, for as much as they continually agitate the Blood. and compel it into an higher fermentation, they conſerve its mixture whole, notwithſtanding the influences of the hurtful *miaſmata*: Yea after the malignity being impreſſed, and the *Craſis* of the Blood after the aforeſaid manner, being begun to be laxed and looſened, theſe ſort of Remedies being given even to a moving a *Diaphoreſis*, for as much as they decoct the *Miaſmata* of the received infection, and induce a new fermentation oppoſite to the other corrupt one, they oftentimes obliterate the impreſſions or the force of the peſtiferous infection. The kinds and forms of theſe ſort of Alexiterian Medicines, are ſet down hereafter. Part I.

In the mean time, as to what reſpects theſe other Cardiacks, by which the too ſtrict joynting of the fermenting Blood is looſened and unlocked, for the ſending away the the ſeveriſh matter and other Excrements, that the vertues and means of the operating of theſe may be better known, what we have above ſaid concerning the energies of Diureticks and Diaphoreticks, ought to be referred hither. For in truth, thoſe Medicines are of a very near kin to ſome Cardiacks, yea are ſometimes of common or reciprocal uſe, for as much as ſometimes the vitiated *Craſis* of the Blood cannot be relieved, unleſs that firſt its joynting being unlocked, there be a way laid open for the ſending away the ſerous water by the Reins or the Pores of the Skin. Salines do beſt of all perform every of theſe ſcopes of healing: For as we have oftentimes already noted, the opening of every Body both liquid and ſolid, is effected almoſt only with a ſaline Key. *What ſort of Cardiacks are preſcribed in the too cloſe joynting of the Blood.*

We have experimentally declared in the Chapter of the *Diureſis*, how by reaſon of the various infuſions of Salts, the coagulation of Milk and its reduction from that ſtate or inhibition are performed, and what analogy they have with the Blood; even as in Milk and in the fluid Blood, ſo likewiſe is it in fixed Metals, and other Minerals: For the Concretion or Compaction almoſt of every thing is from the ſalt of one kind, the diſſolution by ſome of another, which ſnatches into its embraces the firſt Salt, and ſo a precipitation is made by ſome Salt of a diverſe kind whhich deſtroys the combinations of the former. We have before declared theſe things ſo clearly and largely, that there will be no need to repeat them here. That therefore we have placed Salines in Cardiacks, no leſs than in Diureticks and Diaphoreticks, the ſame reaſon is for all: It now remains that we briefly ſhew what are the chief *ſpecies* which belong to that Rank or Cenſe of this kind, and the reaſons and ways of their operating. *They are chiefly ſalines and of a diverſe kind.*

1. In the firſt place therefore, Cardiacks endued with a volatil Salt, offer themſelves and carry away the palm from many others, as the ſpirits of Harts-horn, of Salt Armoniack, Compounds, *viz.* of Amber and Treacle diſtilled from the Roots of the *Virginian Serpentaria*, and other Alexiterians, alſo what was the only and univerſal Medicine of a late Doctor, a Phyſician going over to the Empirical Sect, the ſpirits of dead mens Sculls dug out of their Graves. Hither alſo ought to be referred the Salt of Vipers, alſo the powder of Toads cloſely calcined, (which I knew very famous and beneficial formerly, in the epidemical peſtilential Fever at *Oxford* in the Year 1643.) with many others. Theſe ſorts of Remedies have called back many from the very jaws of Death, and indeed they are often very beneficial in a diverſe and manifold reſpect, *viz.* Firſt, for as much as they open the maſs of Blood, too much thickened and ſtraitned by a feveriſh effervescency, by meeting with the fixed or acid Salts, and ſnatching them into their embraces; and ſo they promote a ſeparation and excretion of the morbifick matter, both beſides that they relieve the animal Spirits, and ſtir them up when ſlothful to the performing their duty. To which we may add, that theſe Medicines in malignant Fevers do overcome, and not rarely extinguiſh the venomous Particles of the morbifick Matter. 1. *Cordials endued with a volatil Salt.*

2. The ſecond place among ſaline Cardiacks, ought in right to belong to Remedies endued with an Alchaliſate or petrifying Salt, for theſe are eſteemed commonly famous Cordials. Of theſe ſorts are the *Bezoar*, Stone, Pearls, Corals, the bone from the Heart of a Stag, the Horn of the ſame Beaſt, the powder of an Elephants Tooth, the Eyes and Claws of Crabs, and other ſtony and ſhelly Powders, 2. *Which are powerful in an Alchal or petrifying Salt.*

Part I.

ders, which common Experience witneſſes to be very often given with ſucceſs: And the reaſon of the help ſeems to conſiſt in this, that the Particles of the Alchal Salt in the Medicine, meet with the Particles of the acid Salt in our Bodies, and by and by they intimately joyn together, and ſo deſtroy their fierceneſſes, and any other wicked combinations. To the claſs of theſe ſort of Cardiacks alſo *Bolus Armenius*, Lemnian ſealed Earth, and other Marls are deſervedly ranked, not therefore however, that they ſuccour (as the vulgar ſay) the ſick Heart, but for as much as they deſtroy the powers of the acid or fixed Salt, either in the *Viſcera* or in the maſs of Blood, and preſently allay or correct the enormities produced by them.

3. *In a fluid or acetous Salt.* 3. If I ſhould exclude from this Rank of Cardiacks acetous Medicines, or endued with a fluid Salt, the Authority almoſt almoſt of all Phyſicians, and eſpecially of the Ancients, would riſe up againſt me: For theſe for the moſt part are eſteemed famous Alexiterians againſt the Peſtilence. For the curing of malignant Fevers, Theriacal and Bezoartick Acetes are highly cryed up, yea Vinegar or acetous things are put into waters diſtilled for that uſe. For the ſame reaſon the ſpirits of Vitriol, the juices of Citrons, of Pomegranates, of Wood-ſorrel with many others of the ſame kind, are eſteemed in the number of Cordials and *Alexipharmacons*; and indeed by good right, becauſe theſe do beſt of all diſſolve the combinations of the fixed Salt with the aduſt Sulphur, and overcome their fierceneſſes; and therefore by theſe ſort of Remedies, the coagulations and extravaſations of the Blood that are wont to happen in malignant Fevers, are often prevented or cured.

4. *In a fixed Salt.* 4. For the ſame or the like Reaſons, by which the aforeſaid ſalines, others alſo whoſe *baſis* is a fixed Salt, are numbred with Cardiacks, or are put into their compoſitions: For that as divers ſorts of Salts are begot in our Bodies, and that they paſs every where from one ſtate to another; hence it is that they ought to give for every intention, ſalines not of one but of a diverſe kind. By what reaſon thoſe endued with a fixed or lixivial Salt, take away or correct the enormities of the acid Salt reigning in the *Viſcera* and the Blood, we have ſhown before.

5. *In a nitrous Salt:* 5. Salt Nitre by good right is ranked with Cardiacks, ſeeing that without its Particles inſpired with the Air the Life of Animals could not ſubſiſt: But this being taken inwardly at the Mouth is eſteemed a famous *Antepyreuticon*, for as much as it takes away the thirſt, and greatly allays the feveriſh heat, which notwithſtanding it effects, not only by helping the miſtion of the Blood but alſo its accenſion or enkindling. We have elſewhere ſhewed, that for the making of flame, together with the ſulphureous Particles, nitrous are required, and by how much more plentiful they are, the more clear and bright it burns. Wherefore when the matter enkindled, which conſiſts for the moſt part of Sulphur, with Salt and Earth mixed together ſends forth but an obſcure flame vitiated with Smoak and Soot, if that Nitre be caſt in, it preſently becomes ſplendid and temperate and ſhines forth with a brightneſs. In like maner we think it to be in Fevours when the Blood, being ſtuft with aduſt Feculencies, fumes forth with a ſuffocating heat, rather than openly flames forth, Particles of Nitre being taken in at the mouth, and carried into the blood, by and by make it to burn more clearly and is therefore beneficial or benign: to the end that the joynting of its liquor being more opened, its excrements both ſerous and fuliginous may go away freely. Wherefore our *Verulamius* truly obſerves that the Particles of Nitre being carried into the Ventricle and alſo inſpired together with the Air conduces very much to the maintaining and the prolonging of our Life.

Theſe are the chief kinds of Cardiack Medicines, whoſe operation is chiefly upon the Maſs of Blood, whoſe cloſe or too ſtrict joynting, and thickning by continual concoction, they ſomewhat looſe and open, that there may be a way opened for the morbifick matter: or they hinder the Blood from putrefaction being diſſolved by an heterogeneous and malignant mixture, and broken into venemous portions and therefore obnoxious to ſtagnations, and corrupt Coagulations; for as much as the Particles of theſe Cardiack Alexiterions being carried into the Blood, and confuſed with it, in the circulating notwithſtanding not being aſſimilated by it, or overcome, they every where riſe againſt the venomous Particles, and either overcome them, or expel them forth adoors; to the end that the bloody Maſs being

ing freed from all malignity, and extricated from all coagulations, might quickly recover its priſtine Diſpoſition. Both theſe medicines for as much as they preſerve the Blood from corruption, or extinction, are commonly called Cardiacks but may be more properly Vitals. Part I.

The aforeſaid Remedies are rather to be called vitals.

But if it be further inquired into, how theſe, or thoſe being put into the Ventricle, without any notable action, or paſſion there ſtirred up, do ſo ſuddenly transfer their Energies almoſt unmixed into the bloody Maſs: I ſay in the firſt place, that theſe Medicines, are by no means adverſe or contrary, but very congruous or agreeable to the Animal Spirits; wherefore they do not irritate the nervous Fibres of the Ventricle neither into a ſenſe of Grief, nor into excretory Motions; but rather provoke the Spirits inhabiting them into a certain Ovation or Complacency, by whoſe undulation preſently the whole Soul is expanded. Then in the ſecond place the paſſage from the Ventricle into the blood is not, as hath been formerly thought, ſo long, or is carried by ſo many *ambages* or turnings, and windings, that there ſhould be any fear leſt the virtue of the Medicine ſhould be loſt in the way; but in a moment is carried from the ends of theſe into thoſe: For as we have obſerved above, innumerable ſanguiferous Veſſels thickly planted do cover the interior nervous Coat of the Ventricle, by which reaſon not only cathartick Medicines, but whatſoever others being deſtinated for the *Præcordia*, or the Brain, yea for the uttermoſt border of the Body, not being yet gone forth from the Ventricle, do begin their operations in the blood.

How theſe being put into the Ventricle, do by and by operate upon the Blood.

So much for Cardiacks ſo commonly called for that they reſtore the Blood being depraved as to its accenſion or mixture, to wit, either of them or both of them together, or reduce it to a better *Craſis*. Whoſe operation and vertue, as it brings ſuccours to the endangered Life; they (as we have hinted) rather may be more properly termed *Vitalia* or Vitals. But moreover ſome Medicines, that are known by the name of Cordials, for as much as they firſt and more immediately ſhew or exert their Energies upon the Animal Spirits, and ſo they erect, vigorate or compoſe either ſome portion, or the whole *Hypoſtaſis* of the ſenſitive Soul being too much contracted, depreſſed or otherwiſe diſturbed. And indeed theſe ſorts of Remedies do as it were, although more remotely, affect the heart it ſelf: For that when from theſe being given, the whole ſenſitive Soul is elevated, and more largely expanded, alſo the ſpirits deſtinated for the *præcordia*, do flow into them more plentifully, and actuate them more lively; and therefore the Pulſe before weak and flagging, preſently ſtrikes more ſtrongly, and the Blood is driven about with a greater force. Theſe ſort of Medicines being eſteemed by a certain right for Cardiacks, do not much differ as to the matter from other Vitals, chiefly reſpecting the Blood: Yea ſome of them are common to either kind. As to the means of affecting theſe latter, may be aptly reduced to two heads, and for as much as they are either gentle or ſharp, they follow the ſame ſcope, to wit, they either ſet up and confirm as it were by gentle ſtroking and ſoft handling the animal Spirits, or elſe by vexing them and urging them as it were with prickings or Goads, they compel them to more quick and ſometimes to more regular motions,

2. *The ſecond kind of Cardiacks which reſpect the Animal Spirits.*

Theſe are of a twofold kind.

The Cardiacks of the former kind aſſoon as they are entered into the Stomach, yea ſometimes as ſoon as taſted in the Mouth, do put forth their Virtues, and with a grateful approach cheriſh the Spirits dwelling in the firſt paſſages, or as it were the Porch of the Body, or reſtore them; then by their continuity, the ſame rejoycing being delivered over ſucceſſively to other Spirits, and from them to others, it preſently waves thorough the whole chain of the Senſitive Soul; ſo that both the Brain and the *Præcordia* being irradiated by a more full influx of as it were rejoycing Spirits, they perform much more briskly and more chearfully the duties of their Functions. For this end (having a care of a too great incitation of the Blood) they make waters commonly called Cordial Waters diſtilled with Wine or winie Spirits, and with Spices; alſo prepared with Musk and Amber Griſe. Alſo Aromatick Pouders mixed with the ſame. Beſides hither belong the magiſteries of Corals, and Pearls, and Tinctures, alſo Elixirs, and very many others of the ſame kind breathing forth a grateful ſcent or odor: hence alſo ſweet ſmells, and pleaſant ſights for as much as they recreate the animal Spirits are numbred among Cardiacks: for whatſoever doth gently affect and delight the Spirits preſiding in every Senſory, doth by and by raiſe up and amplifie

1. *Gentle ſtrokers of the Spirits.*

Which ſort do ſtir up an effect either preſently in the Viſcera, *or in the Senſories.*

Part I.

amplifie the whole Soul. In the mean time, other Cardiacks of this Rank without any great affection of the Spirits placed in the entrance, yea the first passages and mass of Blood being almost unsaluted, are perceived to operate first within the compass of the Head: Of which sort are certain Cephalicks so called, which when as they are not grateful to the Palat or Ventricle, and do scarce ferment or stir the Blood; yet they illustrate the Brain, and sharpen and corroborate the animal Spirits dwelling in it. Of this kind seem to be Sage, Betony, Rosemary, Vervain, with many others.

Or at length in the compass of the Brain.

2. Certain other Medicaments and kinds of Administrations, (which are not undeservedly ranked among Cardiacks) do operate after a different manner, and for that reason bestow quite another help; to wit, these do not gently stroke the Animal Spirits, and make them to be equally expanded; but they rather irritate and compel them to run and be carried forth hither and thither for that end, when that they being before out of order and dispersed unequally; they abound in some places more thickly and in others more thinly; and therefore intermit or perversly perform certain Duties of their functions, and chiefly within the Brain or *Præcordia*: Then the best Remedy is that they be then disturbed, and more agitated by an ingrateful Medicine; wherefore they being stirred up by inflicted Stripes, as it were whipped, leave their former irregularities, and of their own accord return into regular orders: For so it is a usual thing in swoonings, Syncopes, Oppression or Convulsion of the Heart; yea almost in all other Irregularities, Languors, and Faintings away of the Spirits, to give Spirits of Harts Horn, Soot, *Sal* Armoniack, or the tincture of *Castor* or *Asa fœtida*, with other Liquors. These and the like, as volatil Salts and empyreumatick or strong smelling Chymical Oyls to put to the Nose, is expedient, as also in sudden defections of the Soul, to sprinkle cold water on the Face, to shake very much the Body, to pull the Nose, and sometimes to strike or buffet the Body, avails. These kind of Administrations bring help, for as much as they stir up or exsuscitate the Animal Spirits oppressed or distracted, or doing some other thing besides their proper Office, and then command them being expansed, and as it were, set again into order, to their former Offices. But that some suppose that help to proceed from hence, for that the Blood being hindred somewhere in its course, and stagnating chiefly within the *præcordia*, brings forth the aforesaid affections, and is restored into motion by those Remedies and means of Administrations: I say, that the cause of those Affections and the Cure, depends only secondarily and mediately upon the Blood: But that firstly the stagnation of the Blood proceeds from the animal motion of the Heart being stopped, and that the impediments of that are not to be taken away, but by the restitution of this. The various kinds of Medicines esteemed for Cardiacks being now rehearsed, and their manner and ways of working on the Blood or Spirits, or both of them together, being (as I think) rightly drawn or designed, it yet rests that we put down some select Forms of them, appropriated by Physicians to every one of the aforesaid Intentions.

2. Or these Cardiacks are asper and irritating.

Which compel the Spirits as it were by whipping them into order.

CHAP.

Part I.

Chap. II.

Kinds and Forms of Cardiacks.

BEcauſe we have diſtinguiſhed Medicines commonly eſteemed for Cardiacks into two kinds, *viz.* ſome which chiefly and more immediately affect the Blood, and others the animal Spirits; in their firſt rank we have placed thoſe which are deſtinated for the regulating the enkindling of the Blood, which compel its too cold liquor and ſlow in motion to grow more hot, and being exalted or increaſed with more plenty of ſulphureous Particles, more abundantly to be inkindled and to flame forth: Of which ſort are brisk Wines, ſtrong Waters, diſtilled Compoſitions, Spirits and Tinctures of Saffron, *Elixir Vitæ*, of *Quercetan*, the tincture of ſalt of Tartar, of Steel, and other things filled with Spirit and chiefly with plenty of Sulphur, of which ſometimes theſe, ſometimes thoſe may be taken at the pleaſure of every patient. As often as by reaſon of the Bloods being but little inkindled, and for that cauſe too much heaped up and almoſt ſtanding ſtill within the *præcordia*, a languor and wearineſs of Spirits, with a great oppreſſion of the Heart do infeſt: in this caſe *Aqua mirabilis*, Clove, Cinamon, and Wormwood Waters, compounded with the Rinds of Oranges, and diſtilled with Wine, are convenient. To which is ſometimes added a doſe of ſome Spirit, *Elixir*, or Tincture.

1. Cardiacks increaſing the accenſion of the Blood.

But here is need of great caution, leſt theſe kind of Cordials be ſo often indulged: For I have known many both men and women, by the often uſe of theſe to fall into this evil cuſtom, that they were neceſſitated oftentimes in a day to drink a draught of ſtrong Wine, Spirits, or of ſome ſtrong Waters. Moreover their Doſes (becauſe Nature being little accuſtomed to extraordinaries, doth not long endure their Contents) daily to increaſe, and often to repeat; ſo that at length the Stomach was not able to ſuffer or digeſt any moderate thing, ever expecting ſtronger and hotter things: But ſome *Viſceras* and eſpecially the Liver, are ſo dryed and roſted, that the Blood being waſted as to its proviſion, and depraved as to its *Craſis*, a morbiferous *Cacochymia* or ſhortning of Life follows thereupon.

The abuſe of theſe is deſcribed.

Many and various are the occaſions for which many people are brought into this moſt evil cuſtom of ſipping Cardiack Liquors: For beſides ſudden languiſhings ſtirred up perhaps, by great ſorrow, cruel labour, immenſe Sweats, or ſharp grief; moreover if at any time Aliments not agreeable, do bring a trouble or nauſeouſneſs to the Stomach, or by reaſon of a convulſive *Diatheſis*, a *ſyncope* or inſenſibleneſs ſeems to threaten: Further, for many other cauſes it is a uſual thing to take vinous Spirits or *Aqua vitæ*, though very improperly ſo called, then after ſuch kind of Cordials being often taken, they begin to be agreeable and delightful, by every ſup of them the maſs of Blood being a little more enlarged and more inkindled, it cauſes the *Hypoſtaſis* of the whole Soul to be amplified and invited into a certain rejoycing; which afterwards ſinks down again, but the Soul mindful of that complacency and not content with its preſent condition, at length affects the ſame, and by and by looks earneſtly for the ſame to be taken again: Wherefore for every trouble of the Body or Mind, as ſoon as the Spirits begin a little to flag, a draught of Cordial Waters is ſought for to erect them preſently; and if it be ready at hand it is drunk, and ſo by reaſon of often ſtretching forth the Sails of the Soul to no purpoſe, the fabrick of the Body as of a Ship, periſhes and decays. Nor does this evil Cuſtom grow in uſe with Gluttons and great drinkers only, but ſometimes learned men and very fair and ingenious Women, by often ſipping Spirits and ſtrong Waters, whereby they might the better furniſh and exhilarate the quickneſs of their mind, ſpoyl and very often quite deſtroy their own health. There will be no need to add here any forms of theſe kind of Cardiacks, ſo well and commonly known, it ſeems enough to have here noted the abuſe of them.

Upon what occaſions this is wont to grow Cuſtomary.

Part I.

In the ſecond Claſs of Cardiacks we have placed thoſe which do ſomewhat allay the too great efferveſcency of the Blood, and do a little reſtrain and attemperate its immoderate burning; as diſtilled Waters, acid and nitrous things. &c.

2. *What do allay the too great enkindling of the blood.*

Take of the water of Wood-ſorrel, of whole Citrons, of Strawberries, of each ℥iiij, of the ſyrup of the Juice of Citrons ℥j, of the powder of Pearls ʒj, make a Julep, the Doſe is ℥ij, three or four times in a day.

Julep.

Take of the water of Pippins or ſweet ſmelling Apples, of Rasberries, of each ℥vj, of the ſyrup of Violets ℥j, of the ſpirit of Vitriol *gut.* 12, make a Julep.

Take of Spring water ℔jß, of the juice of Lemons ℥j, of Sugar ℥jß, make a Drink, of which take when you pleaſe ℥iij.

Apozem.

Take Graſs Roots ℥iij, of candied Eringoes ℥vj, two Apples ſliced (or of Corinthian Grapes ℥ij,) the ſhavings of Ivory and Hartshorn each ʒij, of the leaves of Wood-ſorrel Mj, boyl them in ℔iij of Spring water to ℔ij, add to the ſtraining of *Sal Prunellæ* ʒiß, of ſyrup of Violets ℥iß, make an *Apozem*, the Doſe is ℥iij or iiij, thrice a day.

Take of the Conſerves of red Roſes Vitriolat. ℥iiij, Spring water ℔ij, diſſolve it in a cloſe thing and warm, then ſtrain it, the Doſe is ℥iij, at pleaſure.

Confection.

Take of Conſerve of *Oxyacant.* Rob of Rasberries, of each ℥iß, of prepared Pearl ʒß, Confection Hyacinth ʒj, of ſyrup of the Juice of Citron what will ſuffice, make a Confection, the Doſe is ʒß, thrice in a day.

3. *Cardiacks opening the too ſtrict joynting of the blood whilſt that it ferments.*

The third claſs of Cardiacks furniſhes theſe ſort of Medicines, which being deſtinated againſt the evils of the fermenting Blood do unlock and open its ſtrict joynting together, whereby its ſuperfluities may be ſeparated and ſent away. Theſe as they are chiefly and almoſt only Salines, for the multiplicity of Particles of which they conſiſt, they are alſo after a divers manner in the condition of Salts; as for the moſt part their *Baſis* is either Volatile or Alchaliſate, or acid, fixed or nitrous Salt. Some of whoſe forms we will here propoſe.

1. *Of that kind whoſe* Baſis *is a volatile Salt.*

Firſt Cardiacks indued with a volatile Salt are wont to be given profitably both in Fevers in reſpect of the Blood and alſo in ſwoonings and ſudden languors in reſpect of the animal Spirits, according to the following preſcriptions.

Spirits.

Take of the ſpirit of Hartshorn *gut.* 15 to 20, of Treacle water ʒij, let it be given in a ſpoon drinking after it a draught of an appropriate Liquor: after the ſame manner may be given the ſpirits of Blood, of mens Sculls, of Soot or the ſpirit of *Sal* Armoniack compounded.

Powders.

Take of the ſalt of Vipers ʒj, of Cryſtal Mineral ʒij of the powder of Claws compounded ʒiß, mingle it and make a powder, the Doſe is ʒiß to ℈ij, in a ſpoonful of cordial Julep, drinking after it a little draught of the ſame.

Take of the flowers of *Sal* Armoniack ℈ß, of Bezoartick Mineral ℈j, make a powder to be given in a ſpoonful of proper Liquor.

2. *Whoſe* Baſis *is an Alchale Salt.*

Secondly they are chiefly noted by the name of Cordials with the vulgar whoſe *Baſis* is an Alchaliſate Salt or petrifying: as in the firſt place Oriental *Bezoar*, Pearls, Corals, aud other ſtony and ſhelly Powders.

Take of Gaſcoins powder or of Claws compounded ℈j to ʒß, let it be given in a ſpoonful of cordial Julep, drinking after it of the ſame ℥ij.

Take of Oriental *Bezoar gr.* vj to xx, let it be given after the ſame manner.

Take of the powder and of the Claws and Eyes of Crabs of each ʒj, of Pearls and Corals both prepared of each ℈iiij, both *Bezoars* of each ʒß, the beſt Bole Armeniack, Diaphoretick Gold each ℈ij, Bezoartick mineral ʒj, mingle them and make a cardiack Powder, Doſe is ℈j to ℈ij, or ʒj, in a fit Vehicle,

In Pleuriſies what are convenient.

Theſe following are eſteemed moſt proper in Pleuriſies, for as much as by deſtroying the powers of the acid Salt they take away or hinder the coagulations and extravaſations of the Blood.

Take of the pouder of a wild Bores Tooth ʒß to ʒj, cryſtal Mineral ℈j, of the pouder of the Flowers of Red Poppy ℈ß: make a pouder to be taken in any Liquor. After the ſame manner is given the pouder of Crabs eyes, and of the jaws of the Pike fiſh.

3. *Nitrous Cardiacks.*

Hither belong alſo preparations of Nitre which according to the following Forms, hath been often given in Fevours with ſucceſs.

Take of Mineral Cryſtal ℈j, of the volatile Salt of Hartshorn *gr.* iij to vj, mingle them, make a Pouder, let it be given in a ſpoonful of Cordial Julep.

Take

Take of Mineral Cryſtal, of Diaphoretick Antimony of each ℈j, of Bezoartick Pouder ℈ß, let it be given after the ſame manner. Part I.

4. Medicines whoſe *Baſis* is a fluid or acid Salt, for the unlocking the jointing of the Blood in Fevours, are preſcribed according to the following forms. *Cordials whoſe Baſis is an acid Salt.*

Take of the ſpirit of Vitriol *gut.* iiij to vj, of Cordial Water ʒiiij, of Treacle water ʒij, of the ſyrup of the juice of Citrons ʒiij, of Pearls ℈ß, make a draught to be taken twice or thrice in a day. In the ſame manner may be taken the ſpirit of Salt of Nitre. For the ſame end the drink of Cherbet with Lemons diſſolved in Spring water, alſo the divine drink of the Palm tree are convenient.

Take of the pouder of Hartshorn calcined, or of Antimony Diaphoretick ʒiij, ſpirit of Vitriol or of Salt ʒj. let them be bruſed together in a glaſs Mortar and dryed, the Doſe is ℈j to ʒß, in a ſpoonful of Cordial Julep.

The fixed Salts or lixivials of Herbs are often put into the compoſitions of *Alexipharmacons.* Beſides Medicines whoſe *Baſis* they are, for as much as they are noted, to be very famous *Febrifuges* or helpers in Fevours ought alſo to be numbred with Cardiacks. 5. *What abound in a fixed Salt.*

Take of the ſalt of Wormwood ℈j, of *Carduus* water ʒiij, of the ſpirit of Vitriol or oyl of Sulphur ℈j, of the ſyrup of Violets ʒiij, make a draught to be taken two or three hours before the fit.

Take of the water of the whole Citron, of Wood-Sorrel each ℔ß, of the ſalt of Tartar ʒiß, of the juice of Lemons ʒij, of Sugar ʒß, mingle them, make a Julep, whoſe uſe is in irregular Fevours which have day by day ſharp fits without ſhaking. The Doſe is ʒiij, twice in a day.

The laſt Claſs of Cardiacks, and indeed in ſome reſpect the chiefeſt, is due to Alexiterians, for as much as they are chiefly vitals. The Kinds and Forms of theſe are ſo numerous, that if I ſhould recount every one or the chief of them only, this work would increaſe into a great volumn. And there are already of theſe ſort of Medicines, extant both many & great Antidotaries; therefore we ſhall be very ſparing concerning this matter. Seeing that Alexiterians are either Preſervatory or Curatory; we will in the firſt place ſhew you ſome ſelect Remedies to be adminiſtred to thoſe yet in health, againſt the contagion of every peſtilence or malignity, in the mean time letting alone what is wont to be preſcribed about the cure and alteration of the ambient Air; then in the ſecond place we ſhall give you the ſelect forms of preſcriptions to be uſed after the Contagion is taken. *Alexiterian Cordials which hinder the joynting of the blood being too look from putrefaction are either.*

1. *Preſervatory Antidotes.* 1. *Preſervatories.*

Take of the Conſerves of the leaves of Rue ʒiiij, of Mithridate and *Confect. Liberantis* of each ʒj, *Confect. de Hyacinth.* ʒij, of the ſalt of Wormwood ʒijß, of the pouder of red Cloath ʒß, Bezoartick Vinegar what will ſuffice to make an Elect. the Doſe the quantity of a Cheſtnut thrice a day. *Electuary.*

Take of the Virginian Serpentary roots, of the roots of *Contrayerva*, and of Zedoary picked, of *Species Liberantis* of each ʒij, of Camphir ℈ij, of Sugar diſſolved in Bezoartick Vinegar and boyled to a conſiſtency ʒvj, make thereof according to Art Tablets weighing ʒß, to be eaten one or two often in a day. *Powder.*

Take of the Roots of Virginian Serpentary ʒiij, boyl them in Spring water ℔iij, half away, to the ſtraining add of the beſt Hony ʒij, of Treacle *Andromach.* ʒj, diſſolve it cloſe and hot, and ſtrain it, the Doſe is ij or iij ſpoonful three or four times a day. *Apozem.*

Take of the Flowers of Sulphur ʒiiij, melt them in a Crucible, then put in by ſpoonfuls one after another, of the ſalt of Wormwood ʒiiij, mixing it together till the whole Maſs grows red; then add to it the powder of Aloes, Mirrh, and *Olibanum*, of each ʒj, of Saffron ʒß, work them together for above a quarter of an hour until they be incorporated, the Maſs being cooled and put on a glaſs Plate let it melt into a moſt fair Oyl like a Ruby to ſee to. The Doſe is *gut.* 10 to 20 in Bezoartick water, ʒiß or ij, twice in a day. *Elixirs.*

Or put the ſpirit of Wine rectified upon the roots of Serpentary Virgin. and *Contrayerva* to the aforeſaid Powder, to the height of three fingers breadth, let there be drawn forth a Tincture whoſe Doſe is *gut.* 20 to 30 in a fit Vehicle.

Or take of the ſame powder ʒß, put to it of generous Wine ℔ij, diſſolve it

close shut and warm, the Dose is on spoonful twice or thrice in a day.

Part I. 2. Curatory.

After the Contagion is taken, and the *Crasis* of the Blood vitiated and beginning to be corrupted, the same sorts of Remedies but a greater dose and oftner are convenient to be given, yea both acetous things, and the fixed salts of herbs are very often added with success to *Alexipharmacaes*; by which the Coagulations of the blood are dissolved, and then all the heterogeneous Particles whatsoever being evaporated, and the others being constrained into a due mixture, its Liquor at length recovers and retains its ancient state and condition. For these end as there are extant every where innumerable forms of remedies in physical Books, I think fit only to set down here one or two.

Curatory Antidotes.

A Drink. Take of Bezoartick water ℥ijß, of Bezoartick Vinegar ℥ß, of Treacle *Andromach.* ʒj, mingle them by shaking them in a glass, make a draught, to be taken for provoking sweat.

Powders. Take of Gascoins powder, of the powder of *Contrayerva*, Virginian Serpentary, of each ℈j to *gr.* 25, make a powder, let it be given in a spoonful of Treacle water drinking after it a draught of the same or of a Cordial Julep.

Take of the powder of Tods prepared, of the powder of Claws compounded each ʒß, make a powder, give it after the same manner.

Bole. Take of Bezoartick *Mineralis* ʒß, Treacle *Androm.* ʒj, of Camphir *gr.* vj, Bezoartick Vinegar what suffices, make a *Bolus* to be taken after the same manner.

Julap. Take of the water of Angelica, *Carduus*, of Dragons each ℥iiij, of *Scordium* Compound ℥ij of Bezorat. of Treacle each ʒj, of the powder of Pearls ʒj, of the syrup of Clove-gilliflowers (or of the Juice of Citrons) ℥ij, of the spirit of Vitriol *gut.* 12, make a Julep, the Dose ℥iij, often in a day; sometimes by it self, sometimes with other Medicines.

Chap. III.

Of Cardiack Passions and their Remedies.

Cardiack Passions are wont to be so called. After the Cardiack Medicines so called, though improperly, follows to be handled the cardiack Passion, in which indeed the Heart labours and therefore truly requires cordial Remedies. Under this true name are commonly noted two Affections somewhat divers in themselves; to wit, the trembling of the Heart and its Palpitation: in either of which Affections the motion or inordinate pulse of the Heart seems to be in a manner convulsive: but yet the inordination of the former consists in the frequency of its Vibrations, and of the other in their vehemency. We will first search into the Reason of this latter, and then we will endeavour also to shew the knowledge of the other, and lastly the cure of them both.

The trembling and the beating of the Heart.

The description of the latter. The Palpitation of the Heart is sometimes so vehement and great, as not only manifestly to be perceived by touch, but also to be beheld by the eyes, yea sometimes may be heard at a certain distance. Moreover it hath been related by credible Authors, that by the more vehement vibration of the Heart and percussion of the Ribs they have sometimes been broken or in younger people driven forth and continued protuberous or sticking out.

The Reason of it searched into. But truly although this motion may be perceived by so many of the senses, yet it does not appear to reason what part is so moved, that it should make the left side of the Breast to leap out by every one of its strokes. I do believe that all both

the

Part I.

the learned and unskilful, will say with one consent that the part so moved and strongly shaken is the Heart it self; but I ask whether it be the whole frame of the Heart, or any part of it, that so leaps forth, and transgresses the wonted Sphear of its vibration? If it be said it is its whole Body that is so carried forth, I would have them say whether this is made in its *Systole* or *Diastole*. Certainly not the first, for whilst the heart is contracted, as may appear by inspection, its bigness as to all its parts is lessned; no more can it be said in *Diastole*, because in that state the Heart returns only to its ordinary and natural site and magnitude, and remains a little time in it. Hence seeing that according to the Laws of its vibration how strong or increased soever, the Heart cannot so palpitate, and leap forth; (which also further appears, because in a fevourish Fit when it beats most vehemently, it does not leap forth and strike the sides) I was once suspicious that during that affection it did obtain a convulsive motion, and quite contrary to its ordinary motion; whereby being agitated like a convulsive Member, the Heart was wholly elevated and moved forth of its place. But the Neurology being more fully understood I presently fell from this opinion, because it is certain that the Heart can no ways be lifted up or carried forth, by any other Muscle, besides it own moving Fibres. Wherefore considering this thing more seriously, it at length came into my mind that whilst the Heart is contracted, for the excluding the Blood from its confines and that its tops and sides yeild on every side and are brought nearer; if notwithstanding all the blood be not forthwith wholly cast forth and sent away at every *Systole*, there will be a necessity for the roots of the Vessels filled to the hight and very much extended to leap forth with a certain force, then by reason of the verberation here made, the whole frame of the Heart to be greatly shaken.

It proceeds not from the Convulsive motion of the Heart it self.

Truly that this Affection doth arise from some such cause sometimes I have seen confirmed of late by an anatomical observation. A godly and known divine after that he had lived obnoxious to the palpitation of the Heart, at very many times now of its own accord now occasionally, he began at length to be afflicted with it continually night and day, with a grievous pursiness, and then within a few months being worn out with the assiduity of this most troublesome Disease, he dyed. His dead Body being opened, the right corner of his Heart appeared tumid with concreted blood, a little lap of which being hugely increased and extended contained great plenty of clotted blood. The Reason of these contents did presently appear, *viz.* because the Lungs being hugely obstructed and stuffed with black extravasated gore stagnating every where, were not able to admit of the blood continually to be thrust forth from the Ventricle: wherefore whilst the Heart highly labouring for its total exclusion is contracted inward towards the middle by every *Systole*, and as to its magnitude is diminished; its *Basis* by reason of the blood there heaped up and sticking or reverberating in its passage, being very much filled bunches forth, and because of the greatness of the Lap, or little Ear; being more tumid, shakes more largely and reaches to the side.

It sometimes proceeds from the efflux of the Blood into the Arteries being hindred.

But indeed the Heart is seen to beat not only from this cause; because this Disease is not always constant and perpetual, but for the most being wandring, and uncertain infests at certain times, and then of its own accord or by the use of Remedies ceases. Besides it has hapned to some frequently whose Lungs are whole enough and free from any infection.

Besides it is wont to arise from other causes.

However although this Disease may arise from divers causes, yet we judge the same means of affecting to be even in them all. For it seems that the Heart only palpitates, for as much as whilst the Cone and sides being contracted together, it is straitned in its *Systole*, the *Basis* with the Roots of the Vessels being enlarged by reason of the blood there heaped up and sometimes adhering or repercussed, swells out or is tumefied. In truth from hence it appears that the course of the Blood in this place is somewhat hiudred or beaten back, because whilst the Heart is vehemently and strongly shaken in the side, the Artery in the wrist for the most part beats languidly and weakly, as it were containing but a small River of Blood. Therefore as the conjunct cause or formal reason of this Disease, consists altogether in the stopping and aggestion of the Blood about the *Basis* of the Heart and Roots of the Vessels, it follows that we must inquire after how many ways and for what other causes this kind of affection is wont to be produced.

This affection for the most part depends upon the vitiousness of the Blood or of the Vessels belonging to the Heart.

Concerning these as we do not lay the fault much on the Flesh or the proper moving Fibres of the Heart, this Evil chiefly seems to be imputed either to the Blood

Part I.

Blood or to the Veſſels hanging to the Heart. The reaſon of the firſt is plain enough, for as much as thoſe indued with a watry Blood or leſs apt to an effervescency or enkindling, as Virgins labouring with the green Sickneſs or chachectical men or women, are found for the moſt part obnoxious to this Diſeaſe, and are wont to be troubled with its aſſault conſtantly upon every the leaſt quick motion of the Body. The cauſe of which is, for that the Blood conſiſting of ſluggiſh and not active enough Particles, is not caſt forth freely and expeditiouſly from the Boſoms of the Heart, but part of it oftentimes remains in them and eaſily ſtagnates: therefore as often as by the motion of the Body more plenty isbrought into them that its whole proviſion cannot be caſt forth by every *Syſtole*, the Heart labouring with mighty ſtrugling drives it forth ſcarce beyond its *Baſis* and the roots of the Veſſels; where when it is heaped together, and remaining a little while, makes the parts containing it to bunch out, it cauſes the cardiack Paſſion together with a *Dyſpnœa* or ſhortneſs of Breath.

The reaſon of the former explained.

Beſides this cardiack affection does oftentimes infeſt ſome, notwithſtanding they are indued with a very hot Blood and apt to be readily enough inkindled or to ferment. This evil is frequent and familiar with very many much troubled with the Hypochondriack, Hyſterick, or otherwiſe convulſive Paſſion: wherefore in theſe caſes we have deſervedly ſuſpected the Arteries belonging to the Heart to have been in the fault. By what means their obſtruction hindring the free efflux of the Blood from the heart, cauſes the palpitation of the Heart, the Hiſtory now recited manifeſtly declares: beſides the ſhutting up of thoſe Veſſels, and infarſions or ſtuffings up being by other ways excited may produce the ſame effect. I knew an old Man accuſtomed for many years to the often drinking of ſtale ſtrong Beer, and alſo of Wine, was wont to ſuffer frequent aſſaults of the aforeſaid Diſeaſe; who dying afterwards with an ulcerous inflammation of the Stomach, with daily vomiting, with languor of Spirit, and other Symtoms; when I opened his dead body, I found the Trunk of the great Artery aſſoon as it was gone from the Heart to be bony or rather ſtony and its ſides to be greatly compreſſed, that a chink only being left, not half the torrent of the Blood could flow that ſhould do. So that I might very well aſcribe the cardiack Paſſion ſo very troubleſome to him to this cauſe. But it is probable this Affection does ſometimes proceed from the Blood clotting within the Boſom of the Heart, and the adjoyning Veſſels, and being concreted as it were into a fleſhy Cruſt.

2. In the other caſe either the Veſſels are obſtructed or they are affected with a Convulſion.

An example of the former is propoſed.

And diverſe kinds noted.

But beſides theſe, for as much as the cardiack Palpitation is wont oftentimes to be accompanied (as we but now intimated) with other convulſive Affections, we may ſuſpect alſo that its cauſe is ſometimes meerly convulſive. We have formerly ſhewed out of anatomical obſervations in our Neurologie, the Nerves, and nervous Branches almoſt innumerable in very many places and cheifly neer the *Baſis* of the Heart to be folded and wound about the Trunks of the Arteries; the Uſe and Actions of which we think to be of this Nature that the divers manner of Heats, Fluxes and Refluxes, yea ſometimes Stagnations of the Blood that are wont to be excited by reaſon of the vehement affections of Anger, Fear, Joy, Sorrow, and ſuch like, may ſo come to them, for as much as theſe little nervous Strings do variouſly ſtrain, preſs together, or perhaps ſometimes wholly ſhut up theſe ſanguiferous Veſſels. Beſides it is not very improbable that by reaſon of thoſe Veſſels being convulſively affected, and a little longer conſtrained, ſo that they hinder the free exilition of the Blood from the Heart, the aſſaults of the cardiack Palpitation may ariſe. Indeed we may very well impute both this, and thoſe other paſſions of the Heart to ſuch a cauſe; but as to the means of doing it we a little ſeem to differ from that opinion. For after I had weighed more exactly the uſe and actions of the Nerves. I underſtood at length that they or their ſhoots did not draw or conſtrain any thing at all, but that all this buſineſs was performed wholly by the fleſhy Fibres, and that the nerves only do convey to theſe moving parts, new and abundance of Spirits, and alſo the inſtincts of approaching motions: which like kind of Office they performs towards the membraneous Fibres for the buſineſs of Senſation.

How the palpitation of the Heart is a convulſive Affection.

For what uſe the many nerves are inſerted into the Coats of the Arteries.

The Arteries being indued with moving Fibres.

Therefore whilſt I did ſeriouſly ſearch for what uſes ſo many Nerves ſowed thorow the Coats of the Veſſels did ſerve, at length I found theſe Arteries by their own ſtrength to contract and dilate themſelves even like other *Præcordia*, and for the performing their motions both naturally and pathetically, both the plenty of Spi-

rits,

rits, and the means of Inſtincts to be carried through thoſe Nerves. For by anatomical obſervation it plainly appears that the middle Coat of every Arterie, is clearly muſcularie, and through the whole conſiſts of fleſhy Fibres as thoſe of the Ventricle, the Inteſtines, and ſome other *Viſceras*, which ringy Fibres compaſſing about with a thick *Series*, as it were of ſmall Hairs, the Pipe or Tube of the Arterie, do atchieve without doubt their proper *Syſtoles* and *Diaſtoles*, even as the Heart it ſelf. Wherefore in the firſt place, whilſt the Cardiack Fibres and then theſe Arterious, are ſucceſſively, and one *Series* after another contracted, there is a neceſſity that the Blood ſhould be rapidly driven along, from one bound to another. Wherefore it is not for nothing that ſome Phyſitians have attributed alſo a pulſifick Facultie to the Arteries: for that it is very improbable that the circuit of the Blood is performed by the impulſe of the Heart as it were the ſtroke of a Bar. It is more likely by much that the Arterie in its whole paſſage being contracted as it were at the back of every ſanguineous Flood, ſhould urge it every where thorow thoſe little ſmaller rivulets and more narrow ſpaces. According to this ordinary rite in equally driving about the Blood, the Arteries ſeem to have their conſtant turns of *Syſtoles* and *Diaſtoles*. Which although they are very ſwift, more quick than the twinkle of an Eye, yet they are made ſucceſſively thorow all the parts of the Arterious Tube. But as we have noted that the equal courſe of the Blood is diverſly broken off, and diſturbed according to the force of aſſaults of the Paſſions, there will be a neceſſity that it is only ſo done for as much as the Arteries (by reaſon of an Inſtinct given through the Nerves to the moving Fibres) being ſuddenly conſtrained in divers places, they either ſtop, or repreſs, or drive to and fro more impetuouſly, the ſanguineous Flood. In Fear, ſudden Sorrow, Shame, Love and other Affections bringing in a conſternation or great confuſion of Mind, it is probable that the Trunk of the *Aorta* is ſo contracted and ſtraitned by theſe Fibres ſuddenly and for ſome time drawn together, that the Blood very hardly and not but by very little Portions drops forth from the Boſome of the Heart. Wherefore from it there heaped up and ſtagnating, there is preſently felt a mighty burthen, and a great oppreſſion: then if to this ſtop of the Blood, a ſtrong and vehement pulſation of the Heart for the caſting forth of the Blood follows, it will be neceſſary by reaſon that the Blood being ejected at every *Syſtole* to the *Baſis* of the Heart, and there repercuſſed, for thoſe parts to be very much diſtended, and for that reaſon the cardiack Palpitation to be produced.

Part I.

Is moved like other Muſcles and the Heart it ſelf.

And is often affected with a Convulſion or Cramp.

From whence the palpitation of the Heart often ariſes.

But as vehement Paſſions of the Mind do bring this affection almoſt upon every one, ſo Hypochondriacal Perſons, and ſuch as are convulſively diſpoſed are ſubject to its aſſaults upon every light occaſion, yea ſometimes without any manifeſt cauſe. But in ſome the Splanchnick and Cardiack Nerves are wont often to be beſet with a morbifick matter; ſo that it being moved by reaſon of plenitude or irritation, compells the Spirits inhabiting thoſe parts, and neer about, frequently into Convulſions and inordinate Contractions; it ſtill happens becauſe that the Nerves being inſerted in the Roots of the Cardiack Arteries from ſuch a cauſe affected, alſo the Fibres of theſe Veſſels being convulſively affected, and contracted therewith, by which means it is ſaid to ſtir up the cardiack Palpitation. By what means the cardiack Nerves are irritated from a neer or remote cauſe, by a morbifick matter ſubſiſting either in the Head neer to the Nervous beginning, or about the *Præcordia* or *Hypocondria*, and are carried into Convulſions or Cramps of divers Kinds, we have ſhown in ſome other place, from whence the cauſes of the Cardiack Palpitation may be deduced as often as the ſame ſhall be alſo Convulſive.

Wherefore this affection is familiar to Hypochondriacal perſons.

As to what belongs to the cure of this Diſeaſe, as the cauſes of it are various and manifold, a divers way of Cure alſo ought to be ſhown. For what ſome affirm that theſe Remedies commonly called Cordials do refreſh the Heart, and are believed to bring help to it being ſick, in ſome caſes it is contrary both to reaſon and common experience to give them. Therefore as we have above declared that the palpitation of the Heart proceeds from the fault of the Blood or of the Arteries hanging to the Heart, and hinted the various means of either of theſe being affected, it now remains that we accommodate an apt method of Curing of every kind of this Diſeaſe, together with ſelect Forms of Remedies.

Its Cure is propoſed.

1. In the firſt place therefore as often as this Diſeaſe proceeds from the default

of

Part 1.

of the Blood, the primarie Therapeutick Intention will be to exalt to a better *Crasis* the too watery Blood being unable to be enkindled and to ferment, and to lift up and increase its active Principles being depressed or diminished; to which end spirituous Medicines, also salines of every kind, sulphureous and chiefly Chalybeate Medicines conduce, yea hither may be referred what are wont to be prescribed in the *Pica* or longing Disease, the Leucophlegmacie or Phlegmatick Dropsie and the colder Scorbute.

What it ought to be as often as the fault is in the Blood.

Electuary.

Take of the Conserves of the yellow Pontic Wormwood, of Orenges and Limons, of each ℥ij, of the Pouder of Winteran Bark ʒij, of the *Species* of *Diacurcuma* ʒj. of Steel prepared with Sulphur ʒiij, of the Salt of Wormwood ʒjß, with what will suffice of the Syrop of the Rind of Citrons, make an Electuary. The Dose the quantity of a Nutmeg in the Morning and five a Clock in the after-noon, drinking after it of the following Julep ℥iij, and walking upon it.

Julep.

Take of the water of the Leaves of Aristoloch, or Birthwort ℔j, of Penyroyal, of Hisop, of each ℥iiij, of the Water of Earthworms, of Snales, and *Aq. Mirabilis* of each ℥j, of Sugar ℥j: mingle them and make a Julep.

Tincture.

Take of the Tincture of Antimony ℥j. The Dose is *gut.* 20 to 25 twice in a Day with the same Julep. Moreover hither may be ranked the Tincture of Steel, or the Syrop of the same, also the *Elixir proprietatis* with many others.

How this Affection ought to be handled proceeding from the Arteries being obstructed.

In the second place the Palpitation of the Heart, both ofter and much more crueller arises from the Cardiack Arteries being in fault: and then their Fault is either an obstruction or a Spasmodick Affection.

This first Disease is for the most part continual, and is often incurable; but especially if it be excited from tabid Lungs, or the Roots of the Arteries being compressed, or half filled by reason of some bony Tubercle or excrescency. which sort of cause if at any time they appear, and may be perfectly known, it were in vain to endeavour their taking away; but rather that it is only to bed one, that the life of the sick though miserable may be a little longer prolonged by some ease being procured by means of Hypnoticks.

But indeed it is not improbable (as we hinted but now) that the Arteries, sometimes from Polypous Concretions that are wont to be begotten there and sometimes within the Bosom of the Heart, are in a great part filled up; and for that cause the free and whole exilition of the Blood is hindred. But as we suppose the *Diagnosis* or thorow Knowledge of this very difficult, so likewise the Cure not less rare. When there is suspition of it, Saline Medicines seem to be of the greatest use; and of those, they that are indued with a Volatile or an Acid Salt are to be given: but not together, but those for some space (which not helping) then it will he necessary to try the others.

Medicines indued with a volatile Salt.

Take of the Spirit of *Sal* Armoniack Compound, *viz.* with *Millepedes* or with other Antasthmaticks or things good against the stoppings of the Lungs distilled ʒiij, the Dose is 15 Drops to 20, thrice in a Day with a Julep or proper distilled Water. After the same manner may be tryed the Spirits of Harts Horn, Soot, Blood or of mens Skulls.

Such as have an acid Salt for their Ground.

Take of the Spirit of Sea Salt, or of Vitriol distilled with the Spirits of Wine impregnated with Pneumonick Herbs, and often Cohobated ʒiij, Dose *gut.* 15. to 20 after the same manner. For this use the Spirit of Tartar of the Woods *Guaicum* or Box.

The Cure of the Disease arisen from the Arteries convulsively affected.

3. The Palpitation of the Heart is most often a convulsive Affection, and is wont to be produced from the like cause and means of affecting as other Hypochondriack or asthmatick affections. Whose Cure also ought to be endeavoured it like manner by antispasmodic Remedies or things good against Cramps or Convulsions. But the Choice of which is made with a certain difference, according as the Disease appears to be either of a Hot or Cold Temperament.

Spirits.

1. In respect of the former these following are prescribed. Take of the Spirits, Amber, Armoniack ʒiij, the Dose is *gut.* 15 to 20, twice in a Day with a Julep or proper distilled Water. After the same manner may be given at times the Tincture of Tartar, Steel, or Antimony.

Of

Of the Trembling of the Heart. Part I.

The Trembling of the Heart (which alſo commonly goes under the name of a Cardiack paſſion) is an affection diſtinct, yea divers from its Palpitation. For in it its own fleſhy or moving Fibres ſeem to be affected by themſelves, and not to ſubſiſt as in the other Affections, in a morbifick cauſe in the Blood or in the Cardiack Arteries. *How the trembling of the Heart differs from its palpitation.*

The Trembling of the Heart may be well deſcribed, that it is a Spaſmodick Convulſion or rather a trepidation of its Fleſh: by which the moving Fibres do moſt ſwiftly effect, but yet being but half contracted, quick, but broken and as it were but half turnes of *Syſtoles* and *Diaſtoles*; ſo that the Blood can both be brought into, and alſo carried out of the Boſoms of the Heart, but only by very little Portions. *Its deſcription.*

Becauſe that this Affection may be a convulſive motion of ſome Muſcle, *viz.* of the Heart, to the more full Knowledge of it, what we have diſcourſed in another place concerning the Muſcular Motion, and alſo concerning Convulſive Affections ought to be referred hither. That I may not ſeem tedious by repeating many things, in a Word know that every Muſcle conſiſts of two Tendons and a fleſhly Belly; and that Contraction is from thence performed for as much as the Animal Spirits leap forth from either of the Tendinous Fibres into the fleſhy, which whilſt they blow up and intumifie, they therefore make ſhort and render contractive; but the motion being ended, the Spirits return into the Tendons, and the fleſhy Fibres are relaxed. *The reaſon of this depends upon the Doctrine of Myologie or knowledge of the Muſcles.* *The ſum of which is delivered.*

As the Motive Function is double, to wit, ſpontaneous and merely natural, in the former we ſay the Spirits are called forth by the government of the Appetite from the Tendons into the fleſhy Fibres, and do remain within them in action till they are diſmiſſed by its beck, but then being returned they remain quiet in the Tendons until they are again commanded forth, hence it is that their motion, and times of reſt are unequal, uncertain, and variouſly to be determinated at our pleaſure.

In the Function meerly natural it is much otherwiſe; for that the Animal Spirits are carried forth from the Tendons into the Fleſh by a perpetual turn or conſtant reciprocation, and a ſhort contraction being made they preſently leap back from theſe into thoſe, and ſo viciſſively; after which manner the Heart it ſelf, the Arteries, and Organs of reſpiration, yea the fleſhy Fibres of the Ventricle and Inteſtines, unleſs they are otherwiſe determinated by reaſon of their objects, are agitated by perpetual *Syſtoles* and *Diaſtoles*.

According to theſe ordinary means, the offices of the motive Function of either are performed; notwithſtanding which they are wont to be diverſly perverted or diſturbed according as the Animal Spirits the performers of thoſe motions are variouſly affected. For indeed it appears plain enough that the Inſtinct of every contractive motion coming from every muſcle is conveyed by the Nerves from the Brain or the Cerebel or little Brain (in the hinder part of the Head) according to the command of the Appetite or the indigency of Nature; *viz.* The Animal Spirits abounding within their Pipes, being ſtirred up according to an Impreſſion delivered from the Head, and moved in the whole *Series*, preſently awaken others inhabiting the Tendons, and provoke them into proportionate motions, almoſt after the ſame manner as if any one ſhould ſet fire of a Train of Gunpouder at a diſtance with a lighted Match. Therefore ſo long as thoſe Spirits implanted both in the beginning, *viz.* Within the ἐγκέφαλον, and in the way, *viz.* the nervous Pipes, and in the end, *viz.* within the Tendons do keep rightly and orderly, they form, thoſe convey, and theſe at length execute the inſtinct of every motion required by the Soul or Nature: but if the Spirits deſtinated to the motive Function being unnaturally affected within any Dominion are compelled into irregularities, for that reaſon preſently convulſive motions are excited in the members or reſpective muſcles. By what means by reaſon of a morbifick cauſe nigh the nervous Origin in the Head, by what alſo, by reaſon of that planted elſewhere within the nervous Pipes convulſive affections either of the members, or *Viſcera* or *Præcordia* are wont to ariſe, we have in another *The convulſive motions of the Muſcles are explicated.* *And diſtinguiſhed.*

Part I.

nother place largely enough declared; *viz.* for that the Spirits flowing within the Nerves being irritated, and ſtruck as it were with a certain fury from ſome preternatural cauſe, whilſt they ruſh into theſe or thoſe parts, and carry falſe and unjuſt ſigns of motions to be ſtirred up, there will be a neceſſity for contractions or violent and convulſive diſtentions in theſe or thoſe Muſcles, or Membranes to be cauſed, we have clearly ſhown the various kinds and formal reaſons of theſe ſort of affections in our *Spaſmologie*; but what was there pretermitted, and belongs to the matter in hand we will now further advert, that we grant there are other kinds of Spaſms or Cramps which do ariſe without any preſent or great fault of the ἐγκέφαλον or of the Nerves, by reaſon of the animal Spirits inhabiting the Tendons themſelves being chiefly and almoſt only in the fault.

Some private convulſions belonging only to the Muſcles.

Two kinds of them ſet down.

We meet with two obſervable kinds of this ſort of ſingular and as it were private Affection: one is commonly enough known in which the ſpirits unbidden do often leap forth from the Tendons, and greatly and grievouſly blowing up the fleſhy Fibres, do not preſently or eaſily recede. The other, although leſs known, yet frequently happens in which the muſculary Spirits are able to remain long, neither within the Tendons, nor within the fleſh, but being highly unquiet, make out of theſe into this and back again in ſpight of Appetite or nature, their very often courſes and recourſes, but even weak and inordinate. Concerning theſe convulſive Affections (becauſe they remain as yet untouched by moſt Phyſicians, and the knowledge of them makes very much for the truly unfolding the cauſes, and the nature of the cardiack Paſſion) I think it worth my labour here, although beyond the matter propoſed, and as it were for Diverſion however to ſet down a few things.

The former commonly called the Cramp explained.

This former Affection which is properly τέτανος (and both in our *Idiom* and the French is wont to be called the Cramp) for the moſt part ariſes, for that the animal Spirits unbidden do of their own accord leap forth from the Tendons from one or both together into the Belly of the Muſcle, from whence they will not go back preſently after their wonted manner, but ſtaying longer within the fleſhy parts do greatly inflate them, and render them highly contracted; then becauſe others neither give place to theſe Muſcles, nor conſpire in Contraction, the part becomes ſtill and ſtretched with exceeding great pain. The cauſe of this is, a certain Heterogeneous matter, and inflating, which deſcending thorow the nervous Pipes together with their Juice into the Muſcles, and ſticking to the Spirits, renders them Elaſtick and alſo obſtinate; becauſe that they cannot be contained within the tendinous Fibres, but deſiring larger ſpace they run forth into the fleſhy parts, and there remain till their Tumour abates.

The latter is a leaping or trepidation of ſome Muſcle.

Of which ſort of Affection is the trembling of the Heart.

2. To this latter kind of convulſive motion properly belongs the Paſſion, or trembling of the Heart. Further to this Cenſe ought to be referred an affection commonly enough known and familiar to many, to wit, that ſometimes they ſuffer a leaping, or very frequent and equal trepidations of ſome private Muſcle. to wit, in the Lips, Cheeks, Eyes, or other Members; which after they have indured two or three minutes perhaps ceaſe of their own accord. Not long ſince I was adviſed with by Letters from *France* concerning a certain Gentleman, all whoſe Muſcles thorow his whole Body, did almoſt perpetually uſe ſuch kind of leapings or trepidations, ſo that his outward Fleſh every where leaping forth, imitated exactly the Vibrations of Pulſes of the Heart it ſelf.

Its formal reaſon.

The formal Reaſon of theſe kind of Affections, and as of the Cardiack trembling ſeems to conſiſt in this, for that the animal Spirits belonging to ſome Muſcles being unquiet, and as it were ſtruck with a ſudden fury, continually leap forth from the Tendons into the Fleſh, and return, and iterate by a perpetual change their excurſions and recurſions; in the mean time as they are carried forth only with very ſmall forces that they hardly fill the fleſhy Fibres, and continue in them but a very little ſpace only, although the motive endeavours be very often, yet they are but very weak and ſmall; in ſo much as the Members, and Joynts are not moved out of their place by the ſo perpetually agitated Muſcles, and the Heart during its tremor, how ſwiftly ſoever it be ſhaken, ſcarcely or not at all is able to drive about the Blood; as it plainly appears by the ſmall and as it were trembling Pulſe and failing of all ſtrength.

The Cauſes.

As to what belongs to the cauſe of theſe Affections, *viz.* the conjunct, and more remote, by which the muſculary Spirits are made ſo unſtable, or acquire that

that deſultorie force; it ſeems to be for that a certain Heterogeneous matter, and elaſtick coming from the Brain and nervous Paſſages, is carried at length into the Muſcles and their tendinous ends; where growing with the Spirits from thence do greatly irritate them, and affect them as it were with a certain fury, ſo that they can ſtand ſtill no where, but run about hither and thither, and in the mean time omit their due tasks, or not ſtrenuouſly perform them. Part I.

The cauſe of the Cardiack Trembling is commonly caſt upon the Spleen; for it is vulgarly ſuppoſed that from this *Viſcus*, being obſtructed or being otherways amiſs, foul vapours are elevated to the Heart; which ſtriking it compel it to be ſo ſhaken and to tremble, yea affect it with a certain rigor. *Not rightly imputed to the Spleen.*

Faith to this opinion is confirmed or at leaſt its probability, becauſe Hypocondriack Perſons (or what is almoſt the ſame, ſplenical) are found to be very obnoxious to this Cardiack paſſion. What and how much influence the Spleen has on the *præcordia*, we have already largely declared: From that and partly from what was but now ſaid, it appears plain enough that this opinion, though much received, of the Heart being affected by vapours, is altogether falſe and erroneous. But that thoſe who are eſteemed ſplenetick and hyſterick commonly, are ſtill infected with the trembling of the Heart, The cauſe is, that great affinity and intimate communication, which the ſplanchnick Nerves have with the Cardiack, ſo that not only the affection of one part eaſily draws the other into conſent, but if at any time a ſpaſmodick matter falls upon the Branches of the Nerves, belonging to the Spleen or the *Viſcera* of the lower Belly, it is very rare but that it poſſeſſes in like manner the Nerves belonging to the *Præcordia*. *The Heart not affected by vapours.*

What belongs to the reaſon of the Cure, to be ſhown in the trembling of the Heart; for that this Affection is merely Convulſive therefore not Cardiack, but rather cephalick Remedies, or for the Nerves, are preſcribed; which notwithſtanding ought to be according to the Temperament and Conſtitution of the Patient, and more hot or moderate, or now of this now of that nature. That I may comprehend the buſineſs in a few words, as in that Diſeaſe three kinds of Remedies are wont to be chiefly profitable, *viz.* teſtaceous or ſhelly, Chalybiats and ſuch as are endued with a volatil Salt, we will here ſhew briefly ſome forms, and the uſe of every one of them. Therefore in the firſt place a proviſion being made by emptying of all, and a choice being had of the evacuation which might ſeem moſt uſeful, you may preſcribe according to the following modes. *Its Cure.*

Take of prepared Coral, of Pearls, each ʒij, of both *Bezoars*, of each ʒß, of the whiteſt Amber ϑij, of Amber Griſe ϑj, make a Powder: The Doſe is ʒß twice or thrice in a day, with ſome appropriate diſtilled water or Julep. *Powders.*

Take of the powder of Claws compounded ʒij, of the powder of the Roots of Male Peony, of a humane skull prepared, of each ʒj, of the Flowers of Male Peony, of the Lillies of the Vallies, of each ʒß: Make a Powder to be taken after the ſame manner.

Take of Ivory, red Coral powdered, each iij, of the *ſpecies* of *Diambræ* or confection of Amber ʒj, of the whiteſt Sugar diſſolved in what will ſuffice of water of *Naphæ*, and boyled to a conſiſtency ʒvij: Make according to Art Tablets weighing ʒß, eat one or two often in a day at your pleaſure. *Tablets.*

Take of the Conſerves of the Lilly of the Vally ʒvj, of the powder of Coral prepared, of Pearls, Ivory, Crabs eyes, of each ʒjß, of Vitriol of Steel ʒj, what will ſuffice of the Syrup of Coral, make an Electuary. The Doſe ʒj to ʒij twice in a day, drinking after it a draught of the following Julap. *Electuary.*

Take of the waters of Betony, Peony, of the whole Citron, each ʒvj, of the rinds of Oranges diſtilled with Wine ʒij, of Sugar ʒj, make a Julep. *Julep.*

Take of our Syrup of Steel ʒvj, the Doſe one ſpoonful in the morning, and at five a Clock in the Afternoon: With ʒij of the before preſcribed Julep without Sugar or with diſtilled water. *Syrup.*

Take of the powder of Ivory, Coral, each ʒijß, of the *ſpecies* of *Diambræ* ʒj, of the ſalt of Steel ʒij, of Sugar ʒviij, of Amber Griſe diſſolved ϑß: Make Tablets weighing ʒß, Doſe ʒiij or iiij twice a day. *Tablets.*

Take of freſh Strawberries ℔viij, of the outward peels of twelve Oranges, the filings of new Iron ℔ß, being all bruiſed together put them to Whitewine ℔viij, *Diſtilled Water.*

Part I.

let them ferment in a cloſe Pot for twenty four hours, then ſtill it in an ordinary ſtill.

Spirits. Take of the ſpirit of Harts Horn, or of Blood or the like ʒiij, the Doſe is twenty drops in ſome convenient Vehicle twice a day.

powders. Take of the flowers of *Sal* Armoniack, of Coral prepared, each ʒij, the Doſe ℈j twice a day.

Take of Cryſtal mineral ʒij, of the Salt of Amber ʒj, of the ſalt of Harts-Horn ℈j, mingle them : The Doſe fifteen *gr.* to twenty, twice a day with diſtilled water.

Of the Intermitting Pulſe.

The intermitting Pulſe ought, and indeed deſervedly, to be ranked with the Cardiack Paſſions, becauſe in this affection or at leaſt in ſome kind of it, the Heart it ſelf labours, but in ſomething a diverſe manner than in its palpitation or trembling: For in theſe as to its motion it is amiſs and irregular, in the other, as to its reſt; for it is ſometimes twice as long as it uſes to be according to its ordinary courſe.

Two kinds of the intermitting Pulſe. Firſt, we ought to diſtinguiſh this affection, which (unleſs I am greatly deceived) hath two diſtinct ways of being made: For although ſometimes the Pulſe does intermit, becauſe the Heart ceaſes for that time from motion; yet beſides the Pulſe being felt ſometimes ſeems to intermit at the Wriſt, whilſt the Heart is perceived to ſhake (as it does in its trembling) moſt ſwiftly and inceſſantly in the Breaſt: The cauſe of which I ſuſpect to be, for that this paſſion of the Heart urging a very little portion only of Blood, is caſt forth at every *Syſtole* into the *Aorta*: Wherefore this being void and growing flaccid, and wanting its load to be moved away; leſt it ſhould act ſo often in vain, it ſometimes intermits its contraction, and ſeems even as in the unloading of a Ship when the wares are more difficultly, and by ſome let for a time, ſtaid in drawing them forth of the hold, the Porters that carry them are put beſides or pretermit ſome turns of going and coming. Further, in malignant or deadly Fevers, if at any time the Pulſe be quicker and weak, it alſo then intermits, the reaſon of which is not that the Heart ſometimes ceaſes from motion, (for then it moſtly and inceſſantly labours) but for as much as the Blood is not carried with enough plentiful proviſion, by every *Syſtole* into the *Aorta*; wherefore this wanting work to do, ſometimes grows idle.

First, that which is excited by the default of the Aorta.

The ſecond which proceeds from the Heart it ſelf. But moreover the Pulſe ſometime intermits, becauſe the contraction of the Heart it ſelf is ſuſpended for a certain time, or its pauſe is twice longer, which indeed any one may eaſily find in himſelf or another, by putting his hand to the Breaſt, yea thoſe who are ſick as often as the Heart ceaſes from motion, may plainly perceive it in themſelves, by the weight and oppreſſion of the Breaſt. Moreover this affection does not ſo much happen to the languid, thoſe about to dye, or that are dangerous ſick, as to thoſe well enough and as to many things in good order; wherefore it ought not always to be taken according to the opinion of the vulgar for a diſeaſe, or for a very pernicious or ſo hurtful a ſign. Theſe who are obnoxious to this, are wont to be troubled for the moſt part alſo with the *Vertigo*, the Headach or convulſive Affections. But this defect of the Heart as to its type is various, for now the periods of Intermiſſion are certain, and determinated to a certain change of the Pulſe, to wit, the third, fourth, fifth, or ſome other more often or more rare, now they are uncertain and wandring, as a ceſſation now happens after a few Pulſes, by and by after more. The vibrations of the Artery whilſt they are continued, are well and ſtrong enough, and for the moſt part are equal, but yet ſometimes the firſt Pulſation is the greateſt after the intermiſſion, that which ſucceeds a little leſſer, and ſo by degrees they are leſſened until the intermiſſion comes again, then afterwards a great Pulſe beginning, it deſcends again as it were by a ladder to a ceſſation.

which does not always betoken Evil.

Various Examples of it.

I have known ſome (ſo much as the buſineſs could be made known to our obſervation) that were always endued with an intermitting Pulſe, ſo that I never at any time touching the Artery could find it otherwiſe, and in the mean time they ſeemed well enough and complained of no ſickneſs. But however I have known

others

others alſo to have had an intermitting and more ſlow Pulſe than ordinary, only when a cruel Headach or ſome more grievous Affection of the Head was preſent or neer at hand. Part I.

The cauſe of it.

From theſe I think it appears that the cauſe or formal Reaſon of the Affection, but now deſcribed, does not depend upon the miſtion or *Craſis* of the Blood, but only from the irregular diſpenſation of the animal Spirits from the Cerebel into the Cardiack Nerves, and from thence into the tendons of the Heart: For it may be well ſuſpected that by reaſon of thoſe Nerves being ſomewhat obſtructed, the animal Spirits cannot deſcend to the tendons of this Muſcle with a full Channel or influx: Wherefore as their proviſion is ſomething deficient, the motion of the Heart ceaſes forthwith for one Pulſe, until more plenty of Spirits being reſtored preſently its action is continued: So we have ſeen a Mill driven about by a ſmall Stream, the water ſometimes falling and growing ſcant, to ſtop or go ſlowly for a little time, and preſently when the water flowed or roſe higher, to repeat its rotation or going round.

The Prognoſis.

Thoſe whoſe Pulſe is great of it ſelf and ſtrong enough, and is wont to intermit, are not only obnoxious to Head-aches and vertiginous Affections, but for the moſt part alſo to the *Incubus* and ſometimes to the Apoplexy: For if it ſhould happen that the Cardiack Nerves at firſt not enough open and fitted, ſhould be afterwards wholly obſtructed, there will be for that reaſon a neceſſity, the Heart (which is the firſt *Elater*) being made immoveable, that the whole Machine of the animated Body, ſhould preſently ceaſe from motion and conſequently from Life.

What the Cure is.

Although this affection having no preſent diſturbance or danger requires not any haſty cure, yet for preſervation ſake, leſt more grievous diſeaſes ſhould follow, Remedies and a certain Therapeutick Method ought to be preſcribed, at leaſt the means or way of living, as to the ordering all things rightly in the whole Life to come; yea a certain light courſe of Phyſick, to be obſerved yearly in the Spring and Autumn is wont to be preſcribed, *viz.* that as much as may be all the morbid ſeminaries lying within the ἐγκέφαλον, or apt there to be begotten, may be taken away and be provided againſt. For this end we refer hither the prophylactick method with the Medicines by us elſewhere preſcribed againſt the aſſaults of the Apoplexy.

The Anatomical Deſcription of an Artery.

Since that we have ſhewn above that ſome Affections vulgarly accounted for Cardiack, do rather proceed from the Arteries being affected, than from the Heart; and that the inordinations of the Blood that are wont to be ſtirred up by the affections of the Mind, do ariſe by reaſon of thoſe Veſſels being irregularly contracted, therefore it ſeems worth the while and opportune, to add in this place a ſhort anatomical deſcription together with the uſes and offices both of the Arteries in general, and chiefly of thoſe which more immediately joyn to the Heart; and that the rather becauſe as the more ancient Phyſicians did much diſpute concerning theſe Veſſels, the latter attributing the whole Buſineſs of the circulation of the Blood almoſt to the Heart alone, for as much as it is a Muſcle, they have been but little ſolicitous about the Arteries.

The Coats of an Artery according to Galen.

Firſt therefore, that I may remember what the Ancients have ſaid, *Galen lib. 7. Adminiſt. Anatom.* Chap. 5. ſays, That every Artery conſiſts of a double Coat, to which (he ſays) the third and fourth may be added. Again *lib. 3. de Facult. Naturalibus* Chap. 11. He ſays that the Arteries have Coats like the Ventricle, and that the interior Coat has long and oblique Fibres, but the exterior tranſverſal Fibres. I will in a few words ſhew, which way and how congruouſly this agrees with our anatomical obſervation.

The preparation for its Anatomy.

For the right knowledge of this Experiment, take a portion of the great Artery or *Aorta* of a Man or Beaſt cut off, which being put upon a ſtick (whereby it may be ſtretched forth) dip it oftentimes in ſcalding water, that the Coats and Fibres being ſomething contracted and made more tumid, may be better perceived and pulled one from another, then a ſeparation being made by a Penknife, four diſtinct Coats will appear. The outmoſt of theſe thin and nervous, ſerving for a cover

It hath four Coats.

Part I.

a cover of the whole Veſſel, hath outwardly many nervous branches variouſly creeping about here and there, but in the exterior ſuperficies a texture, as it were of the form of a Net, and very thickly planted of all kind of Veſſels, and eſpecially of the ſanguiferous, covers the whole. The Arteries aſcending every where in this Coat, firſt from the coronary Veſſels, and then out of the Trunk of the *Aorta* and from its branches are ramified or branched with Veins and Branches in like manner, ſent forth from its hollow. Moreover, the nervous Branches meeting with both theſe are variouſly complicated, and ſo of all theſe interwoven is made as it were a certain Net every where covering the Arterious Tube; from which very ſmall ſurculs or little ſhoots of every kind of Veſſels, ſhoot forth into the other underlying Coats of the Artery.

The deſcription of the outmoſt.

The ſecond Glandulous.

2. To this retiform Coat another glandulous ſucceeds, or rather that ſticks cloſe to this placed upon it. This membrane being planted through the whole with very little and whitiſh Glandula's, is after the ſame manner as the interior glandulous Coat of the Ventricle and Inteſtines lying under the hairy Cruſt, alſo from the back of which a retiform or Net work enfolding of Veſſels is every where diſpoſed.

The third is Fibrous and muſculary.

3. In the third place it hath a muſculary or fibrated Coat, *viz.* contexed or woven thickly with accumulated tranſverſe or annulary Fibres. Theſe fleſhy and moving Fibres, compaſſing the Arterious Tube are not ſcattered by a thin and ſingular *ſeries*, as in the Veiny Coat, but in a certain heap, ſome lying upon others; they make a very thick Skin. Their rows or orders being ſcalded in the Artery, may be very eaſily ſeparated and pulled one from another, which in like manner ſeem (as thoſe of the Ventricle and Inteſtines above deſcribed by us) altogether fleſhy and moving.

The fourth nervous has right Fibres.

The fourth and interior Coat of the Artery, inveſting its Cavity and covering the underlying Coat, is thin and almoſt wholly membraneous: Its little nervous Fibres being ſtretched long ways, cut the anulary Fibres in right Angles; and it ſeems that theſe are thoſe right Fibres of which mention is made by *Galen*, and ſtill by other Anatomiſts: But what they call oblique I think to be only imaginary, becauſe they are no where to be found in this Veſſel. But it appears this error to have been familiar to ſeveral Phyſicians, to wit, that they have aſſigned to many *Viſcera's* and membraneous parts, right, tranſverſe, and oblique Fibres, out of a falſe ſuppoſition that there was in every one of them, an attractive, retentive, and expulſive faculty, and that theſe three Offices ſhould belong to the three orders of Fibres, all which indeed will appear to any diligent enquirer, to have been falſly aſſumed and upon truſt. In the mean time I ſo far aſſent to *Galen*, that I acknowledge four diſtinct Coats of the Artery, yea thoſe to be in this Veſſel even as in the Ventricle, except yet that in the *Viſcera's*, the retiform infolding of the Veſſels together with the Glandulous Coat, is placed under the fibrated or muſcular Coat, but in the Artery above it.

The uſe of the Coats.

So much for the conformation of an Artery in general, and its conſtitutive parts: As to what belongs to their Offices and reaſons, it ſeems that the muſculary Coat endued with fleſhy orbicular Fibres, is of the chiefeſt uſe and operation. For this as we have already hinted, obeying the motion of the Heart, in driving about the Blood obſerves the perpetual turns of *Syſtoles* and *Diaſtoles*, for that whilſt the fleſhy Fibres of this are ſtrained ſucceſſively, and with wonderful celerity behind the River of Blood, there will be a neceſſity for its courſe to be moſt rapidly made from the Heart even to the extremities of the Arteries.

The fibrated for the Syſtoles *and* Diaſtoles.

The other Coats for the benefit of this.

As to the other Coats, and the Veſſels diſtributed through them, they ſeem to be all inſtituted for the commodity and uſe of this one muſculary Tunick: For in the firſt place the Nerves and their ſhoots every where ſowed upon the Trunk of the *Aorta*, and its greater branches, and appearing outwardly do carry to the underlying fleſhy and moving Fibres, after their manner abundance of Spirits for the performance of the continual task of *Syſtoles*, and beſides they carry (as we have ſhewed before) the inſtincts of Sympathetick Contractions. Then the leſſer Arteries (which we meet with next) ſtrictly covering the interior ſuperficies of the outmoſt Coat, lying next to the muſculary Coat, are charged even as the other Arteries next the other muſcles and ſolid parts with a double duty, to wit, that they convey and bring to the ſpirits continually to be renewed, the alible or

To what end the retiform folding of the Veſſels is.

nouriſhing

nouriſhing juice by which they are nouriſhed and grow, and elaſtick Particles; then the Veins, the companions of the Arteries carry back whatſoever is not otherwiſe expended of the Blood. Part I.

But that theſe ſanguiferous Veſſels, planted without the muſculary Coat, and complicated among themſelves, do conſtitute as it were a retiform fold, from which only moſt little and very ſmall ſhoots are ſent forth, (as it is alſo about the Ventricle and Inteſtines) when as in many other muſcles, theſe Veſſels are interwoven with the fleſhy Fibres, and make them therefore to bluſh or ſeem red: The reaſon of this difference ſeems to be, for that it is requiſite for the ſanguiferous Veſſels to be ſeparated a little and placed at a certain diſtance from the fibres of the *Aorta*, and the motional of the *Viſcera's*, leſt that the Blood perchance waſhing theſe more plentifully ſhould be ſometimes obſtructed, and ſo bring forth a Phlegmon, or a ſoon killing Impoſthume: Wherefore for the greater caution againſt ſuch an accident, the glandulous Coat always coheres to the retiform folding of thoſe Veſſels; to wit, for that end that the ſeroſities flowing over and above, both from the Nerves and from the Arteries, and not preſently carried back by the Veins, might be preſently received by thoſe numerous Glandula's, and until they may be carried back to the Blood, (leſt they ſhould ruſh upon the moving Fibres, and ſhould affect them with a Cramp) might be there contained. *The uſe of the glandulous Coat.*

But that the net work folding of the Veſſels, and the glandulous Coat ſticking to it, is placed above the muſculary Coat in the *Aorta*; and in the *Viſcera* under it: The reaſon unleſs I am deceived, is this, *viz.* that theſe ſmall Veſſels which ought gently and moderately to diſpenſe the Blood and Juices, might be removed as far as might be, from the eſtuation of the ſanguineous Torrent within the *Aorta*. But in the Ventricle and Inteſtines, for the rightly performing of the Offices of Concoction, there is need of the former fire of the Blood. *In the Artery the folding of the Veſſels is above the muſculary Coat, but otherwiſe in the Viſcera: The reaſon of this.*

The inward Coat of the *Aorta* inveſting its Cavity; ſeems to be chiefly conſtituted for theſe uſes, that it might carry within it the Bloody Channel, and terminate the other parts of this Veſſel: But beſides we muſt yield to this ſomething of ſenſe, and perhaps ſomething alſo of motion, for this being endued with nervous Fibres, is affected by the Blood paſſing through it, juſt as the Boſom of the Heart; and for that cauſe according to the ſenſe of this, the muſculary Coat is urged into frequenter or ſlower, equal or inequal motions of the *Syſtoles* and *Diaſtoles*. Moreover, this Coat has neer the Heart for the ſpace of about two inches, greater, and as it were, fleſhy right or longitudinal Fibres, in ſo much as I ſuſpect in this place, by reaſon of the greater impulſe of the Blood, the Artery not only to be ſtrained and ſtraitned as to its amplitude, behind the ſtream of the Blood, but like as in the heart, it to be contracted and ſhortned ſomewhat as to its longitude alſo at every *Syſtole*. *The uſe of the inward Coat.*

I might here add many other things about the ſtructure and uſe of this Veſſel, not leſs profitable than pleaſant to be known, ſo full and fruitful of contemplation is every the moſt little part or portion of the animated Body, that the more full knowledge of every of them ſingular being wrote down, might fill many Pages, yea the whole Book. If I ſhould go any further in this digreſſion, it would follow next to ſpeak of the Veins, but it being omitted for this conſideration (ſince that it makes little or nothing for the unfolding the reaſons of Evacuation) we will paſs over to the other kind of Medicines, to wit, to Hypnoticks.

SECT. VII.

CHAP. I.

Of Opiate Medicines or Cauſing Sleep.

AFter the Cardiack Medicine by a certain Law of Method, the Hypnotick follows. For that Sleep oftentimes comes moderately and ſeaſonably it becomes of it ſelf a great Cardiack Remedy. But this paſſion is not always wont to be preſent, when nor as it ought to be, but ſometimes affects us evilly with its troubleſome preſence, ſometimes with its abſence. By the true inſtitution of Nature, Sleep and Waking, as *Caſtor* and *Pollux*, ought to have their turns one after another, and the one to give place to the other, according to the juſt bounds of Reigning. This viciſſitude ſo long as it is rightly obſerved, doth very much conduce both to the preſerving the health of the Body, and to the furniſhing of the gifts of the Mind: But if the dominion of either of them be too long continued, it will quickly be that there will not be long a whole mind in a whole Body. By immoderate ſleep, all the faculties both of the natural and animal Function, become very much ſtupified, and from hence one becomes more fit for the Grave than for Society. On the contrary, over great Waking deſtroys the ſtrength, and makes infirm or perverts the Animal powers: Wherefore among the Remedies accommodated to our needs, the moſt wiſe Creator hath abundantly provided for theſe uſes, to wit, that it ſhould be in our power to procure or repel Sleep aud Waking, as often as it ſhall ſeem convenient, and as often as they ſhall offend in exceſs, or in defect to moderate them: Which Medicines and by what means of working on the humane Body, they are wont to procure theſe deſired effects, it now lyes upon us to ſhew, and firſt we will ſpeak of Opiates or Remedies procuring Sleep.

The viciſſitude of Sleeping and Waking neceſſary for health.

That it may better appear what the Hypnotick Medicines do, and by what kind of affection of the Brain, animal Spirits, and of the other parts they cauſe Sleep, hither ought to be referred what we elſewhere have very largely diſcourſed, concerning the Nature, Subject, Cauſes, and effects of Sleep: To wit, we have ſhown the immediate ſubject of Sleep to be the animal Spirits, not all, but only of the Brain, and the inhabitants of the nervous *Appendix*, *viz.* which execute the Office of all the Senſes, and of every ſpontaneous motion, they in the mean time being taken away, which ſerve for performing the actions of the merely natural and vital faculty.

In the tract of the Affections of the Brain.

Theſe things being premiſed concerning Opiates, it ſhall firſt be enquired into, by what means they affect the animal Spirits, ſo that as it were by a blaſt of a Medicine, they preſently as if they were bound faſt in Chains, ſubſide or ſink down and leave their Tasks. In the ſecond place it behoves us to ſhew where the Hypnotick Medicines begin their operation, *viz.* whether in the Ventricle or the Brain, or whether not in both together, or ſucceſſively. In the third place, it ſhall be determined how far Opiates do extend their energies, whether they reach only to the Spirits of the Brain, and the inhabitants of its *Appendix*, ſeeing that they only are capable of natural Sleep, or elſe to the others of the Cerebel or little Brain alſo, and to thoſe preſiding in its Dominion. Laſtly, in the fourth place, it will be worth our labour to add ſome notable Effects and Accidents of the chief Hypnoticks, together with the reaſons of them.

The Contents of the Opiology are four.

1. As

Part I.

1. As to the firſt of theſe, to wit, that it may appear by what means Opiates do affect the animal Spirits whilſt they bring them to ſleep, we have in another place largely declared our opinion: which is that I think they do not exerciſe their powers by raiſing up vapours into the head, nor by opening the Pores of the Brain, whereby the vaporous matter or otherwiſe ſoporiferous is admitted; but only by deſtroying or profligating ſome animal Spirits, wherefore the reſt as being amazed, or compelled more inwardly, or at leaſt being called back from their wonted Efflux into the nervous parts, do relinquiſh or remit for a little while their Tasks. It manifeſtly appears to be ſo, becauſe Narcoticks, if they are taken in too great a Doſe, for as much as they deſtroy the ſpirits in ſo great abundance that the vital Function can be no longer obeyed, cauſe death. But they being given in a juſt quantity, and with other circumſtances aptly agreeing, for as much as they overthrow and amaze ſome ſpirits, and wholly extinguiſh others, they allay the too great fierceneſs and impetuoſity of the ſenſitive Soul, for the end that ſhe being made more contract, and as it were ſinking down within her ſelf may ly quiet: almoſt by the like means as when the inſperſion of water cauſes preſently the compaſs of the flame more vehemently breaking forth to be reſtrained, and to be reduced within moderate bounds.

1. How Opiates do affect the animal Spirits.

If that it be further asked, in what matter and how diſpoſed the narcotick Virtue of the Medicine conſiſts? no manifeſt quality as of cold, heat, or of other kind ought to be pretended, nor preſently muſt we fly to I know not what occult qualities. It may be lawful to ſuppoſe that Opiates do conſiſt in ſuch kind of Particles, which are greatly contrary to the animal Spirits, and are extinguiſhers or rather poyſoners of them. It will not be eaſy to ſhew of what ſort of ſubſiſtences or conformation the contrary Particles of either kinds are, becauſe they are not perceivable by the ſenſe, and the Anology of the like adverſe Particles is not met with in any other ſubjects. But yet as it is lawful to conjecture, it ſeems that as the animal Spirits are moſt ſubtil little bodies, compoſed of ſpirits and volatile ſalt united together and highly exalted; Opiates on the contrary conſiſt of a ſtinking Sulphur, that is of Sulphur, with a fixed ſalt and earthy matter combined together, and carried forth to an efferation or fierceneſs; which kind of concrete, is well enough known to be ſo much contrary to the ſubtil texture of the animal Spirits, that ſometimes they profligate them at a diſtance by their mere *Effluvia*, they being ſcarce or not at all perceivable by the ſmell; but their Particles (after they are taken inwardly) being diffuſed thorow the blood and nervous juice, whereever they meet within them ſome of the Bands of the Forces of the animal Spirits, they poyſon them and as it were extinguiſh them. But in what places this is firſt or chiefly done ſhall be next inquired into.

In what kind of Particles their virtue conſiſts.

2. We have formerly ſhewn ſpeaking of ſleep, this affection according to the ordinary rites of Nature to begin from the ſhell of the Brain, *viz.* the Spirits dwelling there and being as it were watchmen firſt of all to recede, and their Arms as it were being laid aſide to give way to Idleneſs; then preſently all the reſt to whom theſe Idleneſſes are permitted, in like manner lying down to indulge ſleep.

2 In what places Opiates do firſt and chiefly operate.

Theſe ſpirits of the firſt Band being about to obtain Reſt, relinquiſh their Stations either becauſe they are wearied or leſned in their forces, they of their own accord leave their Tasks until they may be recreated, or becauſe they are drawn away from thence, or laſtly drawn more inwardly by ſome gentle or pleaſant handling. The firſt of theſe ordinarily and often happens by reaſon of an influx or inundation of the nervous juice, and ſometimes of the ſerous *Latex*. For thoſe humours being poured forth from the Blood (whilſt that it is ſatisfied) waſhing the outmoſt Bounds of the Brain, into its cordial or ſhelly ſubſtance, fill the Pores and all the paſſages, and ſo they repreſs the ſpirits and hinder them from their free expanſion by which they make their watches. The reaſon of all theſe and the means of doing it we have already largely declared in another Tract: From which being truly weighed it will be juſt to think that the Particles of every kind of Opiate after it is taken being carried iuto the Blood, and circulated with it doth chiefly exerciſe its narcotick or ſtupefying force neer the ſhell of the Brain; for they meet within this place the firſt forces of the animal ſpirits, and deſtroy or rather extinguiſh wholly many of theſe placed in the fore part of the Battle; then, by reaſon that the other ſpirits of this Troop being made now thinner go back, and their

To wit, firſt in the ſhell of the Brain

Part I.

emanation being reſtrained fly towards the middle of the Brain; and ſo whilſt theſe withdraw themſelves from the Battel, and rejoyce for their retreat, all the reſt within the ſenſories where they are placed as in ſo many watch-towers, their ſuccours being gone, ſome follow and leaving their watches recede, and give way to idleneſs.

Where they deſtroy the outmoſt ſpirits and compel the next to theſe to go back inwardly.

After this manner the Particles of Opiates for as much as they profligate, and deſtroy certain animal Spirits ſtanding in the *Cortex* of the Brain, and do repel and put to flight thoſe which are next, ſo that their influx to the Senſories is ſuſpended, they procure ſleep; but yet by what means, in ſo ſhort a ſpace (as it ſometimes happens) *viz.* preſently aſſoon as the Medicine is taken, and whilſt it is ſcarce diſſolved in the Ventricle, ſleep creeps upon one, when it ſeems to be a work of ſome little time, in which the ſoporiferous Particles may be carried from the Stomach into the Blood and thence by its paſſage to the Brain, is not eaſe to unfold. Firſt I may ſay to this that the Journy from the Ventricle to the Head by the Blood is expeditious enough, and may be performed in a very little time: but beſides I am led to opine that Opiates ſometimes by acting more immediatly on the Ventricle and by its mere contact before there is any commerce of the Blood, do after a ſort procure ſleep. Elſewhere we have deſervedly aſſigned among the evident cauſes of this Affection the aggravation of the Stomach; for how often does any one, having eaten more groſs and undigeſted meats cauſing trouble and heavineſs of the Stomach become preſently ſleepy? The reaſon of which ſeems to be for that there is a great affinity between the ſpirits of the Stomach and thoſe inhabiting the Brain, and an intimate Sympathy betwixt them, ſo that the afflictions and evils of either of them do afflict the other (which indeed may very eaſily be ſhewn in many Inſtances) hence it eaſily comes to paſs that by reaſon of the ſpirits which preſide in the Ventricle being highly oppreſſed, and hindred from their free expanſion, and as it were expulſed, preſently the *Hypoſtaſis* of the whole Soul and eſpecially that principal part ſet before the Brain in like manner is ſtraitned contracts its Sayls and ſubmits its whole ſelf to the yoak of ſleep. How much the rather may it be thought when at any time the ſpirits of the Stomach imbibing the opiatick Juice are impoyſoned, and in a great abundance deſtroyed, that preſently all thoſe watching about the ἐγκέφαλον do every where give place, and are oppreſſed with ſleep, which is not only the Image of Death, but ſometimes one and the ſame? Indeed we have related elſewhere a very rare and true Hiſtory of ſuch kind of effects from *Opium* being taken, *viz.* of a certain ſtrong man and moderatly healthful, who having taken too great a Doſe of *Laudanum* for the aſſwaging the colick pains was immediatly taken with an intollerable weight and ſtupor about the Ventricle, and within four hours dyed, neither yet did there happen to him any ſleep, but his laſt and deadly.

They leſſen or call back their Efflux to the nervous parts.

Opiates by ſome means whilſt they are in the Ventricle do exert their virtues.

The reaſon of this unfolded.

Theſe are the chief and moſt uſual places, *viz.* the Ventricle and the *Cortex* of the Brain in which Opiates exerciſing their powers do begin or procure ſleep. Notwithſtanding it appears beſides by common obſervation that they being adminiſtred after many other ways, do impreſs a certain Narcoſm or ſtupefaction to the whole ſenſitive Soul or at leaſt to a portion of it which is ordinarily and naturally capeble of ſleep. A Liniment of *Opium* being applyed to the forehead, alſo an *Enema* imbued with its ſolution are ſoporiferous. Some have found to their damage the like effect from the ſame things being put into their Noſtrils or a hollow tooth; ſo that it appears that this Medicine may be admitted from any place to the animal Spirits, and doth deſtroy whatſoever are next it by its mere touch; and ſometimes ſo that a contraction or ſinking down of the whole Soul as it were being moved with an Eclipſe of the principle Faculties follows: although it is alſo very like that the Particles of the *Opium* may be carried from thoſe places by the paſſages of the Blood to the *Cortex* of the Brain.

3. *How far and to what parts the virtue of Opiates doth reach.*

Having thus ſhown you the weapons of Opiates by which they effaſcinate or hurt, and the place where they firſt or chiefly operate, now follows to be ſpoken of the Sphere of their Activity, *viz.* into what parts or Particles of the Body, and how far in them they extend their forces. By what hath been already ſaid it appears plain enough that they act upon the animal Spirits; but let us ſeek if not alſo upon the Blood, and other humours? certainly that the Blood is not at all vitiated by them, I judge firſt from their ſo very little Doſe, by which it is highly improbable for the Blood to be empoyſoned or corrupted: then for that though

They do not empoyſon the Blood as they do the Spirits.

Narcoticks

Narcoticks be often applyed, yet no *Stigma*'s or Puſtles or little whelks appear in the skin or *Viſcera*, which uſe to happen to the Blood being any ways empoyſoned. Moreover to whom the uſe of *Opium* becomes familiar, that it does not hurt the animal Spirits although daily taken in a great quantity, no Dyſcraſy of the Blood is wont to be produced from thence. In the mean time we muſt not think the Particles of *Opium* to be agreeable to the blood, and to be aſſimilated by it, but rather to be wholly heterogeneous and immiſcible: wherefore it is no ſooner come into its Maſs but by and by they are expelled from it, and from thence being partly poured on the *Cortex* of the Brain, cauſe ſleep, partly caſt forth by the pores of the skin ſtir up Sweat, and not ſeldom an itching (as I have obſerved in many) very troubleſome. As to the other Humours, I ſee no reaſon for us to judge that Opiates do affix any blemiſh to the *Serum*, or nervous Liquor, or laſtly to the nutritious Juice; ſo that their virtue, and energy ſeems to belong to the animal Spirits. Part I.

Opiates primarily act upon the Spirits inhabiting the Brain.

Notwithſtanding they are wont to affect all theſe not after a like manner, but Opiates given in a moderate Doſe do chiefly and almoſt only reach to thoſe Spirits to whom the priviledges of natural and ordinary ſleep is granted, the reſt being either untouched or not much hindred. Wherefore from *Laudanum* being taken the ſenſes both internal and external are tied up, in the mean time the Pulſe, Reſpiration, alſo the offices of concoction and ſeparation are performed after their wonted cuſtom, and after ſome time the ſpirits of the former Dominion, their forces being reſtored do laſtly ſhew themſelves, and the chains of ſleep being ſhaken off return of their own accord to their wonted watches.

When their force reaches to the Cerebel or little Brain.

If that an opiatick Medicine is more ſtrong then it ought to be, it not only impoſes more ſtrong chains on the ſpirits of the Brain and thoſe inhabiting its *Appendix* whereby they are longer bound up, but alſo inlarges its narcotick force into the other province of the animal Dominion; ſo that after its larger Doſe the appetite is for the moſt part beaten down, reſpiration very much ſtraitned, and is rendred not only difficult but alſo unequal; and alſo ſometimes the motion of the heart it ſelf fails ſo much, that the Pulſe being weaker there happens a certain Eclipſe or *torpor* of all the faculties with a cold Sweat, ſo that ſometimes from ſuch a Medicine follows a perpetual ſleep, the reaſon of which is for that the opiatick Poyſon being further diffuſed goes into the Globe of the Cerebel or little Brain and deſtroying or utterly diſcomfiting in great abundance the ſpirit inhabiting it, cauſes the motion of the Heart at firſt to grow weak and then quite to ceaſe, ſo that the vital Flame is extinguiſhed.

4. The good or evil effects of Opiates.

Theſe things being premiſed concerning the nature, manner of working, ſubjects, and limits or Sphere of Activity of Opiates, it now lies upon us to recount the chief effects and accidents both good and evil which are wont to happen from the uſe of them: and then to add ſome cautions about the right method of Hypnotick Medicine, therefore let us ſee in the firſt place, after what manner and in what caſes opiatick Medicines are wont to be helpful.

1. Their good reſpect either the Spirits or Blood and Humours.

The good or benefit to be procured by the uſe of Opiates is wont to belong either to the animal ſpirits or to the blood and Humours: Thoſe are indeed firſt and more immediatly, theſe only ſecondarily and by the means of thoſe affected.

They are required for the ſpirits as to the ſenſitive or motive Function.

To either in a various reſpect.

As often as the animal Spirits being above meaſure ſtirred up act either too much or irregularly about the performing their offices for the allaying their force or inordinations, Narcoticks being timely adminiſtred do oftentimes bring notable help: thoſe kind of exorbitancies for which the uſe of Opiates is preſcribed, reſpect either the ſenſe or motion. As the former Fuuction is twofold, the chief vices of the internal ſenſes are watchings and *Delirium*; but the ſickneſs of the external chiefly requiring this Medicine is pain. The irregularities of the Motions to be rectifiied by Narcoticks are firſt a more vehement Pulſe, Convulſions of the *Præcordia* or *Viſcera*, and alſo the too violent and exceſſive excretions of theſe. So there are many and divers caſes in which whilſt the animal Spirits like fierce and furious Horſes run about, or leap beyond their bounds, they ought to be reduced or reſtrained by Opiates as it were with Bridles. We ſhall here briefly ſet down ſome inſtances of every one of theſe together with the means of doing and the reaſons of curing.

In reſpect of the watching of the internal Senſes.

1. In the firſt place therefore Opiates are neceſſarily and exceeding properly preſcribed for watching or waking, for as much as ſleep is an Affection contrary to this, and for that reaſon it becomes curative. For what cauſes and by what

Part I.

means watchings are wont to be excited and to remain a long time, we have largely enough ſhown in a late Tract; in all thoſe Caſes of the animal Spirits being ſometimes too much carried forth, and being of themſelves inquiet and importunate ſince they every where blow up and irradiate both the ſenſorie Orgains, and eſpecially the outmoſt Border of the Brain; the opiatick Particles, being carried hither by the paſſage of the Blood do forthwith deſtroy or caſt down or ſcatter the Spirits watching in the forefront, ſo that the next who being compelled do abide more inwardly, and being kept from their emanation on every ſide, they are reſtrained very much, wherefore preſently all the extrinſick Spirits inhabiting the Organs of every Spontaneous, both ſenſe and motion, being deſtitute of the wonted Afflux of thoſe Capitals do alſo leave their watches and retiring inwardly do become Idle.

2. and Delirium.

Secondly in Delirian Affections Opiates are often adminiſtred with benefit (although ſometimes they rather hurt, as ſhall be hereafter declared) the reaſon of the former is that when the Spirits being too much ſtirred up within the Brain, and ſtruck as it were with a fury they eaſily leap beyond the cuſtomary and wonted Paths of their Paſſages, then a narcotick Medicine approaching nigh to the border of the Brain, doth repreſs them blown up like hounds that are apt to expatiate, and ſtops them a little while from all motion, as oftentimes when they are at laſt moved they repeat their former methods and rightly perform their ancient Functions.

In reſpect of the external ſenſe for pain.

Thirdly *Opium* is eſteemed of moſt excellent uſe for the quieting all manner of Pains whatſoever, wherefore it deſervedly is wont to be called *Nepenthe*, and is a truly divine Remedie. And indeed we can ſcarcely enough admire how this Medicine, whilſt ſome notable torture or intolerable Pain of ſome Member or the *Viſcera* doth afflict, as it were an Inchantment doth yeild a ſudden help and Ceſſation from Pain, yea ſometimes without ſleep or at leaſt before ſleep comes. Moreover 'tis yet more ſtupendious that whilſt the Opiatick Particles do continue to operate and to exerciſe their narcotick or ſtupefactive Power, yea ſometimes a little after ſleep is ended there is an high Alleviation or eaſement and freedom from Pain in the Part afflicted, but then the force of the Medicine being ſpent, the Pains return, neither do they remit their atrocity, unleſs whilſt they are charmed again by the ſame Medicine.

By what means Opiates do allay Pain without ſleep or after it is ended.

It doth not eaſily appear to him who ſearches the reaſon of this, in what part the Anodyne Medicine doth moſt ſtrongly operate and exert its Virtue, whilſt it allays Pains without ſleep or after it is finiſhed, and continues its Ceſſation for ſome appointed time, *viz.* whether its narcotick Force is imployed on the grieved Part, or on the common ſenſorie, or on the whole ſenſitive Soul. The reaſon of the Difference of the propoſitions is, becauſe Pain being excited in one place is felt in another, and its effect is poured forth through the whole Soul. Its production conſiſts in this, that the nervous Fibres are irritated very much, and pulled one from another by ſome incongruous, and greatly unproportionate thing, ſo that the Spirits abounding in them are by and by diſtracted, and being ſnatched from their equal expanſion are agitated into Confuſion: but the ſenſe of Pain is effected for as much as that perturbation of the Spirits, by a certain undulation through the nervous Paſſages to the common ſenſory, *viz.* chamfered, delated Bodies, doth ſtir up the Spirits there implanted into the like Diſtraction: which ſort of Affection going forward even to the very middle of the Brain, moves the Imagination, and from thence being preſently reflected thorow the whole *Hypoſtaſis* of Spirits, diffuſes a certain trouble or inquietude. Therefore as this Pain is a Paſſion ſo largely extended and of ſo various a reſpect, it may well be ſearched into, what kind of Sphere of Activity Anodynes have.

Concerning theſe there is no cauſe of Doubt, but as often as ſleep is induced by *Opium* being firſt taken, a Ceſſation from Pain conſequently ſucceeds: then alſo this more immediate effect of it preſently follows; to wit, for as much as thoſe which actuate the firſt ſenſory are alſo bound with the Spirits inhabiting the Brain; and for that cauſe although the paining Part be irritated, the ſenſe of all Pain is inhibited: but indeed that when the patient awakes, and ſo remaining doth lively exerciſe all the animal Functions, continues free from Pain for many hours after the *Opium* is taken, and then the ſtrength of the Medicine bein ſpent preſently the ſame Tragedy returns, this Knot certainly deſerves to be looſed.

For

Part I.

For the ſolving of which we may not ſay, the Spirits of the grieved part, or thoſe inhabiting the common ſenſory, *viz.* either theſe or thoſe ſingly or both together are bound by the Anodyne Medicine. For that it is not credible for the particles of the *Opium* ſo to penetrate and ſo deeply to enter into the Brain and nervous Stock, that in ſo ſhort a time they ſhould deſcend, that being overcome and unhurt to its outmoſt Confines; further neither is it to be thought, that the Spirits inhabiting the chamferated Bodies (whilſt the *Analeſia* or Ceſſation of Pain for ſome time during the waking remains) being awakened for the receiving of all the Impreſſions of other ſenſibles, are made deaf only to the approaches made from the paining part. Since therefore the Indolency after ſleep is finiſhed, ought to be referred neither to the grieving part, neither to the firſt ſenſory ſtupefied by the *Opium*, let us ſee how the reaſon of this may be deduced from a certain narcotick Affection of the whole ſenſitive Soul. After we have premiſed theſe two things this will eaſily be manifeſted.

The reaſon of it unfolded.

In the firſt place it is abſolutely neceſſary for the ſtirring up or continuing of any pain, that there be a very great plenty of Spirits abounding in the part affected: becauſe the excandeſcency, diſtraction, and mutual alliſion or beating of the tumultuating Spirits one againſt another, are the conjunct Cauſes themſelves of that troubleſom ſenſe which is called Pain; wherefore if that an afflux of Spirits from the bound Nerves to the paining place may be hindred or much diminiſhed, there will be a neceſſity for the Pain to ceaſe; for that thoſe Spirits being deſtitute of new forces or ſupplies, ly ſo thinly and diſperſed in the Fibres, that they ſcarcely touch one another, at leaſt that they do not break forth into furie and indignation.

It conſiſts in thoſe two things, viz. In the firſt place there is required to Pain a copious Afflux of Spirits to the part affected.

2. This kind of Deſtitution or withdrawing of Spirits here required for the cauſing an *Analeſia* or Ceſſation from Pain, and may be procured by no other remedy or experiment is very often produced by *Opium* being given. For truly not only ſome outmoſt, and as it were precurſory Spirits (as is ſaid) are deſtroyed by the Particles of this Medicine beſieging the Border of the ἐγκέφαλον, but the firſt ſpringing forth of theſe within the midſt of the Brain and Cerebel, and for that cauſe the Efflux upon the nervous Stock by and by are greatly ſuppreſſed, ſo that during the Energie of the *Opium* they are diſpenſed much more ſparingly and leſs into the *Præcordia*, *Viſcera*, yea and into all the other parts. Hence the Pulſe and reſpiration do remit of their vehemency and quickneſs, and ſometime this becomes ſuddenly difficult or hard and that weak or debilitated; alſo for the moſt part there comes upon all the Members and Limbs an unwonted Languor and Sloathfulneſs. Moreover from hence the *Viſcera* being before provoked into either excretory Convulſions by Vomit or Stool, or dolorifick as in the Collick or Stone, do leave their inordinations: *viz.* for this reaſon becauſe whilſt that a ſubſidiarie plenty and Supplements of Spirits are wanting in the part afflicted, thoſe few that are left are not at leaſure any longer for tumult and anger: yea that they may be able to ſubſiſt and maintain themſelves they ly quiet: But afterwards when the Particles of the *Opium* being ſcattered or blown away, the ſtock of Spirits within the *Encephalon* and their emanation from thence on the nervous Parts is renewed, ſo that they may deſcend again to the Parts affected in a full Stream and fill full again their Fibres, forthwith by reaſon of the Spirits being again accumulated and ſtirred up as before, the ſame Convulſions or Pains return.

which Opiates diſpend.

For the ſame reaſon Opiates take away Convulſions.

Without doubt according to this means of affecting and according to the reaſon but now aſſigned Opiates do for the moſt part quiet the fierceſt Pains, and do procure an Indolency with or without ſleep, and do continue it for ſome determinate time after ſleep is a good while finiſhed; which ſpace being elapſed, the Pains by and by do wax grievous again and are ſhortly increaſed to their wonted fierceneſs. The Effect of theſe kind of Affections, is commonly enough known in the Cure of the ſcorbutick Colick, and ſeems as it were a certain Exorciſm; for as much as the Pain, as a *Dæmon* or evil Spirit may be only bound for a certain determinate Time, and then again begins to rage. Among the dolorifick Diſeaſes to which *Opium* brings help, the Gout and Stone in the Bladder may by right challenge a place. In Arthritick Pains that Anodyne has been an egregious and as it were a divine Succor. This latter Diſeaſe, when it rages moſt cruelly in old Men and that they cannot be cured by cutting, it admits of eaſe by no other Remedy but from

They help in the Stone and Gout.

Part I.

from Narcoticks. Wherefore in this caſe I have perſwaded ſome to the conſtant and daily uſe of *Laudanum* or *Diacodium*, which as they have done with great comfort of Life, they got no hurt by it, although they encreaſing its Doſe aſcended to a great quantity. So much for the Reaſons of healing or helping the to be regulated enormities of the ſenſitive Function which *Opium* is wont to help: let us at length ſee how, and how much this *Panacea* ſerves for the healing or quieting the irregularities of Motions,

2. How Opiates help the irregularities of the motive Function.

2 The Immoderation or Irregularity of the motive Function for the rightly compoſing of which the uſe of Opiates is preſcribed, have chiefly a reſpect to the *Præcordia* and *Viſcera*; (for Convulſions about the Head and Members do not ſo neceſſarily require this Medicine.) To the firſt of them ought to be referred the Pulſe, and Reſpiration, as often as this or that ſhall be more frequent or more vehement than it ought: For when in Fevors the motions of the Heart and Lungs being more intenſe do more rapidly carry about the Blood ſo that then both as to its accenſion, and as to its *Craſis* it is greatly perverted, and cannot ſeparate its ſuperfluities being ſo thorowly incocted, the impetuoſity of thoſe parts is ſomewhat broken by a Narcotick being adminiſtred; ſo that the Blood by and by being gently and temperatly Circulated it diffuſes a leſs intenſe Heat, and being looſned in its Joynting, ſends forth its *Serum*, and impurities by Sweat and Urine. Opiates do extenuate and depreſs the Act of the Pulſe, and of Reſpiration; for as much as they do ſomewhat ſtop the Springs of the animal Spirits in the little Brain, and diminiſh their efflux from thence deſtinated to the nervous *Præcordia*, which if it ſhould happen to be too much, then a great dejection of the Vital Function, yea ſometimes Death follows.

1. They leſſen the vehemency of the Pulſe and Reſpiration.

They regulate the inordinations of Reſpiration.

Reſpiration not only as it is vehement but alſo for as much as the ſame may be interrupted, Convulſive or divers other ways irregular, frequently hath need of a Narcotick Medicine; this is wont to help before all other Remedies in a violent or very frequent and continually troubleſom Cough. But in Aſthmatick Paroxyſms where the Organs of Reſpiration being moſt laborioufly exerciſed, the diſeaſed ſeem to be in the very Agony of Death it ſelf, a Doſe of a very fit Opiate, as it were unexpectedly renders all things preſently ſerene and tranquill. The reaſon of which ſort of Affections is, that in thoſe Diſpoſitions where ſome trouble doth beſet the chiefly vital Parts, the Spirits inhabiting them being highly irritated break forth into cruel Excandeſcencies and by acting too much diſturb and invert all things: wherefore when a Narcotick being taken, the Succors are drawn away from the Spirits ſo raving, they preſently being extenuated and as it were ſuccourleſs, lay down their inordinations. Further a Narcotick Medicine ſeems no leſs neceſſary againſt the immoderate or Convulſive motions of the *Viſcera*, *viz.* of the Ventricle and Inteſtines. For this is wont oftentimes to help chiefly in horrid Vomiting and in too exceſſive or violent purging. The Dyſenterick Affections can ſcarce be cured without *Opium*; not that this Medicine fixes the boyling, and fierce Juices and Humours, but ſtops the excretory Convulſions of the Fibres, and that partly by ſtupefying by its meer Contact the ſpirits implanted within the Cavities of the *Viſcera* themſelves, and partly by ſuppreſſing the Spirits within the Cerebel about to flow from thence to thoſe parts, of whoſe aid being deprived they eaſily lay aſide their Convulſive Excandeſcencies. I might here recount the Convulſions or pains of other parts that are wont to be either allayed or taken away by *Opium*, but there is now enough ſaid of the Energy of this Medicine, and of the Effects of Anodynes which are ſhewn firſt and chiefly on the animal Spirits; let us now ſee what kind of Virtue and alterative force it obtains on the Blood and Humours.

Further Opiates do allay the excretory Convulſions of the Viſcera.

How Opiates operate on the Blood.

And indeed there is no body almoſt of an ordinary Capacity but ſees plain enough that Opiates operate on the Blood and Juices of our Body and do allay their Inordinations. In Catarrhs and Defluxions of every kind, we fly oftentimes to theſe as to the laſt Refuge; theſe ſtrongly ſtay bloody excretions, alſo reſtrain the Serous when they are exceſſive and colliquative or melting, or reduce them: They repreſs the immoderate Ebullition of the Blood growing fevouriſhly hot, and leſſen the too great inkindling thereof. Laſtly theſe happily quiet all fluxes from whatſoever cauſe ſtirred up in our Body, and induce moſt often an Halcyon or calm ſtate to the Blood however diſturbed.

Although

Part I.

Although theſe ſort of Effects for the moſt part are produced (as we intimated before) thorow the mediating Affections of the animal Spirits (for that the nervous Fibres being inordinately contracted do agitate the Blood and Humours, and compel them into divers fluctuations and exundations, therefore a ſuppreſſion of theſe Convulſions by Opiates preſently renders theſe ſmooth and tranquil:) But yet it ſeems alſo probable that the opiatick Particles, whilſt they are poured into the Blood do cauſe certain alterations to its Liquor by their meer ſyncraſe or Commixtion: for we have ſhewed above that theſe are altogether untameable, and immiſcible and heterogeneous to the Blood; which therefore ſince they appear not Enemies or injurious to its Liquor, may be after a ſort eſteemed for Alexiterians, of the ſame ſort doubtleſs, which being confuſed with the Blood, do quickly and almoſt untouched paſs thorow its Maſs, and by opening all holes and Pores in their Paſſage make an open way for the *Serum* and other ſuperfluities or malignities cloſely bound or ſhut up, to go forth, yea drive them before them out adoors, Wherefore not altogether undeſervedly is it that *Opium* is (as it were an *Alexipharmacon*) put into the Compoſitions of the chief Antidotes as of Treacle, Mithridate and *Diaſcordium*.

By what means Opiatick particles operate on the Blood.

Indeed, tis a ſign that the Particles of *Opium* being eaten are preſently carried into the Blood and ſwiftly paſs thorow its Maſs, becauſe they ſuddenly, after the Medicine is taken, being carryed to the *Encephalon*, procure ſleep and eaſe. Moreover it appears by common Experience that they procure Sweat and move Urine, in ſo much that theſe effects are reckoned commonly to the Virtues of *Opium*. Further that its Particles are not Venomous to the Blood but rather Alexiterian or reſiſting Poyſon may be gathered from hence, becauſe that *Laudanum* is oftentimes adminiſtred with great ſucceſs in the Plague, ſmall Pox, malignant Fevours, yea alſo in divers others: but in the mean time we do not eaſily apprehend thoſe Qualities which ſome attribute to this Medicine of fixing and thickning the Blood; unleſs perchance it may be ſaid to effect it, for as much as by unlocking its joynting, it cauſes its ſeroſities to be plentifully ſeparated and ſent away, ſo that the remaining Liquor becomes thicker and more Compact.

They quickly paſs thorow the Blood.

And therefore are to be eſteemed Alexiterian.

They move Sweat and urine.

But indeed that Opiatick Medicines do fuſe the Blood and ſometimes after the manner of *Alexitærians* move both Sweat and Urine ſtrongly as I have found it by frequent experience, ſo by the following Hiſtory (which I here add for a concluſion) it ſhall be manifeſted to all. Some time paſt I was adviſed with concerning a certain Gentleman very cacochymick or full of evil Humors, and miſerably vexed with nightly Pains ariſing from the Venereal Diſeaſe being not, or not well cured. I preſcribed many things, but in vain; becauſe very much abhorring Medicines he would yield to take nothing almoſt beſides a Doſe of *Laudanum* only once or twice a week for the appeaſing his Pains; ſhortly become Hydropical from an *Aſcites* and alſo an *Anaſarca*, he ſwelled ſo much that he could ſcarce move from one ſide to the other without the help of Servants. In this condition I being at length ſent for to him, and finding him obſtinate for his foretaken Medicines, I made a Prognoſtick that he was not far from Death and that it was certainly to be expected, therefore he ſhould prepare himſelf and his affairs for Eternity. He not much diſturbed earneſtly asked that for his more eaſy dying, he might take our *Laudanum*, before but ſparingly permitted him, at his pleaſure or at leaſt in the Evening alſo: granting it with a certain admonition, I left him and gave him as I thought the laſt farewel. Afterwards he took that Medicine dayly, and dayly increaſed its Doſe ſo that in a ſhort time he had taken an incredible quantity of it. By the uſe of this only Medicine he grew better every Day, and within a months ſpace was ſo well that being free from all Humours and Pains, he had got a Stomach and went abroad. By the aſſiduous uſe of this Opiate his Thirſt before much troubling him went away, and being every Night put into a great Sweat he alſo made plenty of Urine. I might here ſhew many cures of of other Diſeaſes eſteemed deplorable performed only by the benefit of *Opium*; but this being ſomewhat beſides the matter and tedious, I will only note in ſhort one or two more.

A notable Hiſtory of their ſuch like Efficacy.

Almoſt three Years ſince a noble Woman after an autumnal Fevour fell into a cruel Colick with Vomiting and ſharp pains, miſerably afflicting the Members and *Viſcera*. Remedies of every Kind both internal and external being carefully

The ſecond Hiſtory.

ly

Part 1.

ly administred for many Weeks, became useless, but the noble Lady within twenty Days was reduced to that Languor and extenuation of Body, that there was scarce any hope left that she should ever recover again: for being fixed to her Bed and almost always without sleep, she was constantly affected with the trouble or egrotation of the Ventricle, casting back again by Vomit whatever she took either of Physick or Food, besides she was almost continually tormented with Pains about the Belly and Loyns, and sometimes also in the Head and Joynts: being sent for to her, when I had tryed divers Medicines, nothing agreed with her besides a Dose of liquid *Laudanum*, which at first I ventured to give and that not without fear and caution twice only in a Week for the mitigating her Pains: she desired at length that she might take that remedy every other Night, and then every Night. And so using this without any hurt, she obtained at Night a plentiful sleep and pleasing enough, and for some time an Indolency and easie digestion of her Stomach, and so by degrees gathering strength left her Bed and began to fall to her wonted Aliments; but then she could and would take other Medicines, till at length she was quite well.

The third History.

No less was a certain Woman of note wont to declare the praises of this Divine Medicine being obnoxious for very many Years to most cruel Colical Pains. For as often as she fell sick of that Disease, she felt intolerable Torments and could be releived by no Remedy besides *Opium*, wherefore she took every Night a Dose of it, until the morbifick matter being by degrees taken away, she at last became free from all Languishment and Pains.

Chap. II.

Of the Harms and Incommodities of Opium, *to which is added Cautions about the use of it.*

Hitherto we have shown the good of *Opium* and as it were its Angelical Face, together with the manner and the Reasons of its helping. If the other *Phasis* of this Medicine as of a turned piece of Coyn be looked upon, it will appear plainly Diabolical; in which we may find out not less of hurt and Evil than we did of benefit in that of the former; so very much Poyson is joyned to this Medicine, that by its frequent and familiar use we cannot secure our selves; wherefore as we have declared its benefits, so it behoves us to admonish you of its harms, so that it is with this Medicine as with a Sea Voyage; that the less danger and difficulty may be met with, 'tis fit that both the Ports they may run into, and the Rocks to be shunned, be well known.

which and how many ways Opium *is wont to hurt.*

That the use of *Opium* hath been sometimes thought hurtful and evil, we have seen by the sad experience of some who have no sooner taken it but they fell into a perpetual sleep, and of others who by reason of too great or untimely a Dose of it have snatched away their Lives or else render it unhappy and unprofitable afterwards, by the hurt of the principal Faculties. Instances and Examples of this Nature are every where too frequently to be met with, made by Quacksalvers and Empiricks. I have known some who having taken a Pill of *Laudanum* to have fallen into so profound a sleep that they could never be awakned: they have lived indeed three or four Days having their Pulse, respiration and heat well enough, yet not to be recalled to Sense and waking by any remedies or tortures. However I have observed from *Opium* taken by others that they have slept moderately only, yea sometimes little or not at all, and presently to be worse as to their pulse, respiration and heat: these indeed were wont to languish assoon as they had taken the Medicine, then to draw their Breath difficultly, and so grow worse and worse, nor could their strength be restored to them by any Cordials but by degrees

degrees lingring they loſt their lives. I have ſomewhere received an Hiſtory of a certain robuſt man killed by *Opium*, who fell into no Sleep but the laſt and deadly, *viz.* Death it ſelf; he preſently upon taking the Medicine, complained of a great weight and coldneſs of his Ventricle, by and by he was affected with a notable *languor* and a ſinking down of all his Spirits, and a coldneſs of the extreme parts, and within four hours complaining that his eyes grew dim and then quite blind, he expired. Part I.

By this 'tis eaſily gathered that *Opium* does not always deſtroy Life by one and the ſame way, but has obtained at leaſt two chief ways of killing. The Reaſon of one of them conſiſts in this, that the Particles of the Medicine being taken, do firſt and rather affect the Brain; of the other, that they in like manner infeſt the Cerebel or little Brain. As to this latter the buſineſs is according to the following manuer; if after the Medicine being taken, it happens by chance that the Orb of the Cerebel be ſo beſet by the narcotick little Bodies, that the outmoſt ſpirits being forthwith deſtroyed, the afflux of the interior towards the *Præcordia* is diminiſhed, and then by little and little cut off; there will be a neceſſity for the heart and the Organs of Reſpiration. firſt of all to flagg in the duties of the vital Function; and then wholly to ceaſe from labour: In the mean time as the ſick being free from an heavy *torpor* do awake, they are well enough in mind, and whilſt they live are perfect in Senſe. But if the opiatick Particles breaking in firſt of all, and with a full charge upon the border or Sphere of the Brain, and its inhabitants are ſtrongly invaded; in ſo muah that by and by the outmoſt Spirits being profligated, alſo all the internal poſſeſſing its middle are greatly overthrown, and leſt they may ſpring up again and recruit anew, their forces are altogether ſuppreſſed, then preſently a deep ſleep or an invincible and perpetual drowſineſs or ſtupefaction follows. In the mean time the Pulſe and Reſpiration continuing for ſome time in a due ſtate. *Its Poyſon affects firſt either the Brain or Cerebel.*

Beſides theſe kind of deadly ſlaughters which *Opium* ſtill attempts upon humane Life, this Medicine hath obtained very many other ways of hurting, which oftentimes becomes deſtructive to ſome private function or part of the Body. Since 'twill be tedious to rehearſe all the kinds of leſſer harms, which Narcoticks are wont to ſtir up, we will here only ſhew what evils do ſometimes happen from the improper or untimely uſe of it in the Head, what in the Breaſt, and alſo what in the Belly. *It produces Evils in the Head, Breaſt, or Belly.*

1. As to the Firſt, it is well enough known that the chief Functions of the Soul, *viz.* Memory, Diſcourſe, and ſharpneſs of Wit, are very often notably hurt by Narcoticks. The frequent uſe of them debilitates the memory in many men, I know one that loſt that faculty wholly by too great a doſe of *Laudanum* taken when in a Fever; then after ſome weeks; when the uſe of it begun to return, he could only remember what was done at a certain or peculiar time, and nothing of what was done before or after. I know ſome to have contracted a ſlowneſs or ſtupidity of wit, and others madneſs by this Medicine. *Hence (as* Freitagius *nortes) when* Proſper Alpinus *and* Bellonius *write, that the Egyptians and Turks are fed with* Opium, *for getting Boldneſs, Alacrity, and Appetite to* Venus, *they add however, that thoſe devourers of* Opium *although they ſeem to be well in health and not to be hurt with the uſe of it, yet that they are rendred more cold, and that their functions were worſe, and that they appeared almoſt perpetually drunk and torpid, and were made full of Hair ſtupid and inconſtant, now affirming and now denying, ſo that people were afraid to meddle or converſe with them; that alſo it became a by-word, which they objected as a blot one to another: Go thou haſt eat* Opium, *which is no other than amongſt us, when they upbraid any one of Fudling or Drunkenneſs.* Freitag. *lib. de Opio Cap.* 3. The Reaſon of theſe appears plain enough from what hath been already ſaid, *viz. Opium* produces the effects but now recited, for that it aſſaults firſt and chiefly the Brain, and whilſt it there deſtroys or profligates ſome animal Spirits, it perverts many others from their wonted ways of Emanations, and bends them into deuious or unuſuall tracts. But that *Opium* is devoured in a great quantity by the Turks (I may add alſo ſome of our Countrymen having gotten by long Cuſtom, as it were, a certain defence or Armour of proof againſt its poyſon) unhurt, or at leaſt without any danger of life; the Reaſon is becauſe its Particles, although at firſt theyare infeſtous and poyſonous to the Spirits, yet by the frequent uſe they at length become more congruous and familiar; even as *In the Head.* *How Opium affects the Turks.*

Part I.

we have obſerved concerning the taking of Tobacco in a Pipe, which when 'tis wont at firſt for a few days, to cauſe a *Vertigo* or dizzineſs, and oftentimes vomiting or purging, yea a cold Sweat with a trembling, and frequent faintings; yet afterwards we take it without any diſturbance, yea at length with great delight. But that a greater doſe of *Opium* ſhould add to them a boldneſs of Mind, ſo that they go to fight undauntedly and with notable confidence, the cauſe ſeems to be that that Medicine by ſtupefying ſomewhat the Spirits renders them aſtoniſhed, ſo that how terrible ſoever the things be that they meet with, to the Senſes they are unmoved. Laſtly, that it is aſſerted that Opiates provoke to Venery, when it ſhould rather ſeem they ſhould ſuppreſs that fury by their extinguiſhing the Spirits: We ſay (if that in truth it has that effect) that the genital humour and the Spirits abounding in it, do not deſcend from the Brain, but is poured forth immediately into the ſpermatick Veſſels, becauſe that for as much as Opiates do hinder or make leſs the *geneſis* of Spirits within the Brain, perhaps they cauſe them to be more plentifully diverted to the genital members.

2. *What evils of the Breaſt* Opium *produces.*

2. That Opiates are ſometimes hurtful to the *Præcordia* and Breaſt, it plainly enough appears, becauſe they depreſs and diminiſh the Pulſe and Reſpiration; and ſometimes alſo (as we have ſhewed above) cauſe them to grow weak, and by degrees wholly to ceaſe: Wherefore in Fevers where the Blood being greatly depraved, ſeems to have no, or no good *Craſis*, and that it yields to the Animal Kingdom but very few, and weak Spirits only, Narcoticks are almoſt always hurtful, and as it were poyſons, for though in the Plague and in malignant Fevers, whilſt the Pulſe and Reſpiration are ſtrong; Mithridate, Treacle, and *Diaſcordium*, yea *Laudanum* are oftentimes given with ſucceſs: Yet if at any time in thoſe Diſeaſes, and in other Fevers not much malignant, the vital function languiſhes, theſe famous Antidotes are but very ſparingly. but more ſtrong Opiates not at all to be uſed. Moreover, in a moſt laborious Cough, Phthiſick, Pleuriſie, *Empyema*, and in other Diſeaſes of the Breaſt, in every one of them where Nature is ſtirred up, ſuddenly ſo that caſting forth what is troubleſome and grievous to the Breaſt, and urges it with its great endeavour, and alſo where the Organs of Reſpiration being deſtitute of great plenty of Spirits, grow weak, and perform their work difficultly and hardly, we muſt abſtain from *Opium* no leſs than from Poyſon; for in ſuch a caſe Narcoticks increaſe the weight to be removed, and fix it, and leſſen the ſtrength of the parts which ought to remove them away.

3. *And what in the loweſt Belly.*

3. We have above ſhewed that Opiates do operate within the *Viſcera* of concoction and other parts of the lower Belly, and oftentimes in a various reſpect do bring notable helps, notwithſtanding they are not always ſo benign and friendly to this Region; but as it will be eaſily ſhewed they ſometimes cauſe a great evil. For truly Narcoticks being often taken, are very injurious ſometimes to the principal faculty, *viz.* to the Appetite or deſire of Aliments, (on which depends all nouriſhment, and the Root of Life) for that they very much blunt it, and not rarely wholly deſtroy it: For when the Spirits inhabiting the inrerior Coat of the Ventricle, are ſtupefied or deſtroy by the Opiatick Particles, ſo that thoſe nervous Fibres although empty are no more corrugated, for which cauſe all hunger ceaſes, and food not at all deſired, but that being brought to the Stomach, becauſe being what is given is rather a trouble than delight; it is by and by ſpewed forth again. Moreover, for the ſame Reaſon the concocting force of the Ventricle is often debilitated, and the excretory motions both of this and of the Inteſtines, grow ſluggiſh: For 'tis a common obſervation, that the want of Appetite, and ſlothfulneſs of the Belly, are the familiar effects of an Opiatick Medicine.

Phyſical Cautions about the uſe of Opium.

From theſe it will not be difficult to draw precepts and medicinal Cautions, about the right uſe of opiatick Pharmacy, which indeed may be done by obſerving theſe four following things, *viz.* Before a narcotick Medicine be adminiſtred, we muſt weigh, 1. What the Conſtitution of the Patient may be. 2. What kind of Diſeaſe it is with which he labours. 3. In what ſtate the Animal Spirits are, in reſpect both of the Animal and Vital Function. 4. And laſtly, in what condition the Blood and Humours are.

1. *In reſpect of the conſtitution of the Sick.*

1. As to the Firſt, when an Hypnotick is required, ſee that the Temperament of

of the Sick, the habit of Body or Indiſpoſition, Cuſtom, kind of Life, do not indicate the contrary. As for example, thoſe who are endued with a moderate ſtature, firm Body and well ſet, hot Blood, lively or quick Aſpect, do better bear this Medicine, and more often take it with benefit; which beſides they may much more ſecurely uſe, if they have been before accuſtomed to it. On the contrary, it agrees much leſs, yea is ſometimes very hurtful to thoſe who are too fat or too lean, likewiſe to thoſe who being of a rare texture have Spirits eaſily diſſipable, or of a more cold temperament, have ſoft and flaccid Fleſh, and that are of themſelves ſleepy and dull, of a ſluggiſh and indocile nature: To which add alſo if that they never had experimented that Medicine before. Part I.

2. The nature of the Diſeaſe is of great moment ſometimes for or contrary to Opiates. In more light affections to make uſe of it (according to *Septalius*) is the trick of a Phyſical Adulator: In the Palſie, *Vertigo*, *Incubus*, or Night-mare, Apoplexy, alſo in the *Orthopnœa* or ſtraitneſs of the Lights, in the Dropſie of the Breaſt or *Abdomen*, in the *Stupor* or trembling of the Members, in very malignant Fevers, and in the paroxyſms of intermitting Fevers, or in the *Criſes* of others, Narcoticks are moſt often interdicted. Beſides in the Cough with much ſpittle and thick in the *Aſthma*, and in all other thoracious Affections with an oppreſſion of the Lungs, and in the Hyſterick and other convulſive Paſſions, they are not to be given but rarely, and not without caution and counſel of a prudent Phyſician. But yet in cruel Headach, Catarrhs, Colicks, Pluriſie, ordinary Fevers, in Vomiting, Dyſentery, in Nephritick Paroxyſms, in Gouts and all kinds of Pains, the opiatick Pharmacy is not only allowed, but is ſought for as the only, and as it were divine *Panacæa*. 2. *In reſpect of the Diſeaſe.*

3. But as often as this is propoſed or is deliberated on, we ought alſo to conſider in what condition the Animal Spirits preſiding in each Dominion are: For if they are already few or oppreſſed, and do not enough expand themſelves; they ought by no means to be any more leſſened or thrown down by Medicine: Wherefore whilſt that the Animal Faculties as to the ſenſe or diſcurſion are not very vigorous, or do not ſufficiently exert themſelves, or when the Pulſe and Reſpiration take the turns of their reciprocations but weakly, or are ſtopped or inequal or alſo more quick or ſlow than uſual, or laſtly, if a *ſtupor* or enervation with an unwonted languiſhment, poſſeſſes the members and motive parts, all kind of Hypnotick Pharmacy is to be avoided: But we doubt not to uſe the ſame, when at any time it is required by reaſon of ſome more grievous Diſeaſes, if that the Animal Spirits according to theſe and the other reſpects be robuſt enough, or are alſo too much expanſed or enlarged, or carried forth above meaſure or become fierce or unruly. 3. *In reſpect of the animal Spirits.*

4. But in the mean time the Condition of the Blood and humours is not to be neglected, becauſe ſometimes the wicked and naughty condition of theſe does altogether forbid Opiates, or permit them to be taken but ſparingly, and with a certain reſtriction: The Blood forbids the uſe of them when it offends either in quantity or quality, or in its *Craſis* or Diſpoſition. As to the former, the bloody *Latex* either ſuperabounds or is deficient; in either reſpect it excludes Narcotick Pharmacy: For in the firſt place, whenſoever the Blood is turging with plenty, and boyling up as in a Fever, it hugely diſtends the Veſſels, and ſo the *Præcordia* do highly labour to drive it about moſt quickly, with ſwiftly repeated turns of *Syſtoles*, leſt it ſhould any where ſtagnate or flow over; then certainly to give a Narcotick, whereby that labour and endeavour of the Heart moſt neceſſary for the preſervation of Life ſhould be hindred; would be the part rather of a poyſoner than of a Phyſician. Wherefore in the *Plethora* or overcharge of Blood, Phlebotomy ought to be uſed inſtead of Opiates. In the ſecond place, no leſs evil proceeds from Narcoticks, as often as in the defect or want of Blood; as after great hemorrhages, long faſtings, or continual ſickneſſes they are adminiſtred, becauſe, when the flood of the Blood is very ſmall, and by reaſon of its exiguity hardly continued, leſt that its *fluor* ſhould be broken off and ſo ceaſe; the Heart ſtrives for or endeavours its quick circumagitation, working with a very nimble Pulſe, as it were, with double endeavours. From hence it is plain to conceive what hurt Opiates will cauſe, which put a *remora* or ſtop to this endeavour of the Heart then ſo highly neceſſary. Indeed for this Reaſon it ſeems to be that we interdict Sleep to women preſently after the Birth of the Child, whilſt the *Lochia* are flow- 4. *In reſpect of the Blood and Humours.*

Part I.

ing down, and to others in a free miſſion of Blood or immenſe Hemorrhage, *viz.* leſt the Spirits in the time of Sleep being called back, ſhould leave the Heart with which it ſwiftly drives about the diminiſhed River of the Blood. Further, ſometimes the Blood offending in quality, or (as I may more properly ſpeak) in its *Craſis*, forbids the uſe of Opiates; becauſe whilſt in a *Cacochymia* or Fever, the Blood being very much ſtuffed with recrements or ſuperfluities, ought to be agitated and more ſwiftly circulated by a greater labour of the Heart, to wit, that the heterogeneous Particles might be overcome and quickly evaporated; the operation of a Narcotick coming between doth ſtop this endeavour of the *Præcordia*, and ſo retards, and ſometimes fruſtrates the luſtration or circulation of the Blood.

As to what reſpects the other recrementitious humours, that are wont to be accumulated within the Ventricle or Inteſtines, theſe alſo ought to be carried away, or purged forth by Vomit or Stool before an Opiate be adminiſtred; for otherwiſe being fixed there they will ſtick more pertinaciouſly. Becauſe the ſplanchnick Fibres being ſtupefied by the Medicine are not irritated as before; neither eaſily go about or lively perform the excretory Convulſions for the expelling thoſe ſuperfluities: Wherefore according to the old Precept, if that there be any thing to be evacuated, let it be evacuated before the Narcotick Pharmacy or Evacuation.

Chap. III.

The Kinds, Preparations, and Forms of Opiates.

After having ſufficiently unfolded the Narcotick Pharmacy in general, and ſhewn the means and the manner of its working, it behoves us next to recount and particularly conſider, both the ſimple and compound Medicines endowed with ſuch a vertue, and ſo to inſtitute a certain Opiology.

The diſtinction of Anodyne Medicines.

Therefore in the firſt place according to the Method obſerved by moſt Authors, we will diſtinguiſh Remedies accounted for Anodynes into two forms, *viz.* as they are ſtronger or weaker: For indeed ſome of them being plainly narcotick do not only compel to a preternatural ſleep, but as occaſion requires indolency, Stupor, and unduly given, not rarely Death. But yet there are other Medicines of this kind preſcribed, which not by ſtupefying or deſtroying the angry Spirits, but by ſtroking and ſoftening them, gently draw and compoſe them to Reſt.

A rehearſal of Narcoticks.

1. They are wont to refer to the former Claſs of theſe (which may only be properly called Opiates or Narcoticks) Poppy both the white and the wild, Henbane, Hounds or Dogs tongue, Mandrakes, Nightſhade, and certain others more venomous; and ſo never to be medicinally preſcribed: But the Roots, Leaves, Flowers, Seeds, and the thickned Juices of ſome of theſe not ſo unwholeſome are made uſe of, and (as we have above ſhown) are often taken with great ſucceſs. But truly ſince each of theſe have ſomething of poyſon mixed with them, therefore they are not indifferently to be preſcribed, now theſe now thoſe, as in other Phyſical Medicines, but only to make uſe of thoſe which are approved of by a ſafe and long experience. Hence at length Cuſtom (from which it is not ſafe to recede without danger to humane Life) hath obtained that Poppy and preparations of it, are the *Baſis* or Complement of almoſt the whole opiatick *Pharmaceutice*, the ſeeds of Henbain, and the Roots and Juice of Hounds Tongue, are put into the compoſitions of ſome Hypnoticks; notwithſtanding as often as we endeavour

White Poppy.

deavour thorowly and alſo ſafely to provoke Sleep, the whole force of the Medicine is placed in *Opium* or *Diacodium*. There will be no need here to deſcribe the white Poppy, out of which theſe are made, nor to ſhew the extraction of the opiatick Juice, or the compoſition of that Syrup, ſince that they are ſufficiently enough declared in the Botanick and Antidotary Books both of the Ancients and Moderns. But what remains for us to do and which is more to our purpoſe, is that we now endeavour to expound the elementary parts of *Opium*, and from thence to ſearch out the vertues both of the *Diacodium*, and the means of their intoxicating. Part I.

The nature and parts of Opium.

The body of *Opium* may as to its conſtitutive parts be better known, and examined whole and untouched, than reſolved ſpagyrically: becauſe if it be diſtilled by fire by reaſon of plenty of impure Sulphur it contracts an horrible *Empereuma* or fiery taſt, and diffuſes a very hurtful ſtink. But yet it is obvious to the ſenſe that ſulphureous Particles do abound in this concrete, which alſo its moſt filthy *Odor*, and its inflammability manifeſtly declare: and although it is equally certain that ſaline Particles are adjoyned to the Sulphur, and ſo this concrete doth chiefly conſiſt of theſe two together with a little Earth, yet of what nature and in what ſtate that Salt ſhould be, cannot be defined; but ſo much we may be able to affirm from the effects that this ſulphureous ſaline Concretion is altogether contrary, and deſtructive to the Texture of the animal Spirits, which is ſpiritual and ſaline volatile. And indeed it may be gathered from very many inſtances that narcotick force lies hid in the Sulphur with the aculeated Salt (from whence it acquires ſo ſtinking a ſmell) for of this nature are the white Poppy, Mandrake, Henbane, Tobacco, and other Opiates, all which have almoſt alike ſtinking ſmell, and in the ſmelling to them very ungrateful to our Spirits. Moreover becauſe the animal Spirits may be ſomewhat of a divers Texture in various Bodies, therefore Opiates may work more ſtrongly and virulently on ſome than others. The Turks and Egyptians, in whom from an aduſt blood, more fixed Spirits and leſs volatile are procured, eat *Opium* without hurt or at leaſt without danger of Life, the Europians not ſo, who have more ſubtle and purer Spirits. Dogs devour *Opium* in a great quantity without any ſleepineſs or death. A little doſe of it preſently kils a Cat, for that the ſpirits of this beaſt, ſo very ſaline volatile cannot at all endure the narcotick Sulphur. And hence it is that one grain of the oyl of Tobacco being laid upon the tongue of this Animal preſently excites Convulſions and Stupor, to which forthwith death follows. Once I ſaw given to an ordinary Dog ſops of Bread rolled in ʒij of *Opium*: after which growing very ſick he became torpid or rather ſtupid, and drawing his Breath difficultly and laborioufly ſeemed as if he was about to dye, but then within half an hour he eaſed his belly plentifully with the moſt horrid and troubleſome ſtink that ever I ſmelt in my life, and preſently thereupon he became well and lively. But that ſuch a quantity of *Opium* did the leſs hurt to this Animal, perhaps the cauſe may in part be the notably acid ferment of his Ventricle, by which the Particles of the narcotick Sulphur might be ſomewhat broken and overcome; and ſo by reaſon of this Sulphur being very much diſſolved by the acid *Menſtruum* of the Stomach, the highly ſtinking dejection of the Belly proceeded. For it is to be obſerved of other Bodies whilſt that an acid body acts on a ſulphureous, there is excited an ingrateful ſmell: For ſo it is wont to be when *Aqua Stygia* or ſpirits of Vitriol are poured upon the filings of Iron. In like manner alſo when the ſpirits of Vinegar is mixed with an Antimonial *Lixivium*. I might take notice of many others of this kind. But indeed 'tis not to be denied that the Particles of *Opium* do work on the dogs ſpirits which notwithſtanding do more ſtrongly reſiſt the narcotick Venom than the ſpirits of a Man, or of other Beaſts, as it is clear by the Hiſtory but now mentioned; for as much as when the torpor and difficult and diſturbed Reſpiration by reaſon of the ſpirits inhabiting the *Encephalon* being affected by the narcotick began to ariſe, thoſe ſymtoms alſoon as the narcotick matter was overcome by purging preſently vaniſhed. Beſides I have known the truth of this opinion confirmed more by an anatomical experiment. Many years ago we ſaw about three ounces of the tincture of *Opium* done in Canary tranſuſed into the Jugulary Vein of a little Dog, the vein being cloſed the dog ran about after his wonted manner and ſeemed little or nothing affected or changed; after a quarter of an hour he began to be a little ſtupefied, to nod his head, and at length began to fall into a Sleep, but not permitting

In what the narcotick force conſiſts.

It doth not operate after a like manner in all.

It hurts not a Dog ſo as it does a Cat or a Man.

Some Inſtances of this.

Part I.

permitting him when we had hindred him a while by beating, terrifying, and coursing him about, at length the soporous Affection being so done away he became whole and lively enough: as it appears from hence, the opiatick Poyson is so overcome either within the *Viscera* of concoction by their ferments, or else resisted by the animal spirits themselves, as that it is not always, nor alike in all, either an Hypnotick or deadly.

As to what respects the top of the white Poppy with the seeds, of which *Diacodium*, Decoctions, Emulsions, and other hypnotick Confections are made, it planely appears that these are far less indued with narcotick Sulphur then the concrete juice of *Opium*; and what of it is in them is much more pure and innocent. Wherefore we oftner and more securely give Remedies composed of this: For it is not fit to make use of *Laudanum* unless when for the vehemency of Symtoms Diacodiates will do little good. Further as these contain in themselves less of virulency, they want not much preparation but being simply made by decoction, or Infusion, or expression, they may be brought into medical use: but *Opium* is seldom so simple and prescribed by it self, but is wont to be corrected and composed after a various and divers preparation, whereby it may become a safe Anodyne.

Diacodiates.

Preparations of Oplum.

The preparation of *Opium* is either simple or with dissolvers and correctors joyned with it. The way of the former consists almost only in this, that its Mass being sliced into little flakes is so long exposed to the heat of the Fire or the Sun until the narcotick Sulphur being in part evaporated, the rest becomes friable and less stinking: which kind of preparation is wont to be first made before others. For whether we would endeavour to get the Tincture, Extract or Confection of *Opium*, first this previous operation is dryed and reduced into a powder. Moreover hither ought to be referred its fumigation with Sulphur by the same means as we cure Scammony: because the acid vapour ascending from the common Sulphur whilst it burns, overcomes or breaks very much the virulency of either of them both of the narcotick and cathartick Sulphur.

The Opiates of the Ancients repeated.

The preparations of *Opium* with adjuncts or rather its Compositions, are divers and many; of which some were more famous and noted among the Ancients, others among those of latter days. The Opiates of the Ancients chiefly noted are Pills of Dogs Tongue, the *Requies* of *Nicolaus*, and *Philonium*, of the last of which there were four, *viz.* Roman, Persian, (the use of which is yet somewhat retained) and the *Philonium* of *Galen* and of *Mesue*.

The descriptions of all these are seen commonly in every Antidotary, so that there is no need to repeat them here. The reason of the Compositions of these chief Anodynes, although built upon an erroneous foundation, as to the other respects is understood well enough. For that out of a false supposition that *Opium* being cold in the fourth degree most of what they received into their *Philoniums* being hot in the same degree, *viz.* Wild Pellitory, *Euphorbium*, white Pepper, and others are added, of the like nature, which truly are not improperly correctors of *Opium*. But yet not as if it were their Heat opposes the frigidity or coldness of that (because indeed it is not cold but rather hot) but these sharp biting things being full of volatile Salt, do predominate over the narcotick Sulphur of the *Opium*, and break its virulency.

Laudanums *invented by latter Physitians.*

Renodæus of Laudanum.

The Opiates of our Neotericks by reason of the Laudability of such a Medicine are commonly called *Laudana*; and because they take away pains, by some also named *Nepenthes*. About what time these were first made known, *Renodæus* very ingenuously complains, *that there were a company of false Physicians arisen, who for the most usual Pills of Dogs Tongue, gave an opiate Confection called by them* Laudanum, *with which they promised not only to restore sleep, but also to drive away all Diseases. So much* (says he) *has the* Encomium *of this Medicine prevailed with these runagates that there is no Empirick, none so dull medicaster or not so common a Barter who does not professs himself a Laudanist. Without doubt this custom however evil and most pernicious to humane Life is not yet worn out.* For that also among our Countrymen there is not only a company but a swarm rather of false Chymists and Quacksalvers; every one of which boasts of his peculiar *Laudanum*, which they rashly give in every Disease and Condition, and if by chance it happens for the sick to sleep and wake again, presently they sing and are Cock a hoop, when rather they merit the gallows, for that the Pulse and Respiration being overthrown by reason

of

Part I.

of their unſeaſonably giving an Opiate, oftentimes all hopes of the *Criſis* and of the cure is fruſtrated: wherefore it behoves you to be warned whoever hath any regard to his Life, that you diligently beware of theſe unskilful Laudaniſts.

Not only the uſe of Opiates but much more the Invention and preparation of them are to be prohibited to Empiricks, and Quackſalvers: For indeed it is the work of a prudent and learned Phyſitian, ſo to temper their Venoms as that they may not be poyſon,but Antidote. Wherefore *Laudana*'s are not to be admitted into practice unleſs ſuch as are invented by skilful men and long made tryal of; of which ſort there are many extant publickly received and approved of, ſo that there is no need of new ones daily to be deviſed. The more Ancient *Laudana*'s of *Paraſelſus*, *Crollius*, *Quercetan*, *Hartman*, and other famous Chymiſts by them related and deſcribed in many *Pharmacopœas* are compoſed only in the form of an extract; in all which the Tincture of *Opium* drawn forth with a fit *Menſtruum* is the *Baſis* or ground; to which tincture others are added, *viz.* of Saffron, Caſtor, (which *Guianerus* names the *Bezoar* of *Opium*) *Species Diambræ*, and ſuch like; and ſo all being confuſed together are diſtilled in *Balneo*, that the *Menſtruum* being drawn off, the remainder may be reduced to the conſiſtency of Hony, in the finiſhing of which laſtly Pearls, precious Powders, Chymical Oyls, and other things eſteemed Cardiacks are added: The Medicine being ſo made up is given for the moſt part in form of a Pill,

Laudana *in form of an extract.*

Although theſe ſort of *Laudana*'s are efficacious enough and ſeem to be elegantly compoſed, yet the Neotericks ſomewhat varying the form make their conſiſtence (whereby they may be the better taken in any Liquor) liquid; and alſo for that when any opiatick Pill (not more noted for its benefits than for its Harms) may be a terror to ſome, a doſe of liquid *Laudanum* (if perhaps it ſeems neceſſary the patient refuſing it) may be better hid, and being poured into other liquor may paſs rather for a Cordial than an Hypnotick. And indeed concerning the uſe of Opiates the ſick are ſometimes too much and ſometimes too little cautious, and ſo as they are in one caſe to be warned, ſo in the other they ought to be drawn to it and deceived. For the making the liquid *Laudanum* in like manner as the ſolid the Tinctures of the *Opium* and the adjuncts are extracted one from another almoſt after the ſame way; which being all confuſed and the *Menſtruums* drawn off to the middle, there will remain a Medicine ſplendidly red or bluſhing whoſe doſe is wont to be from ℈ß to ℈j.

Liquid Laudana's.

Concerning theſe two kinds of *Laudana*'s, it is a great matter with what kinds of *Menſtruum* the Tincture of the *Opium* is extracted; ſo that the buſineſs has cauſed great contention among ſome Chymiſts of no ſmall note; whilſt they ſuppoſing it cold uſe the ſpirit of Wine, others on the contrary to bridle the heat of *Opium*, diſſolve it in the ſpirit of Vinegar or in the juice of Citrons: Indeed either *Menſtruum* is ſufficient and are almoſt both alike,ſo it be reduced into an extract; but if in a liquid form there can be no ſolutive of *Opium* better to be met with than the ſpirit of Wine impregnated with the volatiliſed Salt of Tartar. For this moſt readily diſſolves its Maſs, receives a tincture like to a reſplendent Ruby; moreover ſomewhat brings under the narcotick Sulphur and takes away its evil ſmell: Indeed the ſalt of Tartar is the beſt corrector of *Opium*, or rather its Antidote. Hence the opiatick Pill of a certain empirick, in which the diſſolvent of the *Opium* is ſalt of Tartar imbued with the oyl of Turpentine, hath been accounted of no contemptible uſe, there is added to that Compoſition the powder of white Hellebore; but that only as I ſuppoſe they may aſſert ſome Parodoxes, that tamed poyſons become the moſt precious Medicines.

What Menſtruum *is moſt fit for the making the* Laudanum.

Of late years the uſe of a certain liquid *Laudanum* the Author of which is commonly ſaid to be *Helmont*, hath grown famous: it hath for its *Menſtruum* the juice of Quinces put into a fermentation with Yeſt or Barm of Ale or Beer; when this has extracted the Tincture of *Opium* being dyed with a deep yellow, which being ſtrained and aromatiſed, and drawn off to the half in *Balneo*; then the remaining part is reſerved for uſe, and is this liquid *Laudanum*, whoſe doſe is from *gut.* 15 to 20. The other part by a further diſtillation is reduced into a pilulary form and is given from *gr.* j to ij. That liquid *Opium* I have often given with an happy ſucceſs in dyſenterick Affections: But our liquid *Laudanum* (which we do more often uſe) hath for its *Menſtruum* the tincture of the ſalt of Tartar brought to the higheſt red by long digeſtion; and as the Tincture of *Opium* extracted by this,is the ground of

The Laudanum *called* Helmontian.

Part I.

of the Medicine, we add for its complement Saffron, *Caſtor*, Cloves, and *Lignum Aloes*, the doſe from 15 to 25 props.

Wild Poppy and its preparations.

2. After white Poppy and the preparation of it we ſhall ſpeak next of the wild or erratick which hath indeed a certain hypnotick virtue but far more gentle and benign than the other; wherefore in ſome caſes it is exceeding convenient, and one may be more ſecure as to its uſe. Of this may be had in the Apothecaries ſhop the Syrup and the diſtilled Water, which are often given with great benefit in moſt continual Fevers; and are thought to help in the Pleuriſy with a certain ſpecifick force; becauſe truly they take away pains, and by ſtopping ſomewhat the Pulſe depreſs the feveriſh æſtuation of the Blood. Further, a tincture is prepared of the flowers of this infuſed in the ſpirit of Wine, which is a famous Medicine among the Empiricks and good Women, and eſteemed very good againſt a Surfet. The reaſon of whoſe help ſeems to be, that the ſpirits of the Wine deliver the contents of the Stomach from putrefaction, and the narcotick virtue of the Flowers provides againſt the aſſaulting Fevers.

Dogs-tongue and its preparations.

3. Having finiſhed Meconology or Poppyology, in the Claſs of Narcoticks follows, Mandrake, Henbane, Cynogloſs or Dogs-Tongue, Tobacco. As for the two firſt becauſe they are ſcarce at all made uſe of in Medicines (unleſs the ſeeds of Henbane) I ſhall ſay nothing; but Dogs tongue breathing an odor plainly ſoporiferous, openly ſhews its narcotick Nature, and invites us as it were by the fairneſs of its form to the taking of it willingly: For it is a very neat Plant, having ſoft Leaves, and pleaſantly flowriſhing is crowned with a bright Red and moſt delicate purpliſh Flowers: The powder of its Roots was put into and denominated that ancient and famous Opiate called Pills of *Cynoygloſs* or Dogs-tongue: The juice of the whole Plant gather'd about the beginning of the Spring being expreſſed, and depurated by a cloſe and warm digeſtion, and decanted from its *Fæces*, yeilds a clear Liquor and ſplendidly reddiſh or bluſhing like a Ruby. This may be uſed either for a *Menſtruum* for the making up of narcotick Confections, or an Hypnotick Syrup may be prepared of it, or laſtly being evaporated it may be reduced into an extract, from which, as out of *Opium*, by fit *Menſtruums*, Tinctures and Extracts are gotten.

Tobacco.

Tobacco by right challenges a place among them and brings up the rear of Narcoticks; for although it is not put into their compoſitions, yet its fume being taken in a pipe oftentimes produces the ſame effects as they: yea, not only cauſes ſleep it ſelf but ſometimes its contrary, waking. I ſhall not go about to deſcribe the origin or manner of this cuſtom commonly known to every one of every Sex, Age, and Condition, Indeed why I rank it with Opiates is becauſe it doth almoſt the ſame thing with our Countrymen as *Opium* with the Turks: to wit, either of them by affecting the animal Spirits after an unaccuſtomed manner, and by rendring them as it were aſtoniſhed, diſpoſes them to the doing or ſuffering of any thing without any great ſenſe of trouble or wearineſs. Wherefore virtues and effects not only manifold but diverſe, yea (as I hinted but now) contrary and repugnant one to another are aſcribed to the ſmoak of Tobacco taken at the mouth after the vulgar way. For it is ordinary ſaid to warm us when chill and cold, alſo to refrigerate thoſe that are hot, to cauſe or to drive away ſleep, in like manner to extinguiſh or to excite hunger and thirſt: the reaſon of all which conſiſts in this, that the animal ſpirits being gently agitated by this *Enthymiama* or inflamed ſmoak, and as it were provoked into certain dances, they are wholly deaf to the approaches of any troubleſome thing; yea whatſoever is hard to be perfomed by them, or to be ſuffer'd, they do being almoſt inſenſible and undiſturb'd: wherefore the uſe of Tobacco (when it may be had) ſeems not only neceſſary but profitable for Soldiers and Mariners; for that it renders them both fearleſs of any dangers, and patient of Hunger, Cold, and Labour. But truly it appears from hence that this greatly narcotick fume is very infeſtous to the ſpirits (before by frequent cuſtom it becomes familiar to them) becauſe there is none almoſt who at the firſt taking and uſe of it but ſuffers great perturbations in his Brain and nervous Stock. For when at any time one is initiated into this dry potation, preſently as if he were drunk he is affected with a *Vertigo* and *Scotomia* or dizineſs in the head, then a cruel vomiting and ſometimes purging follows, the feet grow weak or ſtagger, the hands tremble, the tongue faulters, or ſpeaks at random. Oftentimes alſo a cold ſweat and terrible ſwoonings follow; the cauſe of all which is, that the animal Spirits being

The effect of the taking this.

The reaſons.

being as it were intoxicated by the narcotick Sulphur, are distracted very much in their whole dominion, and are agitated into *Ataxias* or irregularities; not only the first and second time, but oftentimes, tis for a very long while after their first taking it before they can be able to take the fume of Tobacco without great confusion of the spirits. But assoon as this custome becomes familiar and customary, 'tis grateful, and takes the animal Spirits with so great a witchcraft or pleasing allurements, that some had rather be interdicted meat or drink than the use of it. The reason of which is that this smoaking gently awaking or stirring up the animal Spirits at any time sluggish and sloathful, and as it were tickling them, provokes them into gentle and expansive motions, with which they are wonderfully recreated as with the drinking of Wine. Part I.

So much for the chief Narcoticks, and their preparations, and manner of using of them, all which belong to the stock of Vegetables: but that minerals may not be thought to effect nothing, there are some who boast they have prepared out of their more hard concretes most excellent Opiates altogether without *Opium*. *Quercetan* prescribes a certain *Nepenthe* to be made out of the narcotick Sulphur of Vitriol and from the oyl of the Sun and Moon (or of Gold and Silver) with the tincture of Corals and of other famous Cordials, highly efficacious for the taking away of all pains and languors: The virtues of which Medicine I am so far from admiring that I rather think there is no such Sulphur and metallick Oyls, or that in truth there can be little or nothing gotten: Therefore returning to the real and genuine Narcoticks, we will as a complement to the work set down some of their select forms; which we will digest into certain Classes according as the Opiates have for their *Basis* either the Syrup or distilled Water of wild Poppy, or *Diacodium* or *Laudanum* extract or liquid or Pills of *Styrax* or of Cynogloss or lastly *Philonium*.

The Basis of narcotick compositions.

Take of the water of wild Poppies, of Cowslip water, of each ℥vj, of the syrup of the leaves of Poppies ℥ij, of *Sal Prunellæ* ʒß, mingle it and make a Julep, the dose is ℥iij or iiij, thrice a day, in a Pleurisy pains, and watchings without a Fever or any manifest cause. 1. *The water and syrup of red Poppy.*

Take of poppy Water ʒiiij to vj, let it be taken by it self sometimes twice or thrice a day for the same end.

Potions.

Take of *Diacodium* ℥ß to ℥vj, Cowslip water ℥iij, Treacle water ʒiij, make a Potion.

Take of *Carduus* water ℥iij, *Diacodium* ℥ß, spirits of Hartshorn ℈ß to ℈j, make a draught for the provoking sleep or sweat.

Take of *Diascordium* ʒß, Gascoins powder ℈j, of *Diacodium* ʒij, mingle it, take it in a spoon.

Take of *Diacodium* ℥iij, Snail water ℥j, mingle it. Convenient in a Cough, Phthisick, and the dose one spoonful at the hour of rest, and if need be, repeat it at midnight.

Take of *London Laudanum gr.* j, of the powder of compounded Claws ℈ß to ℈j, with what will suffice of the syrup of Cloves, make three Pills to be taken going to rest. 2. Laudanum *extract.*

Take of *Laudanum gr.* j, of stomach Pills *cum Gummi* ʒß, make four Pills to be taken going to sleep against the Colick. *Pills.*

Take of *Laudanum gr.* j to jß, of *Diascordium* ℈j, make a *Bolus*, in the place of *Diascordium* may be added the confection of *Alchermes* or *de Hyacinth*. Bolus.

Take of *Laudanum gr.* j, dissolve it in one spoonful of Treacle water, add of the water of Cowslips, ℥ij, make a draught. *A draught.*

Take of our liquid *Laudanum* tartarisated *gut.* 20, let it be given in one spoonful of *Aqua mirabilis* or Cinamon water or any other convenient Water. It is good in colick pains, nephritick or gouty pains. 3. *Liquid* Laudanum *tartarisated.*

Take of the *Species* of *Hiera* ʒß, of the same *Laudanum* 20 *gut.* make four pills to be taken going to rest, to purge and allay pains in Colicks.

Take of liquid *Laudanum Cydoniat. gut.* 15 to 20, let it be given in one spoonful of Cinamon water the smallest for dysenterick Effects. 4. *Liquid* Laudanum *quinced.*

Take of the conserves of red Roses ℥j, Treacle *Andromach. Confectio Hamech*, each ʒij, powder of red Cloath ʒj, *Laudanum Cydoniat.* ʒij, syrup of Coral what will suffice, make a confection, the dose is ʒj, every fourth or fifth hour in very bloody Dysenteries with pains.

Part I.

Take of Pill *de Styrax gr.* v to vj, of the milk of Sulphur ℈ß, of the oyl of Aniſeeds *gut.* j, of the Balſom of *Peru* what will ſuffice make three Pills to be taken in Coughs, Aſthmas, &c.

5. *Pills of* Styrax.

Take of the Pills *de Cynogloſs* or Dogs-tongue *gr.* vj to viij, make two Pills to be taken going to ſleep for the ſame Intentions.

And of Cynogloſs.

Take of Roman *Philonium* ℈j to ℈ij, conſerves of Cloves ʒß, mingle them, and make a *Bolus* to be taken going to reſt. Convenient in the Colick, in a cold Temperament.

6. Philonium.

An antihypnotick Remedy.

After having ſufficiently explicated the narcotick Remedies, we ſhould next ſpeak of Medicines merely Anodyne: *viz.* which not by profligating or by ſtupefying, but only by ſoftning and by ſtroking do gently compoſe, and flatter into reſt the animal Spirits being any way diſturbed or grown fiere or angry. But it ought to be manifeſt concerning the τὸ ὅτι of theſe, whether there are any ſuch in truth, before we make any diſquiſition of the διὸτι or how they are: For beſides this, that Fomentations, Cataplaſms, Liniments, being outwardly applyed, and Clyſters injected into the Inteſtines ſometimes do allay pains, I have not known any other effect to be performed from thoſe kind of mere Anodynes at leaſt taken inwardly at the mouth: Wherefore it does not ſeem worth the while to trouble our ſelves about the *Ætiology* of theſe to which there is no faith to be given, for the conciliating ſleep or for the allaying of Pains when they are very urgent.

But as we have fully diſcourſed hitherto of Opiates, and of their preparations and ways of operating: according to our former method now ſhould follow to be handled, the contrary Medicines to theſe, or Antihypnoticks, *viz.* which by driving away ſleep too much troubleſome do render us wakeful; had I not fully performed this task formerly in the Pathology of the Brain (where we have treated of the Lethargy and other ſoporiferous Affections and their Remedies) ſo that there is no need to repeat here the ſame again. But ſince that both there and in other places hath been made by us frequent mention of a certain Liquor called Coffee, highly efficacious for the driving away the *Narcoſis* or ſtupefyingneſs; it ſeems not to be altogether from the purpoſe to ſpeak here a little more (than we have elſe where hinted) concerning this Drink and the effects of it, and the reaſons of its acting. It will be from the purpoſe to diſcourſe of its Antiquity, and of its common uſe now among the Turks, and formerly among the Arabians and other Eaſtern People: but that this Drink alſo of late years is brought into cuſtom by our own Countrymen, and that there is almoſt none but underſtands well enough by experience its efficacy and virtue for the driving away of ſleep, we will therefore inquire into the reaſons of this ſo well known and experienced Effect. We have ſaid (in the Chapter of Waking) that the reaſon of it conſiſts in this, that this Drink inſinuates aduſt Particles (which we may find both by our taſte and ſmell that it abounds with) into the blood; and from thence into the nervous Juice, which for that cauſe both by their incongruity and their mobility or unquietneſs, detain the Pores of the exterior Brain continually open, and by ſome other way of fettering them add to the Spirits, laying aſide their *torpor* or drowſineſs, certain furies and provokings by which they are excited to the longer performing of their duties: For indeed to the inducing of ſleep theſe two things are neceſſary, one or the other of which is ſtill firſt or rather for the effecting it. To wit, it behoves the Pores and all the paſſages of the exterior brain or its *Cortex* or ſhell to be ſtuffed very much and filled full, and ſo to be ſhut up by the Liquor, there as it were ſtilled forth and overflowing from the Blood; then beſides for the cauſing of this effect there is need that the animal Spirits excluded from the Pores, and thoſe paſſages, and beſides oftentimes burthened with nutritious and ſerous Particles, being given to Idleneſs, ſhould betake themſelves to the middle of the Brain. Concerning this task requiſite to ſleep there is not ſtill one and the ſame order. For ſometimes the animal Spirits firſt and of their own accord relinquiſh thoſe ſpaces the nervous juice by and by ruſhing into the ſame voyd places; but ſometimes the nervous Humour with the ſerous being more plentifully poured in, the firſt invades thoſe paſſages driving their ſpirits thence againſt their wills and compelling them inwardly.

Coffee drink.

Its effect.

Its Ætiology delivered.

But the operation of Coffee ſeems contrary to both effects. The aduſt Particles highly active and ready being delated into the Blood not preſently after the drinking it, do ſomewhat fuſe its Liquor, the ſerous water being detruded towards the

the Reins and habit of the Body; further they driving towards the brain easily open its Pores which they detain very open with their mobility; then they growing to the Spirits do uncloath them from all other Particles both gravative or nutritious, and so stir them up on every side being light and nimble, and make them to be stretched abroad thorow the whole compass of the Brain freed from any heavy oppletion and obstruction. Part I.

Its benefits and imcommodities noted.

In the mean time notwithstanding, whilst the Spirits being continually and unweariedly exercised after this manner, are deprived of the access and assimilation of the nervous juice, plenty of them are not sufficiently renewed after the wonted manner. Indeed the old veterane Spirits are rendred more agil and nimble, but the supplies of the new ones are diminished. Hence as it easily appears that this drink though most commonly used, and very profitable in some cases, and very medicinal; is to others perhaps very hurtful, or less healthful, Indeed that it is so, not only reason but also common observation every where dictitates, for as much as the great drinkers of Coffee become lean, and oftentimes paralytick and obnoxious to an impotency to *Venus*. The first effect is so frequently and every where known, that I have for that reason only forbid many the drinking of Coffee because it disposes to leanness,

It makes people lean.

For that as the Blood by the excessive and continual use of it is made more sharp and torrid, it therefore becomes less able for nourishment. But as to the Affects of the Brain or nervous Stock, I do frequently prescribe this drink sooner than any thing else for their cure, and therefore am wont to send the sick to the Coffee houses sooner than to the Apothecaries shops.

It disposes to the Palsy.

Indeed in very many cephalick Diseases and Sickness, *viz.* great Headaches, *Vertigo*, Lethargy, Catarrhs and such like, where there is with a full habit of body and cold or less hot temperament and watterish blood, an humid brain, but a *torpor* and slothfulness of the animal Spirits, the drinking of Coffee is often taken with great benefit, for continually drinking it wonderfully clears and illustrates either part of the Soul, and dispels all the clouds of each function: but on the contrary, who are lean and of a bilous or melancholy Temperament or have a sharp blood or torrid, a hot brain or animal Spirits too much stirred up and unquiet, ought to abstain wholly from this drink; for that it rather perverts both the spirits and humours and renders themalso weak and altogether unable for the performing their functions. For I have observed many not indued with plenty enough of spirits, and obnoxious to the Headach, *Vertigo*, the Palpitation of the Heart, the trembling or numness of the joynts, to have become worse presently upon the drinking of Coffee, and suddenly to have felt an unwonted *languor* in their whole Body.

PHARMACEUTICE RATIONALIS:

OR, THE

OPERATIONS OF MEDICINES IN Humane Bodies.

The Second Part.

With Copper Plates describing the several Parts treated of in this Volume.

By *THO. WILLIS*, M. D. and *Sedley* Professor in the University of *OXFORD.*

LONDON,

Printed for *Thomas Dring*, *Charles Harper*, and *John Leigh*, Booksellers in *Fleet-street*, 1679.

THE PREFACE TO THE READER.

SInce firſt I began to conſider the Operations of Medicines in humane Bodies, and their manner of working, and for ſome time meditating upon the entire Subject, at length publiſhed an Eſſay of the Rational Curatory part; I became affected with ſo vehement a deſire of farther proſecuting that Speculation, that in all ſpare hours, (to wit as frequently as I might be vacant from my practice) I could hardly intend or admit thoughts of any other thing: And that not ſo much that I might pleaſe others, as by often turning in my mind, and writing my Meditations of this Subject, I might be better inſtructed to preſcribe to my Patients. For certainly the not duely weighing the Reaſons by which Medicines operate, renders all Phyſick to be Empirical, and to be governed rather by Chance or Fortune than by Advice; and it frequently comes to paſs, that a Medicine raſhly adminiſtred, is but caſting a Die for a mans Life. Wherefore, that I might ſatisfie my ſelf, and practiſe Phyſick (as is uſually ſaid) with a ſafe Conſcience, it pleaſed me to beſtow more labour in the ſearch of the true Reaſons of phyſical Energies and Efficacies. And becauſe in this Treatiſe, we chiefly conſider Medicines, reſpecting certain private parts or Regions of the body, and their proper Diſeaſes, therefore we have endeavoured in the firſt place to perform theſe three things; *viz.* Firſt that a moſt accurate Anatomical Deſcription might be given of the parts, (if not already extant) whoſe diſtempers and remedies are treated of, as to the Fabrick and uſes of all their Veſſels. Wherefore, turning over the Breaſt and Lungs, and moſt diligently viewing their inward receſſes and apartments, what thing ſoever obſervable either the Ancients or Moderns have

publiſhed about theſe, and whatſoever further by Kniſe or Microſcope we have detected, we have here ſet forth. In which task, as formerly in ſome others of the ſame nature more exactly done, I muſt confeſs I owe much to the ſedulous labour of my moſt learned Friend Dr. *Edmund King*, and to his moſt dexterous Diſſections. And really I eſteem it ſo neceſſary to lay the Hiſtory of the parts, as a foundation to our Rational Curatory Method, that without it I did believe the whole Superſtructure would be meerly phantaſtical and altogether unſtable, or at leaſt unprofitable. For ſurely, either to practiſe Phyſick, or demonſtrate its Operations on humane Bodies, without an exact knowledge of the parts and paſſages, on which, and by which they work, would ſeem equally abſurd, as if a Philoſopher ignorant of Mechanical affairs, ſhould go about to unfold and explicate the Artifice and cunning Workmanſhip of a Clock moving of it ſelf, according to the Theory of Natural Motion delivered by *Ariſtotle*. Wherefore we have view'd with moſt exact diligence, in the firſt place, the Subjects of Phyſick, or the places of Operation in our Bodies, as the Circuit in which we are to move. Then ſecondly we have not been leſs ſolicitous, that according to the Phænomena of all parts lately detected by Anatomical obſervation, the true and real Hypotheſes of Diſeaſes ſhould be built, whereof we have deſigned the Remedies; that not ſtill perſiſting in the thread-bare paths of Ancient Phyſick, by a certain blind and implicite obſequiouſneſs, after the manner of Beaſts, according to the proverb, to be only guided by our Anceſtors footſteps; but deriving the Cauſes and formal Reaſons of Diſeaſes from their very Springs, we every where endeavour to ſhew, from what Diſpoſition of Blood and Humours, from what affection of Animal Spirits, from what habitude of Fibres, and of other ſolid parts, every diſeaſe proceeds. And theſe things ſo premiſed, and laid inſtead of a ſolid Foundation, at length in the third place, that the ſtructure of our Curatory method being rightly compacted, may happily riſe up and firmly conſiſt, we have gathered together moſt of the Medicines reſpecting moſt of the private parts and regions of the body, and the peculiar Diſtempers thereof, *viz.* both Simple and Compound, both Old and New, both Dogmatical and Empirical, gathered out of the Phyſick-books of every Age, as alſo thoſe chiefly celebrated by Quacks and Nurſes; more choice forms of all which, or at the

leaſt

leaſt the chief of them, and manner of uſing, we have aptly aſſign'd, and annex'd the reaſons as to the Preparations, as alſo the Operations and Effects of them. But that all is not comprehended in this Tract that was omitted in the former, which yet I had hoped might have been, happens from the plenty of matter, and the bulk of the work encreaſing upon our hands: For aſſuredly, it is more than the task of one Man or Generation, to exhibit a compleat Curatory Method, and abſolute in all points. For if this Diſquiſition were more fully inſtituted as to its Latitude, not only all the *Materia Medica* (which is almoſt infinite) but alſo the whole Body of Phyſick offers it ſelf. Wherefore theſe our Attempts court not the name of Treatiſes, but of Eſſays. Truly it will not be needful for many Phyſicians, eſpecially thoſe who neglect the Phænomena of Nature, being intent only on their Practice and Gain, to be learned about the Reaſons of all Remedies: but to the genuine Sons of Art, this will be of value, if not to direct, at leaſt to incite them to the Knowledge and ſerious weighing always of thoſe things they take in hand. And if theſe ſmall endeavours ſhall inſtigate others better to poliſh that Study, whatſoever Reviling I may reap from the malevolent and envious, it ſhall never repent me of my labour. For when I ſhall be well conſcious to my ſelf, that I have not ſuffered my Faculties although ſmall (as the Talent entruſted with me by God Almighty) to periſh through ſloth, nor ſuffered them to be buryed in the earth, but that they may be rendred with ſome Intereſt beſide the Principal, it will much pleaſe me, nay, I ſhall ſeriouſly rejoyce and triumph.

POST-

POSTSCRIPT.

WHile theſe were Printing, the moſt ſad meſſage arrives, that the Author, moſt worthy of Immortality, oppreſſed by the irreſiſtible aſſault of a Pleuriſie, is departed from among the Living; neither did the Arts profit their Maſter, which did all others. The Reader will pardon us, if we for a little ſpace celebrate the Funeral of ſo Sacred a Memory, nor eſteem it ſuperfluous to hear in a few words, what manner of perſon he was who wrote ſuch things: yea he will rejoyce to underſtand that he was equally Good as Learned, that he alſo exerciſed himſelf in the Practice of Piety, who was moſt converſant in that in Phyſick.

The matter requires a juſt Commentary, but we ſhall briefly propound what at firſt came into our ſudden thought, while our mind was ſurprized with ſo unexpected an Accident.

Extracted from an honeſt Family, he had a Father educated in ingenuous Studies, who after he had gone Maſter of Arts in the Univerſity of Oxford, being taken with the retiredneſs of the Countrey, repaired to a Poſſeſſion he had near the ſame City, and ſolely attended his Domeſtick Affairs, and maintenance of his Family: being enough deſerving of the World, who begat ſuch a Son. But He, the Civil War raging, being ſnatcht away by the Contagion of a Camp-Feaver, left his Son an Orphan, near about twenty years of age, placing the firſt Rudiments of his Studies in Chriſt-Church; who being called to take on him the care of an Inheritance, for ſome time remained in the Countrey, but harraſed by the Incurſions of the Rebels, who were poſſeſſed of a Garriſon ſtrong enough Five miles from thence, and every where Plundering, he betook himſelf again to Oxford, being the Tents of the King as well as the Muſes; where liſting himſelf a Souldier in the Univerſity Legions, he received Pay for ſome years; untill the Cauſe of the Beſt Prince being overcome, Cromwell's Tyranny afforded to this wretched Nation a Peace more cruel than any War. From thence, the Church being trampled on, and Divinity together with Divines ſuppreſſed, he applyed himſelf to the ſtudy of Phyſick, in which, in a ſhort time he made eminent progreſs. In the mean time being nevertheleſs addicted to the ſtudy of Piety, (whereof it was a conſiderable demonſtration, that when the Liturgy of the Church of England was thruſt out of the Church, and none could be preſent ſcot-free at thoſe holy Offices after the ancient manner) he entertained Religion then a Fugitive; and allotting part of his Houſe for Holy uſes, brought it ſo to paſs, that Aſſem-

Assemblies, and Publick Prayers, and other Offices of Piety were constantly performed according to the Rites of the Church of England. *In the mean time he writ and published those most excellent Tracts by which he first became known to the World,* viz. *Of* Fermentation, *of* Feavers, and of Urines.

At length the King restored, and accesse opened to University Degrees and publick Employs, he proceeded Doctor, and was publickly declared Professor of Natural Philosophy, which Profession he did adorn with the highest praise; Moreover, his Anatomy of the Brain, *and his Treatise of the* Scurvy, *and of* Convulsions, *were published.*

But about the Year 1667. *being called to* London *to practise Physick, it is incredible to relate, how soon, and with how great Commendations he grew famous, especially being so composed by Nature and Custom, that he could not recommend himself by words composed to deceive, or the cunning Arts of Mountebanks. But though he spent whole dayes and nights in care of the Sick, he was yet at leisure to adorn his Art by composing Books, from whence among a thousand Interruptions he published these Treatises, of* the Accension of the Blood, *and of* Muscular Motion, *of* the Soul of Brutes, *of* the Diseases of the Brain, *and the first part of his* Pharmaceutice Rationalis, *and at length the* other *which we now present. All which, with the Authors Animadversions, and writings unpublished, being collected into one Volume, and committed to the care of the most faithful Apothecary Mr.* J. Hemming, *we hope some time to print here.*

Moreover, the same care for Divine Worship was still impressed on this most Pious Soul; and since he could not be present, by reason of Employ, at the Canonical Hours at the Publick Devotion in the Parish Church where he dwelt, he procured the Sacred Offices of the Church to be there celebrated early in the Morning and late in the Evening, and for the most part was constant at them, whatever Business was repugnant. And seeing this Institution profitable to many in the Neighbourhood, who were likewise all day detained about Commerce and Trades, he endowed a Priest with a fit Salary at his Death, to discharge that Function for ever.

But small was this proof of his excellent Pious temper. Although no Person more frugal and attentive to his Employ, yet none more munificent, denying all things to himself, yet denying nothing to the Poor and helpless. Besides what he bestowed with his own hands, he provided Almsgivers and Dispensers of his Charity every where in the City, Countrey, and in the University. I speak what I know by frequent experiment; one might easier have received from him, for a fit object of Charity, an hundred Crowns, than have extorted as many farthings from most others. And though any one might justly impute the large Revenues he acquired, to his indefatigable Diligence and constant Frugality, yet I believe it rather to proceed from

his

his bountifull Largesses, and the Divine benediction thereon. From the beginning of his Youth to the last period of his life, he was Master of no summe of Money which he accounted his own, untill he had consecrated some considerable Portion of it to God and the Poor: And when a few dayes before his last, which I must ever lament, we conferr'd together, (as if he had foreknown his approaching Death, and being more solicitous about the Poor than his own Offspring,) he diligently advised about stating these Accompts.

I omit here to decipher, how undisturbed he was in Adversity, and how temperate in Prosperity; how modest in the highest Fame for his Learning; when unworthily provok'd, how prone to forgive Injuries; how faithful to his Prince to his death; how obedient to the oppressed Church; how candid and ingenuous in the Profession of his Art; how indefatigable in his Studyes, how sparing in his Speech, and how much a Christian in the whole state of his Life. To finish all which according to his deserts, is not the work of one hour or Paragraph. In short, he was constantly exercised in Prayers, Studyes, Labours, Almes, and Watchings; at length being near Fifty seven years of Age, in the beginning of November *he seemed troubled with a Cough (now the Epidemical Disease of the time) which (while it was thought light and inconsiderable) suddenly passed into a Pleurisie and Peripneumonia. And when this most expert Person was not relieved by frequent Bleeding and diligent taking of Remedies, himself perceived the Period of his Life to approach, (his Friends hoping better;) and after three dayes his Houshold affairs being settled, and having taken the* Viaticum *of the* Holy Eucharist, *and being received into the Peace of the Church, he commended his pious Soul to God, having his senses entire to the last breath, and finisht his most exemplary Life with the like Death.*

THE SECOND PART OF *PHARMACEUTICE RATIONALIS*, OR OF THE OPERATIONS OF MEDICINES IN HUMANE BODIES.

SECT. I.

Of the Medicines of the Thorax.

CHAP. I.

Of the Organs of Breathing and their Uſe.

IN the former Treatiſe having eſſayed to explain the reaſons of every Medicine, for the moſt part we have toucht only upon general Medicines, namely which excite ſome Evacuation, or recreate and reſtore the fainting Spirits, or calm thoſe which are too much raging and unquiet: But moreover there are many other Remedies, and thoſe of ſeveral ſorts, which are ſuppoſed to have reſpect to ſome peculiar part of the Body, or ſome particular Diſeaſe, and to be appropriated to thoſe ends by a certain kind of ſpecific virtue or operation. Now as concerning both the *Ira* and *Fides* of theſe, at leaſt the chief of them, *viz.* whether it be really ſo, and for what reaſon it comes to paſs to be ſo, it ſeems now worthy to be inquired into: And firſt of all we will treat of the Medicines of the *Thorax*, *viz.* thoſe that are wont to be preſcribed againſt the Cough, Phthiſic, Catarrh, Aſthma, Dyſpnœa, and other Diſeaſes of the Breaſt. *The Authors purpoſe in the preſent work.*

But ſince the reaſons as well of theſe Diſeaſes as of medicinal Operations in healing them ſeem very abſtruſe and moſt difficult to declare: therefore before I enter upon this task, ſomething ought to be premiſed about the parts themſelves, as well touching their uſes and ordinary actions, as their ſickneſſes or preternatural affects. As to the firſt, the parts of the *Thorax* are either principal, as the Heart and Lungs, *The parts of the Thorax.*

with the Veſſels appendent unto them; or ſubſervient, as the Membranes and Muſcles, with the Diaphragma; as likewiſe the Ribs, with the Vertebra's; the Pneumonic Veſſels, with the nervous Fibres and Glandules. The conſideration of the Heart and its Veſſels doth not properly belong to this place, becauſe not ſo much the ſickneſſes of the Breaſt alone as the general ſickneſſes of the whole body are uſually reckoned amongſt its paſſions. Whereas therefore the remedies appointed to cure the diſeaſes of that region, have ſpecial reſpect to the Lungs, and to the other Organs of breathing ſerving them; therefore firſt we will deſcribe the fabrick and uſe of theſe parts, then their diſeaſes afterwards, together with the method of cure, and remedies; and laſtly endeavour to add the reaſons of all theſe.

The ſubſtance of the Lungs altogether membranous.

The ſubſtance of the Lungs was always accounted by the Ancients, and moſtly hitherto by modern Authors for fleſh and a Parenchyma, like the frame of the other bowels; which notwithſtanding was accounted lighter and ſpongeous (for as much as it was apt to be diſtended much by air puffit in, and to float upon waters.) Moreover, whereas the Lungs taken out of an Embryo look red, and ſink in water; and the Lungs of ſome grown perſons being boiled, appear compact enough and more ſolid; almoſt no man doubted but they conſiſted really of fleſh: until lately the renowned *Malpighius*, a moſt diligent Searcher of Nature, found thoſe parts to be altogether excarneous, and meerly membranous; "and therefore he judges the bulk of "the Lungs, if the Nerves and certain Veſſels be ſeparated with the branches of the "*Trachea*, to be a certain heap of little Bladders, and thoſe ſmall Bladders every "where ſtretched out and ſinuous, to obtain ſuch poſition and knitting together, "that an entrance lies open into them from the *Aſpera Arteria*, and ſo from one "into another, until at length they all end in the Membrane incloſing the Lungs. "And truly that it is ſo, he makes clear to ſenſe by an Experiment. For let a Lung "be taken out hot, and let water be ſo often caſt by a Syringe into the Pneumatic Ar"tery, as till the whole frame appear ſomewhat white, and almoſt tranſparent, the "blood being clean waſhed out; afterward this water being ſqueezed out by preſ"ſing, and the air let in by the Wind-pipe, and pen'd in, let the Lung ſo filled be "dryed: and it does not only, whilſt expoſed to the light, outwardly ſhew tranſpa"rent little Bladders; but being inwardly cut, it preſents a white heap of little "Bladders to the eyes. Beſides, having viewed it with a Microſcope, he diſcovered a certain wonderful Net, binding and knitting together every one of thoſe little Bladders; which Net conſiſts of the minute productions and branchings of the Artery and Vein; which Veſſels circulate the blood by the ſmall and crooked paſſages, and by the many turnings of the Pipes.

Conſiſting of almoſt infinite Lobes.

The moſt renowned man hath found out beſide theſe little Bladders for the moſt part conſtituting the frame of the Lungs, a new and more admirable furniture of this Bowel, *viz.* he ſhews plainly the bulk of the Lungs to be blown up by almoſt infinite lobes girt about with their proper Membrane, which being endued with common Veſſels, grow to the ſmall twigs of the *Aſpera Arteria:* the inſertion and ſituation of which kind of little Lobes are manifold, as being ſometimes affixt to the Baſis of the *Trachea*, ſometimes to the Ribs, or to its Cone; alſo according as they end in the outward and plain ſuperficies, or in the corners of the Lungs; and according as they ought to have a due poſition, knitting and inter-ſpaces among themſelves, rightly to fill up the frame of the Lungs. The little lobes out of which each lobe of the Lungs is made up, in the third Table are accurately and to the life expreſſed.

Their little branchings.

Certain inter-ſpaces diſtinguiſh theſe little lobes (which manifeſtly appear in a larger Lung or in any other half boiled) which (as the renowned Perſon hath obſerved) are not bare cavities or empty ſpaces, but they have many Membranes ſpreading from the little lobes, ſome parallel, ſome angular, and are alſo covered with many Veſſels, ſo as theſe inter-ſpaces are certain membranous little bladders, yet tranſparent and moſt thin. If you lightly open in one ſingle lobe of the Lung one of theſe inter-ſpaces with the point of a knife, and ſhall blow into it by a ſmall hole through a Pipe, preſently that whole lobe will be very much extended, every inter-ſpace being puffit up; and then if you bring this frame to the light, the inter-ſpaces being made tranſparent, do ſever by great intervals every lobe very conſpicuous; and ſo every rank of the lobes will appear like a Polypody-leaf, and under the ſame figures, as *Malpighius* hath deſcribed, and are repreſented in Fig. 2. of our third Table. But when the little lobes are filled and extended by liquor eaſily congealing caſt into

into the paſſages of the *Trachea*, the appearance thereof is ſomewhat diverſe, and ſeems in the form of Grapes, as is expreſſed in Fig. 1. of the ſame Table. The Veins and Arteries every where accompany this production of the *Aſpera Arteria*, and extend themſelves through the whole ſubſtance of the Lungs by a certain knitting and alike branching. This is plainly perceived by a pleaſant ſight, in a lobe of the Lungs being emptied and turgid, Quick-ſilver being caſt into ſome of the Veſſels, and others filled with a coloured liquor. But in diſſecting the living, another ſort of Veſſels, *viz.* Lymphæducts are manifeſt to the eye to be ſpread through the whole Lungs: and we have in another place clearly enough ſhewn, both very many Nerves and nervous ſlips every where to be diſtributed through them. Beſides theſe parts, and the primary or chief veſſels of a Lung, ſome others, and thoſe as it were ſecondary, are to be obſerved. For the Pneumonic Veins and Arteries are endued with other ſanguiferous Veſſels ſpringing from the *Aorta*, moreover with Glandules, and likewiſe with Fibres as well nervous as moving; and the Wind-pipe is endowed with every one of theſe, and cartilaginous ones beſides.

The Lymphæducts and nervous ſlips.

Whence we may infer, that the entire frame of a Lung is meerly fiſtulous, and compacted of Pipes of ſeveral kinds and magnitude, and variouſly and moſt intricately diſpoſed: which although they may appear wonderfully complicated, and many ways twiſted and wreathed, are yet every where continuous, and being ſtretched out with a mutual reſpect to one another, do hither and thither in good order and regularly convey and diſpoſe the air, the blood, the *Lympha*, and animal Spirits for ſome acceſſary uſes. To deſcribe as it were with a Pencil this bulk of a Lung, together with the branchings, ſeparatings, and mutual complications of all its Veſſels, would be no leſs difficult a task than to trace the ſeveral threads of a harl of ſilk, and their reſpect one to another. Nevertheleſs, that both the Pathology of the *Thorax*, and the cure, may be duly known according to our deſign, it ſeems to be material to recite here all the Veſſels of the Lungs one after another, and to deliver as well their deſcriptions, as their preternatural uſes and diſeaſes, to which at length the Therapeutic Method ſhall be ſubjoyned. And theſe are the Veſſels of which the entire fabrick of the Lungs conſiſts, the Wind-pipe, with the *Bronchia* and little Bladders, Arteries, Veins, Lymphæducts, and Nerves, to which may the parts and appendices of thoſe Veſſels be added, *viz.* the Coats of the greater Veſſels, which are endued with other ſanguiferous Veſſels and Glandules, and alſo with nervous Muſcles and Fibres.

The Veſſels of a Lung.

Therefore as to the chief Veſſels of the Lungs, although all theſe, by reaſon of their mutual offices, communicate among themſelves with a wonderful affinity; yet the Arteries and Pneumonic Veins attend on the *Trachea* and its partitions the moſt exactly; for the branches and ſprigs of every one of theſe ſpringing alike from their reſpective ſtocks, and ſtretcht out to and fro, go on every where with like pace; ſo that the *Trachea* and its branches are always in the middle, above that the Vein, and beneath the Pneumonic Artery are carried, and all are diſtributed with an equal and ſociable branching: and the ſprigs and branches, ſent from each of them, are preſently applied to their like, and are interwoven like wonderful Nets, of which the texture of the Lungs is almoſt totally conſtituted. It will be impoſſible to deſcribe the ſpreadings out and various complications among themſelves of all theſe going on together, as to the leſſer ſprigs and ſlips; yet if you will caſt into every veſſel apart Quick-ſilver, hot and flowing Gypſum, Wax mingled and made liquid with Oyl of Turpentine, or ſome ſuch matter, which will extend all or the chief paſſages, and continue them ſtufft, then you may exactly enough repreſent the figure: and after that manner the frame or texture of the whole Lung may be conceived, each being deſcribed by it ſelf and apart. Wherefore upon theſe and all other Veſſels and parts of the Lungs we will treat in order; and firſt of the *Trachea* or Wind-pipe.

wait on the Trachea.

The Wind-pipe or *Aſpera Arteria* is a Pipe ſomewhat long, conſiſting of Griſles and Membranes, which beginning from the Throat or loweſt part of the Jaws, and leaning on the Gullet, and deſcending into the Lungs, is diſperſed by manifold little branchings through their whole frame. It is divided into two parts by the Ancients, *viz.* the upper, which is called the *Larynx*, and the nether commonly called *Bronchus*; to which a third or loweſt is added, by *Malpighius* called *Veſicularis*, or the bladdery one.

The deſcription of the Trachea.

The former of theſe, which is the beginning of the *Aſpera Arteria*, doth chiefly ſerve

The deſcription of the Larynx.

ſerve for vociferation or loud noiſe, formed of many and various Griſles, to which alſo are adjoyned proper Muſcles; the deſcription and uſe of all which are ſo exactly delivered by Anatomiſts, that there is no need of dwelling longer on the deſcription: we only advertiſe for methods ſake and by way of abridgment, that the Larynx contains ſome greater Cartilages of divers forms, and ſome uniform; the former, by reaſon of reſemblance, bear the denomination of *Epiglottis*, the Buckler-like Cartilage, the Ring-Griſle, and ἀρυταινοειδὴς. To this laſt doth ſucceed a continual rank or row of Cartilages, faſhioned altogether after the ſame figure and manner; every one of which, whereas they reſemble a circle, but not compleat, are diſpoſed after ſuch a ſort, as if one ſo compoſe many wooden Rings, that there ſhould grow up from the ſides of them, by laying a good many one upon another, a certain Pipe as it were with Ribs. Theſe circular Cartilages are equally diſtant one from another in their whole paſſage, and are knit together by the benefit of an inner Membrane (which fills up the ſpaces between like the *Perioſtium*) as with a ligament. But the hinder part of every Ring-like Griſle where it lies upon the Gullet, that it may ſerve better to the ſwallowing of meats, turns into a Membrane, which altogether is the ſame, and binding together thoſe cartilaginous rings, and covering the whole hollowneſs of the *Larynx*, is always moiſt with an unctuous humour, by which it may as well be defended againſt the ſucking in of ſharper air, as breathing out more acrimonious vapours.

Membranes encompaſſing the wind-pipe.

Beſides this inner Membrane, alſo another outward, though thinner, encompaſſes the whole Wind-pipe, by the aid whereof both the Cartilages are more firmly knit among themſelves, and the whole Pipe bound to its neighbouring parts, and deſcends more ſafely and ſtrongly into the Breaſt. Beſides, we judge there are ſome other uſes and offices of either Membrane, than that it only ſerve to faſhion or defend the ſides of the Wind-pipe: for as much as we do here manifeſtly obſerve many Nerves and nervous ſtrings every where inſerted, and alſo the more inward Coat of the *Aſpera Arteria* to be endued with Fibres, as well nervous as fleſhy or muſculous: from whence we may conclude the Wind-pipe to injoy both a certain ſenſe and motion either in the whole, or at leaſt in ſome parts. And truly it is manifeſt even to common obſervation, that its more inward paſſage doth excel with a moſt acute ſenſe; for as much as it is ſo much provoked by the ſmalleſt prejudice, that preſently it is wonderfully forced into a convulſive motion, *viz.* a Cough: but as a ſenſe of annoyance, and from thence very often an inſtinct of motion ariſes from this Veſſel; ſo we think that its Fibres do after a ſort move of themſelves both in breathing and coughing. Surely in reſpect of this it is not to be doubted, becauſe in this inner Membrane we find two orders of muſcular Fibres in that faſhion diſpoſed as in the *Aorta* and Inteſtines: to wit, there is one upper order of ſtraight Fibres, which while they are contracted, make all the circular Cartilages to be drawn together nearer to one another, and for that cauſe to abbreviate the Trunk of this Veſſel according to all its parts ſucceſſively. Under this lies another order of circular Fibres, which (while they are pufft up) being contracted, the hollowneſs of the Wind-pipe is much narrowed. Therefore when the moving Fibres of either kind make the paſſage to be ſtraitned according to all its dimenſions, it is obvious enough that they conduce to the diſcharge of the function of breathing, and more or leſs to be active, as there is endeavour to breathe quicker or ſlower, more intenſly or more remiſs. Theſe Fibres being more vehemently contracted in a Cough, in hawking, in blowing out, and certain other more ſtrong exerciſes of expiration, do force the breath and other contents of the *Aſpera Arteria* to be violently expelled. Moreover from this action ſometimes either depraved or hindred, it ſhall be declared hereafter how an Aſthma, a Dyſpnœa, and ſome other diſeaſes about breathing do ariſe.

The glandulous and vaſculous Coats.

This inner muſculous Coat hath alſo two others, as if growing thereunto, to wit, one glandulous, and that full of veſſels. For as in another place we have remarked about the Anatomy of the ſanguiferous Artery, one may alſo here take notice, that the inward Pipe of the Wezand is covered with a moſt thick weaving of Veſſels of every kind, and eſpecially of thoſe carrying blood, in faſhion of a Net. The Arteries not ſpringing from the Pneumonic Veſſels, but from the Bronchial branch (which the moſt renowned Mr. *Ruiſch* diſcovered to have its riſe from the *Aorta*) are inſerted into this ſame; which the veiny ſlips do accompany, owing their origine to the *Vena cava*. The nervous ſprigs meeting theſe two, are variouſly folded; and ſo of all weaved together, is framed as it were a little Net, covering the whole back of the Wea-

Weazand, under which folding of Veſſels very ſmall and whitiſh Glandules are every where ſtrewed, or rather cleave to them; juſt in the like manner, as we have in another place ſhewn to be in moſt other greater Veſſels, and in all membranous Bowels: on all which the Lymphæducts adjoyned do wait. As to the uſe of theſe, without doubt the Arteries and Veins waſh through the Pipe of the Weazand with bloody ſtream for its nouriſhment; and the Nerves carry plenty of Spirits, and the faculty of performing motions to the muſcular Fibres. Afterwards whatſoever of ſuperfluous moiſture be left by the Arteries, that the Veins cannot bring back, the Glandules do receive and retain, until it may be ſent back to the maſs of blood through the Lymphæducts. When they are too much filled, by reaſon of the Lympha more plentifully left, a humour diſtilling from the Glandules as well as from the Arteries into the hollowneſs of the Wind-pipe brings a Catarrh. All the Coats of the *Aſpera Arteria* diſtinct and ſeparated from each other are expreſſed in the ſeventh Table.

Of the Bronchia.

The ſecond part of the Wind-pipe, commonly called *Bronchos*, begins from the entrance of the Lungs: for near the fourth Vertebra of the Cheſt that great Pipe deſcending, is divided into two Trunks, one whereof goes towards the right ſide of the Lungs, the other the left: afterwards both having entred the Lungs, and being ſubdivided for the greater Lobes, diſtribute very many ſprigs (as for the moſt part in the gills of fiſhes) to the Lobes or leſſer Lobes through the whole frame of the Lungs. The paſſages of all theſe are furniſhed, even as in the Larynx, with Cartilages, but framed ſomething in a differing manner: for in the *Bronchia* theſe are not Ring-like, but reſembling a Coat of Male, ſo that when there is need to contract thoſe paſſages, the inferiour Cartilage goes under the hollowneſs of the upper, almoſt in the ſame manner as it is in the joynts of the ſhelly Coat of a Lobſter. Proviſion is ſo made by the work of God, that when the Lungs are dilated, the *Bronchia* are ſtretcht out into the greateſt length; and when they are contracted, the *Bronchia* are abbreviated, one part being drawn into another.

Their Syſtole and Diaſtole.

The Coats of the *Bronchia*, as alſo of the Larynx, have muſcular Fibres of both kinds, together with the Glandules and the Net-like twiſting of Veſſels: from whence we may alſo conclude, that all the leſſer Pipes of the *Aſpera Arteria* have their conſtant turns of Syſtole and Diaſtole, *viz.* all the Pipes are contracted while we breathe out, and relaxed while we ſuck in air: moreover from the ſame Glandules and little Net of Veſſels every where continued almoſt within every inward receſs of the Lungs, doth diſtil the Catarrh humour. A certain Bronchial branch of the *Trachea* belonging to each Lobe of the Lungs is deſcribed in the ſecond Table *H. H.*

The Lobes of the Bronchia.

And the branched *Bronchia* of both ſides not only conſtitute two or more greater Lobes; but, as *Malpighius* hath obſerved, many leſſer or little lobes diſtinct among themſelves; for each Bronchial branch ſends forth to and fro many little branches or twigs, every of which twigs being joyned with alike twigs of the Pneumonic Artery and Vein, from thence are parted into innumerable leſſer ſprigs; all which being every where fellowed and complicated among themſelves, and having got Nerves and peculiar Lymphæducts, and ending in the outward ſuperficies of the Lungs, repreſent as it were a certain private Grove; and ſo the whole ſtructure of the Lungs conſiſts of many little branches of the aforeſaid Veſſels complicated, as it were of ſo many ſeveral Groves. The branches whereof and outmoſt ſides of which, although they may ſeem mutually to touch themſelves and cleave together, yet they are disjoyned one from the other, and are every one bounded within their proper limits; far otherwiſe than the productions and communications of Veſſels are in the Brain, where the Arteries and Veins riſing up in its ſeveral corners, extend on every ſide, and creeping through its whole ſpace, and mutually inoſculating, do all communicate among themſelves.

Their little branchings disjoyned from one the other.

The uſe of the aforeſaid frame.

That former faſhioning of the Veſſels hath been very neceſſary to the uſes of the Lungs; for ſeeing the air ought only to enter the Lungs for that end, that it might pour out to the blood nitrous particles for its flame and vitality or life, and preſently return back; and ſeeing the blood doth paſs through the Lungs for that cauſe, that it might meet the air ſuckt in according to all its parts; therefore it behoves that both theſe, *viz.* the air and the blood be divided into ſmall portions, and with theſe make every where diſtinct and ſhort meetings. The manner of this is moſt elegantly perceived in the gills of fiſhes; for ſeeing the *Bronchia* are as

ſo

ſo many greater Lobes, every one of theſe is divided into many rundles, furniſhed with a complication of every kind of Veſſels, as if it were into ſo many Lobes; in every one of which the blood is drawn out by minute portions, as it were little rivulets, that it might throughly meet with the nitrous particles, and afterwards return into its chanel.

The uſes of the little bladdery Cells.

The Bronchial Pipes lead into the utter cavities, *viz.* into the numerous little Bladders diſcovered by *Malpighius*; which truly are certain continued parts of the *Aſpera Arteria*, but diſtinct from the former, becauſe the Griſles are wholly wanting to them, and, which ſupply the turn of theſe, are diſtant one from another in larger ſpaces: for all the Bronchial branches ſend forth leſſer ſlips from themſelves every way; whoſe paſſages, although void of Griſles, notwithſtanding are ſtraitned as it were with certain ligaments at certain intervals; and the ſpaces between theſe being filled with air ſuckt in do make partly thoſe ſmall bladdery little Cells. In truth thoſe paſſages may not unaptly be compared to the Gut Colon of a Mouſe, whoſe continued hollowneſs in as much as it is girt about in divers places, ſeems to be divided as it were into many little purſes. Moreover thoſe bladdery paſſages being ſhorter on either ſide the *Sinus* or hollowneſs, have as it were particular little Bladders growing thick to them, and therefore the heap of all the Cells ſeems not much unlike to a bunch of Grapes. The Figures of theſe as much as may be are exactly repreſented in the third Table. Thoſe little bladdery Cells, that they may put forth their contracting endeavours for breathing, have muſcular Fibres, as is plainly ſeen by the Microſcope. For as much as great plenty of air ought to be drawn within the Lungs, and reſerved in part, leſt it fail at any time; therefore beſides thoſe upper paſſages which are as it were the threſhold and dens, moreover more inner chambers and capacious are required, in which the air may be treaſured up, and from thence be diſpenſed upon occaſion. For it ſometimes happens the external is too ſharp, or otherwiſe diſagreeable to the Lungs; ſo that as it was greatly neceſſary that it ſhould be ſuckt in more ſparingly, and its vehemence preſently be attempered and rebated by the air treaſured within. Moreover it cannot be drawn in or inſpired otherwhile in quantity great enough, as in running, ſinging, or much ſpeaking, alſo in ſome crazy diſpoſitions; and in that caſe the inward air being rarified, ſupplies in a manner the defect of the outward.

Endued only with muſcular Fibres.

Therefore ſeeing thoſe bladdery little Cells receive a greater ſtock of air than that they can be bound preſently to return it all by every turn of expiration; therefore the griſly twigs are wanting to them, and their hollowneſſes are more large of themſelves, that they may be more largely diſtended: but that they may puff out a greater quantity of air upon occaſion, or throw out matter to be coughed out, being endued with muſcular Fibres, they contract themſelves more narrowly, and throw out what is contained within them thoroughly. For the ordinary Syſtole's of the Breaſt, which the relaxation of the Muſcles do partly effect, caſt out perhaps at every turn the whole air from the *Trachea* and *Bronchus*, but not from the little Bladders: for the emptying of theſe as often as need ſhall be, both the cavity of the whole Breaſt is very much ſtraitned, and the ſmall bladdery Cells themſelves are ſtraitned from their proper Fibres being drawn together.

The deſcription and uſe of the Pneumonic Artery.

2. The next Veſſel is the Pneumonic Artery, of whoſe moſt thick branches extended every where to and fro, and with other branches twiſted and complicated together, the frame of the Lungs conſiſts. This Artery iſſuing from the right *Sinus* of the Heart, and inclining towards the *Trachea*, is parted into a right and left branch; which applying themſelves to the like parallel branches of the *Trachea*, do accompany them every where, or rather are ſet under them; for they are planted beneath, and are firſt carried into the greater lobes of the Lungs, and afterwards into all the leſſer lobes: in every of which the little branch of the Artery ſtretched out, ſends out on either ſide more ſlips from it ſelf, which preſently are aſſociated by other bronchial and venal ſlips, and are ſeveral ways complicated; and where the outmoſt ſprigs of the *Aſpera Arteria* depart into circular little Cells, the Arteries being complicated with the Veins (as is diſcovered by the Microſcope) do girt about thoſe little Bladders with their thick branching, and enwrap them like Ivy: from whence we may conjecture, that it is not for nothing that the Blood-veſſels that are any where in the Lungs, do curiouſly wait upon thoſe of the air, and every where inſinuate and intimately mingle themſelves. Surely whatſoever hath been ſuppoſed by others, I ſhall not eaſily believe that this is done for the more exact

mingling

mingling of the Blood and its parts, be they never ſo unlike. For to do that, what need would there be of ſo full an acceſs of air, which in rightly making other mixtures (the more perfect whereof are called Digeſtions) we ſeek as much as we can to keep out? For if the air might freely come and go, the Particles that ſhould be mixed, would moſt of them flye away. And as to that which is affirmed, That the Blood in the Lungs is carried through thoſe ſmall, winding and extreme narrow paſſages only that it may be the better mixed; I ſay, that its being ſo carried is quite contrary to ſuch an intention: for the beſt mixture of any liquor (as alſo of the Blood it ſelf) is made by fermentation; and the liquour to be ſo mixed or fermented, like Wine in a Hogſhead, requires a free and ſpacious room: but its going through theſe ſmall and narrow paſſages like ſo many ſtrainers, ſerves rather for the ſeparation than the mixture of its parts; wherefore unleſs the Blood be exactly mixed in the greater Veſſels, and be there rightly fermented, it does, while it paſſes through the Lungs, leave there the dregs and whatſoever parts are not rightly mixt, and ſo does ſtuff up and very much obſtruct their paſſages; as we may ſee in perſons affected with the Green-ſickneſs, Cachexy, and that ſort of Dropſie called *Leucophlegmatia*, who all have a difficulty of breathing, by reaſon of dregs of the ill-mixt Blood that are left there. Wherefore the uſe of the Lungs ſeems to be this, That the Blood through the leſſer Veſſels, as ſo many rivulets, may as to all its parts lie open to and meet with the nitrous Particles of the Air, and be by them enlivened and accended. The Pneumonic Artery, as alſo the *Aorta* and Wind-pipe, hath a muſcular Coat furniſhed with two ranks of Fibres, namely ſtraight and circular; which doubtleſs, when they are contracted, do make the Pneumonic Arteries to beat, and the Blood to be urged and driven ſtill more and more forward. A great many Glandules with a Net of Veſſels lie on this muſculous Coat. The frame and branching of the Pneumonic Artery in ſome one Lobe of the Lungs are expreſſed in the ſecond Table. All the Coats of this Veſſel are drawn diſtinct and apart from one another in the ſixth Table and firſt Figure, and alſo in the fourth Table and ſecond Figure.

The deſcription and uſe of the Pneumonic Vein.

The Pneumonic Vein, having its riſe in the left Ventricle of the Heart, and being divided and variouſly ſubdivided firſt into greater branches, and then, according to the greater and leſſer Lobes of the Lungs, into leſſer, and laſtly into the leaſt of all, is carried above the Weazand, and as it goes on does exactly anſwer to the branching both of the Pneumonic Artery and the Weazand, and goes every where with them as it were cheek by joll; and where the Weazand ends into the little Bladders, the Veins being twiſted with the Arteries (as was ſaid before) do make as it were a little Net wherein thoſe little Bladders are encompaſſed. The Anatome of the Pneumonic Vein differs little or nothing from that of the *Vena cava* and its branches. All the Veſſels of this kind have four Coats diſtinct from one another.

1. The outmoſt of theſe Coats conſiſts of Fibres that ſeem to be nervous, which perhaps are after a ſort muſcular and are extended ſtraight long-wiſe, (though in no very regular order.) This Coat of the pulmonary Vein is very laxe, and looſe from the reſt of the Veſſel, inſomuch that it may all of it be blown up and very much extended, as if it were a diſtinct Veſſel: Whence one might ſuſpect that this were a peculiar paſſage to carry back *Lympha* or *Serum* ſeparated from the Blood: but it ſeems to be more probable, that this outmoſt Coat is therefore made ſo looſe, that the paſſages might be much diſtended and widened for the return of the Blood now hot and boiling.

The uſe of the venous and vaſculous Coat.

2. 3. Two other Coats (common both to a Vein and Artery) *viz.* the vaſculous, and the glandulous lie under this: the office of the vaſculous is to bring nouriſhment to the part, and of the glandulous to receive and ſend away the ſuperfluous ſeroſities.

The muſcular Coat.

4. The fourth and inmoſt Coat is plainly muſcular, having Ring-fibres, as the like Coat of an Artery hath, which certainly being ſucceſſively contracted after the ſtream of Blood, do cauſe its return to be haſtened, and on occaſion to be ſhortned.

Why there is no Pulſe in the Veins.

But here ariſes a doubt, wherefore, ſeeing the Veins as well as Arteries have contracting muſcular Fibres (which in the latter are pulſifick) and ſeeing both are alike joined to the Heart that beats continually, the Veins as well as the Arteries ſhould not ſtatedly beat according to the conſtant turns of the Syſtole's and Diaſtole's in the Heart? It may eaſily be anſwered to this, *firſt*, that the Arteries have a great deal more of the moving Fibres than the Veins have; and therefore whereas *thoſe* being

being ſtrongly contracted ſucceſſively, do force the Blood along as if driven with a wedge, for *theſe* it ſufficeth that whilſt they are gently contracted behind the ſtream of Blood, they calmly and equally drive it forward, flowing back again of its own accord, and as it were down-hill. But *beſides*, the reaſon hereof ſeems to depend ſomewhat on the unlike or rather inverted conformation of the Veſſels; for the Blood conveighed by the Arteries is driven ſtill from wider to narrower ſpaces, and therefore going along it every where violently diſtends them, and lifting up the ſides of the Veſſels raiſes the Pulſe; becauſe whiles that part of the Artery that is behind the Blood is contracted by its muſcular Fibres, that part which is before it, muſt needs beat being filled with the ſtream of blood guſhing in: but on the contrary, the blood in the Veins returning to the Heart, runs out of leſs into greater ſpaces, or out of rivulets into a more capacious and deep chanel, and therefore glides along ſilently and without the fluctuating of a Pulſe.

The diſpoſition of the blood in the Pneumonic Veins.

The blood in the pulmonary Veins ſeems as much, or more than that within the Arteries to be animated or inflamed anew by the air inſinuating it ſelf every where from the Pipes or little Bladders of the *Trachea*, becauſe in thoſe Veins 'tis firſt changed from a black-purple to a ſcarlet: the reaſon whereof is, becauſe the blood at the extremities of the Veſſels, namely as it paſſes out of the Arteries into the Veins, does every where and moſt of all meet with the particles of the air. And for that reaſon it is, that if any liquour be ſquirted into the Pneumonic Artery, it will not ſo readily and quickly paſs through the Lungs and return by the Vein, as it will do if you make the ſame experiment in any member, or part of the body beſides; yea part of the liquor ſo injected will ſweat through into the Pipes of the *Trachea*, or the ſpaces between the little Lobes, and another part, being turned into a froth, will return very ſlowly by the Veins: which is a certain proof, that while it paſſes through the Lungs it makes a ſtay in the mouths of the Veſſels, and is mingled with the airy particles. The Circulation of the blood through the Lungs hath ſomething diverſe from, or rather contrary to that which is made through the reſt of the body; ſeeing the Pneumonic Arteries contain a black-purple blood, and the Veins a ſcarlet, whereas in all the body beſides the branches of the *Aorta* carry a ſcarlet blood, and thoſe of the *Vena cava* a black-purple. Beſides we may obſerve of the pulmonary Vein, that it does every where in its whole length want valves, except where 'tis faſtned to the Heart. Which appears by this, that when any liquor is injected into its trunk (juſt as it is in the Artery) it preſently paſſes through all its branches without lett. Which ought to be ſo, to this end, that the blood may always, becauſe of the violence of the paſſions, freely every way fluctuate and regurgitate in and about the Heart. Beſides, that the left Ventricle of the Heart might never be overcharged with the blood impetuouſly ruſhing into it, by the inſtinct of Nature the Fibres at the root of the Vein being contracted, its courſe might be inverted and flow back. The deſcription of the Pneumonic Vein as to its utmoſt branching is in the fourth Table and third Figure.

The Lymphæducts added to the aforeſaid Veſſels.

To theſe three ſorts of Veſſels, wherein the air and the blood are conveighed, the Lymphæducts that carry forth a water are joined. A power of theſe diſperſed through the Lungs, wait on the Arteries and Veins. All the branches tending from the ſurface of the Lung towards its original, unite into ſome greater trunks; which, being inſerted into the Wind-pipe, diſcharge thereinto the Lympha that is ſuperfluous from the blood and nervous humour. Indeed there is need of a great many of this ſort of Veſſels in the Lungs; becauſe, ſeeing the blood is hotteſt of all here, is haſtily circulated, and yet can exhale nothing to without by tranſpiration, the Veins can hardly receive all the whole maſs of blood from the Arteries; and the Glandules contain not long what is depoſited in them: therefore there as need of Lymphæducts as ſo many chanels, whereby the ſuperfluous humour might continually be ſent off. If theſe at any time happen to be obſtructed or broken, there often follows a Dropſie of the Lungs or Breaſt, and ſometimes Coughs and Phthiſicks. Theſe lymphatick Veſſels of the Lungs may very well be ſeen, if in diſſecting a live Dog you preſs the top of the Thoracick duct, that nothing may be poured into the ſubclavian Vein: for then the Lymphæducts of the Lungs, becauſe they cannot diſcharge themſelves into the common Receptacle now ſtopt and filled, ſwell much and are very apparent. If ſuch a ſtoppage be made for ſome time in a Dog that hath eat and drunk largely, a milky liquor will ſweat into the Lungs out of the Thoracick duct, the Valves being unlocked: yea and the ſame liquor will paſs through the Lymphæ-

ducts

ducts placed far beneath the Reins, and will render them ſtrutted with that humour, as if abounding with milk. The rough delineation of the Lymphæducts ſpreading themſelves in the ſuperficies of the lobe of a Lung, is repreſented in the firſt Table.

5. The laſt kind of Veſſels belonging to the Lungs are the Nerves and their branches, whereof there are many (as we elſewhere intimated) diſperſed every where through the Lungs. Heretofore doubting about the office of theſe, we were induced to think the firſt force, or at leaſt inſtinct of breathing depended on theſe Nerves; becauſe otherwiſe we can hardly conceive, after what manner the motion of the Lungs in breathing, coughing, laughing, and other their actions ſhould be always ſo exactly proportioned according to the ſeveral exigences of Nature. For even as the blood doth more intenſly or remiſly heat and boil up within the *Præcordia*, and as certain contents of the *Trachea* provoke the nervous Fibres, we breathe either quicker or ſlower, and oftimes, though unwillingly, we cough. But beſides there doth occur another and more neceſſary uſe of theſe Nerves: for ſince it is manifeſt, that the Coats of thoſe Veins and of the *Trachea* are every where endued with muſcular or moving Fibres by which they are contracted, it is plain, that the Pneumonic Nerves do convey as well plenty of ſpirits, as inclinations of contraction to thoſe Fibres. And it is very probable from thoſe Nerves convulſively diſtempered, that the Palpitation of the Heart is often excited, as alſo the Aſthma and Chin-cough. We have ſome time ſince delivered the Anatomy or deſcription of the Pneumonic Nerves in our Treatiſe of Nerves, *viz. pag.* 311. ſo that there is here no need to repeat or inlarge. The fivefold Veſſels forementioned being mutual, and many ways accompanied in their diſtribution, as if divided into ſecret Groves with ſmall bladders as in Trenches every where interwoven, when they are complicated and variouſly woven together do conſtitute a fleſhy web, which is the very ſtructure of the Lungs: which moreover appears like a more ſolid *Parenchyma*, in as much the Arteries and Veins being filled with blood are ſtufft up, and the Veſſels of the *Trachea* and Lymphæducts being emptied of the air as well as water, do fall together and ſeem to cloſe. We ſhall the leſs admire the fleſhy fabrick of this Lung wove together out of meer Veſſels and little Bladders, if we conſider the frame of the ſeminal Teſticles to be nothing elſe than a heap compoſed of hollow filaments or ſpermatic Pipes woven together. The deſcription of the Nerves of the Lung, and what relates to the bundle of Fibres whereof it is compact, and to the ſpreading of its branches, are deſcribed in the fifth Table.

The nervous ſlips diſperſed throughout the Lungs.

The web of the Lung, as above-ſaid, being weaved together of Veſſels and little Bladders, and divided according to their greater and leſſer branchings into lobes and little lobes, a Membrane wraps them about as a common covering. Of this there are two Coats, *viz.* one outer and fine, which appears like a certain ſubtle texture or weaving together of nervous filaments (as is apparent in moſt other Bowels;) the other more inward, which is both rough and ſomewhat thick, and conſiſting almoſt of meer ends of Veſſels and little Bladders: and by reaſon of the hollowneſſes every where cauſed from theſe, its inward ſuperficies reſembles a Hive of Bees; the forms of theſe are aptly enough deſcribed in the eighth Table. This Membrane of two Coats blown up hath very many and large Pores, inſomuch that if Quick-ſilver be poured into the Trachial branch of one of the leſſer lobes, almoſt filling within the whole Membrane, it will every where burſt out from the Pores. Both the arterial blood and the air beating in this Membrane as againſt a bank, are reflected; the former is brought back by the Veins into the left Venter of the Heart, a certain watry part being ſent away through the Lymphæducts. In the mean while the air is returned back by the ſame paſſages of the *Trachea* by which it flowed in. For continually freſh air ought to be ſuckt in, that it might ſupply nitrous Particles to the Blood; to make room for which the other old air being now weak and uſeleſs, muſt be firſt breathed out. Becauſe therefore both functions are to be performed within the ſame paſſages, it is to be done by alternate turns, firſt the one, then the other. While the air is drawn in, the Lungs are blown up, as if wind were forced into them; and whilſt the ſame is breathed out they fall down, and are narrowly ſqueezed together for the benefit of excluding it; and ſo after the manner of Bellows diſcharge conſtant changes of the Syſtole and Diaſtole. Yet by what impulſe and Organs it is accompliſhed, is worth our labour here to conſider.

The coats of the lungs, whereof one is ſmooth, and the other rough.

Therefore upon the whole matter it is manifeſt by common obſervation, the Diaſtole of the Lungs perpetually ſucceeds the opening the Breaſt, and its Syſtole in like manner its contraction; ſo that we may conclude, when the cavity of the *Thorax* be-

The Syſtole and Diaſtole of a Lung.

ing dilated a greater ſpace is yielded to the expanſion of the lungs, the extern air of its own accord leaps into the *Trachea*, whether by reaſon of the Pulſe, or by its own Elaſtic force (for it is all one) and preſently enters into its Trunk, the *bronchia* and all the little bladders, and blows them up; namely for that end, that its nitrous particles may every where occur to the blood, waſhing all parts of the lungs: afterwards when the breaſt receding from that dilatation, is ſtraitned as to its cavity, even the lung being compreſs'd, falls together by its Diaſtole, and excludes the air even now breath'd in. But truly, becauſe the air doth not of its own accord leap out with that plenty as it skipt in, neither the hollowneſs of the breaſt ſo ſtraitly contracted, that it ſhould mightily compreſs the lungs; therefore all the paſſages of the *Trachea* are endowed with muſcular fibres, which being contracted orderly while we breathe out, they may promote the expulſion of air. Wherefore, that the cauſe of breathing, and the manner of doing it may more plainly be made known, inquiſition ought to be made after what manner, and by what Organs, that interchangeable dilatation and contraction of the breaſt are performed.

Its motion mechanically unfolded.

We cannot enough admire, concerning theſe motions, the cunning artifice of the Divine Creator, evidently adapted unto Mathematical rules; for truly in no other matter doth He more plainly appear ὁ Θεὸς γεωμετρῶν. For when both the enlargeing and the ſtraitening of the breaſt ought to be performed by ſome muſcles (to whoſe function it only belongs to contract;) the matter is ſo ordain'd, that the ribs which ſhape out the ſides of the *Thorax* even as of oblong parallel lines bowed towards a Cylinder, are brought one while in a ſquare figure with right angles for the enlargement of the breaſt, and afterwards into the form of a Diamond-figure with ſides unequal, with acute angles for the contraction thereof. What follows from the ſcituation of parts ſo chang'd, that whenas the ſides depart fartheſt from one another, the ends are brought nearer, and ſo *è contra*; and for that cauſe the largeneſs of the ſpace is wont rather to be altered than either augmented or diminiſhed; leſt it may ſo happen about the cavity of the *Thorax*, it is ſo provided againſt by an admirable workmanſhip, that whileſt the ribs aſcend upward for enlarging the breaſt to a ſquare figure, leſt the ends ſhould be ſhortned inward, the *Diaphragma*, which cloſes the bottom, ſwells downward toward the Abdomen; ſo that the *Thorax* may be enlarged as well towards its length as to its depth: on the contrary, while the ribs beneath are brought to ſtraiten the breaſt towards the figure *Rhomboides*, leſt they ſhould depart farther than they ought, the Diaphragma aſcends upwards for that cauſe that the largeneſs of the *Thorax* may be ſtraitened, while we breathe out, according to both dimenſions.

The Muſcles ſerving reſpiration.

What belongs to the muſcles of the breaſt, ſerving as well to the enlargement for ſucking breath, as to the conſtriction for breathing out, the moſt wiſe Creator of Nature hath ordained more and ſundry inſtruments of either function; Therefore truly that the work of breathing being eſpecially neceſſary as to life might be performed inceſſantly and very ſtrongly, ſome of the former order of Muſcles, *viz.* thoſe by which the hollowneſs of the *Thorax* is opened, do raiſe the ribs and afterwards draw them back, even as they are bow'd and more enlarg'd; in which number there are three muſcles to the ſhoulder, one belonging to the loyns, and eleven intercoſtal outward; and another inward muſcle, *viz.* the Diaphragma, depreſſes the bottom of the breaſt, and enlarges its length and depth.

Their function as well in inſpiration;

The aforeſaid muſcles, *viz.* the ſcapular, lumbar, and intercoſtals being alſo appointed with the Diaphragma for the function of breathing, are accurately enough deſcrib'd by many Anatomiſts, but chiefly by *Fallopius*, that here ſeems little need to unweave this web; eſpecially becauſe a more full and permanent knowledge of theſe parts is not wont to be acquired unleſs by frequent diſſections and anatomical inſpection. The four former muſcles being of divers forms, conduce chiefly to ſtronger and violent inſpiration; but the exterior intercoſtals in regard of the ordinary actions of breathing employ their continual endeavours by turns during life, every one of theſe being uniform, with a fleſhy and more thick baſis, being rooted in the bottom of the upper rib are carried by oblique fibres, and broad towards the forepart unto the top of the rib that lyes under, and are implanted to it with a ſmall and tendonous end; whence it follows, thoſe fibres being ſwell'd, and ſhortened towards their root, do lead and draw back the nether rib towards the upper; and ſo while all theſe muſcles are contracted together, all the ribs are raiſed upwards, and altered from oblique angles into direct ones, they render the trunk of the *Thorax* more large, but ſomething

thing ſhorter; which defect that it may be helped, the Diaphragma (which being free before from the Syſtole, is hidden within the cavity of the breaſt) together with the ribs drawn upwards, is extended beneath; ſo that the breaſt, as it were a Drum braced, does become moſt capacious; and in the mean time the lungs, having a more ample ſpace yielded to them, are blown up by the air ruſhing in whereſoever there is paſſage, and fill the whole hollowneſs of the *Thorax* enlarged.

Thus far touching the muſcles ſerving to inſpiration, which ever and anon ceaſing from contraction, the ribs preſently fall down from a direct poſition into an oblique; and the Diaphragma alſo being freed from its extenſion, aſcends into the cavity of the breaſt, or is rather thruſt thither by the bowels of the Abdomen; and ſo by reaſon of the poſition of parts ſo changed, *viz.* the breaſt ſtraitened, and the lungs compreſſed, the act of exſpiration doth ſucceed. Some have determin'd this to be a meer intermiſſion of the other, and onely to proceed from the reſt, or ceaſing of the muſcular motion (by which breathing is performed.) But the declination of the ribs from right angles into oblique, and the aſcenſion of the Diaphragma, is related to be the natural poſition of theſe parts, becauſe they are found in ſuch a ſcituation in dead bodies. I think my aſſent not eaſily owing to this opinion, becauſe ſometimes the function of exſpiration is performed much ſtronger and more violently than that of inſpiration, as in coughing, ſinging, laughing, hollowing, and in other affects whoſe exerciſes are the more difficult labour and more earneſt endeavours of the breaſt: Wherefore there is no reaſon that we ſhould think that ſuch vigorous exerciſes of expiration, ſhould be excited by the meer reſt and ceaſing of the aforeſaid muſcles, but from the motion of others oppoſed to them. Moreover the Muſcles now cited and oppoſite, and ſtraitning the breaſt, ſeem to be required not only by reaſon of their violent exſpiration, but for their ordinary and conſtant ſervice, at leaſt for the poiſing the function of reſpiration: for otherwiſe thoſe other whoſe office it is to enlarge the cavity of the *Thorax*, being ſometimes unmindfull of their task, do it either ſtronger or longer than is convenient; wherefore it is neceſſary they be forthwith admoniſhed by others, *viz.* their Antagoniſts ſubſervient to Expiration, and to be reſtrained in their duty. But the muſcles appointed for the ſtraitning the breaſt, are the *Sacrolumbus*, the Triangular, and inward Intercoſtals, and ſome muſcles of the Abdomen; the uſe and deſcriptions of all which are delivered by many Anatomiſts, and moſt accurately by *Fallopius*. The inner intercoſtal muſcles as they obtain a contrary ſcituation, ſo a contrary function to the outer intercoſtals, which namely is to depreſs the ribs, and to ſtraiten the cavity of the breaſt, by forcing it into the *Rhomboidal* Figure. For we are to obſerve, that the carneous and thicker baſis of each of theſe is implanted in the loweſt part of the nether ribs, and the moving fibres, aſcending from thence obliquely and forward, and dividing croſs-wiſe the reſt of the outward intercoſtals, with their ſmaller and Tendony end are engrafted in the bottom of the upper-rib; hence none need doubt, but that theſe inner muſcles do depreſs all the ribs, or bring them downward: but whilſt theſe ribs are ſo depreſs'd, that the trunk of the breaſt is rendred more ſtrait, theſe inward muſcles (otherwiſe than the outer) do not only incline the ribs downward, but alſo their griſtly or cartilaginous proceſſes. For *Fallopius* hath acutely deſcribed this: *That the outward intercoſtal muſcles do onely fill up the inter-ſpaces of the ribs and not of the griſtles, but the inward fill up both ſpaces.* The reaſon whereof ſeems to be after this manner, affording a moſt delightfull ſpeculation of the *Divine Architect*, viz. while the ribs are brought upwards to the exerciſe of fetching in breath, and are withall drawn back towards the Spine, that motion commencing backward, is performed by the ribs themſelves; which being firſt moved together, the cartilages eaſily diſcharge their function as cords fitted to that purpoſe: wherefore there ſeems little need of the muſcular aid to place theſe in their order; but to put the ribs in action, not onely the intercoſtal muſcles afore mentioned, but the four other greater ones do continually endeavour it; but on the contrary, that the ribs may be depreſs'd and brought forwards together, the force taking its riſe before, is performed by the cartilages as ſo many leading cords, moſt eaſily bending the ribs downwards as far as need requires.

As in expiration.

Moreover to this end, that the cartilaginous appendices of the ribs may be drawn down and nearer one the other for the exerciſe of expiration, not onely the inward intercoſtal muſcles fill as well the intervals of the cartilages as of the ribs, but moreover an entire triangular muſcle is allotted for this function; for this ſpringing beneath from the bone of the Sternon, and aſcending upwards obliquely, is inſerted in-

to the lower Cartilages, which it conſtrains towards its head, and bends the *Thorax* nearer on the other ſide. That is worthy of conſideration, which *Fallopius* hath remarked touching this muſcle, *viz.* whereas it is ſo little and minute in a man, that it may hardly be allowed for a Muſcle, it is ſtretched out in a Dog along the whole bone of the Breaſt, and reaches to all the Cartilages, even thoſe inoſculated into the Sternon of the true Ribs. The reaſon of which difference clearly points at the Divine Providence touching the Fabrick of Animals. For whereas this Animal is born to moſt ſwift and long running, that the blood, while it is more vehemently agitated, may duly be kindled and fan'd, as it ought ſwiftly and ſtrongly to draw in the air, even ſo to expire it; (for that freſh air may be more freely ſuckt in, it behoves that all the old be ſtrongly caſt out and exploded) therefore for the ſtronger diſcharge of this exerciſe (of the which little uſe in a man) this Muſcle of a Dog is allotted a great bulk, proportionable to ſuch a work.

Wherefore the triangular Muſcle being ſmall in a man, is ſtretched out through the whole bone of the breaſt in a Dog.

Hitherto of the Muſcles that ſtraiten the Trunk of the Breaſt: by whoſe proviſion it is manifeſt enough, that the relaxation of the oppoſite muſcles are not ſufficient to this function. But that while the breaſt is conſtrained, the Diaphragma aſcending upwards may ſhorten its hollowneſs, it is not enough that it is releaſed from its contraction, but it is alſo neceſſary, that as ſoon as this ceaſes, the muſcles of the Abdomen being contracted ſqueez together the Bowels, and preſs them upwards, by which the Diaphragma being relaxed, is lifted up and driven higher into the Trunk of the *Thorax*.

The Diaphragma follows the motion of the Abdomen.

From the ſuppoſed reaſons of theſe things we may infer, no leſs endeavours of the muſcles are imployed in the exerciſe of expiration, than in inſpiration: nay rather we may affirm them greater, after this is added, that the Pipes of the *Trachea* and *Bronchii* are endowed with muſcular Fibres (as we have ſhewed) which being only contracted while we expire, do cauſe the air contained within to be caſt out with the greater force. And truly ſo it ought to come to paſs, becauſe the air prevailing with an elaſtic force, doth of its own accord readily enter the pulmonary paſſages, as often as they are ſuffered to be open; but from thence that again it may preſently and thorowly be excluded, there needs a certain force and compreſſion of the parts to thruſt out. For although the inſpiration precede in courſe, yet it is neceſſary that expiration follow immediately after, and be proportioned according to the faſhion thereof; for that it may be great, the turns or changes of this being greater are requiſite. Wherefore in vehement exerciſe of the whole body or of the Lungs alone, that the freſh air may more plentifully be drawn in, all the old air muſt be moved, not only out of the *Trachea* and *Bronchii*, but alſo out of the fartheſt little Bladders every turn or change of breathing out, and expulſed moſt of it: whereas while we draw in the breath only the muſcles of the Breaſt are imployed, the Lungs having reſpite, in ſtrong breathing out both the oppoſite Muſcles and the Lungs themſelves labour.

The labour of Muſcles the ſame in exſpiration as in inſpiration.

Having thus explained the Organs of Breathing, it remains yet to be inquired into, by what inſtinct, being ſtirred up to motion, they ſo repeat perpetual changes of Syſtole and Diaſtole, that one while theſe muſcles are contracted for inſpiration, and another while for expiration, in the mean while the oppoſite muſcles have a pauſe, and are moved by turns, that they mutually give place to themſelves ſucceſſively. From all this in the firſt place it is clear (which likewiſe in another place we have abundantly declared) that the animal Spirits, for the exerciſing the contractive motion of the muſcles, leap from the Tendons into the fleſhy Fibres, and afterwards for their relaxation they recede out of theſe into thoſe. Moreover, whereas the mutual function is twofold, *viz.* ſpontaneous and meerly natural, we have before ſhewed in the former, that the Spirits are brought from the Tendons into the fleſhy Fibres by approaches according to the command of appetite, and to remain within during the action, till they are diſmiſſed by its will; and afterwards return into the Tendons, till they are again commanded forth; inſomuch that the times of their motion and reſt are unequal and uncertain, and variouſly determined at our pleaſure.

The cauſes of the above-mentioned motions.

In the animal function.

But it is far otherwiſe in the natural function: becauſe the animal Spirits are carried out from the Tendons into the fleſh by perpetual turns, or conſtant reciprocation, and a ſhort contraction being made, preſently leap back from the fleſh into the Tendons, and ſo alternately: after which manner the Heart it ſelf, the Organs of the *Trachea* and breathing, alſo the fleſhy Fibres of the Stomach and Guts, unleſs they are otherwiſe limited by reaſon of their objects, are drove on by their conſtant Syſtole and Diaſtole.

And natural.

It

It will be needleſs to repeat here what we have already obſerved in another place touching theſe two kinds of motions, *viz.* that the animal ſpirits of the ſpontaneous moving function are altogether or chiefly diſpenſed from the brain, and the others cauſers of the meerly natural function are diſpenſed from the *Cerebellum*; moreover alſo as the plenty of both ſorts of ſpirits, ſo the very inſtincts of beginning thoſe actions have their conveyance through the Nerves.

The motion of the former ſort ariſeth from the brain, the other from the Cerebellum.

Notwithſtanding here ariſeth a doubt, to what kind of moving function, *viz.* whether ſpontaneous, or meerly natural, the actions of breathing ought to be referred; alſo of what original, *viz.* whether of the Brain or *Cerebellum*, the animal ſpirits appointed to that employment, are. It is manifeſt enough that this function is in a ſort partaker of a ſpontaneous motion, becauſe it is in our power one while to ſhorten its exerciſes, at other times to prolong, and otherwiſe diverſly to alter them, yea ſometimes a little to reſtrain them. Moreover the nerves belonging to its chief moving Organs, *viz.* the Diaphragma and Muſcles of the breaſt, ſpringing from the nerves of the Arms and Loyns, do owe their deſcent to the Brain, and do plainly acknowledge the ſpirits they contain are chiefly ordained for voluntary motions: but moreover on the contrary, this function is ſo far natural, that its organs do reciprocate the conſtant changes of Syſtole and Diaſtole in ſleep, without our notice, and while we wake, we not perceiving it: Moreover although we can for ſome little time ſtop its exerciſe, or at our pleaſure vary it, yet we deny it to be altogether or long ſuſpended: beſides, although the nerves appointed to the muſcles of the breaſt and Diaphragma proceed from the ſpinal nerves, yet theſe latter coming from the branches belonging to the arm communicate in their progreſs with the ſlips of the intercoſtal nerves; moreover, all the other nerves (which belong to the *Cerebellum*) ariſe from theſe, which are ſpread about through the *Trachea* and Lungs.

It is a quære of what kind the actions of breathing are.

From theſe it plainly follows, that the power of breathing is as it were a mixt action, and doth participate of either moving function, *viz.* as well of the ſpontaneous as natural; and that the ſpirits and nerves of either Province are imployed in this duty, which proceed as well from the brain as from the *Cerebellum*; and truely ſo it ought to come to paſs according to the animal government: for although ſome actions of breathing neceſſary for the preſerving life, ought to be conſtant and perpetual, there are yet many other motions of the breaſt and lungs onely occaſional, and to be perform'd at our pleaſure, as may be diſcerned in laughing, crying, ſinging, hollowing, whiſtling, and other ſingular offices of the lungs and wind-pipe; in which works that they may be done ſtrongly, the muſcles conſpire together, and endeavour joyntly. As in violent labours and exerciſes of the whole body, by which the blood being ſtirred up doth want the greater ventilation, the arms being vehemently moved alſo do force the muſcles of the breaſt, and other pneumonic organs, into more ſpeedy motions for a more frequent breathing. And truly for joint labour of this ſort of the Arms and Diaphragma, the nerves ſerving this motion proceed from the nervous branches of them. Moreover, it is provided for this purpoſe, leſt the exerciſes of the body might enfeeble at any time the ſtrength of the lungs, or exceed the order of breathing; for when its organs labour more difficultly, or begin to be weary, the nerves of the Diaphragma do warn the other nerves of the arms, plucking them and as it were admoniſhing of their duty to deſiſt from an over intenſe motion.

It is concluded to be a mixt act.

For whereas the function of breathing is ordained for many uſes, whereof ſome are merely natural, and others ſpontaneous or violent; therefore the ſpirits and the nerves which proceed and have their government as well from the brain as from the *Cerebellum*, ought to be joyned together, and to afford their ſocial endeavours; yet on that condition, and as it were by mutual agreement, that one give place to the other by turns for the diſcharging all works chiefly neceſſary, or convenient, and do mutually obey. From the pneumonic nerves, the inſtinct of ordinary breathing or meerly vital beginneth, and is preſently communicated to the nerves of the Diaphragma, and from thence to all of the *Thorax*; ſo that preſently all the moving parts agree together in the action, and cauſe the Syſtole and Diaſtole of the breaſt in ſuch ſort as are required to the preſent ſtate of the blood; notwithſtanding on the contrary, as to other actions of breathing, whether ſpontaneous or violent, it ſeems to have them alſo, *viz.* the inſtinct or firſt force of theſe, beginning one while from theſe muſcles, another while from them is preſently communicated to all the other Organs; ſo that it is called upon by a working conſort of all together ſooner than the twinkling of the eye, for the performing the deſigned acts of breathing.

The nerves of the lungs ſome rulers of the natural motion, and others of the voluntary.

Both do alternately obey one the other, and agree in their office.

What

What we have hitherto declared about the Organs of Breathing and their functions and uſes, that they may more clearly be manifeſt, it ſeems to be material to expoſe to your view the forms of ſome of their chiefeſt parts deſcribed to the life, together with the explication of their Figures: yet it ſeems proper firſt to inſert a few things concerning the Lymphæducts and interſpaces of the Lobes omitted in the former Diſcourſe.

The interſpaces of the little Lobes have paſſage one into the other, and from thence into the Lymphæducts.

The moſt renowned *Malpighius* firſt diſcovered theſe little Lobes of the Lungs and their interſpaces; but to what uſes they ſerve he hath not clearly enough ſhewed. Haply it may ſeem that theſe little places and empty ſpaces within the Lungs, are certain receptacles of the air (that there may be a larger ſtore of it.) Notwithſtanding it is evidently manifeſt upon experiment frequently made, that the air pufft into the Pipe of the *Trachea* (which is the only entrance into the Lung) doth not enter or blow up theſe interſpaces of the little Lobes: notwithſtanding if you blow into the hole of any of theſe interſpaces, immediately all theſe ſpaces pufft up do ſwell in the whole lobe of the Lungs, ſo that all the little lobes diſtinct by great interſpaces, will appear with a pleaſant proſpect; as is expreſſed in the ſecond Figure of the third Table. Moreover the Lymphæducts creeping through the ſuperficies of the Lungs, ſeem to be every where included in little Membranes covering thoſe interſpaces, and to end in them. But as the lymphatic Veſſels are all furniſhed with little valves, ſo thoſe which appertain to the Lungs are furniſhed with almoſt infinite; as is to be ſeen in the warm large lobe of an Ox, and expreſſed to the life in Tab. 1. d, d, d, d.

Which therefore is done, that the vaporous ſteaming of the blood being received by the interſpaces, and condenſed into water in the Lymphæducts, may be conveyed out.

That I may dare to conjecture concerning the uſe of theſe things, it is probable, that thoſe cavities intercepting each little lobe, do receive the vapors flowing copiouſly every where from the blood being kindled, (when they cannot any where elſe be better thruſt down or ſeparated) which ſweat through their ſlender Coats into theſe cavities out of the ends of thoſe Veſſels, and thence being forced further, they are condenſed into water to be carried out of the Lungs through thoſe appropriate Veſſels: moreover leſt the Lympha's cauſed from vapors within thoſe paſſages, and ſo being made thick, ſhould whirle again back into the Lungs (which would bring great prejudice to them) the thickeſt obſtacles of the valves do hinder. For I have frequently admired what becomes of the vaporous ſteams which inceſſantly flow in great plenty, and ſometimes moſt impetuouſly out of the blood burning ardently in the *Præcordia*. For although very many of them flye away through the paſſages of the *Trachea* together with the air while we breathe, notwithſtanding one only way of paſſage or particular ſluice doth not ſuffice to them, from every place breaking forth: wherefore theſe little places or empty ſpaces are every where placed, that they may receive thoſe vapors ſhut up in the Lungs, and may drop out the ſame immediately condenſed through the Lymphæducts, as if through ſo many noſes of an Alembick.

The progreſs and diſtribution of the pulmonary Lymphæducts.

The lymphic Veſſels having their paſſage out of the Lungs incline towards the paſſages of the *Thorax* with their numerous branches, and are for the moſt part mingled with them; but they climb upon the *Oeſophagus* in their way, as alſo the trunks of the *Trachea* and the *Aorta*, and do loſe many ſlips in them by a various inſertion; likely for this cauſe, that ſome of the lymphatic humor may be beſtowed for making ſlippery the ſides of thoſe Veſſels.

The Explication of the Figures.

THE firſt Table ſhews one entire lobe of the Lungs, upon whoſe ſuperficies the Lymphæducts are ſeen ſpread through every where.

Tab. I

A. *The Orifice of the* Trachea *being cut lying in the midſt of the Veſſels.*
B. *The Orifice of the Pneumonic Artery lying under.*
C. *The Orifice of the Pneumonic Vein placed above it.*
d, d, d, d. *The outer Lymphæducts ſpread abroad through the ſuperficies of the Lobe.*
e, e, e, e. *More Lymphæducts meeting on the back of this Lobe, from whence they paſs into the Thoracick ducts.*

The ſecond Table ſhews one lobe of a Sheeps Lung cut in the midſt, that the upper part (wherein is the trunk of the Vein) being removed, and the trunk of the *Aſpera Arteria*

Arteria laid by it ſelf, the branching of the Pneumonic Artery is ſhewn throughout its whole frame, *viz.* through the ſmall and leaſt little Lobes. All the paſſages of this, *viz.* the ſlips and twigs how ſmall ſoever, being filled and coloured by any liquid thing caſt into them, are drawn to the life.

Tab II

A, A, A, A. *The nether half of the Lobe divided, containing the branching of the Pneumonic Artery.*
B, B, B. *The Trunk of the Pneumonic Artery belonging to this Lobe.*
C. *A hole from whence its other branch was cut off and removed.*
D, D, D, D. *The Trunks from which its other branches (becauſe they could not be expreſſed in this Table) were cut off.*
E, E, E, E. *The arterious ſtems thereof ſtretch forward into length, the ſide-branches on both parts ſtretcht out into the right and left ſide.*
F, F, F, F. *The twigs and lither ſlips, which are every where intermingled with the like from the Veins and Bronchials; and at laſt woven together with the Veins every where encompaß the orbicular little Bladders, and bind them as it were in cluſters.*
G, G, G, G. *The Bronchial branches, which being cut from the ſtem of the* Trachea *laid aſide, and entring ſecretly into this lobe of the Lungs, are accompanied with branches that bear blood.*
H, H. *The ſtem of the* Trachea *appertaining to this Lobe, which lay upon the Pneumonic Artery, cut and laid aſide.*
f, f, f, f. *The ſtems of the Bronchial branches, which are immerſed partly in this portion of Lobe deſcribed* G, G, G, G, *and are partly diſtributed in the other half cut off.*

The firſt Figure of the third Table expreſſes one lobe of the Lungs, according to the branchings of the *Aſpera Arteria* divided into leſſer and leſs lobes, the twigs and ſlips of which Veſſel being filled by a liquid firſt injected, and afterwards ſeparated from among themſelves towards the little lobes, are alſo drawn to the life.

Tab. III. Fig. 1.

A. *The Trunk of the* Aſpera Arteria *being cut from the reſt of his body.*
B, B, B. *The inner part being cut open, that as well the holes leading into all its branches, as its ſtraight muſcular Fibres, are viewed together.*
a, a, a. *The above-mentioned holes leading into the every where ſtretched out branches.*
b, b, b. *The ſtraight muſcular Fibres, upon which the other circular do lye.*
C, C. *The upper part of this Tracheal ſtem being whole or ſhut, that the Ring-like Griſles might appear.*
D, D, D, D. *The branches of the* Trachea *conſtituting the leſſer lobes are whole and ſhut, that the Ring-like Griſle may alſo appear in them.*
E, E, E, E. *The like branches being cut open, that the holes and ſtraight muſcular Fibres may be ſeen together.*
F, F, F, F. *The trunks from which the Tracheal branches being cut off are removed, that there may be ſpace afforded to the reſt, when cut open.*
G, G, G, G. *The ſecondary little lobes hung upon the trunks of the* Bronchii *as grapes, which alſo may be divided into leſſer lobes, the more inward paſſages of all which paß out of the* Bronchii *into the little bladdery Cells.*
h, h, h, h. *The Veſſels bringing blood crawling over the ſuperficies of thoſe little lobes.*

The ſecond Figure of the third Table expreſſes a part of the pulmonary lobe, wherein the membranous interſpaces being blown up, all the little lobes appear in their proper figure, and do ſomewhat repreſent the leaf of Polypody.

Fig: II

A, A. *A part of the* Aſpera Arteria *complicated with the other Veſſels, to which trunk made up of all thoſe, the little lobes grow like leaves of a tree.*
b, b, b, b. *The little Lobes themſelves.*
c, c, c, c. *The Veſſels bringing blood creeping through them.*
d, d, d, d. *The membranous interſpaces of the little lobes, which alſo are covered with* e, e, e, e, *the Veſſels bringing blood.*

The fourth Table expreſſes as well the Veſſels belonging to the *Trachea* as thoſe bringing blood, ſeparate and diſtinct one from another, conſtituting one little Lobe, as alſo the peculiar framing of every one of them.

The

The firſt Figure repreſents the ſeparating into divers parts the Tracheal branch diſtributed into one little lobe, and the branching into Pipes and orbicular little bladders.

A, A, *The trunk of the* Aſpera arteria, *in the ſuperficies whereof the ring-like griſtles do appear.*

b, b, b, b, *The leſſer branches going from that trunk, wherein alſo little Rings appear.*

c, c, c, c, *The paſſages of thoſe branches into orbicular little bladders, which ſeem like the cluſters of Grapes.*

d, d, *The Veſſels bringing blood, diſtinct from the Pneumonic which cover the Trachea, and ſerve to nouriſh it.*

The ſecond and third Figure ſhews diſtinctly the equal branchings of the Artery and Pneumonic Veins within the ſame little Lobe; both which being complicated with Tracheal Veſſels, do for the moſt part make up the texture of the pulmonary frame.

The fifth Table ſets forth the pulmonary Nerve more accurately deſcribed by the aid of a Microſcope; ſo that it plainly appears that the Trunk is as it were a bundle of innumerable little Fibres bound together; moreover its Trunk, while it creeps into the lungs in the likeneſs of Mother of Time, doth ſpread the various little ſprigs every way.

Fig. 1. reſembles a part of the nervous trunk cut away, one end whereof being opened and lookt on by a Microſcope, ſeems to unfold it ſelf almoſt into innumerable little fibres.

A, *The trunk of the Nerve.*

a, a, a, a, *The little Fibres divided from one the other about the end cut off, and ſpread abroad.*

The ſecond and third figure do ſhew ſome fibres as well of the trunk as of every branch, and moreover the ſlips of the little twigs from divers ſtemmes often repeated.

B. *The chief trunk.*

b. b. b. b. *The little fibres about the extremity cut off explicated.*

c. c. c. c. *The little twigs ſpringing from the bundles of the little fibres.*

The ſixth Table firſt ſets forth the anatomy of the Artery bringing blood drawn in apt figures, which we have deſcribed in a late treatiſe.

The firſt and upper figures hereof, repreſent the four diſtinct Coats of that Veſſel, *viz.* the nervous, muſcular, glandulous, and the vaſculous.

1. *The firſt inward nervous coat*, which perhaps is ſomewhat muſculous, conſiſting of ſtreight or long fibres, which being contracted ſhorten the Pipe of the Artery.

2. *The coat properly muſcular*, conſiſting of a heap of ſmall circular fibres, which when they are contracted ſucceſſively under the ſtream of blood, do make its circuit to be ſhortened. It is from the motion of theſe that the arteries beat.

3. *The glandulous coat*, which (like that in the guts) being placed over the muſculous coat, is weaved together of very ſmall and moſt numerous glandules.

4. *The outward vaſculous coat*, which variouſly folded together and wreathed, of Veſſels bringing blood, and with ſlips and nervous fibres, ſeems like a certain little net.

The *ſecond and lower figures* of the ſixth Table, do ſhew the anatomy of the Vein, or its four coats expreſſed in fit places; which Coats do appear entire as ſucceſſively taken one part from the other (beginning outmoſt.)

I. *The outward coat* conſiſting of nervous fibres (which perhaps are ſomewhat muſcular) and as it were ſtreight or ſtretch'd out in length, although not orderly.

II. & III. *The vaſculous and glandulous coat*, which are the ſame as in an artery.

IV. *The moſt inward muſcular coat*, conſiſting alſo of circular fibres, as in an artery, which being contracted behind the ſtream of blood, haſtens its returning courſe.

The ſeventh Table expreſſes the diſtinct Coats of the *aſpera arteria*, and ſeparated one from the other.

The firſt figure ſhews the moſt inward Coat, endowed with ſtreight or long muſcular fibres.

The ſecond figure deſcribes the glandulous coat, and the third figure the vaſculous coat (whhic

(which are almoſt the ſame as in the veſſels bringing blood, and alſo in the Guts.)

4. *The fourth figure expreſſes the outward coat* (which is partly cartilaginous, and partly muſcular.) The tranſverſe or annular fibres hereof do fill up and weave together the interſpaces of the Cartilages.

The eighth Table ſhews a part of the outmoſt pulmonary Coat covering over its whole frame, moſt finely and curiouſly deſcribed by the help of a Microſcope.

The firſt Figure ſhews a portion of the above-mentioned coat, which partly by reaſon of the extremities of Veſſels of every ſort ending in it, ſeems pricked full of holes as it were, and partly from the complications of the veſſels bringing blood, which like the twining ſprigs of Vines gird about the orbicular bladders, is diſtinguiſhed into many irregular *Areæ*'s.

The ſecond Figure repreſents a part of the outermoſt membrane ſeparated from the cluſters of veſſels pull'd off, and without any *Areæ*, onely markt with little holes as it were with ſmall pricks.

The third Figure expreſſes one ſingular *area* of the Coat above mentioned, augmented in largeneſs by the help of a Microſcope.

SECT. I. CHAP. II.

Of the ſundry kinds of Breathing hurt, and their cauſes, with the accounts of their Symptoms.

HItherto we have ſtrictly viewed the Lungs, and the parts any way ſerving their motions, and conſequently the vital function; which being many and different, and the proviſion of the Organs as many very accommodate to breathing; ſo the ſame are many wayes in hazard to be perverted or vitiated, upon ſundry occaſions. Truly a Watch framed with the greateſt artifice with a Spring, with wheels plain and toothed, with chain and ballance, is not more prone or eaſie to be obnoxious to depravation than this Pneumonic machine of the breaſt, through which by ſucking in air we preſerve the vital flame of the blood with its motion and heat. For whereas the veſſels of the lungs belong to the function of breathing, *viz.* the *Trachea*, with the *Bronchii* and little bladders; alſo the heart with arteries and veins, beſides which there are nerves with fibres as well muſculous as nervous, Lympheducts and Glandules; alſo the contents of theſe Veſſels, *viz.* Air, the old and freſh blood, with its *Serum*, the Lympha, and the animal Spirits; any fault happening in any of theſe doth oftentimes diſcompoſe the whole Pneumonic function. Nor leſs alſo the moving Organs of the breaſt, *viz.* the muſcles with the Diaphragma, and the nerves appointed to their uſe. And likewiſe ſometimes the animal ſpirits before they enter into thoſe nerves, being ill diſpoſed, often cauſe great diſorders in breathing.

The organs of breathing being hurt, the breathing is hurt alſo.

When the chief function and uſes of the Lungs have been to convey the blood and air through the whole frames of the parts and their inmoſt receſſes, and every their ſmalleſt paſſages, and every where to mingle them; namely for that purpoſe, that the venal blood returning from its circuit, and diluted with freſh juice, and thereby crude and as it were half extinct, may as well be more perfectly mix'd and wrought together, as more effectually kindled afreſh in all its parts by the nitrous air; from hence the chief faults about this buſineſs or function of the Lungs do moſt of all conſiſt in theſe two things. Firſt, that the blood hath not due paſſage through the *Sinus* of the heart, and the pneumonic veſſels: And ſecondly, becauſe the Air is not drawn in and breathed out in a due manner into the *Trachea* and its paſſages. There are two parts of either of theſe: For firſt as to the paſſage of the blood, ſometimes the fault is caus'd within the right *Sinus* of the heart, or the pneumonic Arteries; and alſo ſometimes cauſed within the pulmonary veins, or the left Ventricle of the heart: Secondly, as to the Air, the failure is chiefly in inſpiring and exſpiring; although each function offends ſometimes equally. There are divers accidents of each, and many cauſes and ways of its being done, whereof we will here briefly touch upon the chief.

The uſes and ends of breathing which uſe to be hurt.

The defects and failings of the Lung in its offici.

Firſt in reſpect of the blood.

Therefore firſt, when the blood doth not duly paſs through the right Ventricle of the Heart and the Pneumonic Arteries, either it happens by its own fault, or by the fault of thoſe paſſages, and ſometimes by the fault of further paſſages. For ſometimes the ſtream of blood ſtops in the nether region of the *Præcordia*, by reaſon of obſtruction in the other; moreover, ſometimes the defect or fault of the air breathed in ſtops the free paſſage of the blood.

The opinion of the famous Sylvius *concerning the blood fermenting in the Lungs.*

What relates to that fault of the blood, when it paſſes not quick enough through the right *Sinus* of the Heart and Pneumonic Arteries, the opinion of the Renowned *Sylvius* ſhould here be diſcourſed, but that it would be too tedious, and from our purpoſe. For he ſuppoſes, *The deſcending branch of the venal blood, moiſtned with chyme together with the lymphatic humour returning from the whole body, hath the nature of an acid-ſweet ſpirit; and in the mean time its branch aſcending impregnated with choler from the bladder of the gaul mixt into the maſs of blood, does participate of an oily volatile ſalt; and ſo by the meeting together of theſe ſomething contrary to themſelves, a gentle and friendly contention or boiling is ſtirred up in the right ventricle of the heart, in which and for which the fiery parts lurking and being ſhut up in each, being freed and ſet at liberty, do rarifie the chyle and blood, and ſo change and alter them, that they exerciſe the function of life and heat as well as motion and nouriſhment through the whole body.*

Which ſeems not likely to be true.

There are many reaſons why I aſſent not to this ingenious and neatly-framed Hypotheſis. For beſides that many do far otherwiſe determine about the origine and diſpenſation of Choler, and ſo not without ſtrong reaſons and experiments are thorowly perſwaded, (by eye-ſight) that there is not any ſuch boiling up of the blood of a different quality, and ſtriving or contending in the right ventricle of the Heart: Our judgment continues ſtill, as it hath been, that both ſtreams of blood, waſhed thorowly with the freſh chyme, do conſiſt altogether of one kind; and for that cauſe the milky Veſſels of the Cheſt carry about part of the Chyle ſo long a journey, which they pour into the deſcending trunk of the *Vena cava*, juſt as the meſeraick Veins pour the other part into its aſcending trunk: alſo that the lymphatic humor together with the Chyle is poured into the ſubclavian Veſſels, ſo that it may very commodiouſly be reduced into blood; neither truly doth there ſeem need of other or more paſſages. Moreover we determine that that humor rightly conſtituted doth agree with, and is eaſily aſſimilated to the maſs of blood, as well as the Chyle it ſelf made ſweet, without any contention raiſed in the heart. But if the lymphatic humor returning from the Brain and nervous kind as well as from the Glandules, degenerate from its due temperature, and contract a ſowreneſs (as it often comes to paſs) then being re-infuſed into the venal blood it overcomes it, and it precipitates it into ſeroſities, and from thence great ſtreamings of urine do enſue. Moreover we have ſhewed elſewhere, that the Diabetes is provoked from ſuch a cauſe. But ſuch a flux of the lymphatic humor is ſo far from exciting a greater boiling up of the blood in the right ventricle of the Heart, that rather on the contrary from thence often chilneſs of the whole or ſtiffneſs, with a weak Pulſe, and ſometimes ſwoonings or convulſive fits are provoked, accompanied with a plentiful and pale urine. The reaſon whereof without doubt is, that then the clear humor flowing from the brain and nervous parts, turns the blood into ſeroſities, and cools it by too much diluting; and for that cauſe the animal ſpirits being deſtitute of their vehicle, either faint or run into irregular motions.

Our opinion hereof.

The pneumonic circulation of the blood is ſtopt ſometimes by the fault of the heart it ſelf.

But truly as we altogether deny an Elaſtic effervеſcence of the blood in the right Ventricle of the Heart from contention of diſſimilar parts; ſo as often as from thence the blood is not caſt out into the Lungs after a due manner, we determine it to happen not ſo much from the proper fault and defect of the blood it ſelf as from the animal faculty. For if the ſpirits actuating the moving Fibres of the Heart, either grow weary, or are forced into convulſive diſorders; for that cauſe the Heart beating in diſorder, drives out before it the blood either infirmly or irregularly.

2. Sometimes by the fault of the blood.

3. Sometimes by reaſon of paſſages obſtructed.

But that the blood iſſuing out of the Heart doth not always with expedition paſs through the Pneumonic Arteries, that ſometimes happens from its own proper fault, and alſo ſometimes from the paſſages obſtructed, and alſo by reaſon of other cauſes. The blood it ſelf in a double reſpect hinders its own paſſage through the Lungs, *viz.* either offending as to its kindling, or as to its temperature. There are ſundry accidents of either of theſe. For firſt, even as the blood is more or leſs kindled than is convenient, it is hindred or obſtructed in the pulmonary circuit: if at any time the watry, earthy, or fixt ſaline parts are predominant in the blood, the ſpirit and ſulphur being conſumed or brought low; by reaſon hereof its liquor being not well or leſs kindled by the nitrous air, is not eaſily rarified in the pulmonary paſſage, and ſcarce paſſes through them

them like a flame of its own accord, but it ſticks ſtill in its paſſages, heavy and muddy, and creates much trouble and labour to the Heart whereſoever it is circulated. Hence as often as the blood is a little more plentifully forced into the *Præcordia* by the quicker motion of the whole body, or of its parts, the Heart and Lungs labour hard for its driving about, and that with the utmoſt endeavours. And in this caſe it is probable, that the blood carried more rapidly into the right Ventricle of the Heart, doth ſomewhat ſtagnate; becauſe it cannot preſently be carried into the paſſages obſtructed before it. Moreover from this cauſe thoſe grumous or fleſhy concretions called the *Polypi* of the Heart ſometimes ſeem to ariſe. Hence both in the Pica, Leucophlegmatie, Dropſie, and inveterate Scurvy from the quicker motion of the body ariſes difficult and painful breathing.

The blood hindred in the Lungs ſometimes becauſe not kindled enough;

2. Sometimes the blood is too much kindled, and breaking out almoſt into a flame, and being above meaſure expanded, it can ſcarce be contained in the pulmonary paſſages (which it very much blows up and extends) but endangers them to be inflamed or kindled; wherefore leſt it ſhould tarry longer in them, the *Præcordia* beat with moſt frequent and ſtrong endeavours, that the blood ſo over-much kindled might be ventilated and circulated: for otherwiſe it being carried within the Lungs, and inflaming them all over, would quickly deſtroy the vital function.

Sometimes too much.

Beſides theſe things which concern the kindling of the blood, there are other faults as to its temperament or mixture, by reaſon of which it leſs freely or expeditely is conveyed through the pneumonic paſſages. For when its conſiſtence is either too laxe or too cloſe, it will not eaſily paſs through the ſmall paſſages of the Lungs; but oftentimes is in hazard to ſtick and ſtagnate in them, and alſo run out and be extravaſated.

It is alſo ſtopt through its temperament being vitiated.

The blood being in a diverſe manner made looſe in its conſiſtence, either depoſites its Serum, or its dregs, or its putrefaction in the Lungs; which being lodged in the receſſes of the Veſſels, or affixed unto their ſides, do variouſly ſtop or pervert the courſe of the blood.

1. The diſſolution of blood, which is moſt commonly injurious to the Lungs, (although not very dangerouſly) is wont to happen, for as much as the ſeroſities being unapt to be contained within the maſs thereof, and when they are not preſently ſent away by ſweating or urine, they ſeparate from the blood within the Lungs; and ſo boiling up, and breaking out from their proper veſſels, do as well diſturb and ſtop the paſſage of air, as that of blood; ſo that for the ſake of expelling thoſe ſeroſities and continuation of the circulation of blood, the Lungs are provoked into a frequent and very troubleſom Cough. What the formal reaſon of this Cough is, and the manner of its being brought about, we ſhall declare hereafter.

When the blood is too much looſened in its conſiſtence.

Though there are many cauſes and occaſions, by which the ſerous liquor, departing from the looſned conſiſtence of the blood, flows out abundantly into the Lungs; yet for the moſt part it happens from one of theſe three, *viz.* firſt and moſt frequently, becauſe the Pores outwardly bound up by cold, caſt back the ſeroſities which were wont to be ſent away by perſpiration, into the maſs of blood; which compel it preſently to boil up, and caſt off the ſerous ſuperfluities in the Lungs. From this kind of cauſe Catarrhs and Coughs frequently ariſe, inſomuch that the beginning of every cough by the vulgar is always imputed to ſuch an occaſion, to wit, catching cold. 2. The drinking of ſharp and thin liquors, as Cider, Rheniſh Wine, white Wine, *Paris* Claret commonly cauſes to ſome a Cough, or catarrhal diſtemper: the reaſon whereof is, for that the blood, weak in temperament, is preſently diſſolved and precipitated into ſeroſities like milk by ſowre things caſt into it, which flow plentifully from the mouths of the inward Arteries. I have experimented this upon my ſelf yearly, when in the Summer ſeaſon (when the blood abounds with ſulphur) I have drank Cider and tartiſh Wines ſafely, yea frequently to advantage, the ſame in winter (when the blood is prone to ſowreneſs) but moderately taſted of, do preſently provoke a Cough. 3. There is another cauſe of this ſerous inundation flowing out upon the Lungs, *viz.* when the *Lympha* watering the nervous and ſolid parts, doth ſuddenly ſuffer a flux; and for that cauſe it ſtreams back into the blood out of the Fibres and Glandules, and other paſſages and receptacles; whoſe liquor it preſently diſſolves, and precipitates into ſeroſities, which often infeſts the Lungs.

Why it lodges the Serum in the Lungs.

The various cauſes and ways of doing it.

For this reaſon a ſudden and troubleſom Cough frequently accompanies convulſive diſtempers, which being commonly called a vaporous Cough is aſcribed unto vapours. Moreover in great alterations of air, eſpecially when the ſeaſon varies from dry into moiſt, and the volatile and fixed ſalts do thereby melt, the Cough and Catarrhs increaſe very much.

Neither doth the ſerous liquor only, but alſo many other humors or recrements of the blood lodged in the Lungs frequently ſtuff up their paſſages; ſo that by obſtructing both the paſſages of air and of blood, they cauſe difficult breathing or a cough. This is every where perceived in ill-habited bodies, alſo in Gluttons and Drunkards, and others leading an inordinate and ſlothful life. Wherefore Foot-men uſe a thin and ſpare diet, that they may have their Lungs free from the filth and recrements of the blood. I have obſerved ſome melancholy perſons, the aduſt *faeces* abounding in the pulmonary paſſages, to have voided blackiſh ſpittle like ink; alſo others cholerick, and inclining to the Jaundice to void yellow, and ſometimes very bitter, as if it had been meer choler.

The blood diſſolved alſo lodges in the Lungs infections that cauſe corruption.

3. Moreover many inſtances manifeſtly declare, that ſometimes the Lungs are tainted by the corruption and putrefaction of the blood. For the blood, toucht with an infection or a peſtilent or venemous contagion, begins to be corrupted, and withdraw into clotted and corrupted portions; from thence the Lungs undergo the chief taint, from whence the greateſt danger of life is threatned. This is too well known in the Meaſles, ſmall Pox, Plague, and malignant Feavers, for me now to undertake to explicate it: by which maladies as often as the ſick die, it ſeems to come to paſs, either becauſe the blood clodding in the veſſels of the Heart or Lungs, obſtructs the way of its proper courſe, ſo that preſently its influx into the Brain is hindred, or becauſe the corruption of the blood, affixt to the ſides of the pulmonary paſſages, cauſes a Phlegmon as it were; and therefore provokes a moſt troubleſom cough or difficult breathing, and frequently bloody ſpittle. So much for the impediments of the circulation of the blood, which happen in the Lungs by reaſon of the maſs of blood too much diſſolved, and apt to depart into parts and portions, (which being there left obſtruct their paſſages.)

The blood is hindred in the Lungs by reaſon of the too thick conſiſtence of the blood;

There remain other no leſs prejudices to the *Praecordia*, which proceed from the conſiſtence of the blood too much bound up together, and ſending nothing from it ſelf: by which a burning Feaver, Pleuriſie, or Peripneumony ariſe.

As is perceived in a Feaver.

In the former diſtemper the blood being more ſulphureous than it ought, and therewithal being thick, is not diluted enough with its Serum; and thoſe particles of it contained within it ſelf, it puts away with great difficulty: wherefore it is more plentifully kindled in the Lungs; and when it paſſes through the paſſages hereof with more difficulty, by reaſon of its greater boiling, and of its thickneſs, the Heart beating quick and moſt vehemently, endeavours its circumpulſion with all its might; notwithſtanding from its greater flame growing hot within the *Praecordia*, heat and a moſt troubleſom thirſt, with roughneſs, and as it were a certain parching of the tongue ariſes.

In a Pleuriſie and Peripneumony.

In the other kind of diſtemper, *viz.* a Pleuriſie and Peripneumony, the blood is alike thick, but leſs ſulphureous, and inflammable; wherefore it doth not participate of ſuch a burning: yet by reaſon of its thickneſs it doth not ſo eaſily and quickly paſs through the Cheſt or Lungs, is frequently extravaſated, and ſticking to the interſpaces or ſides of the paſſages, cauſes obſtructions, and ſoon after an inflammation, to which pain often ſucceeds with bloody or diſcoloured ſpittle. We may obſerve in blood-letting in theſe kinds of diſtempers, that after it hath ſetled, its ſuperficies is covered with a little whitiſh skin, or otherwiſe diſcoloured, but always with a thick and viſcous: the reaſon whereof is, that the blood, when it doth not ſend away in the circulation its old particles, nor doth admit enough of new, it is thickned with a continual boiling, and like boiled fleſh changed from a bloody colour into a whitiſh; in which ſtate, paſſing with difficulty through the ſmall paſſages of the veſſels, it is in danger to be extravaſated, and eaſily provokes a Pleuriſie or Peripneumony.

The blood is hindred in the Lungs by the fault of the heart.

Beſides theſe ſtoppages of the blood, cauſed by its own fault, while it paſſes through the *Praecordium*, there are alſo other impediments, which happen either by the defect of the Heart, or its paſſages, or by the fault of the air inſpired. By what means and for what cauſe the Heart offending in its motion, forces the blood from its right ventricle through the Lungs into the left irregularly, we have clearly ſhewn in our late Tract of Cardiac Diſtempers: to wit, that muſcle ſometimes labouring for want of ſpirits doth not vigorouſly and ſtrongly enough perform its beatings. For when in corporal exerciſe the blood more plentifully than uſual, is forced from the *Vena cava* into the ventricle of the Heart; if this cannot firmly contract it ſelf, labouring according to its ſtrength, it cauſes frequent and weak Pulſes: moreover to help this, as well the Pneumonic Arteries, as others in ſundry parts of the body, which drive about the blood every way, do cauſe frequent and inordinate contraction. Thus I have obſerved in Virgins afflicted with the Green-ſickneſs, and in other cachectical bodies, from a quick motion of

1. When the ſpirits thereof are wanting.

the

the body, not only a palpitation of the Heart, but in the neck, temples, and other places the Arteries to have beaten irregularly. Neither is it the want of ſpirits only, but their diſorder is ſometimes the cauſe that the *Præcordium* doth with leſs ſtrength convey the blood; for ſometimes the ſpirits, the inmates of the Cardiacal nerves, being ſtirred up by an incongruous conjunction, and affected convulſively, do impreſs their irregular contractions upon the Heart or Arteries, whereby the progreſs of the blood is ſeveral ways perverted or hindred, as it often happens in Palpitation of the Heart, Trembling, intermitting Pulſe, and other the like paſſions.

2. Becauſe moved inordinately.

3. The pneumonic proceſs of blood is variouſly ſtopt, becauſe the paſſages are not open enough: which impediments happen as often as the Pores or thoſe paſſages are either ſtopt or broken. Of the former there are two reaſons, *viz.* ſometimes the ways are ſhut, for as much as the paſſages of the veſſels, contracted by the carneous fibres, are brought nearer one another; as we have elſewhere ſhewed, doth ſometimes happen in Palpitation of the Heart, and a convulſive Aſthma. The affects of which ſort, by reaſon of the ſtream of blood ſhut within the *Præcordia*, difficult or hard breathing, a ſmall Pulſe, and chilneſs of the whole body are wont to accompany. Moreover ſometimes the courſe of the blood is ſhut up, becauſe the paſſages of the veſſels are preſſed together by a body, or by ſome humor from without: wherefore when the little Cells or bronchial Pipes (as is uſual) are filled with a viſcous flegm, purulent matter, or blood extravaſated, as the free paſſage of the air is hindred in them, ſo alſo the paſſage of blood is ſtopt in the veſſels adjoining. On the ſame account come tumors, little ſwellings, worms, alſo ſtony, ſandy, and curdly concretions, and others of another kind are in diverſe manners excited; the chief whereof we ſhall touch on hereafter. Moreover we ſometimes ſee the canals as well of an Artery as of the pneumonic Vein, made very bony in ſome part, and their ſides ſo compreſſed, that a very ſmall chink remains for the blood to paſs. Not long ſince we diſſected a young man who died by reaſon of an ill formation of the pneumonic Vein, in whom the trunk of this veſſel growing ſtony near the juncture to the heart, did ſtick ſo cloſe, that the blood did drop into the heart only by drops, or by a very little ſtream. 2. That the paſſages bringing blood are often filled and ſtopt, inſomuch that the ſtream of blood is obſtructed or ſtraitned, many anatomical inſtances and obſervations manifeſtly declare. From thence it appears, that grumous, or as it were carnous concretions of the blood do frequently ſo ſtop the ventricles of the heart, and the roots of its larger veſſels, that the courſe of the ſtream of blood is almoſt entirely ſtopt. Moreover reaſon perſwades, and experience concludes this more frequently to happen in the leſſer veſſels: for ſeeing (as we have even now intimated) the blood emitted by Phlebotomy in Rheumatiſms, Peripneumonies, and Pleuriſies, when it is cold is covered all over with a thin skin altogether of the like ſubſtance with thoſe concreted Polypus's; it plainly appears, that it paſſes with difficulty through the paſſages of the leſſer veſſels by reaſon of thoſe viſcous excrements: wherefore that it may paſs by ſome means, it diſtends them very much, and ſometimes breaks quite through them, alſo it frequently unlocks their mouths, and opens gaps into the *Trachea*, inſomuch that portions of the extravaſated blood are by coughing frequently ejected. We have known ſome to have died Aſthmatic or ſhort-winded, whoſe Lungs being free from an Ulcer, or any more grievous wound, have ſwelled ſo much, that they wanted room for their motion within the cavity of the Cheſt: the reaſon whereof doubtleſs was, that the thicker and more feculent blood, for that cauſe not eaſily paſſing through thoſe veſſels, every where extended the Arteries and Veins, and cauſed it to ſtagnate in the leſſer Pipes. Moreover the feculencies of blood one while ſalt of different kinds, another while ſulphureous or earthly being combined with them, and thruſt into the ſmall paſſages of the veſſels, and fixed there, do altogether obſtruct them; inſomuch that the pneumonic circulation of the blood is contracted into a ſhorter ſpace, and conſequently the function of breathing is ſtraitned in the compreſſed Pipes or little Cells. There are many kinds and ſundry ways of ſuch an obſtruction, which if all or the chief ſhould be enumerated, ſuch a Pathology would ſwell into a too great bulk.

3. The blood is hindred from obſtruction of the paſſages. which are ſhut up divers ways: For divers cauſes here rehearſed.

The bronchial Pipes are filled.

Sometimes wax hard.

The veſſels are ſtuffed with concretions reſembling the Polypus.

3. The pneumonic paſſage of blood is not only hindred by reaſon of the paſſages ſhut and obſtructed, but ſometimes alſo being burſt aſunder. For thoſe veſſels being ſmall, or tender, or very looſe in ſome perſons, are frequently opened by the force or acrimony of blood; ſo that the blood either burſting into the *Trachea*, is ejected by ſpitting, or heaped up in the interſpaces of the paſſages, cauſes a Peripneumony, or falling down into the cavity of the Cheſt, produces an Empyema. Of all theſe we ſhall treat ſingly in the Chapter of ſpitting of blood.

The blood is alſo hindred becauſe the paſſages are burſt aſunder, as in ſpitting blood.

There

One impediment of the blood is want or default of air.

3. There remains as yet a third impediment of blood in the pneumonic paſſages, which happens for the want or fault of Air. If at any time the Blood is not kindled after a due manner within the paſſages of the Lungs, from air breathed in by the *Trachea*; for that cauſe as preſently its flame is irregular, ſo likewiſe its motion is variouſly ſtopt or perverted: for although the blood is forced through the lungs by the meer impulſe of the heart, notwithſtanding the pulſe hereof is proportioned according to the tenour of its being kindled by the air; wherefore when the flame of blood is diminiſhed, or ſuppreſt, for want or through the fault of the air, preſently the pulſe proves languid or unequal, and by reaſon of the bloods courſe being troubled, or ſtopt, preſently a paleneſs and coldneſs ſucceeds throughout the whole body, with enervation of the members. But if inſpiration be wholly intercepted or fruſtrated (becauſe the nitrous particles are wanting) preſently the pulſe ceaſes, and anon life is loſt. The reaſon of all which is, both becauſe the blood being much impeded in its accenſion, or extinct, like Muſt given over working preſently ſubſides, and is unapt for any motion; and chiefly becauſe the flame of the blood failing, and being ſubſtracted from the brain, preſently the Hypoſtaſis of the animal ſpirits, as it were light ſtreaming from thence, immediately fails, and together with it the exerciſe or actions of all faculties do ceaſe. But if the blood is too much kindled, the Sulphur of the Blood, and the Nitre of the Air running together more than it ought; for that cauſe preſently, that this too much burning may be eventilated enough, the pulſe of the heart is increaſed to its utmoſt. We might adde many inſtances of this kind; but truely this conſideration of the blood leads us to the ſecond thing propoſed of Reſpiration hurt; namely that we may duely weigh, what ſort of failings or defects do happen about the inſpiration as well as expiration of the Nitrous air, requiſite for the preſerving the nitral flame of blood; that is to ſay, from what cauſes they proceed, and alſo what effects they are wont to produce; in which ſearch we will firſt treat of Inſpiration hurt.

SECT. I. CHAP. III.

Of Inſpiration hurt.

Breathing hurt by the vicious qualities or defect of air.

BReathing is accounted hurt, when its uſe is fruſtrated, or any ways hindred; which moſt frequently happens, by reaſon of the fault or defect of the Air drawn in. As to the former, if the Air chance to be depraved, it neither duely kindles nor eventilates the blood, yea it ſometimes overthrows the temperament thereof, or infects it, as is every where ſeen in a Conſtitution of Air very malignant. That we may touch on the chief reaſons of theſe diſtempers, we are to obſerve, That as the Nitrous particles of Air are chiefly neceſſary, (as is manifeſt by manifold experiment) for the preſervation of life; ſo frequently it happens that Nitre of the Air either to fail or be wholly wanting, or by particles of another kind to be ſo much muffled, or bound up, that they cannot enough exerciſe their vital power; or laſtly, malignant or fatal Corpuſcles to be adjoyned thereunto. Firſt, the nitrous particles of Air are deficient, if when it ſtagnating or growing hot the Nitre is chaſed thence, or not ſtirr'd into action. Wherefore, in a low-rooft Chamber, or too cloſe, and in other places crouded with aſſemblies of men, or made hot with the ardor of the Sun, we difficultly or weakly breathe. The ſame comes to paſs in places of great height, on the tops of thoſe mountains exceeding the top of the *Atmoſphere*; wherein breath is faintly drawn for want of Nitre, neither can we live long there. Secondly, the Nitrous particles of Air are wont to be obſcured or blunted by other acceſſories, alſo ſometimes they are too much ſharpened. For as often as the South-wind blows, the Air is too moiſt and thick, inaſmuch as the Nitrous particles are ſeiz'd upon by the watry and ſulphureous, and are much blunted, ſo that while it is drawn in, the blood is not vigorouſly kindled, but like green wood put into fire it rather ſmokes than burns bright; wherefore during ſuch a ſtate of Air we become ſtupid and dull, and unapt for motion; but on the contrary, the North-wind blowing, the cooling, ſharp and moſt nipping particles are adjoined to the Nitrous, and the blood is enough kindled, and we breathe freely; yet the Vital flame is every where reſtrain'd by intenſe froſt diſproportion'd thereunto, and unleſs refreſh'd by motion and heat, it is frequently entirely extinguiſhed.

The faults of the air.

2. Be-

2. Beſides theſe faults of the Air, whereby breathing is wont to be hurt, moreover this evil ſometimes proceeds from its defect; inaſmuch as it cannot be drawn in in plenty enough. Of which effects though there are many and divers cauſes, yet for the moſt part it happens in reſpect of the organs of breathing, either hindred as to their motion, or their paſſages obſtructed. *The defect of air hurting breathing, proceeds from the pneumonic Organs.*

1. The Organs of breathing are either meerly paſſive, *viz.* which are moved, as the Lungs; or are Active, and move themſelves, and thoſe together, as the muſcles of the Cheſt and Diaphragma. In every of theſe the impediments of the motion by which breathing is hurt, happen variouſly. And firſt what reſpects the Lungs, we mentioned before, that they ſometimes very much ſwell, by reaſon of the veſſels being much diſtended, and fill'd with blood, inſomuch as being ſtiffe and inflexible, they obey not the turns of the Syſtole and Diaſtole of the Cheſt. Moreover it happens ſometimes through a phlegmon, little ſwellings, and other concretions of divers forms, that a like ſtiffeneſs is cauſed in them. Secondly, the active organs of breathing, or the moving parts, *viz.* the muſcles of the Cheſt and Diaphragma are wont to be perverted or ſtopt from their moving function by divers cauſes. A ſolution of continuity made in any part of theſe, either by clotting of blood, or by falling down of the *Serum*, and other humors, as in the Pleuriſie and Scurvy, or in thoſe that are wounded or bruiſed, doth every where cauſe pain in the place affected, with impotency of motion and difficult breathing. Moreover, ſometimes without pain, or any evident cauſe, thoſe parts being hindred from their motion do produce a moſt heavy purſineſs; As is frequently ſeen in an Aſthma, Suffocation of the womb, and in certain other convulſive or hypochondriac diſtempers. The reaſon of which paſſion without doubt conſiſts in this, for that the animal ſpirits appointed to the moving function of thoſe parts, are diſturbed about their Origine, or hindered in the paſſages of the Nerves, and are turned aſide from their due influx into the moving fibres: Inſomuch as many who are ſound enough as to their Lungs, and only obnoxious to affects of the Brain and Nerves, are frequently ſurprized with horrid fits of an Aſthma, as we have at large declared in another place.

2. The ſtopping of air, hindering breathing, whereby it leſs freely enters the Lungs, frequently happens, by reaſon of the Conveyances, *viz.* the paſſages of the *Trachea* being ſhut, or not enough open. For indeed thoſe paſſages are wont to be ſtopt (as we have formerly obſerved touching the Veſſels bringing Blood) and prohibit the full entrance of air, when they are either obſtructed or compreſſed, or more narrowly contracted. Though there are many cauſes and wayes whereby the paſſages of the *Trachea* are wont to be obſtructed, yet chiefly and moſt often a Catarrhal diſtillation of the *Serum*, while it departs from the blood, and flows out of the veſſels bringing blood into theſe parts; which being firſt thin and ſharp, produces a troubleſome Cough; afterwards thickening by digeſtion, and cleaving to the ſides of the *Trachea*, exceedingly ſtraitens the ways of inſpiration, and ſhortens them by quite ſtuffing up their extremities. In like manner the ſweating out of extravaſated blood, as alſo of *Pus* or ichorous matter out of the Lympheducts or Veins into the tracheal little bladders, doth frequently produce an Aſthma, and often a Conſumption; the reaſon of which ſort of diſtempers ſhall be more largely explained hereafter. Secondly, it is manifeſt enough by common obſervation, that the Tracheal paſſages as well the laſt as the intermedial, often-times are ſtraitened, or ſhut, by compreſſion. For after a plentiful meal, or abundant drinking of Wine or ſtrong Ale (inaſmuch as the pneumonic veſſels are very much diſtended by reaſon of the turgency of blood, and the ſides of the Trachea being preſs'd together, do not admit of a free and uſual entrance of air) men otherwiſe healthful enough, do breathe difficultly and painfully: Which truely we eſteem to happen from the lungs being filled and extended rather, than from a cram'd ſtomach hindering the Syſtole of the Diaphragma. Moreover, for this reaſon, even in the very paroxyſmes of feavers a frequent and painfull breathing is manifeſt. Neither onely from the turgency of blood, but alſo from the ſame ſtagnating, or extravaſated, and alſo from ſtony concretions, and divers other manners, the veſſels of the Trachea being preſſed together, cannot diſcharge a free breathing. *The various ways of Obſtructions.* *A Catarrh.* *The ſwelling of blood by which the paſſages are preſs'd together.*

3. The paſſages of the Trachea being ſometimes more nearly contracted and cloſed from their fibres convulſively diſpoſed, deny a paſſage to the Air for due breathing. From hence, when there is no obſtruction, or ill conformation in the lungs, as alſo no conſumptive diſpoſition, yet from thoſe fibres preternaturally convulſed and drawn together, dreadfull fits of an Aſthma frequently ariſe. Whereas we have in another place *The Cramps of the tracheal paſſages.*

place diſcourſed of theſe paſſions, it will not be requiſite here again to repeat that diſcourſe. Beſides theſe accidents of breathing hurt, there are certain others which are ſtirr'd up by reaſon of the Air prohibited in its firſt entrance, *viz.* in the Noſtrils, the throat, the *Larynx*, from a tumour or ill conformation: For the *Polypus* in the Noſe, the Quinzy in the Throat, or inflammation of the Tonſils, do render a difficult breathing; in the ſame manner as a heap of ſand about a Haven, obſtructs the ingreſs and regreſs of Ships. But truly ſince the reaſons of thoſe paſſions, and their manner of being made, are expoſed to ſenſe, it ſeems ſuperfluous here to deliver their cauſes.

SECT. I. CHAP. IV.

Of Expiration hurt.

The act of expiration is eaſier than of inſpiration.

AS Expiration is much eaſier, and with leſſer trouble performed than Inſpiration, ſo it is leſs endangered to be ſtopt or perverted, as to its function: for in truth the contractive endeavours of fewer muſcles are required to perform that, inſomuch as ſome do affirm that the meer relaxations of the moving parts, whereby the dilatation of the breaſt is diſcharged, doth ſuffice for its conſtriction. Hence when in the agony of death, the ultimate labour is to open the breaſt, and fetch breath, by which the flame of life may be continued; as ſoon as that endeavour is become fruſtrate, the animal exſpires, and is readily extinct. But truly we have already clearly enough evinced, that the tasks of breathing out, no leſs than thoſe of breathing in, are performed by the help of peculiar muſcles. Wherefore, when it happens that the Organs of Expiration are either hurt or prejudiced, there muſt needs follow difficulty or depravation of that function. The moving parts, which bind together the breaſt, and ſtraiten the cavity thereof, are eſpecially the inward muſcles of the breaſt, ſome belonging to the Loyns, and others to the Abdomen; as alſo the muſcular fibres of the *Larynx* and *Trachea*; by reaſon of ſome faults, occupying ſometimes theſe, anon them, either ſingle or many together, exſpiration is wont to be ſtopt or perverted after a diverſe manner. Although the hurt of this function frequently depends upon inſpiration being prejudiced; notwithſtanding it ſometimes happens alone; ſo that when we ſuck in Air eaſily and duely enough, we return it diſturbed or perverſly, which truely is wont to come to paſs through divers cauſes, and after many manners (the chief of which we ſhall here briefly touch upon.)

Expiration hurt ſometimes proceeds from the fault of inſpiration.

Sometimes being alone depends on various cauſes.

1. For firſt, when a wound, or convulſive or paralytical diſtemper happens in one muſcle (which cauſes exſpiration) or in more, for that cauſe the cavity of the *Thorax* cannot be ſo freely drawn together and compreſs'd, for the more full breathing out air or breath. Hence not only ſuch as labour in a Pleuriſie, but in a tumour or wound in the intercoſtal muſcles or the Abdomen, cannot eaſily cough, or ſing, or perform other acts of ſtronger expiration: Neither is the due drawing together of the *Thorax* leſs ſtopt, by reaſon of the moving fibres of thoſe parts affected either by a reſolution, or a cramp.

1. On the wound of a part moving.

2. In a Cough.

2. The act of expiration, whereas it is variouſly perverted or diſturbed, ſo it chiefly happens in a cough, in ſneezing, in laughing, in crying, and in Hiccough; into the reaſon and manner whereof we will briefly enquire; And firſt we ſhall ſpeak of a Cough.

The deſcription of a Cough.

A Cough may be deſcribed, that it is a vehement, more frequent, unequal and loud expiration, ſtirred up either for the quieting of ſome troubleſome and provoking thing, or for expelling of it out of the Lungs through the paſſage of the *Trachea*. For air being violently excluded, and daſh'd in the way on the ſides of the Tracheal paſſages, whatſoever is in any place impacted in them, if it be eaſily moved, it diſcuſſes and wipes it away, and frequently ſends it out of doors.

Its formal reaſon and the manner of its being done.

For the exciting of a Cough, both the muſcles contracting the *Thorax*, and alſo the moving fibres of the *Bronchii*, do concur in motion with a joynt force together. For while the muſcles ſtraiten the cavity of the breaſt, and every where ſqueeze the whole lungs; theſe fibres one while contracting theſe tracheal paſſages, another while them, cloſing behind the air while it is driven forwards, do endeavour its expulſion more quick and vehement.

A more intenſe ſudden inſpiration precedes every act of a Cough, to wit that the air being admitted in greater plenty, may preſently be more violently driven out with noiſe; in which endeavour not onely the new that is freſh breathed in, but alſo the old, being heaped up before in the tracheal little bladders, is driven forth together with a noiſe, for the encreaſe of breath blown out; and when what is troubleſome is not ſettled nor removed at the firſt aſſault, the vehement exſpiration of this kind is repeated by a frequent courſe, even to the great wearying of Nature.

Its primary cauſe.

The firſt cauſe of every Cough is an irritation of the nerves or fibres belonging to the lungs; concerning the nerves we are to obſerve, that not onely the branches and their ſlips inſerted into the Lungs, but others from which they do ariſe, or with which they do intimately communicate, being provok'd in places far diſtant from the breaſt, immediately cauſe a cough: for which cauſe oftentimes a ſharp humour being lodged within the Brain, and from thence falling down into the little head of the pectoral nerves, is wont to produce a moſt troubleſome Cough or Aſthmatick diſtempers, as not long ſince we have declared by notable inſtances. For the ſame reaſon a pain inflicted on the noſtrils, palate, or *Gula*, provokes a Cough, or rather a vain attempt of coughing. Moreover a little *Serum* diſtilling from the Arteries into the upper parts of the *Gula* or *Larynx* produces a frequent and very troubleſome Cough, without any notable prejudice of the Lungs. But truly this provocation, inflicted on the nerves and fibres diſtributed in the Lung it ſelf, more frequently, and truly more violently provokes an endeavour of Coughing, which is repeated by courſes, till what is troubleſome be turned forth, or the provocation reſtrained. Of this kind of Cough from the nerves, a notable Example ſhall be after ſet before you.

The evident cauſes thereof.

The provoking cauſes producing a Cough are manifold, and make their ſtay in ſeveral places: for beſides that the nerves, as we but now intimated, and alſo the membranes, with which there is an intimate communication with the Lungs, being provoked in the open Noſtril, give an impreſſion of that paſſion at a diſtance to the Lungs; moſt frequently that irregular exſpiration is ſtirr'd up, by reaſon ſome incongruous or in ſome meaſure unproportion'd thing is caſt into the Lungs. For in the firſt place, that this troubleſome thing may be removed, the nerves and the nervous fibres diſperſed about the Lungs are irritated; afterwards by the conſent of theſe, the muſcles of the breaſt that draw it together, and the moving fibres of the Trachea at once are forced into vehement and often repeated contractions.

The kinds thereof.

Every Cough is either moiſt or dry; in the former a certain humour being depoſited in ſome place within the tracheal paſſages is ſhaked by coughing, and being to be thrown out upwards is caſt into the mouth. That humour, whereas it is manifold and after divers ſorts, for the moſt part it is either call'd ſerous, or nutritious, or purulent, or bloody.

A moiſt Cough.

Of the former there are many kinds and differences; namely, as to its conſiſtence it is either thin, or thick, or crude, or digeſted; as to its colour, it is either white or yellow, or ſomewhat greeniſh; alſo ſometimes it is blewiſh, or black. Moreover, a moiſt Cough is variouſly diſtinguiſhed, as to the places from whence the humour to be coughed out proceeds. For ſometimes cleaving to the ſides of the *Larynx*, or ſweating from them, the moving fibres being ſhaken by a gentle little Cough, it is eaſily and by a ſhort paſſage caſt forth into the mouth; ſometimes the matter to be excerned, being impacted a little deeper in the pipes of the *Bronchii*, is not ſhook out but by large expirations, and often repeated; and laſtly it ſometimes happens, that the excrements to be caſt out, are depoſited within the fartheſt little bladders of the Trachea, out of which it is not brought forth without a vehement labour of coughing, and that frequently repeated, and at laſt driven forth by a long journey through the whole lungs. Concerning the Cough of a nutritious humour, as alſo of a bloody and purulent, hereafter it ſhall be diſcourſed when we treat of a Conſumption and its remedy.

A dry Cough.

A dry Cough, as often as it is the proper paſſion of the Lungs, is excited after many manners and by ſundry cauſes; for an obſtruction of any of the pneumonic paſſages, whether it be by compreſſion, or oppletion, or contraction, doth neceſſarily induce this. Wherefore an inflammation, a tumour, a little ſwelling, a ſtagnation of the blood either through plenty or ſcarcity, alſo gravelly, ſtony, or polypoſe Concretions, worms and many other preternatural things, inaſmuch as they almoſt perpetually provoke the nervous fibres, do induce a dry, vain Cough, but very troubleſome. But

a dry Cough ſometimes is ſtirr'd up by the inſtinct of Nature, as in place of a Pump; to wit, that the blood either by reaſon of its proper ill temperament, or by reaſon of the pneumonic Veſſels not being open enough, not paſſing well through the lungs, may be promoted by the ſhaking of theſe parts, and forced into a more rapid motion.

What belongs unto the other acts of expiration hurt, as when in ſneezing, hiccough, laughing, crying, and in other affects its natural and even function is troubled or perverted; ſeeing the rendrings of the cauſes of theſe (which alſo in another place we have in part deſigned) do not properly appertain to our purpoſe, omitting them here we will paſs to the thing chiefly deſigned, *viz.* to the diſeaſes of the breaſt and their remedies, and to the reaſons of curing them.

SECT. I. CHAP. V.

Of a Phthiſis or Conſumption in general.

WHereas we have hitherto viewed the fabrick of the Lungs accurately delineated, and the motion thereof together with that of the whole Breaſt, and the ways and paſſages of the air, and of the blood, and of other humors through them; and have alſo obſerved their various impediments, their remora's, or diverſions, according to which it happens the act of the pneumonic function is after a diverſe manner hurt or perverted in inſpiration and expiration: now in the next place we are to deſcend to the Pathology of this region ſo travelled over, and, which was our deſign from the beginning, to treat of Medicines belonging to the *Thorax*, or Remedies appropriated to heal the diſtempers of the Breaſt, and the manner of their operation.

A Phthiſis accounted chief among the diſeaſes of the breaſt.

Of all the diſeaſes of the Breaſt a Phthiſis, or Conſumption, by right claims the firſt place: for there is none more frequent or difficult to cure. Moreover all the other affects of the *Thorax* being ill, or not at all cured, do lead into this, as leſſer ſtreams into a greater Lake, and ſo ending in a Phthiſis, loſe both their natures and ancient names.

The various acceptation of Phthiſis.

But truly theſe terms of *Phthiſis* and *Tabes* in their proper ſignification denote an Atrophy, or a withering away of the ſolid parts with debility of ſtrength: the diſtempers of which ſort frequently proceed from a wound or Ulcer of the Lungs; notwithſtanding ſometimes without any fault of theſe, the extenuation or pining away of the whole body takes its riſe from the meer fault of the blood, or chiefly from the nervous juice. Therefore before we handle a private pulmonary Phthiſis, ſeems to our purpoſe to explain the general reaſons of this ſickneſs, and to declare how many ways, and from what cauſes the ill temperaments of the humors are wont to induce a privation of nouriſhment of the whole body, as it were conſumptive. For truly the Conſumption of the Lungs it ſelf doth not next and immediately proceed from an Ulcer or corruption of that bowel; but it ariſes for as much as the blood from them contracting a corruption, and highly defiled, for that very cauſe loſes altogether its nutritive virtue. Moreover as well this as the nervous liquor acquires ſuch an indiſpoſition. Of which in general we will now inquire.

It denotes any Atrophy.

An Atrophy firſt depends on the blood made unfit to nouriſh.

And firſt what relates to the Blood, we may often take notice, that ſome pine away without a Cough, or without any apparent fault either in the Lungs or Breaſt; in the mean time as to appetite, digeſtion, ſleep, and almoſt the œconomy of the whole natural and animal function do carry themſelves indifferent; notwithſtanding, as if nouriſhment ſhould be poured into a Receptable bored through, they are not nouriſhed, but pine away ſenſibly maugre all Dietetical Rules. The formal or conjunct reaſon of which kind of affect frequently conſiſts only in this, that the blood being notably depraved, cannot aſſimilate the nouriſhing juice continually mixt with it; wherefore it doth not only forthwith ſend it away, but alſo takes away ſome particles of the ſolid parts; which ſnatching to it ſelf, it preſently throws out, or caſts it into ſome place or other, or conſumes it by evaporation.

The depravations or degenerate ſtates of the blood, that are wont to induce an Atrophy, either conſiſt in its proper diſtemper, or themſelves are communicated from ſome other place, and indeed chiefly from the bowels, or from the nervous liquor being alſo degenerate.

The

The proper Dyſcraſie of the blood it ſelf is twofold, according to which it happens, that the ſaline-acid particles or the ſulphureous and moſt-ſharp are exalted above meaſure, and predominate over the reſt. For ſometimes the blood withdraws it ſelf from its genuine diſpoſition, *viz.* a ſweet and volatile into an acid, as is always found in ſcorbutical, melancholy, or cachectical perſons. Wherefore the nutritious juice being ever mingled with the bloody maſs, ſeeing it cannot for that reaſon be aſſimilated, and affixed to the ſolid parts, is releaſed again in a ſhort time; and is either forthwith ſent away by urine, ſweat, or a Diarrhœa; or being pen'd up within the fleſh or cavities of the bowels, brings a Dropſie: of which ſort of diſtempers, being led forth into an evil ſtate, the ordinary effect is wont to be, that when ſome parts do ſwell very much, other parts are very much extenuated. Here it would be far from our purpoſe to deliver the true cauſe of the above-mentioned affects, and to put our ſickle not only into another mans harveſt, but alſo one far remote. 2. Moreover there is another ſtate of blood unfit for nouriſhment quite contrary to this, to wit, when being above meaſure hot and ſulphureous, and from thence always violently burning out, it conſumes the nutritious juice by its effervescence and raging, and cauſes it too much to evaporate; ſo that the ſolid parts being defrauded of their proviſion pine away. The perſons obnoxious to this diſtemper have large veſſels, and much diſtended with blood, but their fleſh withered and hardned by heat. Though perſons ſo affected ſeldom pine away to death, yet they grow old ſooner, and end their life in a ſhorter ſpace.

The conſumptive Dyſcraſie of the blood either from it ſelf or communicated from other parts.

1. The kinds of the former reckoned up.

2. The blood not only from its proper *indoles*, but alſo by reaſon of a Conſumption elſewhere, and chiefly communicated from the bowels and nervous juice, is often unfit to nouriſh. And firſt this frequently happens by fault of the bowels; for theſe being ill-affected, ſometimes do not duly digeſt the Chyme to be conveyed over to the blood; alſo oftentimes they pervert and defile it with their extraneous and heterogene ferments, inſomuch that the functions are fruſtrated in the faculties of breeding good blood and nouriſhment. Moreover ſometimes by reaſon of the Veſſels bringing the Chyle obſtructed within them, though much be eaten, yet little or leſs than due, is conveyed into the bloody maſs. Alſo in the bowels of concoction ſometimes Tumors, Impoſthumes, and Ulcers happen; from whoſe corruption the blood being infected in its paſſage, contaminates the reſt of the maſs, and renders it unapt to the work of nouriſhing. How often do we ſee from a Schirrus happening in the Spleen, Liver, Pancreas, or Meſentery, or by an Ulcer or cancrous Tumour of ſome Gut, as alſo of a Kidney, Womb, or Bladder, or otherwiſe malignant Sore, a deadly Atrophy to have ſucceeded without any notable fault of the Breaſt or Lungs? Yea Tumors, Impoſthumes, or cancrous and ſtrumous Ulcers happening in the outward parts, and eſpecially in the Back, do frequently end in a pernicious Conſumption. The reaſon whereof is plain, *viz.* in as much as in ſuch diſtempers both great plenty of the nutritious juice brought to the affected part through the Arteries, is either entirely beſtowed in the ſame place, or from thence is poured forth abroad, inſomuch that all the other parts of the whole body are defrauded of their due proviſion; as alſo that the virulent or very incongruous matter there engendered and lodged is ſwallowed up by again the Veins, which defiles the blood by an impure black gore, and from thence renders it altogether unapt to diſcharge the faculty of nouriſhing.

This proceeds ſometimes from a fault of the bowels or ſolid parts;

Neither only from the bowels and ſolid parts, but alſo from the nervous juice the ſtain (by which it becomes unfit to nouriſh) is frequently communicated to the blood. For when this liquor degenerates from its genuine temper, to wit, ſweet and volatile into an acid, preſently flowing out of the fibres and nervous parts, and flowing back into the blood, it doth precipitate the liquor thereof, and compels it into fluxes, whereby all the nutritive matter is caſt forth, and one while poured forth by Urine or Sweat, another while by Vomit or Looſneſs. The reaſons of all theſe, and how they come to paſs we have explicated in a late Treatiſe.

Or from the nervous juice.

But the nervous liquor, ſometimes by it ſelf, departing from its good temper, and being vitiated in its temperament, is a cauſe of want of nouriſhment, which alſo happens to be made in a twofold reſpect, or two manner of ways. For ſometimes that Juice being very much vitiated and degenerate, proves as it were vappid and decayed; ſo that it doth not actuate enough the fibres as well nervous as carnous, and inlighten them with an animal ſpirit: wherefore as the motive virtue, ſo alſo the nutritive fails in the ſolid parts. From hence either the entire body, or certain members and parts thereof being for ſome while affected with a Palſie, at length they wither away: as we have at large declared the reaſon thereof in another place. 2. We have

The nervous juice ſometimes of it ſelf is chiefly the cauſe of an Atrophy.

alſo obſerved, that many labouring with a ſlow Feaver (or as called by us a nervous) do preſently languiſh, and in a ſhort time become much emaciated. In either caſe the ſame reaſon ought to be aſſigned; for, as is ſhewed in another place, ſeeing the animal ſpirits, together with the nervous liquor, their vehicle (which is as it were the maſculine ſeed) do actuate the nutritive humour every where collected by the ſolid parts even as the feminine ſeed, and render it as it were pregnant with a nutritive faculty; for that cauſe if that nervous liquor becomes either depraved or vappid, the bulk of the ſolid parts pines away as if it were made barren.

Two chief kinds of Atrophies.

So much of theſe things touching an Atrophy, or waxing lean, and the formal reaſons thereof, the cauſes and various manners of its coming to paſs in general. Of this diſeaſe as there are many kinds and differences, ſo two chiefly and more obſervably occurr, whereof either will deſerve a particular conſideration; *viz.* *Tabes* or *Phthiſis Dorſalis* commonly ſo called, and a Conſumption of the Lungs. This latter, which properly belongs to this place, ſhall be diſcuſſed in the following Chapter; in the mean time concerning that (becauſe the knowledge thereof doth illuſtrate the Pathology of this) we ſhall ſpeak in a word.

Tabes Dorſalis.

Two kinds.

Tabes Dorſalis, although it hath almoſt loſt its name in this our Age, or perhaps changed it into a Gonorrhœa, yet *Hippocrates* makes mention of it, and handling it avowedly, he aſſigned a twofold kind thereof, *viz.* one from immoderate Venery, and the other from a deſtillation into the Spine of the Back. What relates to the latter, I have often obſerved ſome to be moſt grievouſly vexed with a pain about their Loyns, yea ſometimes in the whole Back, which when for ſome time ſome have ſo laboured under, they afterwards come to be lame or crooked, and at laſt fall away in the whole body, all but the head. The cauſe of which diſeaſe doubtleſs conſiſts in this, *viz.* firſt a humour or a certain incongruous morbific matter, deſcending with the nervous juice through the ſpinal marrow, did run into the branches of the vertebral Nerves, and therefore from the beginning, by reaſon of the Fibres being twitched, a continual pain almoſt did ariſe; afterwards by reaſon of ſome Fibres being reſolved, the oppoſite ones more vehemently contracted diſtort certain Vertebra's of the Spine; and laſtly ſeeing the animal Spirits cannot actuate enough the Nerves and Fibres belonging to the trunk and members, by reaſon of the nouriſhment fruſtrated, the withering of the entire body ſucceeds. Surely when the nervous liquor and animal ſpirits paſs not fully and freely out of the Dorſal Spine into the whole body, from thence oftentimes a pining doth ariſe: hence Impoſthumes and Ulcers ariſe about the Loins or the *Os ſacrum*, which in as much as they conſume or pour forth the nervous liquor too much, cauſe an Atrophy in the whole, or at leaſt in the lower parts.

From the nervous juice ſtopt or depraved in the loyns.

From the expenſe of the humour through the genital parts.

2. Another kind of *Tabes Dorſalis* far more frequent, is alſo twofold: *viz.* it either ariſeth from the great or too-often loſs of the genital humor, or from a continual corrupt flux from the genital parts.

That humour is firſt either ſeed, a too great expence whereof induces an Atrophy.

1. As to the firſt, it is manifeſt by vulgar obſervation, that the immoderate uſe of Venery, yea involuntary efflux of the ſeed, if it be either great or continual, produce a faintneſs in the whole body, and at length a pining away. The reaſon of this (as we have intimated in another place) is not, that the ſeed, according to the opinion of ſome, deſcends from the Brain through the Nerves into the ſpermatic bodies, and from thence, by reaſon of a great loſs thereof firſt the Brain, and then the parts, all depending on the influence of the Spirits ſpringing from thence, become infirm and pine away. But ſeeing we have ſufficiently evinced, that the ſeminal matter is immediately ſupplied out of the maſs of blood into the genital parts, and that it is altogether the ſame with that out of which the animal Spirits inſtilled into the Brain are procreated, it will neceſſarily follow, by how much the greater portion is got to the Teſticles for repairing the loſs of ſeed, by ſo much is the Brain defrauded of its due ſhare, and therefore at length the function in the whole body, as well motive as nutritive, doth waver and diminiſh. Our furious Whoremongers are ſenſible of a great debility about their Loins, and the parts placed below them, to wit, the Thighs and Legs, do chiefly wither away; the reaſon is, becauſe as well the proviſion of the animal Spirits in its firſt ſpring, *viz.* in the Brain failing, the outmoſt chanels, *viz.* the ends of the ſpinal marrow, and the Nerves ſpringing from it, do ſuffer firſt and chiefly for this defect; and moreover becauſe near the Loins the arterious blood gives out to the Teſticles more excellent particles and chiefly reſtaurative, being deſtined to nouriſh the Back, and in the mean time the venous blood being for that cauſe decayed or conſumed, is enfeebled, and ſteals from the Loins as much as poſſibly may be.

The

The loſs of the ſeed cauſing a Conſumption is ſometimes voluntary, of which ſort the ſalacious and prone to Venery do ſuffer: ſometimes involuntary; of which affects there are divers kinds. For in ſome it only happens by dreams or obſcene phantaſms; but in others, beſides thoſe occaſions, every endeavour of the Back, whether through bearing a weight, or excretion of Urine, or the *fæces* of the Belly, cauſes the genital humor to be thruſt out: the cauſe whereof is, both becauſe the ſeed is watry and thin and at once ſharp and provocative, alſo becauſe the parts are weak, and not able duly to digeſt or retain it. *The loſſes whereof are voluntary or involuntary.*

In the other *Tabes Dorſalis* above-mentioned, not the ſeed it ſelf, but an ichor or a certain putrilage is caſt out abundantly from the genital parts; the efflux whereof, if it be great and continual, doth frequently impair the ſtrength of the whole body, and by withdrawing and prodigally removing the nutritive matter, it induces an Atrophy or conſumption. For near the ſpermatic Veſſels, or in paſſage from them, as well in men as women, there are certain Emunctories placed, whoſe faculty is to receive the ſuperfluous humour from the ſeed formed, and when it abounds to ſend it abroad through the genital parts. For this cauſe that thoſe paſſages in either Sex may be made ſlippery and moiſt (leſt they grow dry, and become leſs ſenſible) the Proſtates in men and the Glandules about the horns of the womb in women are conſtituted; out of both which always in the act of coition, and ſometimes without, when the ſpermatic bodies abound with too much moiſture, a certain ſerous liquor ſweats out: and in women (whoſe bodies are more moiſt, and in whom Nature hath made theſe ways for their menſtrual excretion) this doth oftner and more plentifully happen than to men. But if theſe Emunctories be affected with a great debility, or a certain virulency, ſo that they corrupt this liquor ſent, or do not retain it enough, it is not only ſent away inceſſantly, and flows out plentifully through the *Pudendum*, but alſo other ſuperfluous humours or recrements of the whole body flowing together to thoſe weak parts are thrown forth together. Alſo the nutritious Juice deſtined to the neighbouring parts flows thither, and preſently goes out together; ſo that at length by reaſon of the loſs of the nutritious Juice (which flowing to the ſame place is corrupted and continually ſent away) not only pains of the neighbouring parts, but of the whole body, and a pining doth ſucceed. Theſe things are commonly known in a Gonorrhœa, alſo in *fluore muliebri*, or thoſe affects from an impure bed, or immoderate Venery, or are cauſed by a blow, a bruiſe, violent exerciſe, or any other hurt inflicted upon the Loins. It is not proper to this place to deliver particularly the true rendring of the cauſe and curatory method of healing of this ſort of paſſions: we ſhall proceed to treat of a *Phthiſis* or *Tabes* properly ſo called, *viz.* which ariſes from the only or chief fault of the Lungs, which was the buſineſs of our deſign. *2. Or Ichor flowing into thoſe parts from ſolution of continuity.* *The formal reaſon of a virulent Gonorrhea.*

SECT. I. CHAP. VI.

Of a Phthiſis properly ſo called, or of a Conſumption ariſing by fault of the Lungs.

A Conſumption doth ſo frequently and uſually proceed from the Lungs being depraved, that ſome have termed it the peculiar Diſeaſe of this Bowel: and that it very often ſo comes to paſs, the reaſon is; becauſe (as we have ſhewed before) the pining of the body doth for the moſt part more immediately proceed from the blood depraved and unapt for nouriſhment, it is manifeſt, that as its perfection is acquired in the Lungs, ſo from theſe being ill-affected the ſame is moſt of all vitiated, and degenerates into a languiſhing and corruptible ſtate. For in the Lungs rather than in the Heart or Brain, the threads of life are ſpun, and there they are oftneſt defiled or broken.

A Phthiſis is uſually defined to be A pining away of the whole body, taking its riſe from an Ulcer in the Lungs. But leſs true: becauſe I have opened the dead bodies of many that have died of this diſeaſe, in whom the Lungs were free from any Ulcer, yet they were ſet about with little ſwellings, or ſtones, or ſandy matter throughout the whole: for from thence the blood, becauſe it could neither be freely circulated in the *Præcordium*, nor animated enough by the nitrous air, and when in the mean time it is perpetu- *The definition of a Phthiſis.*

perpetually polluted by its proper dregs depoſited in the Lungs, is frequently vitiated and made incapable of nouriſhing thereby: wherefore a *Phthiſis* is better defined, *that it is a withering away of the whole body ariſing from an ill formation of the Lungs.*

The cauſe aſſigned by the Ancients.

The Ancients following *Hippocrates*, for the moſt part have aſſigned only two cauſes of this diſeaſe, *viz.* a *Catarrh*, and *the breaking of a Vein*, to which ſome have added an *Empyema*: and others exclude a Catarrh from this number: for what is vulgarly affirmed, that flegm falling from the Head into the Lungs, and abiding there putrifies, is moſt commonly the cauſe of a Phthiſis, or is often brought by it, we have formerly intimated to be altogether erroneous, and ſhall preſently ſhew it more clearly. In the mean time to ſhew what the matter is that generates a Conſumption as often as it ariſes without an Empyema or Hæmoptoe going before, it muſt be conſidered after how many manners and by what ways any thing diſagreeable or heterogene can enter into the Lungs; which diligent ſearch being made, it will eaſily appear, that any thing that is an enemy to the Lungs creeps in and is admitted chiefly either by the *Trachea* or by the pneumonic Arteries, yea and ſometimes haply by the Nerves, but nothing by the Veins or Lymphæducts, whoſe function is only to carry back or away the blood or Lympha, and to leave there nothing at all.

What the conſumptive matter is.

By what ways it enters the Lungs.

As to the *Trachea*, it is manifeſt it is ordained for this end, that by its paſſages or pipes the air might be conveyed in or preſently carried back by a conſtant recourſe from whence it comes; moreover, whether any matter being hurtful or mortal to the *Præcordia* may be admitted the ſame way, ſhall be now our preſent diſquiſition. And that the Lungs frequently incur a pernicious pollution by this entrance is clear from hence, becauſe the moiſt air of ſome regions, repleat with fumes, or abounding with malignant vapours, doth frequently induce the conſumptive inclination; nevertheleſs the affection thereof is wont to be communicated only by aerial minute particles (whereby either the temperament of the blood or the conformation of the Lungs or both are prejudiced.) But whether beſides this a ſerous matter or ſome humor corrupting the Lungs doth enter them through this paſſage, is not without reaſon doubted: although many do determine a Catarrh or a deſtillation of the Serum from the Brain into the Lungs by the paſſages of the *Trachea*, the principal cauſe of a Phthiſis. Which opinion being erroneouſly delivered by the Ancients, I admire any either of our modern Phyſicians or Philoſophers have admitted thereof; for it is manifeſt by anatomical obſervations, that nothing from the Brain by the *Glandula pituitaria* (which ſeems the only paſſage from thence) falls down into the Palate or Breaſt, but that the Serum there depoſited is conveyed by appropriate paſſages to the jugular Veins, and is remanded to the blood. Moreover it is manifeſt to ſight, that whatſoever relique of Serum is laid aſide in the Glandules of the Ears, Mouth, Noſe, or Face, is conveyed from them all by peculiar paſſages, inſomuch that no humor whatſoever deſtils from the Brain or the Palate into the Lungs.

Sometimes by the Trachea, yet not deſtilling from the head.

But although matter exciting a Cough doth not deſtil from the Head by the *Trachea* into the Lungs, yet ſometimes falling down from the ſides of the *Trachea* into their cavities, it produces that diſeaſe commonly called a Catarrh. For the *Aſpera Arteria*, like the Arteries bringing blood, are endued with a nervous and muſculous Coat, and ſo do occaſionally enjoy ſenſe and motion, having alſo a glandulous Coat and full of little veſſels to ſuſtain the vital heat and nouriſhment. Theſe laſt Coats make thoſe interſpaces, and as it were cover the Cartilages. Moreover the ſuperfluous ſeroſities proceeding from the blood watering the *Trachea* are depoſited into this glandulous Coat, which for the moſt part preſently ſweating into the cavities of the *Trachea*, ſerves chiefly to make them ſlippery and moiſt: but if the maſs of blood be poured out too much, and precipitated into ſeroſities (as it frequently happens, a cold being taken, or the ſwallowing down of acid things, and on many other occaſions) for this cauſe a great plenty of watry matter ſweats out of the Glandules of the *Trachea* and mouths of the little Arteries into its cavities, which ſoon doth cauſe a moſt troubleſom Cough, and often much ſpittle (which afterwards comes to be conſumptive.)

But ſweating out of the ſides of the Trachea.

The conſumptive matter brought into the Lungs rather by the pneumonic Arteries.

But ſurely this cauſe of Spittle and as it were a Catarrhal Cough very rarely comes alone, becauſe while the blood watering the Trachea having ſuffered ſolution, throws in its ſeroſities into the Glandules (whence preſently they ſweat into its cavities) and alſo the remaining blood being in like ſort diſſolved, it inſinuates its *Serum* ſet apart within the pneumonic arteries, partly into the tracheal hollowneſſes, and partly into the Lympheducts, by the overflowing whereof the Lungs are as it were

were overwhelmed and much incited, for the moſt part provok'd to Cough and continual ſpitting. A Cough and ſpitting of this kind as long as moderate, only throwing off the ſeroſities of the blood, rather are beneficial than prejudicial; becauſe the maſs of blood, and the very lungs being throughly purged after this ſort, thoſe ſymptoms for the moſt part ſpontaneouſly abate, and from thence enſues a more perfect health. But if they be protracted a long time, the ſerous humour being on both ſides laid aſide into the tracheal paſſages, and from thence more plentifully daily heapt up, at length it will change into corruption; becauſe as well the free enjoyment of air is impeded, as alſo the motion of the blood, and its temperature wholly perverted; from hence a Cough becomes more fierce, and breathing more difficult; nay rather the whole maſs of blood in as much as it is defiled by the foul blood (which the Veins receive from the Lungs) degenerating by degrees from its benign properties, and being depraved, it not only continually pours forth the ſuperfluous Serum, but alſo the nutritive Juice (which it cannot aſſimilate) out of the pneumonic Arteries into the tracheal paſſages; and ſo this maſs of conſumptive matter is daily increaſed, till the Lungs being more and more obſtructed and filled, and the blood being defiled, and rendred unfit to perform any of its functions, the Cough and Spittle become worſe and worſe, and preſently become dangerous; Moreover breathing being hurt, the faintneſs and pining away of the whole body, the debility of all the functions, and at length a hectick feaver, and a haſty declination to death follows.

A Cough and ſpitting ſometimes healthful.

Yet often being too much is dangerous.

When by the long continuance of a Cough and Spitting, leaſurely encreaſing, the humour is more plentifully depoſited out of the maſs of blood into the lungs, it firſt of all enters into the tracheal little bladders, and at length fills them, and ſomewhat diſtends them, from which while every morning by expectoration then more copiouſly performed, it is almoſt entirely caſt out from them, thence the *Thorax* is exempt for a ſhort ſpace from the burden, and reſpiration ſeems more free: yet a little afterwards the blood being ſtuff'd again with *Serum* or nutritive juice, it pours down new matter into the lungs; and from thence again after meat or ſleep the little bladders are fill'd, and the humours by the afflux daily encreaſed, are more diſtended and enlarged, and at length the ſides of two or more of the little bladders, being burſt, many little bladders are here and there framed as it were into one lake, within which the conſumptive matter being more abundantly collected, there it putrifies (for it is not entirely preſently caſt out) and from thence it corrupts the ſubſtance of the lungs, to which it is joined, and imparts a putrid defilement to the blood paſſing through it. This breach thus made in the lungs is daily encreaſed, and frequently more are at the ſame time formed in divers places, and by reaſon of the great plenty of humours heaped up and putrified in them, a heavineſs of the breaſt is felt, like a weighty burden upon them, the breathing is more hindred; moreover from the tabid blood being more plentifully intermix'd with the maſs of blood, frequent effervеſcences of it, deſtruction of the nutritive juice, alſo thirſt, heat, loſs of appetite, nightly ſweats, and a pining of the whole body do ariſe. But the blood being polluted from the lungs, cauſes them to be puniſhed with a reciprocal affection, that is to ſay from its peculiar pollution; becauſe the blood in the veins receiving this purulent matter in every circuit, it immediately delivers it into the arterial; from whence, whereas it cannot be ſent enough away by ſweat, or by Urine, it is brought back by the pneumonic arteries to the lungs, where again being ſeparated from the blood, it is every where conveyed as well into the little bladders of the Trachea as into the leſſer paſſages; inſomuch, that at length the whole frame of the lungs being filled, clefts or ulcers are formed conſequently in many places, and all the other hollowneſſes are ſtuffi with frothy quitter.

Why the Conſumptive matter afflicts, and by degrees hurts the lungs.

How an Ulcer of the Lungs is made.

But ſometimes it happens that there is one Ulcer or hole, or happily two formed in the Lungs, and the ſides grow callous round about, ſo that the matter being there gathered together is not conveyed into the maſs of blood, but is daily expectorated though in a vaſt plenty. They that are ſo affected, as if they had but an iſſue in the lungs, although they caſt up much Spittle, and thick and yellow matter every morning, and a little ſometimes all day, yet otherwiſe they live well enough in health, they breathe, eat and ſleep well, are well in fleſh, or at leaſt remain in an indifferent habit of body, and frequently arrive to old age: inſomuch that ſome are ſaid to have been conſumptive thirty or forty years, and to have prolonged the diſeaſe even unto the term of their life (for that cauſe not being ſhortened). And in the mean time others who cough or ſpit leſs, within a few months fall into a hectick feaver, and in a ſhort while are hurried into their grave.

An ulcer of the lungs covered with a callus leſs prejudicial.

Hither-

The evident cauſes of a conſumption.

Hitherto touching the conjunct cauſe and formal reaſon of a Phthiſis or pulmonary Conſumption; what belongs to the other cauſes (that is to ſay, procatarctic and evident ones) they truly are various and manifold, inaſmuch namely as they are more near or more remote, inward or outward, and laſtly connatural or adventitious: That I may undertake to deſign the powers, operations, and modes of effecting of all theſe in producing a Phthiſis; primarily it is requiſite that I ſhew, by how many modes, and by reaſon of what occaſions the ſerous humour or (as folks commonly ſay) the Catarrhal, is laid apart out of the maſs of blood into the little bladders of the lungs, and into other paſſages of the Trachea.

The primary cauſes of a conſumption ſome from the blood, others in part from the lungs.

Upon diligent ſearch of this it is obvious to any one to perceive the morbific cauſe conſiſts of two parts, and that the fault is in the ill temper of the blood ſending an offending matter to the *Thorax*, and alſo the weakneſs or ill tone of the lungs eaſily receiving it.

The ill temper of the blood diſpoſes to it.

As to the former, it is manifeſt enough by common obſervation, that the maſs of blood being ſtuft with incongruous particles, *viz.* its proper ones degenerated, or with others from other places intermingled, doth boyl up for the expurging of them, and what is to be ſeparated, when it is not eaſily ſent away by any other ways, it is ſpread abroad into the lungs, (if they are of a weaker conſtitution) and cleaves to them.

There are many dyſcracies of the blood, and thoſe of divers kinds and affections, by by which its liquor being diſſolv'd in its conſiſtence, and as it were curdled, doth not rightly contain the ſerous and nutritive juice within it ſelf; moreover ſending away theſe and other excrementitious humours unceſſantly from it ſelf, as ſometimes it depoſits them among other parts, ſo more often into the lungs.

1. The blood ſometimes like Milk grown ſour of it ſelf, is depraved by little and little, and at length departing from its genuine faculty into a ſourneſs, and being diſſolv'd in its exiſtence, doth caſt abroad its ſeroſities (too eaſily prone to ſeparate themſelves) out of the Pneumonic and alſo Tracheal Arteries into the tracheal paſſages. Thus to ſome it is ordinary once or twice in a year, without any manifeſt cauſe to be afflicted with a grievous and troubleſome Cough, with copious ſpitting, which in a certain proceſs of time (after the blood purged from its dregs and excrements recovers its temperature) doth ſpontaneouſly abate, and after doth ſucceed a more firm and durable health. By reaſon of ſuch a Cough ſerving for a purge to the blood, I have known ſome often in a day, and eſpecially every morning, who were wont to ſpit out ſpittle like black Ink, with a ſmall endeavour of the Trachea; which diſtemper when for many months they had conſtantly labour'd under, after a greater Cough occaſionally contracted, with much and yellow ſpittle, they have afterwards eſcaped altogether free from that former black ſpittle; the reaſon whereof is, that a heavier Cough abiding with plentiful ſpitting for ſeveral days, altogether purges away thoſe melancholy fœculencies from the blood, and moreover it alters the temperament of the blood, or rather takes away the ill temperament thereof.

And ſometimes it receives a conſumptive taint from the nervous juice.

2. The nervous juice being frequently degenerated, and with an abundant lympha returning back out of the fibres and nervous parts into the blood, as it produces ill affects of the bowels, and of the reins (whereof in another place we have hinted) ſo ſometimes it cauſes a fierce and very troubleſome Cough. This kind of Cough one while is Catarrhal, inaſmuch as the Lympha having paſs'd through the maſs of blood, is depoſited in the Lungs by the arteries; another while it is convulſive, inaſmuch as the Nerves and fibres, conſtituted to move the breaſt, are poſſeſt by that liquor, and are provok'd into convulſive motions: from either cauſe either conjunct or ſeparately it comes to paſs, that more grievous paſſions of the brain and nervous kind frequently call on a troubleſom Cough, or are wholly changed into it.

And ſometimes by reaſon of a fault communicated from the Lymphæducts.

3. Beſides the faults of the blood and nervous juice, frequently exciting a Cough, it is probable that it ſometimes ariſes from the Lymphæducts being obſtructed, which belong unto the Lungs: for whereas very many Veſſels of this kind are ſpread abroad through the Lungs, whoſe function it is to receive whatſoever is ſuperfluous of the Lympha that is carryed through the Arteries into the *Præcordia*, and not immediately brought back by the veins, and to convey it to the trunk of the paſſage of the *Thorax*; if by chance it happens that theſe paſſages are ſtopt or obſtructed by viſcous matter, or compreſs'd or thickned by cold ſhould not well diſcharge their duty, it muſt needs be that thoſe watery excrements ſhut out from their wonted ſluces, or whirling back into the blood, do incite its fierce boyling up, or being poured into the paſſages of the Trachea, do ſtir up a Cough.

4. Neither

4. Neither do the humors above-mentioned only, in as much as they either pervert or hinder the craſis or motion of the blood, induce a Cough (which frequently is the beginning of a Phthiſis;) but moreover any uſual or wonted Evacuations ſuppreſſed, or let, do uſually impreſs a fault upon the Lungs. The menſtruous flux or the Hæmorrhoids obſtructed, often bleeding at the Noſe if by chance it ceaſes, Iſſues cloſed up, Puſtles, Scabs and Wheals driven back, do frequently affix a taint in the *Thorax*. If a plentiful ſpitting from the Glandules of the Mouth ſtops of its own accord, or be cured by Medicine, afterwards ſometimes a conſumptive Cough ſucceeds; wherefore the ſame is vulgarly called a Rheum, which had lately fallen from the Head into the Jaws and Throat, and thence deſtilled deeper into the Lungs; when indeed it is nothing elſe but a certain ſuperfluous ſeroſity of blood, that being uſed to be put aſide by the cephalic Arteries into the Glandules of the Mouth, now being excluded thence, is hurried through the pneumonic Arteries into the Lungs. *The fourth reaſon is uſual evacuations ſuppreſſed.*

Beſides theſe private and periodical, or extraordinary Evacuations, whoſe ſuppreſſions incline to a Cough and Phthiſis, there occurs another general and conſtant Evacuation, *viz.* inſenſible tranſpiration; which being either ſtopt or ſuppreſſed, is oftner the occaſion or parent of that evil than all the reſt. For the ſteams that uſually evaporate by the Pores of the skin being reſtrained within, ferment the blood, and ſoon pervert it, and cauſe it to be precipated into ſeroſities; which with other excrements of the maſs of blood being immediately laid aſide in the Lungs, do ſtir up a troubleſom Cough and often a conſumptive one. Hence it is a common obſervation, that the catching of a cold, by which the Pores are ſtopt, whether it be by the blowing of cold air, or being wet by rain, or leaving off cloaths, or by what other means it may come to paſs, diſpoſes very many to diſtempers of the *Thorax*. Wherefore in our Idiom the cauſe being put for the effect, a Cough is called *Catching of cold.* *By reaſon of tranſpiration hindred.*

Theſe are the chief cauſes and occaſions which occur from the blood any ways depraved, and therefore depoſiting a peccant matter into the Lungs. There follow other cauſes in regard of the Lung it ſelf, *viz.* thoſe which diſpoſe this Bowel more readily to a Cough or a Phthiſis, of which there are three ſorts. 1. An ill frame of the Breaſt. 2. An innate weakneſs of the Lungs, or hereditary diſpoſition to a Conſumption. 3. Preceding diſeaſes of the *Thorax*, as a Wound, a Blow, a Pleuriſie, a Peripneumony, Empyema, Spitting of blood, the ſmall Pox and Meaſles, *&c.* 4. The incongruity of air which is inſpired (as deſerving a place among the procatarctic cauſes.) By reaſon of any one of theſe cauſes, and ſometimes of many together, the matter provoking a Cough, proving often after conſumptive, doth eaſily aſſault the Lungs, and enters them, and frequently imprints a deadly hurt. On each of theſe we ſhall inſiſt a little. *Partly from the Lungs.* *From the breaſt ill formed.* *From the hereditary diſpoſition.* *From foregoing diſtempers of the breaſt.* *From incongruity of the air.*

Firſt therefore as to the frame of the Breaſt the caſe ſtands thus: *viz.* that the Lungs being ſtill whole and ſound, and free from any phthiſical impreſſion, may be kept for a long time in their office, it will behove that they ſtill be exerciſed with a motion that is vigorous, and with ſtretched out ſails as it were to diſcharge the ſtrong interchanges of the Syſtole and Diaſtole; to that end, that the air being plentifully ſuckt in, may be admitted to their inmoſt apartments, and from thence immediately be caſt back for the moſt part together with all the effluvia and ſooty vapours at every change of breath. Wherefore ſince the action of the Lungs doth depend much on the frame of the *Thorax*, as being the moving Engine, it muſt needs be, that by reaſon of its ill faſhioning, the function of breathing becomes defective in many things. There are two ſpecial kinds of a Breaſt ill framed, (*viz.* crookedneſs, and ſhoulders like wings) for which reaſon many are found prone to a Phthiſis: the reaſon of which is, that in any ſuch figure of the breaſt, being either depreſſed or made long, the Lungs do neither injoy a ſpace ſo free and ample, nor can the moving Muſcles be ſo ſtrongly contracted as in a ſquare breaſt. *The reaſon of the former expoſed.*

2. The innate debility or hereditary diſpoſition of the Lungs to a Conſumption is ſo frequent and vulgarly known, that when any is found inclining to a Conſumption, he is preſently queſtioned, whether his parents were not obnoxious to this diſtemper? Very many of theſe being endued with a narrow breaſt and a neck ſomewhat long, and of a conſtitution very tender, contract a Cough from the leaſt occaſion; neither can they endure a cold or moiſt air. To ſome of theſe a manſion in a City is very prejudicial, where the air is breathed in thick and ſmoaky; on the contrary, to others prone unto the ſame diſpoſition it is very friendly (the reaſon whereof we ſhall diligently inquire hereafter) To all of them a North-wind is for the moſt part an enemy, conſidering that it uſually irritates a Cough, alſo a Spitting of blood, a Pleuriſie, or Peripneu- *What an hereditary diſpoſition is.*

mony, *viz.* the pneumonic or the thoracical Veſſels being thereby ſtufft, and in the mean time the blood being rendred more turgid and ſharp, by reaſon of tranſpiration hindred, and the effluvia's reſtrained within the maſs thereof.

In what it conſiſts.

For an hereditary diſpoſition to a Phthiſis doth chiefly conſiſt in theſe two things: *viz.* 1. In regard the Patients being endued with a more ſharp and elaſtic blood, do require a more plentiful tranſpiration; which perhaps if it be leſs granted, the matter that was wont to evaporate redounds upon the infirm Lungs. 2. If the pneumonic Veſſels be too looſe and tender, they do not duly contain the Serum and other recrements of blood within the diſſolved maſs thereof, but they ſometimes ſuffer both them and a certain portion of the blood it ſelf to break out into the Tracheal paſſages: whoſe moving Fibres, when they are infirm, do not preſently turn forth what is poured out into the cavities; but they ſuffer it to abide and putrifie in the ſame place, and at length to degenerate into black filthy gore corruptive both of the Lungs and blood.

What the conſumptive diſeaſes of the breaſt are.

3. A Phthiſis is ſometimes the product or conſequent of ſome other previous diſtempers of the Breaſt. Thoſe conſumptive paſſions chiefly are Empyema's, Pleuriſies, a Peripneumony, and Impoſthume of the Lungs; and ſometimes the ſmall Pox, Meaſles: alſo irregular Feavers ill or ſlightly judged, do cauſe the ſame effect. The chief of theſe diſtempers, or at leaſt thoſe which are proper to the *Thorax*, together with the rendring the reaſon of the cauſes, and how they diſpoſe to a Conſumption, ſhall be declared hereafter, with the reaſons and manner of procedure; in the mean time we are to take notice, that this kind of fault is common to them all, that is to ſay, they diſſolve the unity and weaken the tone of the Lungs, and pervert the temperature of the blood; whence whatſoever incongruous or diſtempered thing is poured out upon them from its depraved maſs, they do eaſily admit thereof, and difficultly or not at all drive it back.

The influence of the air for exciting a Conſumption.

4. The procatarctic cauſes of a Phthiſis being now explained, *viz.* thoſe which conſiſt as well from the blood as the Lungs, there is another common to them both, which may be juſtly added, and (although altogether extrinſec) hath great affinity with them both, *viz.* the condition or temper of the air breathed in. For ſuch is the influence hereof to ſome conſumptive perſons, that the cauſe of the diſeaſe is ſometimes wholly aſcribed to the incongruity of the air wherein they dwell, and for a cure the alteration of air or ſoil is preferred to all other remedies whatſover. Hence many of our Country troubled with a Cough, or being in a Conſumption, flock to the Southern parts of *France*; and others in the mean time who cannot go beyond Sea, or will not, preſently haſten to remove out of the City-ſmoke into the Country as to a moſt undoubted refuge: wherefore all our Villages near *London*, which injoy a clear and open air, are eſteemed as ſo many Spittles for conſumptive perſons. Notwithſtanding all do not alike receive help from ſuch a change of places; for many either paſſing to *France* or to Country Villages, do in thoſe places rather find their graves than health. And therefore *London* is not preſently to be forſaken by all phthiſical perſons: for I have known many obnoxious to a Cough or Conſumption to have enjoyed their health much better in this ſmoaky air than in the Country. So that for cure of the ſame diſeaſe, while ſome avoid this City as Hell, others flye to it as to an *Aſylum*.

The groſſer and City-air to ſome conſumptive perſons healthful, to others hurtful.

The reaſon whereof is inquired.

The reaſons of theſe things do clearly appear out of the Doctrine of Breathing before handled; for we do demonſtrate the blood paſſing through the Lungs, both as to its kindling or vitality, and as to its motion doth chiefly depend on nitrous air ſuckt in; whence it is a conſequence, that the tenor of this ought to be ſo proportioned to the temperament of that, that the blood being moderately kindled within the *Præcordia*, may burn out clearly and vigorouſly, as well without ſmoak and ſootineſs as without too intenſe a flame, and that it may paſs the pneumonic Veſſels freely, and without any hindrance or leaving of recrements. Wherefore a moiſt, fenny, and cloſe air, as it is healthful to none, ſo to them that cough it is eſpecially hurtful; on the contrary, a ſerene and mild air, moderately injoying the Sun and wind, as it is healthful to all perſons, ſo it is friendly to all conſumptive perſons. As to other conditions of the air, ſome eſcape a Cough, or loſe it living in mountainous places expoſed to the Sun, where the impendent Atmoſphere being free from all thick, ſmoaky, and feculent vapours whatſoever, abounds with nitrous particles: for thoſe whoſe thick and feculent blood abounds with an impure Sulphur, to kindle this duly and to waſte the dreggineſs, there is need of a very thin and nitrous air. If the Lungs be not too tender, but firm and ſtrong, they endure the more fierce aſſaults of its particles; on the other ſide, they who have a thin and ſubtil blood, eaſily diſſolvable and endued with a more

pure

pure but very little Sulphur, and having tender and ſoft lungs, very ſenſible, and of a finer texture; theſe perſons being impatient of a nitrous and ſharper air, are moſt at eaſe and beſt in a thick and more ſulphureous one. Wherefore it conduces to theſe perſons, that they breathe the groſs and more fat air of a ſmoaky City; which to an impoveriſhed and more thin blood, doth afford Sulphur (which fails ſometimes) and alſo Nitre, and doth ſomething thicken and fix its ſubtile conſiſtence; moreover it dulls the ſubſtance or texture of a Lung too much ſenſible and more thin, and is a defence againſt the invaſions of a more ſharp and improportionate Air. It is manifeſt by frequent experience, that a thicker Air, provided it be ſulphureous, proves very benign to ſome phthiſical perſons (that I do not ſay to all.) It is a common obſervation, that a Conſumption ſeldom infeſts thoſe Regions either in *England* or *Holland*, where fires are nouriſhed by turff, and do breathe a very ſulphureous odour, yea rather thoſe places are chiefly wholeſom and frequently ſanative to perſons obnoxious to a Phthiſis, or labouring under it. To which we may add, that a ſuffumigation of Sulphur and Arſenic (which is filled with much Sulphur) is reputed for the curing of almoſt incurable Ulcers of the Lungs, although the laſt, yet the moſt efficacious remedy. Moreover add to this, that pectoral Medicines prepared of Sulphur are far to be preferred to any other; ſo that Sulphur is juſtly reported by Chymiſts to be the Balſam of the Lungs. By what order and by what means theſe Medicines do work, and ſo notably help in diſeaſes of the *Thorax*, we ſhall hereafter make diligent ſearch into: in the mean time that ſulphureous Air is found helpful to certain phthiſical perſons, the reaſon conſiſts in theſe two things; *viz.* in the firſt place, as we now intimated, from ſuch an Air ſuckt in there is help brought to the jejune and depauperated blood and to the tender Lungs. Secondly, that the ſulphureous Particles being ſuckt in with the nitrous, do provide againſt, or take away the acidities of any of the humours (by which their flowings and extravaſations into the Lungs do chiefly ariſe.) And for this reaſon it is that ſulphureous Medicines, being alſo taken inwardly, do confer ſo excellent a help to them that cough or are phthiſical: and therefore Sulphur, as I now hinted, hath the report of being the Balſam of the Lungs. For as balſamic things applied to an Ulcer or Wound extinguiſh the acidity of the Ichor there ſweating out and corrupting and paining the little Fibres, ſoon eaſe the pain, and afterwards heal the wound; ſo alſo the ſulphureous Particles, paſſed into the Lungs either with the air or with the blood, in as much as they provide againſt or aboliſh the acidities of all humors, *i. e.* the blood, the Serum, the Lympha, the nervous or nutritive Juice, they conduce to the prevention or cure of a Conſumption. We ſhall in what follows more at large declare the cauſe, when ſulphureous Medicines ſhall be particularly treated of.

A ſulphureous air healthful to ſome conſumptives.

Sulphureous Medicines chiefly agreeing.

The reaſon thereof diſcourſed.

The conjunct and procatarctic cauſes of a Phthiſis being thus handled, it will not be neceſſary to diſcourſe much touching the evident cauſes. For in what manner a cloſing of the Pores by cold, a ſurfeit or tipling, and other errours of ſeveral ſorts, in the ſix non-naturals, diſpoſe to thoſe diſtempers, and ſometimes preſently do bring them, is ſo clear, that it needs no explaining. Neither is there any reaſon we ſhould be long delayed about the Semiotical part of this diſeaſe; nevertheleſs it is fit we obſerve the divers ſtates or diſtinctive ſigns which certainly belong unto it. 1. When it is meerly a Cough. 2. When it begins to degenerate into a Phthiſis. 3. When it is a perfect and almoſt deſperate Phthiſis. From which things duly deſigned, the Prognoſtic of the above-mentioned affections will be very apparent.

The three times or diſtinct ſtates of a Cough.

1. And in the firſt place what belongs to a new Cough, and as yet alone, this taking its riſe from any cauſe whatſoever in bodies prediſpoſed to a Phthiſis, will ſcarce ever be free from the ſuſpicion of danger; but in a ſtrong man, and one who hath often before endured a Cough Scot-free, it will not be immediately to be feared: for when being ſtirred up from a more forcible evident cauſe, without Feaver or indiſpoſition of the whole body, it ſhall not be very troubleſom, then it meerly paſſes for a cold being taken, and is altogether neglected, or in a ſhort time is wont to be finiſhed without many or very conſiderable Remedies. Moreover if a ſmall Feaver with thirſt and want of appetite accompany this, there is hope that the blood being reſtored to its due temperament, the Cough then will ceaſe of its own accord: but if it be protracted longer, and not eaſily yield to vulgar Remedies, and produces much ſpitting, and that diſcoloured, it muſt not be any longer neglected, but be provided againſt by a method of healing, and by fit remedies and an exact courſe of diet. For then it may well be ſuſpected, that the Lungs being prejudiced in their ſtructure, do not circulate the blood entirely, but let fall the Serum and Lympha, and frequently

When new, there is no ſuſpicion of a Conſumption.

frequently the nutritive Juice; and moreover thoſe humors ſo laid aſide do putrifie; and from thence the blood is defiled, which by a reciprocal hurt prejudices again the Lungs.

When it begins to induce a Conſumption.

2. But if to a Cough growing daily worſe and worſe with plentiful and thick ſpittle, a languiſhing and pining of the whole body, loſs of appetite, difficult breathing, thirſt, and fervent heat of the blood be added, there is great cauſe of ſuſpicion that it is come at leaſt to the firſt limits of a Phthiſis (if not further.) Wherefore it will behove us to uſe all means, whereby the Lungs may be freed from the great quantity of matter heaped up together, and be defended from its continual aſſault or invaſion; and alſo that the maſs of blood may be cleanſed from all dregs, and reſtored to its due temperament whereby it may rightly contain its ſeroſities and other humors within it ſelf, or transfer them to ſome other place than to the Lungs.

When it becomes a confirmed Conſumption.

3. But if, beyond the ſtate of this diſtemper now deſcribed, plenty of ſpittle, and that diſcoloured, ſhall be daily increaſed, and all other things growing worſe and worſe, a dejection of the whole ſtrength, and a hectic Feaver with a continual thirſt, night Sweats, an Hippocratical face, an utter decay of the fleſh almoſt to the drineſs of a Skeleton, happen upon all theſe, then for the moſt part no place is left for Medicine, but only a dreadful prognoſtic; at leaſt all hope of Cure being waved, we muſt inſiſt upon Anodynes, whereby an eaſie death may be procured.

The curing method, and firſt againſt a beginning Cough.

What therefore belongs to the cure of a Cough in general, according to the three above-mentioned ſtates of this diſeaſe, a threefold method of healing ought to be appointed, *viz.* that bounds as it were being ſet, we may more diſtinctly preſcribe what is to be done for the cure of a Cough, whilſt being on this ſide the limits of a Phthiſis, it paſſes only for a cold catched. 2. What manner of healing to a beginning Phthiſis. 3. What to a Phthiſis conſummated, or deſperate.

1. Although againſt a new Cough for the moſt part there are uſed only Remedies Empirical, and ſcarce any of the common people but are furniſhed with many and divers of this ſort, which every where without the advice of a Phyſician very many confidently take, and without method, and give them to others: yet men of a delicate conſtitution, or inclining to a Conſumption hereditarily, or ſometimes formerly in hazard from a Cough, ought immediately to provide againſt the firſt aſſaults thereof, and readily betake themſelves to the Precepts of Phyſick; according to which, that the method of healing may be duly inſtituted, the curatory indications ſhall be chiefly theſe three; *viz.* 1. To appeaſe or take off the diſorder of the blood, from whence the fluxes of the Serum do proceed. 2. To derive the excrements of the blood and all *exuviæ*, apt to ſeparate from it, from the Lungs to the Pores of the skin, or to the urinary paſſages, and into the other Emunctories. 3. To ſtrengthen the Lungs themſelves againſt the reception of the Serum and other humors, and alſo to defend them againſt the invaſion of outward cold, whereby they are wont to receive further hurt. Upon each of theſe we ſhall treat a little more plainly.

Three indications.

The firſt reſpects the effervescence of the blood.

1. The firſt indication reſpects as well the boiling up of the blood, wherein by reaſon of the effluvia's reſtrained, it grows too fervently hot, and boils in the veſſels; as its diſſolution, whereby being ſolved in its conſiſtence, it lets go too much Serum and other humors from its embraces. For the taking away of both, a thin diet muſt be appointed, and, the injury from outward cold carefully declined, a little more ſweating ought to be procured, or at leaſt the accuſtomed reſtored. To this end let the Patient put on thick garments, and let him keep his bed or chamber, at leaſt let him hardly go out of his houſe, evening and morning let a ſmall breathing Sweat be provoked by Poſſet-drink boiled with Roſemary or Sage. If notwithſtanding all this the Cough increaſes, Phlebotomy, if the ſtrength and conſtitution will bear it, is often uſed with ſucceſs: after which Hypnoticks for the moſt part help, in as much as they retard the motion of the heart and conſequently the too precipitate courſe of blood: moreover they cauſe it to circulate in the pneumonic Veſſels gently and mildly without any great throwing out its ſeroſities, and to ſend away what is ſuperfluous either by Sweat or Urine. To this purpoſe pectoral Decoctions are alſo to be adminiſtred, in as much as they deſtroy the acidity of humors, and hinder the diſſolution of the blood, and its melting into ſeroſities. By the like reaſon and manner, Medicines prepared of Sulphur do ſo ſignally help againſt a Cough.

The ſecond reſpects the derivation of the Serum and other excrements from the Lungs.

The ſecond indication, *viz.* that the Serum and other recrements of the blood, derived from the Lungs, may be evacuated by other ways, is performed by Diaphoretics, Diuretics, and mild Purgers; which ought to be mixed with other Remedies,

or

or now and then uſed alone. Wherefore after Phlebotomy we uſe to preſcribe a gentle Purge, and ſometimes to repeat it. Among the Ingredients of the pectoral Decoction let the Root of Chervile, Butchers-broom, Elicampane, and other things that provoke Sweat and Urine be put. Hog-lice, volatile Salt of Amber, and other fixed Salts and Powders of Shells made into Pills with Turpentine are often given with ſucceſs.

The third intends the ſuppreſſing the Catarrh and ſtrengthing the Lungs.

The third indication, that the Lungs and their paſſages might be defended againſt the flowing of humors, the encountring of cold, and the ſuppreſſion of the Catarrh, as they commonly call it, is performed by Linctus's, Lohochs, and other private Remedies, and chiefly reſpects two things; *viz.* that the mouths of the Veſſels and Glandules opening into the *Trachea* be ſhut with moderate Aſtringents, leſt they ſhould too much caſt out the ſeroſities into it: and ſecondly, that the ſides of the Tracheal paſſages may be made ſmooth and glib, that neither from the pouring out of the ſharp Serum, nor invaſion of any outward cold they may be offended, and continually provoked into a troubleſome Cough; and moreover when thoſe paſſages are made ſlippery enough, the ſpittle ſometimes obſtinately cleaving to their ſides, might be the more eaſily coughed out. For the firſt intention it is, that Conſerve of red Roſes, Olibanum, Maſtich, Lohoch of Pine tree, Syrup of Jujubes, of dried Roſes, of Cup-moſs, and other Aſtringents are often put into the forms of Pectoral Preſcriptions. For the ſecond intention Liquoriſh, with the divers preparations thereof, is reputed a famous Remedy againſt any Cough: for this purpoſe Syrups and Lohochs, and all other ſweet Pectorals ſeem to be ordained. To which is added Oyl of ſweet Almonds, either adminiſtred by it ſelf, or brought with pectoral Syrups after a long ſtirring of them together into a milk-form liquor.

Forms of Medicines which are moſt in uſe.

Theſe are the chief Therapeutic indications, together with the apt intentions of healing, which ſeem chiefly to be of uſe for a new Cough, while as yet we have no ſuſpicion of a Phthiſis, or at leaſt that it ſubſiſts without the manifeſt limits thereof; it now remains, after this general method briefly ſhadowed out, that we ſubjoin certain choice forms of Medicines appropriated to every intention. Theſe, though they are manifold and of divers preparations, yet thoſe which are of chiefeſt note and moſt in uſe, are Mixtures, Linctus's, Lohochs, Tinctures, Balſams, Troches, Lozenges, Powders, Pills, Decoctions, and diſtilled Waters. Of each of theſe we ſhall ſet down ſome choice Receipts.

1. Mixtures.

Take of Syrup de Macemo, of Jujubes, of each an ounce and half; of powder of Olibanum a dram, the water of Earth-worms, or of aq. Hyſterica, or Paony compound a dram, mingle them. The Doſe is one ſpoonful at bed-time and after midnight.

Take of the water of Snails, of Earth-worms, of each an ounce and half; of the liquid Laudanum Tartarizated two drams, Syrup of Violets an ounce. The Doſe is one ſpoonful at bed-time.

Take of Snail-water ℥vj. *Syrup of the juice of ground-Ivy,* ℥ij. *Flower of Brimſtone* ʒß. *mix them. The doſe is one ſpoonfull at bed-time, and ſoon in the morning.*

Take of our ſyrup of Sulphur 4 ounces, Water of Earth-worms 1 ounce. Doſe 1 ſpoonfull after the ſame manner.

2. Linctus's.

Take of ſyrup of Jujubes, Maiden-hair of each one ℥ *and half, ſyrup of red Poppys 1 ounce, mix them; to be lick'd with a Liquoriſh Stick.*

Take Oyl of Sweet-Almonds freſh drawn, Syrup of Maidenhair, of each 1 ounce and half, white Sugar-candy 2 drachms, mix them by beating in a Glaſs-morter, or ſhaking them in a Glaſs Vial till it wax white.

3. Lohochs.

Take Conſerve of red Roſes 2 ounces and half, Lohoch Sanum 1 ounce and half, Spec. Diatragacanth. frig. 1 dram and half, flowers of Brimſtone half a dram, Syrup of Violets or red Poppyes as much as ſufficeth, let it be made a ſoft Lohoch. Doſe 1 dram and half at night and early in the morning; at other times to be licked with a Liquoriſh ſtick.

Take of the powder of the leaves of Hedge-muſtard, or Rockets, 1 ounce and half, clarified Honey 4 ounces, mix them for a Lohoch, let it be adminiſtred after the ſame manner. It agrees with cold Conſtitutions.

4. Tinctures.

4. Tinctures.

Take of Tincture of Sulphur, without empyreuma 3 drams, Doſe from 6 drops to ten in the evening, and early in the morning in 1 ſpoonfull of Syr. of Violets, or of the juice of ground-Ivy; I ſcarce know a more excellent remedy for any Cough, provided there be no feaver.

Take of Tincture of the Sulphur of Antimony 2 drams, Doſe 20 drops evening and morning in one ſpoonful of the pectoral Syrup.

Take of the Tincture of Gum Ammoniack (prepar'd with the Tincture of Salt of Tartar) 1 ounce, Doſe from 15 drops to 20. After the ſame manner the Tinctures of Galbanum, Aſſa fœtida, Gum of Ivie (prepar'd after the ſame manner) are proper for a Cough in any cold conſtitution.

5. Balſams.

Take of Opobalſamum 2 drams, Doſe from 6 drops to ten in a ſpoonfull or two of Hyſſop, or Penny-royal, or any other Pectoral water.

Take of the Balſam artificially diſtill'd, commonly call'd the Mater Balſami, *two drams, Doſe from 6 drops to ten in one ſpoonfull of Syrup of Violets or Canary Wine evening and morning.*

Take Balſam of Sulphur two drams, the doſe from five drops to ten after the ſame manner.

Take of Balſam of Peru *one dram, Doſe from two drops to 4 or 6 in Conſerve of Violets.*

6. Troches.

Take of the Species of Diatragacanth. frigid. ℈ß. Liquoriſh ʒj. flower of Sulphur ℈ij. flower of Benzoin ℈j. Sugar Penids ℈iij. make a Paſte with the diſſolution of Gum Tragacanth in Hyſſop-water, form it into troches of the weight of ʒß. Take one often in the day or in the night.

Take of the ſeeds of white Poppies ʒvj. of the powder of the flowers of red Poppies ʒj. extract of Liquoriſh *ʒij. milk of Sulphur ʒß. Sugar Penids ℈ij. with mucilage of* Quince-*ſeeds make a Paſte, and form it into troches.*

Take of the Species Diaireos, *of the lung of a Fox, of each ʒß. Sugar Penids ℈ij. with the diſſolution of Gum Tragacanth, make them into Troches.*

Take of powder of Elicampane, Anniſeeds, Liquoriſh, *of each ʒij. flower of Brimſtone ʒj. of Tablet Sugar ℈iß. juice of* Liquoriſh *diſſolv'd, as much as will ſuffice, make Troches.*

7. Lozenges.

Take of the Species Diatragacanth. frigid. ʒiij. powder of the flowers of red Poppies, milk of Sulphur, of each ʒß. of Sugar diſſolv'd in Poppy-water, and boyl'd to make Tablets, ℈iiij. form lozenges of ʒß. weight.

Take of Species Diaireos, *of the lung of a Fox, of each ʒiij. flower of Brimſtone, powder of Elicampane of each ʒß. of the whiteſt Benzoin ʒj. make them in a fine powder, adding of Oyl of Anniſeeds ℈j. Sugar diſſolved, and boyled to a height to make lozenges ℈viij. for lozenges of ʒß. weight.*

8. Powders.

Theſe though more ſeldom, yet are ſometimes given with ſucceſs in a Cough, and pneumonic diſtempers.

Take of the tops of Ground-Ivy ſomewhat reddiſh, a ſufficient quantity, bruiſed let them be form'd into a Cake, which dryed preſently in the hot Sun, reduce into fine powder, and keep it in a glaſs. This Plant keeps its virtue with ſmell and taſte longer than any either Conſerves or Syrups, and greatly profits in a grievous and pertinacious cough. Take from ʒß. to a dram, in diſtill'd water, or pectoral decoction twice in a day.

After

After the ſame manner Powders of other pectoral Plants are prepared, and taken with benefit.

Take of Cup-moſs or chin-cups ℥iij. milk of Sulphur ℥ j. Sugar-candy ℥ß. make a powder; the doſe from ℈ j. to ℥ſs. twice in a day. This powder is given with great benefit to thoſe labouring with a chin-cough.

Take of the flour of Brimſtone, Olibanum, *Ceruſe of Antimony, of each ℥ ij. divide it into* xii. *parts, take one part in the morning, and another in the evening in a ſpoonfull of a convenient vehicle.*

9. Pills.

Take of Aloes roſata, *or rather of* Ruffus's *his Pill, flower of Brimſtone of each one dram and half, flowers of Benzoin ℈ j. Juice of* Liquoriſh *diſſolv'd in as much Snail-water as will ſuffice to make a maſs, form it into ſmall pills to be taken 4. at night, to be repeated every or every other night.*

Take of powder of Elecampane, Liquoriſh, *flower of Brimſtone, of each one dram, flowers of Benzoin half a dram, Tarr as much as is ſufficient, form it into ſmall pills, the Doſe 3 or 4, evening or ſoon in the morning.*

Take of Millepedes or Hogs-lice prepared ℥ ij. the powder of the ſeeds of Nettles, Burdock of each half a dram, Oyl of Nutmegs diſtilled ℈ j. Salt of Amber half a dram; Juice of Liquoriſh *what will ſuffice, form it into ſmall Pills, take three in the morning and in the evening.*

10. *Decoctions.*

Theſe are taken either by themſelves, or with the addition of Milk. Among thoſe which are of the firſt kind, 1. The Pectoral Decoction according to the *London Diſpenſatory*, offers it ſelf. Which is taken twice a day from ℥ iiij. to vj. or ℥ viij.

Take of the leaves of Ground-Ivy, white Maiden-hair, Harts-tongue, Coltsfoot, Agrimony, of each one handfull, Roots of Chervil, *Knee-holm, of each one ounce,* Carthamus *and ſweet Fennel ſeeds, of each half an ounce, boyl them in 6 pints of Spring-water to the conſumption of half, adding towards the end* Liquoriſh *three drams, Raiſins ſtoned two ounces, Jujubes,* n° vi. *or clarified Honey three ounces, make an Apozeme, clarifying it with the white of an Egge; Doſe 6 ounces warm, 2 or 3 times in a day.*

Decoctions taken with Milk, are uſed morning and evening inſtead of Breakfaſt and Supper, according to the manner following.

Take the flowers of greater Daiſies one handfull, three cleanſed Snails, half an ounce of candied Eringo roots, Barly 3 drams, boyl them in a pint and half of water to a pint. Take 6 or 8 ounces warm, adding a little milk; and afterwards the quantity encreaſed by little and little.

After the ſame manner, Cup-moſs, Ground-Ivy, St. *John's*-wort, and other pectoral herbs are boyl'd and taken with Milk.

The Decoction of Woods often does conduce much to the cure of a ſtubborn Cough, eſpecially if appointed in the place of Beer, for ordinary drink, and taken for ſome time.

Take of the roots of Sarſaparilla 4 ounces, China two ounces, white and red Sanders of each half an ounce, ſhavings of Ivory and Harts-horn of each 3 drams, let them be infuſed, and boyled from 8 pints of Conduit-water to 4, adding Liquoriſh *6 drams, Raiſins ſtoned an ounce and half; in a phlegmatick or colder conſtitution, adde of ſhavings of* Lignum vitæ.

11. *Diſtilled Waters.*

Every one may compound manifold and divers forms of theſe as occaſion requires, and appoint according to the conſtitution of the patient, ſometimes ſimple Milk, ſometimes Milk with ſome part of Wine, ſometimes Ale, or *Brunſwick* Mum. For a Sample we will preſcribe the form of theſe.

Take

Take of the leaves of ground-Ivy, Hyſſop, Penny-royal, of each four handfulls, of Snails half-boyl'd in their ſhells two pounds, Nutmegs ſliced no. vj. *Upon all being cut ſmall pour eight pints of freſh milk, let it be diſtilled in the common Organs,* i. e. *a Pewter-Still.*

The doſe 3 *ounces twice or thrice in a day by it ſelf or with ſome other Medicine.*

Every doſe let it be ſweetned when it is taken with Sugar-candy, or with the ſyrup of the juice of Ground-Ivy.

In a conſtitution leſs hot, eſpecially if there be no fervent heat of the blood or *Præcordium*, to ſix or ſeven pints of Milk, adde one pint or two of Canary wine; and in a phlegmatick or old body, inſtead of Milk let the *Menſtruum* be Ale or *Brunſwick* Beer, *i. e.* Mum.

Moreover, in Winter-ſeaſon when Snails cannot eaſily or ſcarcely be procured at all, there may be ſubſtituted in their ſtead Lambs or Sheeps Lungs, alſo ſometimes Calves, being half-boyl'd and cut ſmall, with the forementioned ingredients, and a fit *Menſtruum* being added, let them be diſtilled in common Organs, or Roſe-ſtills.

The convulſive Cough of children call'd the Chin-cough.

To this form, treating of a Cough not yet arrived to a Phthiſis, ought to be referred the convulſive or ſuffocating Cough of children, and in our Idiome called the *Chin-cough*. This aſſaults chiefly Children and Infants; and at certain ſeaſons, *viz.* Spring and Autumn eſpecially, is wont to be epidemical. The diſeaſed are taken with frequent and very fierce fits of Coughing, wherein namely the Organs of breathing do not only labour in pain, but alſo being affected convulſively, they do variouſly ſuſpend or interrupt their actions; but for the moſt part the Diaphragma convulſed by it ſelf, or by the impulſe of other parts, doth ſo very long obſtinately continue the Syſtole, or Diaſtole, that Inſpiration, or Expiration being ſuppreſs'd for a ſpace, the vital breath can ſcarcely be drawn; inſomuch that coughing as being almoſt ſtrangled they hoop, and by reaſon of the blood ſtagnating, they contract a blackneſs in their countenance; if perhaps, thoſe organs not in ſuch a meaſure convulſed, they are able to breathe any thing freer, notwithſtanding they are forced always to cough more vehemently and longer, untill they wax faint.

The reaſon thereof.

The formal reaſon or conjunct cauſe of this diſeaſe, conſiſts in theſe two things, *viz.* that there is preſent a quick and vehement irritation of the lungs, whereby they are almoſt continually incited to throw off ſomething troubleſom by Cough; and alſo that the motive parts of the *Thorax*, *viz.* the Nerves and nervous fibres being prediſpoſed to convulſions, as often as they are irritated, do excite a Cough not regular but convulſive, and ſuch as is oppoſite or injurious to the uſual function of breathing.

The cauſe partly a Catarrh.

The matter provoking the lungs ſo frequently into a Cough ſeems to be the *Serum*, unceſſantly ſoaking out of the maſs of blood, by reaſon of its frame being too much looſened, and troubling the parts belonging to the breaſt, inaſmuch as it deſtills as well through the tracheal arteries into the hollowneſs of *aſpera arteria*, as that it is poured in plentifully through the pneumonic arteries into all the open paſſages.

A convulſive diſpoſition of the parts of the breaſt.

The convulſive diſpoſition of the moving parts, as in other convulſive diſtempers, ſeems to proceed from a heterogene and elaſtic matter falling from the brain through the nervous paſſages, together with the nervous liquor, into the ſmall moving fibres of the breaſt; wherefore, when the ſpirits that are contained in thoſe little fibres, are ſtirr'd to perform violent motions of breathing out, they paſs into convulſive motions.

The prognoſtick of this diſeaſe.

What relates to the Prognoſtick of this diſtemper, this Cough although it be ſeldom very dangerous or mortal, yet it remains very difficult of cure; and frequently it rather ceaſes by change of the ſeaſon than is extinguiſhed by remedies. The cauſe whereof is, that here not, as in an uſual Cough, the blood onely ought to be altered, and its recrements to be derived out of the Lungs, to be conveyed to the habit of the body by ſweating, but moreover an amendment of the nervous juice ought to be procured.

Cures firſt Empirical.

About the curing of this diſeaſe, the way of healing uſed in other kinds of Coughs doth rarely profit here; wherefore old women and Empiricks are oftener conſulted than Phyſitians, and the rational curatory method being poſtponed and neglected, remedies for the moſt part onely Empirical are brought into uſe.

Among the many remedies of this kind, theſe two following are preferr'd to all others, and chiefly wont to be uſed; *viz.* Cup-moſs or Chin-moſs or Chin-cups, and the various preparations thereof and compoſitions are taken inwardly, and if there

ſhall

ſhall be need of any further medicine, that ſome Bugbear being preſented, the Child labouring with it may be caſt into a ſudden fright. But if the wiſhed ſucceſs be wanting to adminiſtrations of this ſort, Ptiſans, Syrups, Julips, or Decoctions, and other pectoral helps are rejected, and frequently they deſiſt from all other Medicines, expecting untill the diſeaſe either at length of its own accord determine, or be cured by reaſon of the ſucceeding change of the year.

1. Chin-cups or Moſs is in moſt common uſe in our Countrey againſt the Coughs of Children, and is vulgarly enough known as to its form and manner of growing. It is of an aſtringent nature (as far as we gather by its taſte) and contains in it ſelf particles ſomewhat ſharp and biting, and ſmelling of plenty of volatile Salt: from whence we may ſafely conjecture that its uſe is to fix the blood, and to appeaſe the fluxes of *Serum*, and moreover by volatiliſing the nervous juice, to take away the convulſive diſpoſition. It is uſually adminiſtred in form of Powder, Decoction, and Syrup, according to the following Receipts. *Chin-cups a great remedy.* *The reaſon wherof is inquired.*

Take of Chin-cups in powder one dram, Sugar-Candy one ſcruple, mix them, divide it into three or four parts, take a doſe morning and evening with a fit vehicle.

Take of the ſame Cup-moſs two drams, milk of Brimſtone two ſcruples, powder of Anniſeeds one ſcruple, divide it into ſix parts to be taken as the former.

Take of the ſame Chin-moſs or cup-moſs one dram boyled in milk for one doſe; take it morning and evening. To thoſe with whom milk doth not agree, or to whom it little profits, let it be boyled in Spring-water or Hyſſop-water, or in any other pectoral water, and let it be given from two ounces to four, twice in a day, ſweetning it with Sugar or ſome fit Syrup.

Take of this Muſcus Pyxidatus or chin-moſs one ounce, boyl it in two pints of ſome pectoral water to the conſumption of half: To it ſtrained adde of Sugar-Candy one pound, and evaporate it in a gentle bath, to the conſiſtence of a ſyrup.

2. The other remedy for the convulſive Cough is wont to be, that they be caſt into ſome ſudden fright; from hence, whenas medicines effect leſs, with the vulgar it is a familiar practice, that, to fright them, while a great Mill is driven about with a ſcreeking noiſe, and a dreadful aſpect of the wheels, the diſtempered be put into the Trough or Receiver of the Grain or Corn, and from thence the ſudden cure of this diſeaſe ſometimes happens. The reaſon whereof without doubt conſiſts in this, that the Animal ſpirits being put to flight and forced into freſh diſtractions, they relinquiſh their former diſorders; moreover, the convulſive matter is either diſſipated by that diſturbance, or is forced into other nerves where it is leſs troubleſome. *Frights profit in this Cough.*

The Empirical cure of this diſeaſe being deſcribed after this manner, together with the remedies vulgarly uſed, and the rendring a reaſon of the cauſe at leaſt probably unfolded, from hence it will be lawfull to deſign a rational method of curing, and perhaps more efficacious againſt childrens Coughs of this kind. Wherefore, in ſuch a caſe ſometimes ſucceſſefully enough I have preſcribed according to the following forms. And ſeeing we ought to begin with purging, *The rational cure.*

Take of the ſyrup of Peach flowers one ſpoonfull, of Aqua Hyſterica one ſcruple, mix it, and let it be taken with government. Purging.

Or, take of Mercurius dulcis 6 *grains, Scammony prepared with Sulphur, Reſine of Jalap, of each three grains; make a powder, give it in a little Pulp of a preſerv'd Cherry to a lad ſix years old, and let the doſe be encreaſed or leſſened according to the age, let the Purge be repeated in 6 or 7 days.*

If the Patient (as it often happens) be prone to vomit, Take of Oxymel of Squils 6 drams, Salt of Vitriol 4 grains, mix it for a child of ſix years old, and according to this proportion let the doſe be accommodated to others. I have known a Vomit of this kind taken every morning for four or five dayes together with good ſucceſs.

Veſicatories or Medicines drawing bliſters are in daily uſe, and are applyed ſometimes to the *Nucha* or nape of the neck, another while behind the ears, then to the inſide of the arms near the arm-pits, and as ſoon as theſe ſores begin to heal in theſe places, let others be raiſed in other places. *Veſicatories.*

Inſtead of Beer let the following Decoction be uſed for ordinary drink.

Take China-roots an ounce and half, of all the Sanders of each half an ounce, the ſhavings of Ivory, and Harts-horn of each three drams, let them be infuſed and boiled in ſix pints of ſpring water to the conſumption of half, adding Raiſins ſtoned an ounce and half, Liquoriſh three drams.

Mixtures. *Take of Spirit of Gum Ammoniac with Salt Armoniac a dram, Syrup of Chin-moſs three ounces, Aq. hyſterica an ounce: the doſe is a ſmall ſpoonful in the evening and morning faſting.*

Or, *Take of tincture of Sulphur two drams, doſe three drops in the evening and firſt in the morning in a ſpoonful of the Syrup of Cup-moſs.*

To ſome endued with a hot conſtitution, and while they cough their countenance is ſpread with redneſs, or rather blackneſs, I have preſcribed Phlebotomy or drawing of blood with Leeches to two or three ounces with good ſucceſs.

Take Hog-lice living and cleanſed two ounces, powder of Aniſeed a dram, Nutmeg half a dram, fine Sugar an ounce, bruiſe them together, and pour upon them ſix ounces of Hyſſop-water, of Magiſtral Snail-water two ounces, ſtir them together a little, and preſs them out hard: the doſe two or three ſpoonfuls twice a day.

Hitherto of a Cough and its Remedy, while it is only an entrance to a Conſumption; now it remains to treat throughly of the diſtemper it ſelf, having paſſed the limits of this dangerous diſeaſe, and to deſign a method of curing, and the forms of remedies, which are proper to heal an inveterate Cough, when either being neglected, or not eaſily giving place to remedies, it begins to degenerate into a Phthiſis; namely when it arrives to that ſtate, that the blood being diſſolved in its conſiſtence, doth not only pour out the ſuperfluous Serum, but alſo the nutritive Juice, and perhaps the nervous, the Lympha, and other its ſuperfluities on the Lungs, and lodges them within its paſſages; and in the mean time the corruption of the Lungs is ſo much increaſed, that the little Bladders being diſtended, or many of them broke into one, ſo that a ſolution of continuity or an Ulcer being cauſed, a greater plenty of corruption is daily heaped in; and moreover the matter in that place gathered together, becauſe it is ſuffered to abide there long, putrifies, and for that reaſon doth ſtill more corrupt the Lungs themſelves, and defile the blood flowing through. In this caſe the Therapeutical indications ſhall be chiefly theſe three: *viz.* in the firſt place to ſtop the diſſolution of the blood, which is the root of all this evil, and to make proviſion that it pour not out the matter any longer in ſuch abundance upon the Lungs. Secondly, by expectorating the purulent matter heaped up within the Lungs, and to evacuate it quickly and ſufficiently. Thirdly, to ſtrengthen and dry the Lungs looſned from their unity, or being too looſe or moiſt or otherwiſe infirm, leſt they be daily more and more corrupted, and give more reception to the morbific matter. Every of theſe indications ſuggeſts various intentions of healing, and requires remedies of divers kinds and many ways of adminiſtrations. The chief of which we ſhall here briefly treat of.

Of what ſort the beginning of a conſumptive Cough is.

Three indications concerning its cure.
1. *To ſtop the diſſolution of the blood.*
2. *To draw out the filth from the Lungs.*
3. *To heal the Lungs hurt.*

1. Therefore what the firſt indication ſuggeſts, that the diſſolution of blood may be prohibited, theſe three things (as much as may be) ought to be procured: *viz.* Firſt that the maſs of blood may contain and aſſimilate whatſoever of nutritive juice it may be furniſhed with; and that it be ſo proportioned, that it neither offend in quality nor in quantity. Secondly, that the acidities either generated in the blood, or poured into it from ſome other place, may be ſo deſtroyed, that the blood retaining as yet its mixture or temperament, may not be prone to flowings and pourings out. Thirdly and laſtly, that all the excrements produced in the blood may be derived from the Lungs to other Emunctories and places of Evacuations.

The firſt indication ſuggeſts three intentions of healing.

The firſt intention, that the nutritive juice may be proportioned to the blood and aſſimilated by it.

1. As to the firſt intention of healing, *viz.* that the nutritive Juice may be proportioned to the blood, let it be adviſed before all things, that they who cough and are phthiſical abſtain chiefly from drink, and that they take liquid things in a very ſmall quantity; for that the blood being infirm in its temperament, ſo long as it is not too much imbued with freſh juice, may be able to digeſt ſmall portions, and retain it within its own conſiſtence. Moreover, let that freſh juice conſiſt of ſuch kind of particles, which being mild and thin, may be tamed by the blood, and aſſimilated without any effervescence or heat. Wherefore Aſſes milk, alſo ſometimes Cows or Goats milk; alſo Water-gruel, Cream of Barley, Ptiſan, Almond-milks, and other ſimple nouriſhments will better agree and nouriſh more than Fleſh, Eggs, and Gelly-broaths,

broaths, ſtrong Ale, Wine, or any other kind of richer fare. Secondly, that the blood retaining its own temperament, be not eaſily diſſolved into ſeroſities injurious to the Lungs, it behoves that as well the acidities of it ſelf as of other humors mixt therewith, and chiefly the nervous and limpid ones be deſtroyed: which intention Medicines prepared with Brimſtone will beſt accompliſh; which for that cauſe in this caſe (provided a hectic Feaver be not preſent) may be more frequently and in abundance taken. Wherefore the Tincture, the Balſam, the Syrup, the Flowers, and Milk of Sulphur in ſomewhat a large Doſe may be exhibited twice or thrice a day. For the ſame reaſon traumatic or vulnerary Decoctions, alſo Decoctions of the pectoral Herbs commonly ſo called, alſo of the Woods, are to be taken inſtead of ordinary drink. Moreover the Powder of Crabs eyes, Hog-lice, and other things endued with an Alcali or volatile Salt are often adminiſtred with great ſucceſs. The third intention of healing reſpecting the firſt indication, *viz.* that the ſuperfluous dregs of the depraved blood, (if they ſhall be very much predominant) being commanded out from the Lungs, may be diſcharged by other Emunctories, ſuggeſts very many ways to be uſed for their diſpatch. For beſides Phlebotomy, Diureſie, and ſometimes a gentle Purgation (which take place in all Coughs, yea in the beginning of a conſumptive Cough, or Phthiſis) hither alſo ought to be referred Baths, taking in a more warm air whereby they may more freely tranſpire, alſo Frictions of the extreme parts, Dropaces, Iſſues, Bliſterings, or Depilatories, Errhines, Gargles, and other private or public ſluices either of humors or vapors.

2. That the acidities of the blood and other humours be taken away.

3. That the excrements of the blood be drawn off from the Lungs.

The ſecond indication in the beginning of a Phthiſis, *viz.* that the conſumptive matter laid aſide within the Lungs may be eaſily and daily evacuated, is performed by expectorating Medicines. Theſe are ſaid to operate after a twofold matter, according to which their virtue is conveyed two ways to the Lungs. For of thoſe being taken by the mouth, ſome immediately diſmiſs their active particles into the *Trachea*, which partly by making the way ſlippery, and looſning the matter impacted, and partly by provoking the excretory Fibres into Convulſions, do procure expectoration: in which number are chiefly accounted Linctus's and Fumigations. The expectorating Remedies of another kind, which deſervedly are accounted more available, do exerciſe their energie by the paſſage of the blood. For whereas they conſiſt of ſuch kind of particles which cannot be digeſted and aſſimilated by the maſs of blood, being ſpread through the blood, becauſe they cannot be mixt with it, they are preſently again exterminated, and ſo penetrate from the pneumonic Arteries into the tracheal paſſages; where lighting on the matter they divide, and attenuate, and ſo diſturb it, that the little fibres being irritated from thence, and ſucceſſively contracted while they cough, the contents of the Trachea and of its little bladders are ejected upwards into the mouth. Medicines proper for this uſe beſides Sulphur and the preparations of it, are artificial Balſams diſtilled with Oil of Turpentine, Tinctures and Syrups of Gum Ammoniac, Galbanum, Aſa fœtida, Garlick, Leeks, and ſuch like yielding a ſtrong ſcent; from which alſo Lohochs and Eclegma's are prepared. And theſe work both ways, partly by ſlipping into the Trachea, and partly by entring the Lungs by the circulation of the blood, and aſſault the morbific matter both before and behind, and ſo exclude it with the greater force.

Second indication requires expectorating Medicins.

3. What belongs to the third indication, *viz.* that the frame of the Lungs being hurt, or their conſtitution vitiated, may be either reſtored or amended; ſuch things are of uſe as reſiſting putrefaction do cleanſe, heal, dry, and ſtrengthen; to which intent alſo Remedies prepared of Sulphur, Balſamics and Vulneraries do agree. Hence ſome Empirics do not only ſucceſsfully preſcribe the ſmoak of Sulphur vivum, but alſo of Auripigmentum, to be ſuckt through a Pipe or Funnel into the Lungs. Moreover it is for this reaſon, that change of air and ſoil, *viz.* from Cities to the Country or ſulphureous air, or the paſſage from one Region into another that is hotter, is of ſuch a ſignal advantage.

Third indication is performed by Balſamicks and vulneraries.

Hitherto of the Method of Healing, which ſeems to be of uſe againſt the more painful Cough, or Phthiſis beginning; now it remains according to all thoſe curatory indications to ſubjoin certain ſelect forms of Medicines, which alſo, according to the way of healing deſcribed above in a ſlight Cough which is ſhort of a Phthiſis, we ſhall diſtinguiſh into certain ranks, *viz.* which are Mixtures, Linctus's, Lohochs, Tinctures, Balſams, Troches, Lozenges, Powders, Pills, Decoctions, and diſtilled Waters. We ſhall ſet down ſome Examples of each of theſe: whereto alſo may be referred ſome of the forms of Medicines before deſcribed for a beginning Cough, and not as yet conſumptive.

Forms of remedies for a conſumption.

1. Magiſterial Medicines and Syrups.

Mixtures.

Take of our Syrup of Sulphur three ounces, water of Earth-worms an ounce, tincture of Saffron two drams, mingle them. Take one ſpoonful at night, and firſt in the morning.

Take of Syrup of the juyce of Ground-Ivy three ounces, Snail-water an ounce, flour of Brimſtone a dram, mix them by ſhaking. The Doſe one ſpoonful at night and morning.

Take of tincture of Sulphur two drams, Laudanum tartarizated a dram, Syrup of the juice of Ground-ivy two ounces, Cinamon-water two drams: the doſe one ſpoonful at bed-time, and if ſleep be wanting, towards morning.

Syrupus Diaſulphuris.

Syrups.

Take of Sulphur prepared after our manner half an ounce, beſt Canary wine two pints, let them be digeſted 28 hours in a water or ſand Bath; which being done, take of the fineſt Sugar two pounds diſſolved in Elder-flower-water, and boil to a height to make tablets: afterwards pour to it by little and little Wine coloured with Sulphur and warm, let it boil a little on the fire, ſtrain it through woolen. You will have a moſt delicate Syrup of a gold colour, and for coughs and other diſtempers of the lungs (where a hectic Feaver and heat of the Præcordium is abſent) moſt profitable: the doſe a ſpoonful morning and evening by it ſelf or with other Pectorals.

Syrup of Garlick.

Take ten or twelve cloves of Garlick ſtript from the little skins, and cut into ſlices, Aniſeeds bruiſed half an ounce, Elicampane ſliced three drams, Liquoriſh two drams, let them digeſt for two or three days in a pint and half of ſpirit of Wine cloſe and warm; ſtrain it clear and hot into a ſilver diſh, and add a pound and half of fine Sugar, the diſh ſtanding upon hot coals, let the liquor be fired, and while it burns ſtir it; and ſtrain it through woollen, and keep it for uſe.

Syrup of Turneps.

Take Turneps ſliced and fine Sugar of each half a pound, put them in a glaſed pot a lay of Turneps and a lay of Sugar, the pot being covered with paper, put it into an oven to bake with the bread; when it is taken out, preſs the liquor, and keep it for uſe: the doſe one ſpoonful morning and evening.

Syrup of Snails.

Take freſh Snails with their ſhells n. xl. cleanſe them with a linen cloth, afterwards each being run through with a bodkin, let the open ſhell be filled with powder of Sugar-candy, and being put in a linen bag, let them be hung in a cellar, it will diſſolve into a Syrup and drop into a glaſs veſſel ſet under it: the doſe one ſpoonful twice or thrice a day in a convenient vehicle, viz. *Milk-water or pectoral Decoction.*

2. & 3. Linctus's and Lohochs.

Linctus's.

Take of conſerve of red Roſes three ounces, of our tincture of Sulphur two drams, mix them in a glaſs mortar: the doſe the quantity of a Nutmeg evening and morning. To this ſometimes to appeaſe a troubleſom cough add from half to a dram of powder of Olibanum.

Lohoch.

Take conſerve of red Roſes four ounces, flour of Brimſtone four ſcruples, fine oyl of Turpentine a dram, powder of Fox-lungs three drams, ſyrup of the juice of Ground-Ivy as much as will ſuffice to make a ſoft Lohoch, to be taken after the ſame manner, viz. *morning and evening; alſo to be licked at other times with a Liquoriſh-ſtick.*

Take powder of Sugar-candy four drams, tincture of Sulphur two drams, mix it in a glaſs mortar: take it after the ſame manner.

In the place of Tincture of Sulphur may be adminiſtred other balſamic Tinctures, *viz.* Balſam of Peru, Opobalſamum, Gum of Ivy, Guajacum, Amber, with many others, which either may be mixt with Conſerve of red Roſes, or with the Conſerve of the flowers of Colts-foot, or with Sugar-candy.

4, 5. *Tinctures* and *Balſams* of the ſame nature and compoſition, but in a larger Doſe are convenient in a Phthiſis, which we have above preſcribed for a beginning Cough.

Take

Take of Tar an ounce, Lime-water thrice cohobated two pints, diſtil it in a Bath to half; afterwards being filtrated, let it be drawn off to the conſiſtence of Honey in Balneo; to which pour half a pound of tincture of ſalt of Tartar, let it digeſt in a cloſe glaſs to extract the tincture: the doſe from 20 drops to 30 in a fit vehicle. After the ſame manner is prepared the tincture of the black oyl of Soot, liquid Amber, liquid Storax, and many others. Tinctures.

Take of our prepared Sulphur an ounce, adding Mirrh, Aloes, and Olibanum in treble quantity, draw off a tincture with oyl of Turpentine, alſo with rectified ſpirit of Wine: doſe from 15 drops to 20.

6, 7, 8. *Troches, Lozenges,* and *Powders,* becauſe they chiefly reſpect a Cough, are almoſt of the ſame nature and compoſition with thoſe before-deſcribed for a new Cough; unleſs that for the drying and healing of the Lungs things ſulphureous and Vulneraries are required in a greater proportion.

Take powder of the leaves of Ground-Ivy a dram, flour of Brimſtone two drams, of Sugar penids a dram and half, with juyce of Liquoriſh diſſolved in Hyſop-water make troches of the weight of half a dram. Troches.

Take of Yarrow bruiſed and dried in the Sun half a dram, flour of Brimſtone, Olibanum, of each a dram; powder of dried red Roſes half a dram, Sugar diſſolved and boiled to a height ſix drams, oyl of Aniſeeds a ſcruple and half, make Lozenges of half a dram weight: take one three times or oftner in a day, and eſpecially evening and morning. Powder.

9. Pills.

Take a pint of the juyce of Ground-Ivy clarified in the Sun, flowers of Colts-foot dried, the tops of Hyſop, Sage, Pennyroyal, each a handful; Aniſeed, Caraway-ſeeds, ſweet Fennel-ſeeds bruiſed, each half an ounce; diſtil them in Balneo Mariæ to half; ſtrain it and diſtil it to the conſiſtence of Pills, by adding half a dram of juyce of Liquoriſh, powder of Elicampane, flour of Brimſtone, each three drams; flowers of Benzoin a dram, Balſam of Peru *half a dram, tincture of Sulphur three drams, tartarizated Laudanum two drams: make it into a maſs, and form it into ſmall Pills to be taken three or four evening, and firſt in the morning.* Pills.

10. *Decoctions,* as I have above preſcribed for a ſtubborn Cough, are uſed with ſucceſs againſt a beginning Phthiſis. In a caſe almoſt deſperate I have preſcribed the following Decoction to be taken twice a day, and alſo inſtead of ordinary drink with very good ſucceſs. Decoctions.

Take Lignum vitæ four ounces, China, Saſſaphras, each two ounces; of all the Sanders each an ounce, ſhavings of Ivory, Harts-horn, each three drams: infuſe them, and boil them in twelve pints of Spring-water to half, adding Liquoriſh an ounce, Raiſins ſtoned four ounces: ſtrain it.

11. *Diſtilled Waters,* ſuch as we have before preſcribed, are ſpecific here, whereto may be added Solenander-water of Hogs blood and Turpentine; alſo Balſamic Waters diſtilled from Turpentine with Pectoral Ingredients. Diſtilled Waters.

Take leaves of Ground-Ivy, white Horehound, Hyſop, Pennyroyal, each three handfuls; roots of Elicampane, Orris of Florence, *each two ounces; Turpentine diſſolved in Oyl of Tartar four ounces, Hyſop-water four pints, Malaga-wine two pints; diſtil them in a ſand Bath: let all the liquor be mixed, the Oyl ſeparated: the doſe two or three ſpoonfuls twice a day, with a ſpoonful of Syrup of Ground-Ivy.*

12. *In the laſt place* we muſt deſcribe the forms of Vapors and Fumes; the adminiſtration whereof doth uſe to profit more than any other remedies in a Phthiſis not yet deſperate, for that they arrive at the very Lungs, and ſo purge them by an immediate affect, dry them, and keep them from putrefaction, ſtrengthen and open all their paſſages. 1. Therefore a moiſt ſteam may be made after this following manner. Fumes and Vapours.

Take leaves of Hyſop, Ground-Ivy, white Horehound, each two handfuls; Elicampane two ounces, Calamus aromaticus half an ounce, Aniſeeds and Caraway-ſeeds, each an ounce: boil them in a ſufficient quantity of Spring-water: let the vapor of the hot ſtrained liquor be drawn by the lungs through a paper rolled up like a cone or funnel: and uſed morning and evening for a quarter of an hour. Formules of the former.

2. A fumigation or dry vapour, is made one while more mild out of meer Balſamics, another while more ſtrong out of Sulphurs, and ſometimes out of Arſenicals.

Forms of the more gentle Fume.

Take of Olibanum, white Amber, Benzoin, of each two drams, Gum Guaici, Balſam of Tolu *of each one dram and half, powder of red Roſes, and red Sanders, of each one dram to be ſtrewed upon burning coals.*

Of the more ſtrong.

Take Gum of Ivie, Frankincenſe, of each two drams, Flower of Brimſtone one dram and half, Maſtich one dram, with a diſſolution of gum Tragacanth, form Troches.

Arſenicals.

Take of white Amber, Olibanum, of each two drams, prepared Orpiment half an Ounce, Styrax, Labdanum, of each one dram and half, with ſolution of Gum tragacanth, make Troches for fumigation.

Smoak of Auripigment.

Mountebanks do ordinarily preſcribe the ſmoak of Arſnick to be ſuckt into the mouth, like Tobacco kindled in a Pipe, and ſometimes with good ſucceſs: Moreover, it is in practice with the Vulgar, to burn like Tobacco in a Pipe little bits of cloth ſtained with Arſenick (ſuch as wherewith the walls of Taverns are hung) and ſo ſuck the ſmoak into the conſumptive Lungs for cure.

Of a confirm'd Conſumption.

3. Theſe things being thus unfolded concerning a Cough, and a Phthiſis beginning, both as to what belongs to the Pathologie, and cure; it remains now laſtly to diſcourſe of a more painfull Phthiſis confirm'd, and almoſt deſperate; and to conſult what is to be perform'd, when the lungs being very much vitiated, and affected with one or more filthy ulcers, neither the air nor the blood do rightly paſs through them, but choak or corrupt the maſs thereof, by continually ſuggeſting filthy corruption; inſomuch that a hectick feaver and an Atrophie, by reaſon of nouriſhment being fruſtrated, infeſt the diſeaſed, with the loſs of all their faculties, and by daily weakening their ſtrength precipitate them to the grave. The moſt certain ſign of this diſeaſe growing deſperate, uſes to be accounted a pain very troubleſome with an inflammation of the throat; for this ſymptom argues a great putrefaction of the lungs, from whence the putrid *effluvia*'s exhaling are thrown about in the narrow paſſage of the throat, which wound and grievouſly irritate thoſe tender fibres there. In this caſe the cleanſing of the lungs, as alſo the drying up of the Ulcer are in vain deſigned: for all hotter Medicines ordain'd for thoſe purpoſes, and fit enough in the beginning of a Phthiſis, are not to be endured in a confirmed one; inaſmuch as augmenting the inflammation of the lungs, they procure a hectick feaver, thirſt, watchings, and other more painfull ſymptomes, or call them back afreſh. For truly in ſuch a ſtate of this diſeaſe where onely the prolongation of life is propoſed with a light toleration and an eaſie death; thoſe remedies help chiefly, which bridle the fervour of the blood, allay the heat in the *Præcordia*, and reſtore the ſprits, and gently cheriſh them. Hence for food, Aſſes Milk, alſo Water-gruel, Barly-broths, Cream of Barly, and for drink, Ptiſan, Emulſions, water of milk diſtilled with Snails and temperate pectoral herbs, are uſually of greateſt ſucceſs. Syrups and Linctus's, which appeaſe the inflammation of the throat and Lungs, and facilitate expectoration, but chiefly the more mild Hypnoticks, whereby moderate reſt may be procured, may be frequently or daily taken. The forms of theſe are common enough; but however according to our method, we will annex ſome of the more ſelect of each kind.

The formal reaſon thereof.

Forms of remedies in a deſperate Conſumption.

Decoctions.

Take of Barly half an ounce, candied Eringo roots 6 drams, parings of Apples one handfull, Raiſins ſtoned two ounces, Liquoriſh three drams, boyl them in three pints of ſpring-water to two, make a Ptiſan to reſtrain thirſt: take it 3 or 4 times a day, alſo in the room of ordinary drink if it agree.

Take the tayls of twenty Creviſes, candied Eringo roots one ounce, a cruſt of white-bread, Raiſins ſtoned two ounces, Liquoriſh 3 drams, boyl them in 3 pints of Spring-water to two, ſtrain it, and take 3 or 4 ounces three times a day. After the ſame manner is prepared the Decoction of Snails.

Diſtilled waters.

Take of Snails half-boyled and cut three pound, ground-Ivy 6 handfulls, Nutmegs ſliced numb. 6. crum of white-bread two pound, freſh milk 8 pounds, diſtill it in a Pewter Still. The ſame way is diſtilled the water of Creviſe-tayls. The doſe 3 or 4 ounces three times a day, ſweetned with pearl'd Sugar or Sugar of Roſes.

Hypnoticks.

Take ears of greeen Wheat as many as convenient, diſtill them in a common ſtill; drink three or four ounces three times a day, ſweeten'd with pearl'd Sugar.

Take

Take ſyrup de Meconio *three ounces, water of green Wheat 6 ounces, mix them, drink two or three ſpoonfulls at bed-time, every or every other night.* *Hypnoticks.*

Take Conſerve of Mallow-flowers wild or garden three ounces, Lohoch de pino *two ounces, Syrup of Jujubes two ounces, make a Lohoch, of which take often a dram and half or two drams.* *Eclegma's.*

What hitherto we have diſcourſed of concerning a Cough of every kind (whether it be ſolitary and ſimple, or the forerunner and companion of a Phthiſis) alſo what is to be preſcrib'd in every caſe touching the method of healing, it would be eaſily illuſtrated by the hiſtory of Cures, or by the Anatomical obſervations on thoſe that have dyed by that diſeaſe. For inſtances of this ſort, and very many examples are every where had, and happen daily; it pleaſes us here to annex a few of the more ſelect, out of the large choice of theſe, accommodated to the chief kinds of a Cough, and Phthiſis. And firſt I will endeavour to illuſtrate the type of a ſimple Cough by one hiſtory or two, and which takes its riſe of it ſelf, and is altogether void of the ſuſpicion of a Phthiſis.

The Hiſtory of a Cough threatening a Conſumption.

It is now many years ſince I took care of the health of a certain Student, obnoxious to a Cough from his tender years, and who was wont frequently to undergo the more painfull affections of it, and thoſe of long continuance. This perſon ſeemed of a melancholick temper, of a ſharp wit, of an indefatigable ſpirit, of a conſtitution indifferently ſtrong, but that his Lungs originally being infirm, did ſuffer when the blood diſſolv'd into ſeroſities. In Summer as long as he tranſpired freely, he lived healthily enough; but in the Spring and Autumn, when the blood changing its temperament, thoſe ſerous fluxes came upon him either of their own accord, or from any ſleight occaſion, he fell eaſily into a Cough with abundant and thick ſpittle; notwithſtanding this diſtemper frequently within ſix or ſeven dayes, as ſoon as the maſs of blood was purged throughly by the Lungs, vaniſhed leiſurely without any great uſe of remedies. But if to the aforeſaid occaſions of this diſeaſe were added ſome ſtronger cauſes, as chiefly the obſtruction of the pores, and errors touching his diet, ſometimes a more prodigious and ſtubborn cough, neither preſently nor eaſily yielding to remedies, and threatning nothing leſs than a Phthiſis, did come upon him, then manifeſtly the patient for the firſt days ſuffered light ſhiverings in his whole body, and the ſenſe of a Catarrh in his *Larynx*; afterwards by frequent coughing with thin ſpittle, together with a giddineſs, he was afflicted with numneſs of his ſenſes, and a dropping at his noſtrils.

In this ſtate his beſt remedy was wont to be, and frequently tryed with ſucceſs, to drink a little more freely generous Wine, and any other liquor very ſparingly: for ſo the acidity and fluor of the blood being ſuppreſſed, and tranſpiration procured more freely, he was much eaſed, and ſometimes recovered health in a ſhort time. Moreover at night and early in the morning he was uſed to take ſeven or eight drops of the tincture of Sulphur in a ſpoonfull of Syrup of Violets, or of the Juice of Ground Ivy, or

Take Conſerve of red Roſes three ounces, ſpirit of Turpentine two drams mingled, the doſe the quantity of a cheſnut evening and morning.

If that theſe remedies together with the *Canary* Antidote and thin diet effected little, the diſeaſe not being ſo cured, ſpinning out into a long period, and preſſing him ſharply for many weeks, yea ſometimes months, it reduced the ſick to a remarkable leanneſs, and to the very brink of the Grave. For then the Cough daily encreaſing and being very troubleſome, did very much impede and break his ſleep, his ſtrength languiſhed, his appetite was dejected, heat and thirſt moleſted him; in the mean time ſpittle every day encreaſed, and was caſt forth in great plenty; ſo that not onely the *Serum* of the blood, and the recrements, but alſo the nutritive Juice, and the drainings of the ſolid parts being continually poured out upon the lungs, turn'd into corruption, which was abundantly cough'd out; moreover his breath was difficult, his joints very infirm, and his fleſh very much conſumed.

When of late our patient laboured after this manner, we preſcribed the following method, and remedies, by the continued uſe whereof at length he recovered his health. Firſt of all, a thinner diet being appointed him, and for the moſt part Ale being forbidden altogether, he took twice in the day of the following Apozeme about ſix ounces warm, and a little at other times cold to reſtrain his thirſt.

Take

Take of the roots of China two ounces, Sarsaparilla three ounces, white and yellow Sanders of each one ounce, Ivory and Harts-horn of each three drams; infuse and boyl them in 8 pints of water to half, adding Raisins of the Sun 3 ounces, Liquorish 3 drams, strein it, and keep it for ordinary drink.

Take tincture of Sulphur three drams, take from seven drops to ten, at night and in the morning, in a spoonfull of syrup of Violets, or of syrup of the juice of Ground-Ivy.

When he began by continual use to nauseate this Medicine, in its place the following Eclegma was appointed.

Take conserve of red Roses three ounces, spirit of Turpentine two drams, mix them; the dose is one dram, at the same hours.

Afterwards instead hereof the following Powder was sometimes taken.

Take of the powder of the leaves of ground-Ivy dryed in the Summer Sun three ounces, Sugar-candy half an ounce, mix them, the dose half a spoonfull twice in a day, with three ounces of the following water.

Take Ground-Ivy 6 handfulls, Hyssop, white Hore-hound, of each 4 handfulls, Lambslungs half-boyl'd and cut small, pour upon them eight pound of Posset-drink made with small ale, distill it in common Organs, the liquor being mixed, let it be sweetned to the taste as it is used with Sugar-candy or syrup of Violets.

Troches. To appease his almost continually troublesome Cough, he swallowed the following Troches, and sometimes a little of the extract of Liquorish.

Take of the species of Diatragacanth. frig. 3 drams, Annise, Carue, sweet Fennel-seeds, of each half a dram, flower of Brimstone two scruples, flowers of Benzoin one scruple, extract of Liquorish dissolv'd in Hyssop-water; make a paste which form into Troches.
Or,

Take of Species Diaireos, è pulm. Vulpis, of each two drams, flower of Sulphur, of Elecampane, of each half a dram, Oyl of Annise-seeds ℈ß. Sugar dissolv'd in a sufficient quantity of Penniroyal-water and boyl'd to a body ℥vj. form Lozenges of half a dram weight, let him eat one, swallowing it by degrees, as oft as he will.

In the midst of this course, although he was endowed with a weak pulse and more cold temperature, we breath'd a vein in his arm: moreover, with these remedies, the chiefest help accrued to him from the open air, which for the most part he daily enjoyed, either by riding on Horse-back, or in a Coach; for from hence he first began to recover his appetite, his digestion, and sleep; whereto afterwards a relaxation of the other symptoms did sensibly follow, till at length he recovered his entire health. As often as he was afflicted since then with a stubborn and tedious Cough, he used a method like this, and with the like success; and now although he lives altogether exempt from that distemper, notwithstanding he is constrained to decline carefully all occasions or causes whereby either the pores might be shut, or the flux of blood or its precipitation into serosities might be provok'd; which were chiefly his going by water on the *Thames* at *London*, and drinking of acid liquors, as Cider, French or Rhenish wine.

From the above-mentioned history, you may easily conceive both the means and the reason of healing of the Cough, (which caused by the fault of the blood, is without the limits of a Phthisis): The other follows, which illustrates the nature of the same distemper, when it chiefly proceeds from the nervous juice.

The second remarkable History. A Boy about ten years of age, of a hot temper and fresh countenance, from his infancy obnoxious to a frequent Cough, in his succeeding years sustained more grievous and lasting fits and assaults of this distemper, and by turns was used to labour with a strong and shrill Cough, without spitting, which almost continually afflicted him day and night, and so infesting him many days, yea weeks, brought the sick to utter weakness. Afterwards the period of his disease being come (which happened not but by consuming the store of the morbific matter) he again in a short time became healthy enough, and very free from any sickness of the Thorax: till the morbific matter (as it seems) being heaped again to great abundance, without any evident cause, the same distemper

A hooping Cough.

ſtemper returned and performed its Tragedy with its wonted fierceneſs. About its firſt beginning the Cough was troubleſom only morning and evening: afterwards the evil by little and little increaſing, he almoſt continually coughed whole days and nights, and if at any time ſleep happening of it ſelf, or by the uſe of Anodynes, afforded any truce, a more outragious fit of coughing ſucceeded his wakening. After this manner moſt frequently and fiercely coughing without any ſpittle, he laboured for three or four weeks, till he was brought to an extreme leanneſs and weakneſs; and then the ſickneſs leiſurely remitted, ſo that he coughed ſomewhat ſeldomer, and enjoyed moderate ſleeps; afterwards in few days growing very hungry, being quickly made full of fleſh and vigorous, he recovered his former health in a ſhort time. Fits of this kind more ſeldom infeſted him in Summer-ſeaſon, but in the reſt of the year, repeated three or four turns, and brought the ſick even into great hazard of life.

If diſquiſition be made of the nature, cauſes, and formal reaſon of this unwonted and as it were irregular kind of Cough, it is manifeſt it proceeds like all others, from the provocation of the Lungs; nevertheleſs as to the matter exciting, its ſeat, and manner of affecting it is doubted: becauſe neither thick ſpittle, nor plentiful thin (as is uſual in other diſtempers) is here caſt out; neither doth the Patient complain of feeling a Catarrh, nor of any weight of the Lungs. Wherefore, not as in a common Cough, does the ſerous humour either ſlowly or plentifully ſweating out of the Trachea or pneumonic veſſels into the little bladders or pipes of the Trachea, induce the afore-mentioned ſymptoms: But it is plain from thence that the paſſages of the *aſpera Arteria* are wholly empty of the ſerous or thick humour, becauſe the deep and ſounding Cough throws off nothing. Moreover, neither from the blood impacted in the Membranes of the Lungs, doth this Cough take its origine, becauſe neither feaver, nor thirſt, nor pain are preſent here as in a Peripneumonie. Beſides, neither doth the morbific matter ſeem to adhere to the nerves or muſcles appointed to the function of breathing; becauſe then beſides a Cough, Aſthmatical or otherwiſe convulſive fits would ſometimes urge with a ſenſe of ſtrangling; which notwithſtanding did not happen to our patient.

Having frequently and ſeriouſly meditated about the ætiologies of this very difficult caſe, I am at length induced to think, that a certain ſerous and ſharp matter, as being loaded with a ſcorbutical taint, falling from the head by the paſſage of the nerves, doth enter into the nervous fibres and Membranes of the lungs or Trachea; which cleaving throughly to them, is by degrees encreaſed to a fulneſs, and at length being chaf'd, and grown turgid with a perpetual provocation, creates ſo troubleſom a Cough. We have in another place declared the matter of this kind impacted in the Coats of the guts, and the neighbouring parts about them, not rarely to excite a ſcorbutical Colick, for many days, yea ſometimes weeks, infeſting them with vomiting and a moſt ſharp torment; and what elſe is this Cough, but a certain convulſive diſtemper of the lungs, whoſe taint notwithſtanding, according to the capacity of the part labouring, is impreſt rather and more on the motive, than on the ſenſitive Power. For the lungs however twicht and hurt, do ſuffer ſmall pain, or ſcarce any at all; notwithſtanding from any light occaſion, they are invaded by ſtorms and fits of coughing. Indeed we compare this diſtemper of coughing ſo much the rather to the Colick, becauſe the ſubjects of either of them, that is to ſay, the Trachea, and the guts, as to their coats, veſſels, little fibres and glandules, are after the ſame manner faſhioned. *The conjunct cauſe of the diſeaſe.*

The chief cauſe of the Cough now deſcribed, depends upon the morbific matter heaped together within the little fibres of the rough arteries, to a provoking fulneſs; wherewith when they are loaded, firſt a quick and painfull breathing infeſts onely, with a mornings Cough; becauſe from the beginning onely ſome ſmall portion of that matter being diſquieted provokes the part: afterwards when the whole maſs thereof growing turgid, almoſt perpetually twitches the fibres, there follows a moſt troubleſom cough; which alſo being often repeated, endures a long ſeaſon; becauſe the morbifick maſs impacted in the parts affected, is neither preſently caſt off by the ſtrength of nature, nor eaſily gives place to any remedies.

For in all the fits of this diſeaſe, I have made tryal of various methods of curing, and of medicines of divers kinds, though with little ſucceſs. That diſtemper beginning at any time, is wont to make a long period, maugre all remedies. The medicines commonly called pectoral, as Syrups, Lohochs, Eclegma's, or Lambitives, have conferred little benefit to its cure; notwithſtanding ſometimes it hath ſeemed good to

admit of them into uſe for this purpoſe, that they might make ſlippery and moiſten the Lungs, leſt they run the hazard of being rent by a violent Cough, and their veſſels burſt aſunder: for ſometimes a more fierce fit troubling our ſick Patient, he hath been wont to cough out a little blood, though no thick ſpittle.

A gentle Purge both in the beginning and declination of this diſtemper hath ſucceeded well. Opening and diuretical Apozemes are ever adminiſtred with ſucceſs, both which he uſed enough through his whole courſe inſtead of ordinary drink. Evening and morning he took ſome drops of the Tincture of Sulphur with the Milk-water of Snails; late at night I was ſometimes conſtrained to adminiſter a Doſe of Diacodion or of liquid Laudanum: his belly for the moſt part looſe enough, that it ſeldom required Clyſters: in two of his fits he breathed a vein, whereby nothing of ſucceſs enſued.

The uſual method of curing. In the laſt fit, beginning about the Autumnal Equinoctial, which paſſed away a little more lightly and gently, this following method of healing was obſerved.

A Purge. Firſt of all this Purge was given, and after four days repeated. *Take of Mercurius dulcis ten grains, Reſine of Jallop four grains, mix and make a powder to be taken in a ſpoonful of Syrup of Violets.*

A Drink. *Take China-roots ſliced a dram, Graſs-roots three ounces, Chervil an ounce, candid Eringoes ſix drams, ſhavings of Ivory, Harts-horn, each three drams; Raiſins of the Sun ſtoned three ounces: boil theſe in three pints of Spring-water to two pints, ſtrain it, and uſe it for ordinary drink.*

A Mixture. *Take ſyrup of Jujubes two ounces, Diacodion an ounce, ſpirit of Salt Armoniac with Gum Ammoniac a dram, mix them: the doſe a ſpoonful at night and early in the morning. He was much relieved with this medicine, notwithſtanding he took it only every other or third day, and for change ſometimes a doſe of the tincture of Sulphur with ſyrup of Violets.*

The diſeaſe declining a Purge was twice repeated, and afterwards, recovering his health by degrees, within two weeks he became healthy enough. But when I beheld him not only obnoxious to frequent relapſes of coughing, but every fit to be irreſiſtible when it aſſaulted him, and its ſtay very long notwithſtanding the uſe of remedies, and all this threatning no leſs than a Phthiſis at length; I adviſed that as well for his preſervation, as for the more eaſie cure of the diſtemper, if it ſhould return, he ſhould travel into a hotter Region. Hereupon he did not much delay, but ſails into *France* about the beginning of *November*, and from thence by a ſtraight journey to *Montpelier*, where abiding half a year he was ſick only twice and both times lightly: afterwards returning into *England* quite free from a Cough, praiſe be to God he enjoys his perfect health.

SECT. I. CHAP. VII.

Of Spitting Blood.

HItherto of a Cough and Phthiſis, as well in its beginning as confirmation; which are the moſt common affects of the Lungs, and moſt eſpecially dangerous. Beſides which there are many other diſeaſes of thoſe parts that do occur, which when they are not at all, or not ſeaſonably enough cured, for the moſt part degenerate into a Phthiſis. Theſe paſſions, or at leaſt the chief of them, (as we have before hinted) are ſpitting of blood, an Impoſthume, or Ulcer of the Lungs, a Peripneumony, Empyema, a Pleuriſie, a Tumor of the Lungs, and obſtructions by reaſon of things divers ways concreted, *viz.* ſometimes little Puſtles and Scirrhus's, another while gravel and little ſtones, and ſometimes other preternatural matter; and laſtly hitherto belong an Aſthma and convulſive diſtempers of the Breaſt. Of theſe we ſhall treat in order, and firſt of Spitting blood.

Spitting blood a diſtemper very frequent. The ſpitting of blood out of the Lungs and the ejection thereof by Cough ſometimes leſs and almoſt none, another while more violent, is a diſtemper frequent enough, and truly an admiration it is, that it happens not more frequently. For whereas the veſſels bringing blood are divided into twigs and innumerable ſlips, and thoſe very ſmall; and whereas the blood even fiercely boiling, is violently conveyed through them all, complicated after divers manners and variouſly intorted; we can hardly conceive how the

the circulation thereof being ſo perplexed and intricate, and alſo ſo impetuous, ſhould be performed without ſome impediment and interruption. And truly we conclude it to be very difficult in living bodies, becauſe it hardly ſucceeds by injection in the dead: for as much as liquor ſent through the entrance of the pneumonic Artery, will not readily and eaſily return by the Veins; but ſticking longer in the paſſage, and skipping over the uſual paſſages, variouſly runs out into the little bladders and other canals of the Trachea, and into the interſpaces and other various gaps of the little Lobes.

Three things to be conſidered concerning it.

Concerning an Hæmoptoſis or ſpitting blood we are to conſider, firſt out of what veſſels, and by what diſtemper the blood burſts out; ſecondly in what places moſt frequently laid up; thirdly by what means it is wont either to be ejected or brought upward, that it may be diſcharged by the mouth.

Out of what veſſels the blood burſts out.

As to the firſt, we are to ſuppoſe by the Law of Circulation, that the blood of it ſelf burſting out, doth altogether proceed from the Arteries: for the Veins, as long as they remain whole, do reduce it towards the Heart, and not at all pour it out; although we deny not that ſometimes they being hurt by a wound, fall, bruiſe, or ſome violent accident, ſo as to be looſned from their unity, do let go the blood out of their cavities. Nevertheleſs the blood moſt commonly cauſing an Hæmoptoe or blood-ſpitting, proceeds from the little mouths of the Arteries being open or torn; and then the fault is wont to be either in the ill temperament of the blood, or ill framing of the veſſels.

By what fault both of the veſſels and of the blood it happens.

Of either of theſe there are various kinds and differences, which alſo concur after a diverſe manner to provoke the ſpitting of blood. For the blood being ſometimes more thin and alſo ſharp, it unlocks or corrodes the mouths of the little Arteries; and ſometimes again being more thick and prone to coagulate, when it cannot readily enough be received by the Veins, it is extravaſated. By reaſon of theſe faults in the blood, they who labour with the Scurvy or with a peſtilent Feaver, as alſo thoſe who have drunk ſome ſort of poiſon, do frequently fall into a ſpitting of blood. Neither is this diſtemper leſs wont to ariſe from the fault of the veſſels, in as much as thoſe being too tender or too thin, many times are burſt by a violent motion, as by coughing, hollowing, leaping, or other vehement exerciſes; or for that being too looſe and moiſt, their mouths open, and ſuffer the blood to break out of its circulation: moreover ſometimes for that the Veins being contracted and wrinkled by cold, do not readily paſs away the blood, but the ſame reſtagnating diſtends the little Arteries, and burſts out of their mouths.

What Arteries chiefly and where placed do void blood.

As to the Arteries, out of which the blood breaks, cauſing a ſpitting of blood, it concerns much of what ſort they are, and where they are placed; for beſides that there ariſe notable differences of bloody ſpittle, according as the blood breaks out from a ſmaller or a greater veſſel; and if either of them be placed in the top of the Lungs near the Larynx, or in the middle region thereof among the greater branches of the veſſels, or laſtly in the lower region among the orbicular little bladders: moreover we obſerve, that the Arteries which uſe to void blood, are either of the number of them, which ariſing out of the pulmonary Trunk, do every where accompany the branches of the Trachea; or of thoſe which owning their origine to the Aorta, do cover the coat of the Trachea with a thick branching.

Both the pneumonic and tracheal are in fault.

For it is apparent (as we have declared before) from the mouths of theſe, as alſo of the Glandules, an unctuous humor ſweats out to make the inner ſuperficies of the Trachea ſlippery: moreover in as much as a ſerous humor diſtils abundantly out of the ſame into the cavity of the rough Artery, a Catarrh ariſes. Wherefore we doubt not at all to affirm, that even from the mouths of theſe being open, meer blood ſometimes ſoaking into the Tracheal paſſages, does propagate a bloody ſpittle, though in quantity very ſmall. I have obſerved many, who without a Cough or any indiſpoſition of the Lungs, have once or twice a day voided one or two bloody ſpittles: which as often as it came upon them, the Patients perceived, either in the bottom of the throat, or on the top of the breaſt a kind of diſtillation; whence immediately by the meer contraction of the Tracheal Fibres, with a Snail-like motion, a little of the fluid blood being mixed throughly with flegm, and not at all frothy, is voided: and when ſometimes that diſtemper had laſted for many months, no prejudice enſued from thence, which might bring or threaten a Phthiſis: which would not have come to paſs, if any of the pneumonic Veſſels had been opened.

Spitting blood from the tracheal Arteries.

2. So much concerning Veſſels voiding blood, and of their divers affections. What belongs to the places wherein the extravaſated blood is depoſited, theſe chiefly and almoſt only are the rough Artery, and the inward cavity of the parts thereof. For into

2. In what places the blood is depoſited.

this, as into a Jakes, all the filth or ſuperfluities of all the reſt of the paſſages are derived by the utmoſt endeavours of Nature, as far as is poſſible, to be preſently ſent out of doors. But if the extravaſated blood be thrown into the interſpaces of the little Lobes, or ſoaking out of the outer Membrane, fall into the cavity of the *Thorax*, it doth propagate an Empyema, and frequently an Impoſthume in that place. But for the moſt part the blood ſubject to fall from the pulmonary courſe, produces various kinds of bloody ſpittle; according as it makes its neſt, either upwards within the cavity of the Larynx, or a little beneath about the intermedial paſſages of the Trachea, or laſtly further within the orbicular little bladders. The firſt diſtemper proceeds alone from the mouths of ſome Artery being opened, which covers the trunk of the Trachea; the next ſometimes perhaps from this cauſe, yet more often from the pneumonic Arteries themſelves being open or burſt aſunder, which veſſels as they are greater, pour out often a dreadful quantity of blood; the ſpitting out whereof proves plentiful and violent, in regard that the muſcles of the whole breaſt, together with the fibres of the Trachea are much provoked and greatly contracted. But if the ſpring of bloody ſpittle conſiſts in the lowermoſt little bladders, the blood is thrown out more ſparingly, but with a profound, frequent, and very troubleſom Cough.

Either in the Larynx, or in the middle of the Bronchii, or in the orbicular little bladders.

3. And from hence (which was in the third place purpoſed) the differences of bloody excretion out of the Lungs, and the manifold modes and courſes of bloody ſpittle are made known. For the blood ſoaking into the Larynx, after a ſmall tickling in the throat without coughing or hawking, doth eaſily and almoſt inſenſibly aſcend into the mouth: and if an extravaſation of this kind of blood happens in ſleep, it preſently flows out of the mouth upon wakening, they being ſcarce ſenſible of it; in as much as the moving fibres of the Trachea being contracted while one ſleeps, have then emptied the blood freſh diſtilled into the mouth. But if from a greater veſſel gaping or burſt about the middle of the Lungs, the blood (which is ever frothy) does break out abundantly into the Tracheal paſſages, this by an outragious Cough raiſed thereby is forthwith caſt upwards with violence and in great plenty; inſomuch that the ſick ſeem rather to vomit than cough out blood. And finally, if the blood breaking out of the foldings of the veſſels wherewith the orbicular little bladders are incompaſſed, falls down into thoſe little cells, from thence it is diſcharged by turns in leſſer quantity, and not unleſs by a ſtrong and very frequent Cough.

The procatarctic and evident cauſes thereof.

So much concerning the formal reaſon, the conjunct cauſes and differences of an Hæmoptoe: as to what belongs to the primary and evident cauſes, either of them are manifold and various. In the former number are reckoned, firſt an hereditary indiſpoſition of the Lungs, whenas they have originally been weak and ſoft with a ſtraitneſs of the breaſt. Moreover their ill temper from a Cough, Empyema, or Pleuriſie going before, and eſpecially an obſtruction or ill conformation do very much diſpoſe to ſpitting blood, and ſo much the rather, if in ſuch a habit an acrimony or Dyſcraſie of the blood ſhall accrue from an ill courſe of Diet, unwholeſom Air, or by any other means. The ſuppreſſion of the Menſtrua, the Hæmorrhoids, or blood flowing from the Noſtrils incline moſt to a ſpitting blood. Secondly, among the evident cauſes ought to be reckoned primarily the exceſs either of heat or cold; for when the blood grows above meaſure hot, or the tranſpiration thereof through the Pores of the skin is hindred; thereupon ſwelling after a huge manner, it frequently burſts out of the pneumonic Veſſels. From hence *Hippocrates* long ago obſerved, and as yet it is a vulgar obſervation, That ſpitting blood moſt frequently happens in the winter when the North-wind blows. Neither leſs ſeldom hath the uſe of bathing brought this evil upon many, before the uſe whereof they were healthful enough. Moreover many contract this from drinking of wine and ſtrong waters, from a blow, a fall, hollowing, vomiting, coughing, or any other violent ſtirring of the whole body or of the Lungs. Alſo certain poiſons, and according to *Heurnius* the Lunar beams (the reaſon whereof doth not eaſily appear, neither doth there remain any credit thereto) are reported to provoke this diſtemper.

The Progniſtics of this diſeaſe.

The Prognoſtics of this diſeaſe are enough known to the vulgar, whereas there is not any one of them, who doth not ſuſpect the ſpitting of blood as very dangerous. Nevertheleſs whereas the kinds hereof are various, one is found more or leſs dangerous than another. The blood ſoaking out of the veſſels of the Trachea is often free from any evil: moreover when breaking out from the loweſt and leſſer pulmonar Veſſels, it often admits of Cure; at leaſt it is much ſafer than a plentiful ſpitting of blood happening from the great branches of the Artery being opened into the Trachea. But the prediſpoſition of the Patient makes a great difference in the Prognoſticks of this diſ-

eaſe:

eaſe: for if blood-ſpitting be provoked by reaſon of a ſolitary evident cauſe, and ſhall happen to a body formerly ſound and well ſet, there appears far greater hope of help, than if the diſtemper ariſing of its own accord ſhall happen to a cachectical, phthiſical, ſcorbutic, or otherwiſe ſickly body. However 'tis a common obſervation, that this diſeaſe is dangerous and always difficult to cure: the reaſon whereof is alſo clearly manifeſt, for as much as the function of the Lungs conſiſting in a perpetual motion, is altogether contrary to the method of healing a wound, whereto primarily eaſe and reſt are required. In like manner this happens to be a greater hindrance to its Cure, in as much as the frame of the Lungs is not a Parenchyma (as was thought) but a texture or very ſubtile web of innumerable veſſels; the unity whereof if once diſſolved, it will be altogether impoſſible for the ends of the disjoined veſſels to meet again together, or the ſpace to be filled up with fleſh or callous, as in other parts. But there is this only to be hoped, that while the ends of the veſſels grow together incongruouſly and always imperforated, the circulation of the blood ceaſing in the part diſtempered, may be ſupplied by another neighbouring part: which indeed rarely ſucceeds without hurt or prejudice of the whole Lungs.

As to what appertains to the Method of healing the Hæmoptoe or ſpitting blood, the curative indications ſhall be chiefly theſe two, *viz.* to ſtay preſently and reſtrain the flux of blood; then ſecondly, to heal the diſſolution of unity without any relicts of a Conſumption in the Lungs. *The Cure thereof.*

I. As to the former, theſe two things are chiefly to be procured, *viz.* firſt that blood flow not to the part diſtempered; and ſecondly, that in the mean time the opening of the veſſel may be ſome-how ſhut. I. *Indication.*

1. That the blood may not flow to the part diſtempered, there are many intentions of healing in uſe, *viz.* it will be requiſite to diminiſh the abundance of blood, to reſtrain the boiling thereof, to alter the intemperament, and depreſs its motion or divert it another way: for which purpoſes Phlebotomy, Ligatures, and Frictions are often convenient: alſo Juleps, Decoctions, Emulſions, and ſucculent Expreſſions of Herbs ought to be drunk. Likewiſe moderate Hypnotics, and in the firſt place Diacodiates are exhibited with ſucceſs: for theſe, by reſtraining the motion of the Heart, do force the blood to cool. 1. *It ſtops the flux of blood.*

2. That the opening of the veſſel may be ſhut, aſtringent and agglutinating remedies are in the firſt place convenient. The chief of theſe are uſed to be exhibited in the form of a Linctus, ſo that while one ſwallows, certain particles gliding into the rough Artery, may more immediately communicate their power to the part diſeaſed. But the reaſon of this operation ſeems not to be of any great moment; becauſe the efficacy of the Medicines themſelves, chiefly and almoſt only by the conduct of blood reaches to the ſeat of the diſeaſe. Wherefore not only Lohochs, but alſo Decoctions, Powders, and Pills of vulnerary and balſamic Ingredients are preſcribed with ſucceſs. The forms hereof we ſhall annex beneath. 2. *It ſhuts the opening of the Veſſels.*

II. The ſecond indication, which is alſo preſervatory, reſpecting the healing of the diſſolution of unity without any remaining hurt of the Lungs, ought to provide againſt two ſorts of evils, *viz.* leſt the ſpitting blood (whereunto the diſtempered are afterwards always prone) begin again; and leſt a Phthiſis ſucceed, which threatens every body ſubject to the Hæmoptoſis. For theſe ends for the prevention of this diſeaſe daily care and conſtant courſe of healing ought to be miniſtred to the blood and Lungs. II. *The ſecond preſervatory indication.*

1. As to the blood, the maſs thereof ought to be contained ever in a due quantity, and a right temperament, with a mild and equal motion. Hence leſt it ſuperabound, or diſtempered with a Dycraſie enter into turgeſcencies, or lodge its impure ſeculencies in the breaſt: it is requiſite ſometimes to uſe Phlebotomy and a gentle Purgation. An exact courſe of Diet is always neceſſary. Moreover for the depurating and ſweetning the blood, drinking of Aſſes milk, or of Medicinal waters ſometimes does greatly help. But Decoctions, diſtilled Waters, Juices of Herbs, which carry away the ill temperaments of blood, and derive the Serum and other impurities from the Lungs, and bring them forth either by Sweat or Urine, are to be carefully drunk. Beſides for this purpoſe Iſſues do chiefly conduce. 1. *It reſpects the blood which is to be kept in a right Craſis.*

2. Neither ought there to be leſs care of the Lungs themſelves, namely that the whole frame thereof, and chiefly the place affected, be preſerved in due frame and right tone. Hence every violent motion, whereby its unity is more diſſolved, or the reſtitution thereof hindred, ſhould be induſtriouſly declined. Let the party live 2. *And frame of the Lungs to be procured.*

in

in a clear and open air, but not too fierce, or ſharp; let him abſtain from groſſer foods, from Noon-ſleeps, from plentiful Suppers, and other errors in diet, which induce either repletion or obſtruction upon the *Præcordia*. But let remedies be admitted in daily uſe, which by a peculiar property, or certain ſpecifick vertue are reported to heal the Lungs.

The method of healing requiſite for ſpitting of blood, being ſhadowed after this manner, there yet remains as to all the therapeutic indications, and according to the various intentions of healing which belong to them, for us to ſubjoyn ſome more choice forms of Remedies, whoſe Van thoſe deſervedly lead which meeting with the ſymptom moſt urging, do ſuddenly reſtrain the flux of blood caſt out by coughing or otherwiſe out of the Lungs. In the firſt rank of theſe Medicines thoſe are reckon'd which hinder the blood from flowing to the part affected, and together are impregnate with a certain aſtrictive and agglutinative power whereby the opening of the veſſel may be ſhut; and after the Belly being cleared with a Clyſter, and Phlebotomie (unleſs a weak pulſe and defect of heat withſtand it) made uſe of, there is wont to be given ſomewhat in form of a Julep, Decoction, Emulſion, juicy Expreſſion, Powder, Pills or Lohochs. We will annex certain more elegant and more efficacious Receipts of all of theſe, as likewiſe of Narcoticks, which notwithſtanding ought not every where and indifferently to be uſed, but methodically and ſeaſonably, according to advice of a diſcreet Phyſician, according to the various conſtitution of the patient and condition of the diſeaſe.

The forms of Medicines.

1. Juleps *and* Diſtilled Waters.

Juleps.

Take of Purſlain and Poppy-water of each 6 ounces, Dragons-blood in moſt fine powder half a dram, ſyrup of red Poppies two ounces, ſpirit of Vitriol of Mars ℈ß. *mix them; the doſe* ʒiij. *repeated once in 5 or 6 hours.*

Take of Plantane-water ℔j. *Gum Tragacanth and Arabick powder'd, of each* ʒß. *mingle and diſſolve them; after adding ſyrup of dryed Roſes* ʒj ß. *make a Julep; the Doſe* ʒiij. *or* ʒiiij. *every third or fourth hour.*

Take of the water of Oak-buds, red Roſes, Water-lillies, of each ʒiiij. *of Blood-ſtone finely ground, Bole-Armenick powder'd, of each* ʒß. *ſyrup of Water-lillies* ʒij. *mix them; the doſe* ʒiij. *or* ʒiiij. *three or four times a day.*

Diſtilled Waters.

Take of the Dew or almoſt inſipid Phlegm of Vitriol ℔j. *Syr. of Myrtles* ʒij. *mix them, the doſe* ʒij. *or* ʒiij. *often in the day or in the night.*

Take of Cypreſs-tops M. viij. of the leaves or flowers of Willow M. vj. *the greater Comfry-roots, Water-lillies, of each* ℔ß. *Pomegranate-flowers* M. ij. *All being cut ſmall together, pour on them* ℔ viij. *of new Milk; let it be diſtill'd in common Organs, the doſe* ʒiij. *or iiij, often in a day.*

Take of this diſtill'd Water, and of Plantane-water, of each ℔ß. *Gumm Tragacanth and Arabick of each* ʒij. *diſſolve them; the doſe is* ʒiij. *every third hour.*

The following Mixture is preſcribed by Dr. *Frederick Decker*, to be taken a ſpoonfull at a time in ſpitting blood, and ſeems a very beneficial one.

Take of Plantane-water ʒij. *Cinnamon-water* ʒij. *conf. of Hyacinth* ʒi ß. *diſtill'd Vinegar* ʒß. *of red Coral prepar'd* ʒß. *Balauſtins, Dragons-blood, of each* ℈ß. *Laudanum Opiate gr. iij. Syr. of Myrtles* ʒj. *mingle them.*

A Julep.

Take of Plantane, red Roſe, and Purſlain-water, of each ʒiiij. *of Blood-ſtone and Dragons blood reduced into fine-powder, of each half a dram, Sugar-Candy* ʒ vj. *make a Julep.*

A Solution of common Vitriol, or of Vitriol of Mars made in Spring-water, and applyed with a rag to a wound, wonderfully ſtops bleeding, but is ſcarcely convenient to be given inwardly.

2. Decoctions, Tinctures, *and* Emulſions.

Apozems.

Take the leaves of Blood-wort, Periwincle, Mouſe-ear, Plantane, Wood-ſorrel, both ſorts of Daiſies, of each one handfull, red Roſe leaves half a handfull, Barly half an ounce, Raiſins two ounces, boyl them in three pints of Smith-forge water filtred, (or water wherein hot Iron hath been often quencht) to two pints. To the ſtrain'd liquor add

add two ounces of the ſyrup of the Juice of St. John's-wort, *or of Mouſe-ear, make an Apozeme, doſe from four ounces to ſix, three times in a day.*

Take the leaves of St. John's *Wort, roots and leaves of Tormentil, of the greater Burnet, Meadow-ſweet, of each one handfull, of the ſeeds of Purſlain, Plantane, Sorrel, of each one dram, Conſerve of red Roſes half a pound, Spring-water eight pound, boyl them for* 12 *hours in* Balneo Mariæ, *to it being ſtrained adde half a ſcruple of the ſpirit of Vitriol of Mars, to be taken as the former.*

Take of Barly-water with Madder-roots boyled in it a pound and half, infuſe in it being warm a handfull of red Roſe-leaves, adding one ſcruple of ſpirit of Vitriol, after three hours ſtrain it, adding Syrup of the Juice of St. John's *wort one ounce and half, take three or four ounces, three or four times a day.* Tinctures.

Take of the decoction of the roots of freſh Nettles a pound and a half, white Poppy and Henbane-ſeeds of each two drams, Melon-ſeeds 6 drams, make an Emulſion, ſweeten it with Sugar penids; the doſe is three ounces, three or four times in a day. Emulſions.

3. Juices of Herbs and juicy Expreſſions.

Take of the Juice of Plantane half a pound, take two or three drams three times a day, in 3 ounces of the diſtilled water preſcribed before; ſweeten it to pleaſe. Juyces of Herbs.

Take of freſh Nettles, Plantane, the ſmaller Daiſies, of each 3 handfulls, bruiſe them, and pour upon them of Purſlain-water 6 drams, make an expreſſion, take it as the former.

4. Powders *and* Pills.

Take of the powder of Blood-ſtone, Dragons-blood, ground with Roſe-water on a Marble, Pearles, of each one dram, Bole Armenick, and Earth of Lemnos, of each half a dram, Troches of Winter-cherries two drams, make a powder, divide it into twelve parts, one part to be taken three times a day in the former diſtill'd water. Powders.

Take of Henbane, white Poppy-ſeeds, of each 10 drams, ſealed Earth, red Coral, *of each 5 drams, Sugar of Roſes three ounces, make a powder, the doſe one dram morning and evening; this compoſition made up with a fit Syrup into a ſoft conſiſtence, was anciently call'd and renowned in* Germany, *by the name of* Helidæus *Electuary.*

The aforeſaid Powders with the addition of Gum Tragacanth diſſolv'd, or ſome fit ſyrup, may be reduced into Pills or Lozenges. Pills.

The ſpongious excreſcence uſually growing to the fruit of Hipps or Dog-bryar, reduced into powder, half a dram taken twice a day, is a very profitable remedy in ſpitting blood.

Take of Yarrow bruiſed and dryed in the Summer-Sun as much as you pleaſe, reduce it into powder to be kept in a Glaſs; the doſe from half a dram, to a dram twice a day in any convenient liquor.

Julius Cæſar Scaliger's *Powder, or rather that of* Serapion *is mightily commended. Doſe four drams, twice or thrice a day.*

5. Lohochs *and* Electuaries.

Take conſerve of red Roſes, of Dog-roſe, of each two ounces, powder of white Poppy and Henbane ſeeds, of each two drams, ſpecies Diatragacanth. frig. one dram and half, of Blood-ſtone, Dragons-blood prepared, of each half a dram, Syrup of red Poppyes what will ſuffice to make an Electuary. Take the quantity of a Cheſnut evening and morning, at other times let him lick with a liquoriſh ſtick. Electuaries.

Take conſerve of the greater Comfry *flowers, of Water-lillies, of each an ounce and half, Troches of Winter-cherries, of Diatragacanth. frig. of each a dram and a half, ſyrup of Jujubes what will ſuffice to make a ſoft Electuary, of which lick often.* Lohochs.

Take of the white of an Egge well beaten two drams, Sugar of Roſes one dram, of white Starch three drams, make a Lohoch to be taken often with a ſpoon.

Take of Conſerve of red Roſes 3 *ounces,* Leucatella's *Balſam half an ounce, Troches of Winter-cherries two drams, Syrup of red Poppies what ſuffices to make a ſoft* Lohoch: *the doſe is the quantity of a Cheſnut night and morning.*

II. The

The second Indication. II. The second preservatory Indication exhibits such remedies, which by containing the blood in its right temper, and the Lungs in their due frame, do provide against a relapse of spitting blood, and the following of a Phthisis. Such things which respect the blood, either are mild evacuators by Stool, Urine or Sweat; or are meerly Alteratives. Every of these are usually prescrib'd either in form of Potion, Powder, Electuary, or Pills: We will here shew you the most select patterns of the chief of them.

The first intention in respect of the blood.

A Purge. 1. As to Evacuators, a gentle Purgative is sometimes appointed after this manner.

Take of the best Senna three drams, Cassia fistula bruised one ounce, Tamarinds three drams, Coriander-seeds a dram and a half, boyl them in Spring-water to 6 ounces, to it strain'd add syrup of Chichory with Rhubarb one ounce, clarifie it with the white of an Egge. Or,

Take 4 ounces of Gereons *decoction of Senna, Syrup of Apples purging one ounce, mingle them and make a potion.*

Alteratives. 2. That the good temper of the blood may be preserved, and the superfluities drained from the Lungs may be continually discharged by Sweat and Urine, these following Alteratives, or some of them are for the most part receiv'd in constant use; which also being endued with a healing power, do succour the weak Lungs, or those whose Unity is dissolv'd.

For ordinary drink, let simple water, especially in a hot constitution, or being colour'd with a little Claret-wine, be drunk. Those with whom this doth not agree, *a Bochet of China, Sarsa, with shavings of Ivory, Harts-horn, with white Sanders,* or *small Beer, or small Ale, with the leaves of Harts-tongue, Oak of Jerusalem,* and the like infused, are frequently used with good success.

Pectoral Decoctions or Hydromels with temperate Vulneraries are taken twice or thrice a day to 6 or 7 ounces.

Decoctions. *Take of fresh Nettles, Chervil, of each one ounce, Harts-tongue, Speedwell, Mouse-ear, Ground-Ivy, St.* Johns-*wort, of each a hand-full, boyl them in three pints of Spring-water, to two pints, adding Raisins stoned an ounce and half, Liquorish two drams, to it strain'd add Syrup Byzantine two ounces, clarifie it with the white of an Egge, make an Apozeme to be taken from 4 ounces to 6, twice or thrice in a day for a month. In a more cold or phlegmatick constitution, let the Liquorish and Raisins with the Syrup be omitted, adde at last of Hony well clarified two ounces, strain it and keep it for use. The Dose is the same.*

The use of these is sometimes intermingled with a distilled water appropriate for that use, which likewise is more frequently taken by such who nauseate and loathe Apozemes.

A distilled water. *Take the tops of Cypresse, leaves of Ground-Ivy, of each 6 handfulls, of Snails half boyled one pound and half, of all the Sanders bruised of each one ounce, being cut and bruised infuse them in 8 pound of fresh Milk, distill it in common Organs, the Dose 3 or 4 ounces with a spoonfull of Syrup of Ground-Ivy, to be taken twice in a day.*

The second intention respects the Lungs. 2. In respect of the Lungs, *viz.* that without obstruction or opening of the vessels, the Union of parts, and due conformation of the whole may be preserved, temperate balsamicks chiefly conduce. To this intent *Leucatello's* Balsam is commonly prescribed to be taken daily and for a long season. Chymists and certain Noble women do cry up with great praise a balsamick Oyl drawn by distillation, called by them *the Mother of Balsam.*

It would be easie here to reckon up very many other remedies against spitting blood, very much celebrated by the ancient as well as by modern Writers; notwithstanding the harvest of these already gathered together doth at present seem rich enough. But it remains, that I illustrate as well the Theory of this disease, as the curatory method above delivered, by a History or two of sick Patients.

The first History. A noble young man, when after a scorbutical *Cachexia* he was affected with a Palsie, and for curing this disease, remedies not only great but improportionate to the blood and spirits were experimented by him, *viz.* Salivation and the use of Baths,

he

he contracted a ſpitting of blood, whoſe fits (of all I ever knew not preſently mortal) were moſt fierce. Preſently on the firſt appearance of this diſeaſe, ſpitting blood followed the Operation of *Hues*'s powder (from which having for ſome time ſuffered a flowing of the Mouth, without his Palſie being cured he was reduced to great weakneſs:) Then being afflicted with a Catarrh, and a Cough very troubleſome, he began to diſcharge a diſcolour'd Spittle, ſometimes ſtained, and ſometimes ſprinkled with blood; but this diſeaſe being mild from the beginning, did ſuddenly vaniſh away by the uſe of remedies, and after going into the Countrey, and ſucking in a more pure air, he became better, and after a while ſeeming healthful enough in his breaſt, he went to the Bath, for the benefit of his Palſie; where daily bathing for a fortnight in thoſe hot waters, he again contracted a Cough, and a little after an horrid Hæmoptoe or a ſpitting of blood, ſo that in the ſpace of 24 hours, coughing often and plentifully, he poured out blood in a vaſt quantity.

I firſt viſiting him in this condition, proviſion being made for the whole, I preſcribed preſently Phlebotomy for revulſions ſake: notwithſtanding after this adminiſtration (both then and ever after) he either repeated the bloody ſpittle, or grew worſe. Moreover, I exhibited Juleps, Lohochs, Decoctions, and alſo Hypnoticks, which helping little or nothing, ligatures made about his arms and thighs, did firſt of all reſtrain the tyranny of this diſeaſe: And when afterwards the Evil broke out again, I perſwaded him at length, (his drink of Beer being left) that he ſhould conſtantly drink the decoction of China and Sarſa with the Pectorals. By the continual uſe hereof, obſerving moreover an exact courſe of diet, and altogether abſtaining from wine, more hot aliments, and Salt, and Sugar, for above two years he was well in health.

But afterwards when by being crouded in a Court of Judicature, he grew mighty hot, he relapſed back again into a terrible ſpitting of blood. A Phyſitian being ſent for, he was preſently let blood in the arm, whence his ſpitting of blood became more ſharp; and when afterwards letting blood was repeated the ſecond and third day, and the evil grew worſe every time, at length Ligatures (as at firſt) being adminiſtred, and the pectoral drink and a Linctus being often taken, the diſeaſe preſently remitted, and in a ſhort ſpace wholly ceaſed; notwithſtanding he continued the uſe of his pectoral decoction and ſlender diet, *viz.* no fleſh-meat, for a fortnight; and from thence he obtained truce from his enemy for three years; and when afterwards at any time the blood ſwelling by drinking of wine, or taking more dainty food, began to break out from the Lungs, preſently by ligatures, and the uſe of the Decoction and Lohoch, and a thin diet, its aſſault was wont to be repulſed. But he did not ſo ſafely eſcape, but that it was neceſſary for him for the moſt part to keep perpetual watch againſt that enemy always lurking: for not long ſince by reaſon of the intemperature of the year, he contracted a troubleſom Catarrh, with a Cough, a plentifull ſpittle, and ſometimes bloody, and then the former medicines effected leſs; wherefore, he betook himſelf by his own advice to new things, and in the firſt place took evening and morning a ſpoonfull of Syrup of Ground-Ivy, and thereby enſued a notable help: but when that Syrup became quickly loathſome by reaſon of the Sugar, he took the powder of that herb well prepared to half a dram, or one dram twice a day in a ſpoonfull of ſome liquor; by the long uſe of which Medicine he was much better as to his Catarrh and Cough. But when the ſpitting of blood now and then broke out, though in little quantity, he chang'd again his Medicine, and took twice in a day the powder of the tops, and chiefly of the hairy excreſcences of Cynorrhodon or Dog-bryer: which only medicine a certain Phyſician renowned formerly for the cure of ſpitting blood, uſed with great ſucceſs. Neither did our Patient receive a leſs happy effect from that medicine, for preſently after he eſcaped altogether free from a Cough, a Catarrh and bloody Spittle, and ſo remained for a long while: untill at length believing this diſeaſe of the Breaſt to be wholly ſubdued, and therefore ſlighting it, he aſſumed weapons againſt the other more ancient enemy the Palſie. Wherefore, while his Hæmoptoſis or Spitting of Blood was neglected, he daily took a large doſe of hot Medicines to conquer that other diſtemper, *viz.* magiſtral waters diſtilled with Wine, ſpirit of Harts-horn, of Sal Armoniack, and Aromatick Powders and Confections; Beſides, whilſt he indulg'd himſelf in a more plentiful diet, with a moderate drinking of Ale and Wine, the roaring Lion that at firſt ſeem'd to ſleep, was again ſtirr'd up, *viz.* he had not long continued in that antiparalytical Method, but the Spitting of blood returned with its greateſt fierceneſs, ſo that in the ſpace of a day and a night he

coughed out above three pints of ſpumous blood. But afterwards a Phyſician being ſent for who preſently preſcribed Phlebotomy, the ſpitting of blood began to ceaſe upon bleeding (as formerly it was always wont to do) but then fell into ſharp fits again: which however by the uſe of Ligatures, and a Lohoch and pectoral Decoction daily taken, was preſently aſſwaged, and a while after wholly ceaſed. And when afterwards he uſed the pectoral Decoction three months, and a very ſlender Diet, *viz.* without any fleſh, only of Herbs, Barley, &c. and Milk-meats, in a ſhort time he recovered his former health, and now lives in that ſtate, ſo triumphing over that cruel diſeaſe, that many Hæmoptotic perſons conſult him as their Oracle, and for a Cure do propound a method of this kind of living to be followed before the Phyſicians advice.

The reaſon of the caſe. What is moſt wonderful in this caſe is, that after ſo many breaches ſo often happening in the Lungs, this famous Perſon was not in the intervals affected with a Cough, neither fell afterwards into a Conſumption; whereas moſt after any of the ſmalleſt veſſels being open in the *Præcordia*, for ſome time after labour with a Cough with plentiful and thick ſpittle, and at length frequently become conſumptive. And that it happened otherwiſe to our Patient, I chiefly attribute to the balſamic conſtitution of his blood, *viz.* in the maſs whereof the ſerous recrements are either leſs collected, or ſo ſtrictly mingled, that they cannot be eaſily ſeparated thence; wherefore after the veſſels were broken, or their unity diſſolved, a plentiful Ichor or ſharp humor (being wont to generate a Cough and ſpittle) did not ſweat out as in many others. Moreover what he himſelf obſerved, contrary to many others, that his ſpitting blood happened never in winter, but in Summer, came alſo ſo to paſs by the ſame reaſon: becauſe when the blood did leſs abound with vaporous recrements, the opening or obſtruction of the Pores were neither an advantage nor prejudice to it; nevertheleſs the blood growing hotter than it ought to be, ſeeing it exhaled not, there was a neceſſity it ſhould break out of the veſſels; and when again diminiſhed in quantity, ſending away little or no ſerous Ichor out of the orifices of the veſſels, the ſpitting of blood ceaſed without a remaining Cough. The ſame reaſon holds of many that ſpit blood, wherefore ſome are found much inclinable, others not prone to a Conſumption. This Gentleman ever found the uſe of the pectoral Decoction advantageous to him: wherefore when he often varied other Medicines he always retained the ſame Decoction: moreover he hath commended it to many others ſpitting blood with ſucceſs. The form of the Preſcription was this.

A Drink. *Take of all the Sanders of each ſix drams, infuſe them for twelve hours in ſeven pints of Spring-water, then boil them to a conſumption of a third part, after add leaves of Colts-foot, Maidenhair, Mouſe-ear, Speedwel, flowers of St. Johns-wort, each two handfuls; ſweet Fennel-ſeeds ſix drams, Liquoriſh half an ounce, Raiſins ſtoned half a pound: boil them to four pints, afterward ſtrain it, and keep it for ordinary drink.*

Moreover the ſpitting blood threatning and preſſing upon him he took thrice or oftener a day the quantity of a Nutmeg of the following Electuary, drinking after it ſeven ſpoonfuls of a Julep.

The Electuary. *Take conſerve of red Roſes three ounces, conſerve of Hips, Comfry, each an ounce and half; Dragons blood a dram, ſpecies of Hyacinth two ſcruples, red Coral a dram, with a ſufficient quantity of ſyrup of red Poppies, mix them and make a ſoft Electuary: let him take hereof evening and morning a dram and half, drinking after a draught of the following Julep. At other times let him lick it with a Liquoriſh-ſtick.*

The Julep. *Take Plantane and Spawn-Frog water, each ſix drams; ſyrup of Coral, dried Roſes, each an ounce; Dragons blood two ſcruples: mix them, and make a Julep.*

Among the examples of them that ſpit blood the caſe of that Reverend perſon Dr. *Berwick* S. T. P. and lately Dean of St. *Pauls* Church ought not to be omitted, which ſome while ſince I learned partly from the Patient himſelf, and partly was communicated to me from his Brother that moſt skilful Phyſician Dr. *Berwick* my moſt dear Friend.

The ſecond Hiſtory. That moſt renowned Divine fifteen years before he died laboured with a moſt obſtinate Cough, and ſometimes with a bloody and ſalt ſpittle, with a grievous breath ſtinking like Hell; by which being made lean by a pining away of the body, he wanted but little of being almoſt extinguiſhed by a Conſumption. As often as his ſpitting blood intermitted, the rankneſs of breath and ſpittle ceaſed alſo; afterwards the return hereof declared conſtantly that other affect to be preſently attendant. In this langui-

languiſhing condition, when this Renowned man was diſcovered to favour the Kings Party at that time oppreſſed with a grievous Tyranny, and being caſt into a ſtrait Priſon, did drink meer water inſtead of ordinary drink, he recovered his health beyond the hope and expectation of all perſons, and ſo remained indifferently healthful for above ten years ſpace. Nevertheleſs afterwards, I know not by what occaſion, unleſs by the hardſhip of a cold winter, not only the aforeſaid evils, *viz.* a Cough with bloody and ſalt ſtinking ſpittle did become fierce upon him, but alſo over and above, a debility of ſtomach, want of appetite, and a nightly Feaver did accrue. But not long after theſe Symptoms a little remitting, fair weather again ſeemed to ſhine out; until on a certain day, the air being ſuddenly changed into an intenſe cold, towards night he was aſſaulted with great ſtraitneſs of breaſt and difficult breathing, with a quick and weak pulſe, and fainting of all his ſpirits, as if he had been expiring. Nevertheleſs from this danger he ſuddenly eſcaped by the interpoſition of a Criſis, *viz.* by a plentiful ſpitting of blood, and after by a breathing Sweat: but from that time his ſpittle remitted much of the uſual ſtench, and ſomething of its ſaltneſs; and when in a ſhort time afterwards the laſt and moſt painful invaſion of ſpitting blood threatned him, that uſual preſage from ſtench of breath was wanting; but the ſubſequent ſpitting of blood being very plentiful, did ſo debilitate his ſtrength, that from that time declining ſenſibly, he expired within a month: and when a little before his deceaſe, by reaſon of a ſharp pain in his ſide, a Vein was breathed, his blood ſeemed to fail ſo, that almoſt none ſtreamed out. Moreover in his body diſſected after death very little quantity of blood was found: nor could they find any footſteps of the other moſt notable Symptoms, *viz.* ſpitting of blood and of the ſtinking breath and ſpittle; for there was no collection of any filth or ſtinking and putrid matter, nor any cavity in the Lungs made by an Ulcer or Wound; but only one lobe of this bowel, or rather the whole left ſide was ſo hardned from a ſcirrhous Tumor, that the blood could not eaſily or but very little paſs through the frame being ſo obſtructed, and as it were ſtony: wherefore it is no marvel, if the blood that ſhould have paſſed moſt ſwiftly through the Lungs, did now and then burſt out in ſome place from the veſſels, which were joined together, or ſuffered not a circulation by reaſon of the Schirroſity.

Notwithſtanding here a greater difficulty ariſeth, *viz.* whereas his Lungs were found altogether free from any Ulcer or notable wound, whence that moſt dire ſtench of ſpittle and breath, always a forerunner and companion of the bloody ſpittle (the laſt invaſion of this diſeaſe only excepted) proceeded. We have in another place given remarks upon all theſe things, as that Ulcers of the Lungs and the purulent ſpittle of conſumptive perſons ſeldom or never ſtink, but the matter caſt out of an Impoſthume of the Lungs doth frequently ſtink: but that in the ſick Doctor the Lungs being free from either affect, breathed out ſo horrible a breath, the reaſon will beſt of all appear, if we inquire of the manner and cauſe of a ſtench in general. For we obſerve this to be excited when the impure Sulphur is diſſolved either by a lixivial, or an acid Salt, and is precipitated by the other. Let common Sulphur, or Sulphur of Antimony be diſſolved by Oil of Tartar or Stygian water; afterwards if you pour on this ſolution a diſſolution of fixed Salt, and upon that, Vinegar, a moſt hideous ſtench will ariſe. In like manner we may conceive in the caſe propoſed, that the ſulphureous particles of the blood being very impure, were corroded by the fixt Salt, with which its juice abounded very much; afterwards when the acid humor, having endured a flux, reflows from the nervous parts into the maſs of blood, it precipitates the diſſolved Sulphur, and ſo cauſes that ſtench to be exhaled from the Lungs, and whilſt it forces the blood into a turgency, a little after it compels to a ſpitting of blood. I have known ſome endued with a breaſt firm enough, and free from all Coughs and conſumptive diſpoſition, who have for the moſt part breathed out a moſt hideous ſtench: which could proceed from no other cauſe, beſides what even now we have obſerved. The impure blood abounding with Sulphur diſſolved with Salts, if perhaps while it is rarified within the Lungs, and looſned in its frame, it meets with an acid humor, it will exhale in breathing putrid and horrid effluvia's. It happens by the like reaſon of the blood otherwiſe diſpoſed, that as the breath of ſome perſons is very ſtinking, ſo of others very ſweet. And indeed the breath or air reciprocated through Reſpiration, for that it carries out with it the effluvia's of blood highly rarified within the *Præcordia*, one while diſperſes a grateful vapor, another while a moſt unpleaſant.

The reaſons of the caſe.

SECT. I. CHAP. VIII.

Of a Peripneumony, or Inflammation of the Lungs.

The deſcription of a Peripneumony.

A Peripneumony is uſually defined to be, an inflammation of the Lungs with an acute Feaver, a Cough, and difficult breathing. They who labour with this diſtemper are greatly ſenſible of a notable inflammation in their breaſt with a ſwelling of the Lungs, and ſometimes a pricking pain, they draw a painful and ſhort breath, or, as *Hippocrates* affirms, a deep breath; the Feaver preſſes with great thirſt, watching, and painful Cough; whereto alſo bloody ſpittle, or ſtreakt with blood, ſucceeds. By which Symptoms it clearly appears, that this diſeaſe ariſes, in as much as the blood boiling feaveriſhly, doth not eaſily paſs through the leſſer pneumonic Veſſels; but ſticking in their paſſages, begets firſt an obſtruction, afterwards being more heaped and extravaſated, propagates a Phlegmon or inflammation with heat, a Cough, and diſcoloured ſpittle. Moreover in as much as the blood ſo accumulated and ſtagnating, puffs up theſe paſſages of the Lungs, and compreſſes them, a difficulty of breathing is cauſed; and in as much as it pulls or diſtends the nervous Fibres, a pain frequently ariſes.

After what manner a Phlegmon is bred in the Lungs.

But if it be asked, how a Phlegmon ſhould grow together in the frame of a Lung meerly bladdery and excarnous; and after what manner it is diſtinguiſhed from that diſtemper which is wont to be ſtirred up in muſculous fleſh, or the ſubſtance of a bowel? We muſt anſwer, although the above-mentioned parts vary as to the texture, notwithſtanding the reaſon of the affect is altogether the ſame in each of them. For the ſmall ſanguiferous veſſels do every where alike embrace, bind, and variouſly gird about both all the Tracheal paſſages in the Lungs, and alſo the fleſhy fibres in the Muſcles, and laſtly the little fibres and nervous threds, with the thickeſt foldings like cluſters, of the Parenchyma. But that which produces a Phlegmon is the blood it ſelf, which, while it grows very hot, and is hindred in its paſſage, every where, and eſpecially in the Lungs, whoſe veſſels branch into very ſmall foldings, doth firſt beget an obſtruction, and then an inflammation.

The conjunct cauſe of a Peripneumony conſiſts in two things.
1. That the blood boils.
2. That it ſticks in the paſſages.
Sometimes this diſpoſition, ſometimes that is firſt.

Wherefore the formal reaſon and conjunct cauſe of a Peripneumony conſiſts in theſe two things, *viz.* that the blood boils feaveriſhly, and ſticking alſo within the more narrow paſſages of the Lungs, engenders there an obſtruction cauſing inflammation. Unleſs theſe two things concur, there is an exemption from this diſeaſe; for in many other Feavers, eſpecially in a burning Ague, though the blood, moſt intenſly heated and inflaming all the *Precordia*, as alſo in the longing of women, the Green-ſickneſs and the Dropſie of the breaſt, is very clammy, yet though ſticking very much in the paſſages of the Lungs, it does not ſtir up a Peripneumony: to produce which both diſtempers muſt concur and join their ſtrength. Nevertheleſs when there is an indiſpoſition of both theſe, one while this, another while that, is firſt in act, and after a ſort one is the cauſe, or at leaſt the occaſion of the other. For ſometimes the blood irritated into a Feaver cauſes an obſtruction of the Lungs; and the blood alſo ſometimes finding a remora in the Lungs, receives a feaveriſh boiling from its proper obſtruction. Notwithſtanding, for the conſtituting the procatarctic cauſe of this diſeaſe, the blood ought to be fitted as well for the boiling, as for the obſtructing the veſſels of the Lungs.

What that is Phlebotomy diſcovers.

Though it will not be eaſie to ſhew what this diſpoſition of the bloody liquor is inclining to a Peripneumony, yet the reaſon thereof doth ſomething appear by Phlebotomy, always made uſe of in this diſeaſe with the beſt ſucceſs. For the blood being drawn from any labouring with this diſeaſe, as alſo from thoſe in a Pleuriſie, after it grows cold, in its ſuperficies inſtead of a Scarlet cream, it hath a little film ſomewhat white or otherwiſe diſcoloured growing on it, which alſo is very tough and viſcous: whence we may conjecture, that the maſs of blood being too ſtrait in its frame, whilſt that in the circulation it doth not diſcharge its recrements, grows too thick, and as it were clammy, and for that cauſe becomes too prone as well to boil as to ſtick within the narrow paſſages, and eſpecially of the Lungs.

What affection of the blood produces it.

But if farther inquiſition be made, from whence this diſpoſition of blood proceeds, by which it becomes clammy and viſcous like ropy wine; the general reaſon hereof is this, *viz.* that the more thick parts of blood are not made thin enough by the more ſubtile; ſo that all of them being equally mixed and mutually incorporated, at length the

good

good humors ſeparate themſelves into their appropriate functions, and the ſuperfluous are perpetually diſcharged by their proper Emunctories. But on the other ſide in as much as the ſulphureous particles of the blood being combined together with the ſaline and earthy too much exalted, enſnare and entangle all the reſt; for that cauſe its liquor containing within it ſelf all its recrements and impurities, grows clammy as glue, and in that regard contracts an inflammable diſpoſition.

For it is obvious to every perſon, that the blood that grows clammy in this manner, is rendred prone to obſtruct the narrow paſſages of the veſſels (which ſurely are very ſmall in the Lungs); moreover for the ſame reaſon they are diſpoſed to become feaveriſh: *viz.* becauſe retaining obſtinately within its own boſom all the feculencies and recrements, from the ſame preſently gathered into a heap, it is conſtrained into a great turgeſcence or ſwelling, whereby of neceſſity an inflaming obſtruction of the Lungs takes either its origine or augmentation.

The fault of the Lungs produces it.

Moreover as to the procatarctic cauſe of this diſeaſe, very frequently the faultineſs of the Lungs is joined herewith, and determines that general intemperament of blood to affect this part in ſuch a ſort. For as the clammy blood grows hot, the more ſtrong and ſound *Præcordia* do frequently diſcharge the deſigned miſchief from themſelves, and the taint being fixed to the Pleura, or about the habit of the body, a Pleuriſie or Rheumatiſm is rather cauſed than a Peripneumony. Nevertheleſs the tender Lungs being obnoxious to a Cough, or formerly prejudiced in their frame either by ſpitting blood, or other diſtempers of the breaſt, from the blood boiling up (while it is too much bound and clammy in its own conſiſtence) they eaſily engender an obſtructing Phlegmon.

The evident cauſes of a Peripneumony.

Hitherto of the conjunct and procatarctic cauſes of a Peripneumony: as for what regards the evident cauſes, whatſoever ſuddenly perverts the temperament of the blood, or reſtrains its free tranſpiration ought to be referred hither, as chiefly are exceſſes of heat and cold, or the inordinate drinking of Wine or ſtrong Waters, any vehement exerciſe, and the drinking of ſome waters, and thoſe eſpecially icy. Beſides, ſometimes a malignant diſtemperature of Air doth engender this diſeaſe in many, and makes it Epidemical.

It often ſucceeds or follows after a Pleuriſie.

Authors in Phyſick do every where obſerve (and it is alſo a vulgar obſervation) a Peripneumony frequently ſucceeds or comes upon a Pleuriſie; but nothing is more uſual than in a Pleuriſie a bloody and thick ſpittle, and as it were purulent to be voided. Hence a great diſquiſition ariſes, by what paſſage or ways the matter by ſpittle caſt out, can be conveyed from the Pleura to the Tracheal paſſages. Some think, that this being fallen into the cavity of *Thorax*, is ſucked into the Lungs as with a Sponge; and others ſuppoſe, that it is transferred thither by the Membranes adhering thereto, by which the Lungs often ſtick unto the Pleura. But truly either way ſeems improbable, if not impoſſible. For firſt, that the Lungs do not ſuck in the contents of the hollowneſs of the Cheſt is manifeſt from hence, becauſe in a Dropſie or wound of the breaſt, when they happen, the Lungs being unhurt, neither water nor blood is at all diſcharged by coughing; though frequently great plenty of this or that humor be there, which preſently flows out of its own accord from the *Thorax*, inciſion being made. But that ſometimes the Membranes growing from the Lungs, knit themſelves to the Pleura, is clearly manifeſt by Anatomical obſervation; yea and by this way of return I have ſometimes known the purulent matter tranſlated into the ſide, and there by an Iſſue, made by Art or Nature, to have been evacuated with a heathful Criſis: nevertheleſs ſuch Membranes of the Lungs joined to the Pleura do ſeldom pre-exiſt, and in a Pleuriſie, which is a very acute diſeaſe, they cannot, like a Muſhroom, be the iſſue of one or two days: moreover, though ſometimes thoſe obſcure paſſages may be ready at hand, which perhaps by ſome admirable inſtinct of Nature diſcharge ſomething out of the Lungs towards the precincts of the *Thorax*; yet it ſeems againſt the Oeconomy of Nature, that they can derive any corruption outwardly engendered to this moſt noble part within, which ſurely is the fountain both of life and heat.

The reaſon of this is inquired into.

As to this, if it may be lawful to propound our Judgment, I am induced to think that a Peripneumony and Pleuriſie are one while ſingular and ſeparate affects, and another while bred together and coexiſting from the firſt, and another while are by courſe one after another or ſuccedaneous. For the procuring cauſe being ſtirred up into act, ſo that the blood growing clammy, and boiling together, obſtructs in ſome places the leſſer veſſels: the neſt of the diſeaſe ſometimes is faſtned on the Pleura, or ſeparately in the Lungs, ſometimes in each of them together, and ſometimes firſt in one, and then in t'other: but for the moſt part, the Pleura being firſt healed, preſently the

ſame

ſame morbific cauſe invades alſo the pneumonic Veſſels. Moreover we have known a various ſhifting of this affect; *viz.* that it has firſt troubled the right or left ſide, preſently that being deſerted, to have occupied the Lungs, and afterwards both being deſerted, to affect the Brain, and frequently to transfer its ſeat from thence into the above-mentioned places. But for the reaſon aforeſaid a Peripneumony not only ſucceeds a Pleuriſie, but frequently a Squinancy, and ſometimes other diſtempers: for while the blood growing clammy, and boiling together, continues a Feaver in the whole, it transfers the obſtruction cauſing a Phlegmon variouſly hither and thither. And from hence the ſolution of that obſervation is clearly manifeſt, which has ſo much puzled Interpreters, *viz.* that a Palſie or dead Palſie of one ſide doth ſometimes ſucceed a Peripneumony, becauſe the blood that being clammy, had lately obſtructed the pneumonic Veſſels, afterwards ſtuffing certain foldings of the veſſels of the Carotides, prohibits the engendring of animal ſpirits in this or that part of the head, and ſo reſtrains their influence into the reſpective nervous parts. From what hath been ſaid, the chief differences of a Peripneumony are made plain, namely that it is either a ſimple diſtemper, or joined together with a Pleuriſie, Squinancy, or ſome other, and then it is either primary or ſecondary. Moreover it is uſually diſtinguiſhed as to the Feaver and ſtate of breathing: to wit, according as this is more or leſs prejudiced, and as it ſhall be more intenſe or remiſs, this diſeaſe alſo is denominated either more or leſs acute.

The differences of this diſeaſe.

Prognoſtics.

As to the Prognoſtics of this diſeaſe, common experience doth atteſt, that it is a very dangerous diſeaſe, becauſe many Patients either die of it, or very difficultly recover health. No leſs may we conclude this from the reaſon or Etiology of it; for a wound with much extravaſation of blood, or a ſtagnation cauſed in the Lungs, is moſt difficultly cured, and the affected place is never reſtored unto its former conformation. The prognoſtic ſigns, which are of greateſt note, are taken from the appearance of Symptoms and nature of things thrown out, and the ſtate of ſtrength.

1. From the appearance of Symptoms.

1. A Peripneumony coming upon a Pleuriſie or Quinzy, for the moſt part is worſe than ariſing of it ſelf, or ſucceeding either of them: but if upon this diſeaſe, after what manner ſoever begun, an acute Feaver follows with great thirſt, watchings, and not breathing unleſs ſet upright, it is ill; and yet much worſe, if upon it a Delirium, a Frenzy, convulſive motions, or a Palſie on one ſide enſue. Moreover the Patient is not in leſs danger, if he be very purſie, if troubled with vomiting, or frequent ſwounding away, a weak Pulſe, and a cold Sweat. For while theſe Symptoms are inſtant upon him, the obſtruction of the blood in the Lungs is not removed, nothing is digeſted or ejected by ſpittle; but the circulation of the blood being more and more hindred, and its kindling by breathing ſtopt, the animal ſpirits are throughly diſordered, and at length faint, until together with a proſtration of the whole ſtrength the vital flame is extinguiſhed.

2. From what is excreted.

2. As to Prognoſtics from things excerned, we obſerve a Peripneumony to be dangerous, wherein nothing is thrown out by ſpittle; next to this, when the ſpittle is thin and crude, mixed with blood; it is far better when the ſpitting is yellow and thick, ſtreaked with a little blood. The Urine being yellow from the beginning, and of a good conſiſtency, with a cloud in the midſt, ſhews that almoſt all the recrements of the blood are lodged in the place affected; when from that ſtate it is changed into a thick and turbid Urine, it ſhews the morbific matter to be ſwallowed up again from that part into the blood; but if ſuch kind of Urine be ſuddenly changed into a thin one, then a Delirium or death it ſelf is impendent. Much Sweat and plenty of Urine, a Diarrhœa, bleeding at Noſe, flowing of the Menſtrua's, or the Hæmorrhoids do frequently promiſe good in this diſtemper, yea any of theſe Evacuations happening ſeaſonably doth frequently diſcharge the diſeaſe.

3. From the ſtate of ſtrength.

3. The condition of ſtrength is ever of great moment in forming a due Prognoſtic in this diſeaſe: for oftentimes when horrid Symptoms, as an intenſe Feaver, a Breathing very painful, with a Cough, watchings, and other ominous ſigns, ſhall be preſſing, if the Pulſe be as yet ſtrong, and the animal ſpirits perſiſt in their vigor, there is better hope of the Patient, than if theſe things being more quiet, there were a weak Pulſe, and the Spirits ſhould become drowſie and oppreſſed.

The Cure hath two chief indications.

The firſt indication about the curatory Method in a Peripneumony is, that the blood being impacted in the pneumonic Veſſels, and cauſing a phlegmonous obſtruction, may be from thence diſcuſſed and reſtored to its priſtine circulation. Which if not to be procured, the ſecond indication will be, that that matter be duly digeſted or brought to

to ſuppuration, and with all expedition voided by ſpittle.

While the former indication prevails, the intentions of healing will be theſe enſuing. *The firſt indication ſuggeſts four intentions of curing.* Firſt, that the more plentiful afflux of blood to the part affected be prevented, or prohibited by ſome means. Secondly, we muſt endeavour, that the matter ſtagnated or extravaſated in the Lungs, be ſwallowed again by the Veins into the reſt of the maſs, and cauſed to circulate. Which that it may be the better procured, thirdly, the blood ought to be freed from its clammy viſcouſneſs, whereby its fluidity is impeded. Fourthly, that we apply to the Symptoms moſt urgent, *viz.* a Feaver, Cough, Watchings, and difficult Breathing, fit Remedies. But if notwithſtanding all theſe another indication ſhall come into uſe, it will be requiſite to preſcribe maturating and expectorating Medicines vulgarly ſo called, together with theſe.

1. That we may ſatisfie the firſt and ſecond intention together, Phlebotomy is for the moſt part requiſite in every Peripneumony, yea ſometimes it ought to be more frequently repeated; for the veſſels being emptied of blood do not only withdraw the nouriſhment of the diſeaſe, but do alſo ſup up the matter impacted in the place affected. Wherefore if ſtrength remain, and the Pulſe be ſtrong enough, a more free breathing of a Vein is convenient at the very beginning; but otherwiſe let it be uſed in a little quantity, which however may be repeated as occaſion offers it ſelf. We intimated above, that blood drawn in a Peripneumony and alſo in a Pleuriſie, after it is cold, contains in its ſuperficies a ſmall viſcous and diſcoloured film: moreover we may obſerve one while the blood entirely, another while only a portion thereof is ſubject to this change. For when the blood is received into three or four diſhes, ſometimes in all, but oftener in the ſecond and third diſh it is apparently bad, and in the firſt and laſt laudable enough: wherefore they commonly give it in precept, that blood is always ſo long to be emitted, till that which is ſo depraved begins to come forth; and if ſtrength remain, the bleeding ſhould continue till the good blood flows out again. Truly as common experience doth approve of this practice, even ſo doth reaſon it ſelf; for in this diſeaſe, becauſe the whole maſs of blood doth not preſently acquire that clammineſs, the depraved portions are chiefly accumulated about the place of obſtruction, and adhere on every ſide in the leſſer veſſels. Wherefore the blood firſt iſſuing by Phlebotomy is often void of any fault; afterwards the veſſels being emptied receive the other morbific matter at firſt ſtagnated, and reſtore it to its circulation; and when the portions thereof being placed near, are carried as it were in a joint troop, they flow out together at the orifice of the opened Vein, and after that entire maſs of bad blood hath flowed out, the reſidue being more pure doth ſucceed. Wherefore in this caſe ever let inciſion be made with a large orifice, and let the blood be drawn out not only with a more plentiful ſpouting, but alſo with a continued: for otherwiſe if in the midſt of Phlebotomy, the bad blood iſſuing out, the orifice (as the manner of ſome is, leſt the ſpirits ſhould faint) be cloſed with the finger, when again it is opened, the blood pure enough will iſſue next, but the bad ſliding by, if there be any remaining, will not return preſently to that orifice. Beſides Phlebotomy many other remedies, *viz.* whatſoever do repreſs the turgency of blood, and empty the paſſages thereof, whereby the morbific matter may be ſuckt up, are here to be uſed. Wherefore a very thin diet is preſcribed for the moſt part meerly of Barley and Oats: and if Cathartics are altogether prohibited, becauſe they diſquiet the blood, and hurry it more impetuouſly into the part affected; notwithſtanding Clyſters which gently looſen the Belly, and draw the recrements of the blood towards the Belly, ought to be daily uſed. Moreover Juleps and temperating Apozemes which bridle the fervor of the blood, and draw out the ſuperfluous ſeroſities thereof, and which alſo do gently open the paſſages of the Breaſt, are taken with ſucceſs.

1. The firſt intention that the afflux of blood may be cut off.
2. That the extravaſated be reduced to circulation.

Rules concerning Phlebotomy.

3. The third intention of healing, which reſpects the withdrawing of the clammineſs or obſtructing viſcoſity of the blood, is altogether to be performed by remedies which unlooſe the frame thereof being too much bound, and diſſolve the coupling together of its ſalts. And truly the remedies of this kind, which in this reſpect reaſon and analogy would dictate, are now received into uſe by long experience. For Powders of Shell-fiſh, the Tooth of a Boar, and the Jaws of a Pike, and other things endued with an Alkali Salt, alſo Sal Prunellæ, for the moſt part are preſcribed by all Practitioners, as well modern as ancient. I have more frequently known the Spirit of Salt Armoniac and of Harts-horn to have yielded notable relief in this diſeaſe: and for the ſame reaſon it is, (*viz.* becauſe the volatile Salt is uſeful) that the infuſion of Horſe-dung, though a common remedy, affords oftentimes ſingular help.

The third intention of healing is that the clammineſs or viſcoſity of the blood may be taken away.

4. As

4. That the moſt urging Symptoms may be helpt.

4. As to the Symptoms and their Cure, very many remedies appropriated to theſe fall in together with the former; for againſt the Feaver the ſame Juleps and Apozems which appeaſe the heat of blood, and withal recreate the animal ſpirits are of moſt common uſe: to which beſides in reſpect of the Cough and difficult breathing, temperate pectoral Remedies are added. The great difficulty is what ought to be exhibited againſt want of ſleep, when it ſhall grievouſly oppreſs; for Opiates, becauſe they do further prejudice the breathing, which in this diſeaſe is already hindred, are ſcarce ſafely adminiſtred, nay ſometimes become mortal. Wherefore Laudanum and the ſtrong Preparations of Opium are to be ſhun'd in a Peripneumony worſe than a Dog or a Snake; nevertheleſs Anodynes ſometimes, and mild Hypnotics, as water and Syrup of red Poppies, are not only allowed, but accounted ſpecific remedies in this diſeaſe and in a Pleuriſie: but ſometimes it will be expedient to uſe Diacodiates as long as ſtrength endures, and as long as the Pulſe is ſtrong and good enough. For the pain of the breaſt, if at any time it be troubleſom, it is expedient ſometimes to apply Liniments, Fomentations, and Cataplaſms.

The ſecond indication reſpects the maturation and expectoration of the morbific matter.

The ſecond curative indication, whoſe intentions are to digeſt the matter impacted in the Lungs (if it cannot be diſcuſſed or ſuckt up) and to throw it out by ſpittle, requires ordinary maturating and expectorating Medicines, both which notwithſtanding ought to be temperate, that is to ſay, ſuch as aſſwage thirſt, and appeaſe the feaveriſh heat rather than exaſperate it. We have above recited in the Chapter of a Cough, the kinds of theſe ſorts of Remedies properly called Pectorals; the more ſelect Receipts, and chiefly accommodated to this affect, ſhall be annexed here beneath.

The Forms of Remedies.

1, 2. The Medicines conducing to the firſt and ſecond intention are preſcribed according to the following Forms.

Juleps.

Take the water of Carduus Mariæ ten ounces, red Poppies three ounces, Syrup of the ſame an ounce, Pearls prepared a dram, make a Julep: the doſe ſix ſpoonfuls every fourth hour.

Take water of black Cherries, Carduus benedictus, Balm, each four ounces; powder of a Boars tooth a dram, Syrup of Violets ten drams: make it into a Julep to be taken after the ſame manner.

Apozemes.

Take Graſs roots three ounces, ſhavings of Ivory and Harts-horn each three drams, Raiſins ſtoned an ounce and half, Liquoriſh two drams, boil them in Spring water from three pints to two, to the ſtrained liquor add Syrup of Violets an ounce, Sal prunella a dram: make an Apozem to be taken thrice a day about three or four ounces.

Purgation.

For the ſame intention, *viz.* that the Veſſels being emptied may withdraw the nouriſhment from the diſeaſe, or ſup up the morbific matter, a Purge is preſcribed by many. In the Practice of the Ancients againſt this diſeaſe, even as againſt many others, after Phlebotomy, Preparatives and Purgatives were uſually appointed in a conſtant courſe, and of late the Chymiſts with greater boldneſs do recommend Vomits, and in a Peripneumony prefer it to all other remedies. Yea Phlebotomy being omitted or countermanded, they place the chief Cure in ſtibiate Vomits: than which raſh advice of theirs I know not any thing may be thought of more pernicious. Indeed in ruſtic and robuſt bodies ſometimes this Cure has been effected without danger, notwithſtanding for the moſt part no leſs unſucceſsful; but in tender conſtitutions it ought to be reckoned little inferior to poyſon. But for what reſpects Purgation, although it may not be preſently convenient from the beginning, becauſe it is then for the moſt part prejudicial, nevertheleſs the flowing of the morbific matter being finiſhed, and the effervescency of blood being appeaſed, we may ſafely and gently evacuate the body with a looſning Purge.

Purges.

Take of the decoction of Senna of Gereon *four ounces, ſyrup of Roſes ſolutive an ounce: mix them for a Potion.* Or,

Take the beſt Senna three drams, Caſſia and Tamarinds each half an ounce, Coriander ſeed two drams: boil them in a ſufficient quantity of Spring-water to ſix ounces, to which ſtrained add ſyrup of Violets an ounce, clarified with the white of an Egg, and let it be given.

Purgatives are not always to be exhibited, nor ever unadviſedly in this diſeaſe: but frequent Clyſters, and almoſt daily are in uſe; but let them be gentle and emollient only,

only, which eaſily looſen the belly, without any great agitation of humours or blood. For this purpoſe Milk or the Whey thereof is often convenient, with red Sugar, or ſyrup of Violets: Or, *Take the leaves of either ſort of Mallowes, of Melilote, of Mercury, of each one handfull, Linſeed and ſweet Fennel-ſeeds, of each half an ounce, ſweet Prunes, numb.* vi. *boyl them in a ſufficient quantity of Spring-water to a pinte, to which adde ſyrup of Violets one ounce, Sugar ten drams, ſal Prunella one dram, make a Clyſter.* *Clyſters.*

3. Medicines for the third intention, *viz.* for the diſſolving the Clammineſs of the Blood, are wont to be adminiſtred in form of a Powder, of a Spirit, a Potion, or of a Bolus, according to the manner following. *Things diſſolving the clammineſs of the blood.*

1. Powders.

Take of Crabs eyes two drams, ſal Prunella one dram and half, pearl'd Sugar one dram, make a powder for 6 doſes, one to be taken every ſixth hour, with a proper Julep or Apozeme. Or, *Powders.*

Take of the Tusk of a Boar, (or the Jaw of a Pike) of Crabs-eyes, of each one dram and half, flowers of Salt Armoniack, Powder of red Poppy Flowers, of each half a dram, mix them for 4 doſes.

2. Spirits and Chymical Liquors.

Take of ſpirit of ſalt Armoniack diſtill'd with Olibanum, 3 drams; the doſe from 12 drops to 15 or 20, three times in a day. Or, *Spirits.*

Take Spirit of Urine or Soote, after the ſame manner, three drams.

Take of the ſweet Spirit of Nitre, (viz. often cohobated with Spirit of Wine,) 3 drams, the doſe from 6 drops to ten after the ſame manner.

Take half an ounce of Spirit of Tartar, doſe 15 drops to 20 or 25, in a fit vehicle.

Take of the ſimple mixture one ounce: the doſe is one ſcruple to half a dram, after the ſame manner.

3. Potions.

Take of Carduus-water one pound, freſh Horſe-dung 3 ounces, diſſolve it warm, and filtre it; the doſe is 3 or 4 ounces, twice or thrice in a day, with half an ounce of Syrup of Violets or red Poppyes. *Potions.*

Take of the Leaves of Dandelyon two handfuls, bruiſed and infuſed in half a pound of Cardnus Mariæ water, Treacle-water half an ounce, preſs it out, and adde powder of Crabs-eyes one dram: take 4 or 6 ſpoon-fuls three times a day.

The fourth intention of Healing in reſpect of the ſymptomes greatly urging, doth ſuggeſt divers ſorts of preparations of Medicines. 1. In reſpect of the Feaver, the Juleps and Apozemes above recited are convenient. Moreover, the uſe of Mineral Cryſtal ought to be frequent. 2. For the Cough and difficult Breathings, Linctus's, Eclegma's, and Decoctions, or pectoral Juleps are adminiſtred with ſucceſs. *The cure of the Symptomes.*

Take of Syrup of Jujubes, of Maiden-hair, of each one ounce and half, of Violets one ounce, flowre of Nitre one ſcruple; make a Linctus to be lickt now and then. *Linctus's.*

Take of ſyrup of Marſh-mallowes one ounce, Diacodium, red Poppyes, each half an ounce, powder of Crabs-eyes two ſcruples; make a Lohoch, to be taken the ſame way.

Take Syrup of Hyſſop, of Liquoriſh, of each one ounce and half, red Poppy-flowers powder'd, one ſcruple, Crabs-eyes one dram, Lohoch de Pino 6 drams, make a Lohoch, take the quantity of a Nutmeg four times or oftner in a day. *Lohochs.*

Take the roots of Graſs, Chervil, Marſh-mallows, of each one ounce, Figgs numb 4. Jujubes and Sebeſtens, of each numb. 6, Raiſins one ounce, Liquoriſh three drams, Barly half an ounce, boyl them in three pints of Spring-water to two, ſtrayn it; the Doſe three or four ounces. *An Apozeme.*

Take Raiſins ſtoned one ounce and half, Filberds numb. 4. cut, Liquoriſh ſliced 3 drams, of Hyſſop-water a pound and half, infuſe them warm in a cloſed Veſſel 6 hours, ſtrain, and adde Syrup of Marſh-mallows an ounce and half, make a Julep, the doſe is 3 or 4 ſpoon-fuls often in a day, ſwallowing it by degrees.

Againſt Watchings. 3ly, Againſt Watchings, *Take Poppy-water* 3 *ounces, Syr. of red Poppies* 6 *drams, Aq. Epidemica* 2 *drams, for a draught, to be taken at night.*

If the Pulſe be ſtrong, and the ſtrength agreeable, *Take Cowſlip-water* 3 *ounces, ſyrup de Meconio half an ounce, for a draught at night.*

For Pain. 4. If the pain be troubleſome about the place affected, *Take Oyntment of Marſh-mallows two ounces, Oyl of ſweet Almonds an ounce and half, mingle them for a Liniment to be applyed with thin Lawn-paper.*

Take of Oyntment of Marſh-mallows and pectoral Oyntment, of each an ounce and half, Linſeed Oyle freſh drawn one dram, to which adde the Plaiſter call'd Emp. de Mucilaginibus, make a Plaiſter for the Region of the breaſt, to be applyed on the place affected.

Fifthly, For the laſt intention of curing which anſwers to the ſecondary Indication, and preſcribes Medicines ripening and expectorating, the following forms are convenient.

Maturating medicines. *Take Linſeed Oyl freſh drawn three ounces, Syrup of Violets two ounces, Hyſſop-water half a pound, mixe them in a Glaſs, take two or three ounces three times in a day, ſhaking the Glaſs firſt.*

Take powder of Olibanum one dram, put it into an Apple made hollow, and roaſt it in hot Embers, let him eat it at night, repeating it three or four times.

Expectorating Medicines. *Take Oyl of Almonds freſh drawn, Syrup of Maiden-hair, of each an ounce and half, Sugar-Candy two drams, ſtirre them well in a Glaſs-mortar untill they are perfectly mixt, make a Linctus to be taken often in a day with a Liquoriſh ſtick; alſo let a ſpoonfull be taken three times a day in a draught of Poſſet-drink.*

As to the reſt, Remedies preſcribed againſt a beginning Conſumption do alſo profit in this caſe.

It would be eaſie to heap up here many Hiſtories and Inſtances of Patients affected with a Peripneumonie; but whereas the ſame order and figure of the diſeaſe, and the ſame reaſons of the Symptoms are almoſt in all, it ſuffices here to note one or two Examples only. *The firſt Hiſtory.* And while I was writing theſe things I am ſent for to a Patient grievouſly ſick with a Peripneumonie. He was aged about Fifty years, lean in body, and of a cholerick temper, by taking cold he fell into a Feaver, with a Cough, with pain of the Breaſt, and difficult breathing: when he had laboured thus four dayes without any remedy or phyſical adminiſtration, I found him in a notable Feaver, with thirſt, and a huge inflammation of the Precordia, breathing very difficultly, with labour of the Thorax, and painfully, with a noiſe of the Bronchia, inſomuch that he ſeemed evidently in the very Agony of death. His Pulſe being ſtrong enough (although quick and diſturbed) I immediately preſcribed Phlebotomy, to eight or ten ounces, by which when he received a little relief, after three hours intermiſſion, a Clyſter being firſt adminiſtred, I ordered him to repeat his bleeding to twelve ounces: Moreover, I ordered Spirit of Harts-horn to be given twelve drops every ſixth hour, with an appropriate Julep, and in the diſtance between I ordered a doſe of the following Powder to be adminiſtred:

Take powder of Crabs-eyes, ſal Prunella, of each one dram and half, Pearles a dram, Sugar-Candy two ſcruples; make a powder to be divided into 8 *doſes.*

Moreover, he took as often as he pleaſed a draught of a pectoral Apozeme. By the uſe of theſe within three hours all the ſymptoms began to abate, and the night following he ſweat, and ſlept a little; the day after I repeated Phlebotomy, and after continuing the ſame Remedies in four or five dayes he intirely recovered his health. The blood we took from him was alwayes in the Superficies viſcous and diſcoloured.

The ſecond Hiſtory. A certain Gentleman of a ſanguine Complexion and a ſtrong habit of body, after an immoderate drinking of Wine contracted a Feaver, with a moſt painful Peripneumonie, inſomuch that thirſt and heat mightily preſſing him, ſitting always upright in his bed or Chair, and breathing ſhort and very frequent, he could ſcarcely, yea almoſt not at all ſuck in air enough to ſuſtain the vital flame. Becauſe he could not undergoe a large Phlebotomy, I drew blood twice or thrice day after day; frequent Clyſters were adminiſtred: Moreover, Apozemes, Juleps, alſo Spirit of Armoniack, and

powder

powders of Fiſh-ſhells were adminiſtred by turns. Within four or five dayes the Feaver ſomewhat abated, alſo he began to breathe better, and ſometimes to take ſhort ſleeps, yet he did always complain of a notable heavineſs of his breaſt, and intolerable oppreſſion of the Lungs; wherefore, when Phlebotomy was no longer ſafe, I applyed very large Veſicatories to his Arms and Thighs, the bliſters in his arms dry'd up in a ſhort ſpace, but thoſe on his legs did not only remain open, but after five or ſix days did run hugely, and afterwards almoſt for a month daily diſcharged great plenty of a moſt ſharp ichor; in the mean time his lungs ſenſibly amended, and at length were delivered from all their burden; laſtly, the little ſores raiſed by the Veſicatories very painfully and not without frequent Medicines could be cured.

SECT. I. CHAP. IX.

Of a Pleuriſie.

The diſeaſes of a Pleuriſie and Peripneumonie are akin.

HOw great affinity there is between a Pleuriſie and Peripneumonie, we have hinted before; *viz.* although either diſtemper is ſometimes ſolitary, and exiſts ſeparately from the other, yet they often happen together, or one while this, another while that, come one upon the other, or ſucceeds it. The foregoing cauſe is the ſame of both, *viz.* a diſpoſition of the blood to be clammy and boyl up withall; alſo, the conjunct cauſe is the ſame, *viz.* an obſtructing Phlegmon in ſome part of the leſſer Veſſels, by reaſon of ſuch a diſpoſition of blood. Moreover, the ſame method of Cure is preſcribed by moſt modern Phyſicians for either diſeaſe: The chief reaſon of the difference whereby they are diſtinguiſhed one from the other, is taken from the places affected, which their Names denote. For the blood prediſpoſed to the enkindling in ſome place an enflaming obſtruction, therefore often plants the neſt of the diſeaſe in the breaſt, becauſe here it burns out more hideouſly, by reaſon of the Hearth of vital fire; and alſo is not freed from the vaporous Effluviums and other Recrements which hinder Circulation. To all which there enſues, that in this Region, the maſs of blood being ſhut up, and not able to paſs through the more ſtrait Conveyances; is not as in the bowels of the lower Belly, opened with any ferment, or new waſht with any watery juice: wherefore, if perhaps the blood, carried through the vertebral Arteries into the membrane encompaſſing the ribs, ſhall ſtick in its paſſage, about the narrowneſs of the Veſſels or inter-ſpaces, the Diſtemper of which we now treat ſucceeds: In like manner, if an obſtruction happen within the paſſages of the Lungs, a Peripneumonie will enſue, as we have declared before. Wherefore, according to the Pathologie of this diſeaſe before delivered, thoſe things which belong to the Theory of a Pleuriſie, as well as the Curatory method, may with ſmall labour be deſigned.

How they differ betwixt themſelves.

The ſeat of a Pleuriſie.

Both the ſenſe of pain, as well as Anatomical Obſervations taken from the Patients dead of a Pleuriſie do plainly atteſt, the ſeat of this Diſeaſe (as often as it exiſts primarily and ſolitarily) conſiſts in the Pleura or Membrane environing the inſide of the ribs. And a true and ſingular Pleuriſie is an inflammation of the Pleura it ſelf, from the abundant flowing in of inflamed blood, growing clammy withall, taking its motion through the vertebral Arteries, with a continual and acute Feaver, a pricking pain of the ſide, a Cough and difficulty of breathing.

The next cauſe of it.

The next Cauſe is the blood obſtructed by reaſon of its clammineſs in the leſſer veſſels and interſpaces of that membrane (in like manner as it is in a Peripneumonie) or being extravaſated, being heaped in the ſame place more plentifully, by reaſon of the ſwelling up, for that cauſe exciting an inflammation. An acute pain ariſeth upon this, by a wound in a part highly ſenſible; alſo there ariſeth a Cough by reaſon of a provocation giving impreſſion to the intercoſtal muſcles; moreover a difficult breathing by reaſon of the muſcular fibres being hurt as to their action; which becauſe they cannot perform long and ſtrong contractions, they are conſtrained to undergoe weak although more frequent Contractions: otherwiſe than in a Peripneumonie, in which that ſymptome ariſeth from a Lung too much fill'd and ſtuffed. The Feaver is caus'd from effervеſcence of blood, and is for the moſt part rather the aſſociate than the ef-

fect of a Pleuriſie. For the blood from what cauſe ſoever driven into a feaveriſh turgeſcency, if it be bound up together in its maſs, will be apt to grow clammy, which together with the Feaver moſt often induces a Pleuriſie or a Peripneumonie, or both of them. From hence we may obſerve this diſeaſe doth frequently vary its kind, and change its place, *viz.* from a Pleuriſie into a Peripneumonie, and on the contrary; afterwards it paſſes from both or either into a Frenzy or a Squinancy: for that the blood while it is boyling throws off its viſcous recrements one while in this part, another while in that, another while in more together, and laſtly it reaſſumes them again, and variouſly transferrs them.

The more remote cauſes of this Diſeaſe.

The more remote cauſes of a Pleuriſie are the ſame as of a Peripneumonie, *viz.* whatſoever ſtirs up the blood, prediſpoſed to grow clammy and alſo to boyl up, and provokes a feaveriſh turgeſcency. Hither appertains exceſs of heat and cold, a ſudden conſtipation of the pores, ſurfeit, drinking of Wines or Strong-waters, immoderate exerciſe; ſometimes the malignant conſtitution of the Air brings this diſeaſe almoſt on every body, and renders it Epidemical: whereto may be added, that this diſeaſe is very familiar to ſome from their conſtitution or cuſtome; ſo that a diſtemperature of blood, induced almoſt by any occaſion, immediately paſſes into a Pleuriſie.

From what we have already ſaid, the ſigns of this diſeaſe do appear manifeſt enough, by which it is well known as to its Eſſence, and is diſtinguiſhed from other diſeaſes, and eſpecially from a Baſtard Pleuriſie and a Peripneumonie. But it is to be obſerved that a pain in the ſide ariſes ſometimes very troubleſome, which while it counterfeits a Pleuriſie, is ſometimes taken for it, although falſly. For in ſome perſons obnoxious to the Scurvy, and the affects of the nervous kinde, ſometimes it happens that a ſharp humour, and very painful deſcends into the Pleura or intercoſtal Muſcles, and being fixt there produces moſt fierce tortures; which diſtemper is yet diſcriminated from the Pleuriſie, inaſmuch as it is void both of Feaver and Thirſt, the Pulſe always abides moderate and laudable, frequently the appetite and ſtrength endure; moreover, the pain is not long fixed or limited to one place, but ſenſibly creeps hither and thither into the neighbouring parts, as the matter ſlides down through the paſſages of the fibres, out of one place into another.

The differences of it.

We meet not with many differences of this diſeaſe; notwithſtanding it is uſed to be diſtinguiſhed, *viz.* to be either true and exquiſite even as we have now deſcribed, or ſpurious, which having its ſeat in the intercoſtal muſcles, or their interſpaces, proceeds from winde, or a ſerous and ſharp humour heaped up in the ſame place, and raiſes a pain leſs ſharp, without ſo much as an inflammation or feaver: And whereas the grief is planted externally, the Patient for the moſt part lyes better on the oppoſite ſide, otherwiſe than in a true Pleuriſie. Secondly, a Pleuriſie is either ſingle, or complicated with a Peripneumonie or ſome other diſtemper, and ſo it is either primary, or ſecondary, or join'd with ſome other affection.

The Prognoſticks.

As to the Prognoſticks of this diſeaſe, *Hippocrates* hath obſerved many certain tokens whereby a good or evil event is ſignified to patients ſick of the Pleuriſie. To run through each of theſe, and to unfold them with Commentaries added to them, we have neither leiſure, nor doth it ſeem worth our endeavours. The chief thing of all in a Pleuriſie, is, that the diſeaſe be preſently diſpatch'd, partly with a free and frequent bleeding, and partly by a Critical Sweat, ariſing about the fourth day, or before the eighth; or theſe things not duely ſucceeding, it will be prolonged, and then moſt frequently a Peripneumonie or Empyema, or a collection of corrupt matter between the Breaſt and Lungs, or both diſtempers do ariſe upon this diſeaſe; from which there follows a ſolution of the diſeaſe but ſlow and incertain, and moſt frequently full of dangerous chances.

A Peripneumonie coming upon a Pleuriſie not preſently cured (as it is often wont to be) all our hope is placed in digeſting maturely the Spittle and quick Expectoration thereof: for if this be laudable and plentiful, and eaſily and haſtily thrown off, it doth often finiſh both diſeaſes intirely. Notwithſtanding, it is not therefore a conſequent that the matter of a Pleuriſie is derived from the ſide into the Lungs by I know not what blinde paſſages, or that the ſame being ſweat out of the Pleura into the cavity of the breaſt is imbibed by the Lungs, and at length drawn upwards through the paſſages, and excern'd forth. But when a Peripneumonie ariſes on a Pleuriſie, and the matter impacted in the Lungs begins to be evacuated by Spittle, ſo that the affected places of the Lungs are continually emptyed; the blood reſſumes

the

the other matter fixed in the Pleura, and carryes it to the Lungs where the places of conveyance are open, to be ejected by Spitting. But if the Pleuriſie be cured neither by it ſelf, nor aſſociating with a Peripneumonie, then at length either by an Impoſthume made in the Pleura or in the Lungs, an Empyema or corruption between the Breaſt and Lungs ſucceeds; or all the matter being brought into the Lungs and there putrified, looſning the unity of the Viſcera, it propagates a mortal or ſcarce curable Conſumption.

The Cure thereof.

As to the cure of a Pleuriſie, foraſmuch as the ſtate of this Diſeaſe, the Criſis and tendencies are manifold, divers curatory Indications offer themſelves according to their various regards; and as occaſion ſerves, according to the advice of a prudent Phyſician, they ought to be appointed in the beginning, and ſometimes altered or continued. For ſurely one Method is convenient for a ſolitary and ſimple Pleuriſie, and another if it be complicated with a Peripneumonie: Beſides it behoveth to ordain another and another if perhaps a Criſis be expected by Spitting, or matters growing worſe, the diſeaſe is either paſſing into an Empyema, or tends to a Conſumption. As to the three later caſes, that is to ſay, when a Pleuriſie commencing, paſſes into a Peripneumonie or Empyema, or laſtly into a conſumptive diſpoſition, there is deſigned an appropriate way of curing in the pathologies of each of theſe diſeaſes particularly delivered. But as to what appertains to our preſent purpoſe, three Indications offer themſelves for a primary and ſimple Pleuriſie, and they are curatory, preſervatory and vital.

The firſt Indication.

I. The firſt Indication takes care that the Inflammation or obſtruction of blood in the Lungs by all manner of means with all expedition be removed; for which intent phlebotomie in every Age by all phyſicians (excepting ſome Fanatick or falſe Chymiſts) is wont to be preſcribed, as a principal remedie: The reaſon of which is altogether the ſame as in a Peripneumonie and many other diſtempers, cauſed by reaſon of a ſtop of blood in ſome place, and ſo an accumulation: Becauſe that the veſſels bringing blood being much emptyed, do not only reſcind the nouriſhment of the diſeaſe, but drink up the matter which is the conjunct cauſe thereof, and convey it to another place. Wherefore blood is to be freely drawn away in a Pleuriſie, if the ſtrength endure it, and the Pulſe be ſtrong. And ſurely it is far better that the firſt time and every time after (as often as there is need to repeat it) blood be more largely emitted, than to do it more often and more ſparingly. For very many portions of the blood growing clammy and degenerating into viſcouſneſs, are heaped up about the place affected; which, unleſs they are call'd away from thence by emptying the Veſſels through large phlebotomie, and in a great part let forth, the letting of blood will be fruſtrated of its deſired effect. Wherefore, that Phyſicians preſcribe blood in a Pleuriſie to be drawn out even to ſwooning, ſeems not incongruous to reaſon, although that practice is not raſhly to be attempted, for that every evacuation ought to be proportioned to the tenour and tolerance of the ſtrength, which rule ſuch a phlebotomy doth exceed.

Phlebotomie neceſſary almoſt in all Pleuriſies.

But though there is almoſt a general conſent of all Phyſicians to breath a vein in a Pleuriſie, notwithſtanding there was ever an earneſt contention about the place, what Vein ought to be opened. *Hippocrates* and *Galen* opened a Vein on the ſame ſide of the patient; afterwards the *Arabians* and their followers the *Italians*, and *French*, did either open the *Saphene* or the *Baſilica* of the oppoſite ſide, damning the phlebotomy of the ſame ſide by Bell, Book and Candle. Yet in the later generation, the practice of the Ancient *Greeks* by little and little revived, ſo that ſome did dare to make inciſion on the ſame ſide; yet always one ſide judged the others of the oppoſite perſwaſion as it were guilty of murder, as often as any unlucky event did happen. So that while among Phyſicians about phlebotomy there was no leſs a contention than among the *Jews* and *Samaritans* about the Sacred place of Worſhip, at length the Doctrine of the Circulation of the Blood held out like a new Light by the moſt renowned *Harvey*, diſcuſs'd all the clouds of this Controverſie; ſo that immediately it clearly appeared to be almoſt the ſame thing, whether inciſion be made in the Vein on the affected or oppoſite ſide of a patient ſick of a pleuriſie; although in our Age Cuſtom hath prevailed firſt and rather to open the Vein of the affected ſide. Notwithſtanding a Vein being opened in either Arm draws nothing at all immediately from the vertebral Arterie or from the pleura; they are only the branches of the Azygos, or of the vertebral vein that receive the blood out of the place affected: but that they may accompliſh this, they are not unloaded in any other manner, but

What Vein is to be opened in a Pleuriſie.

Various opinions are recited.

that

that the quantity of the whole blood be abated by phlebotomie whereſoever made. Onely this may be affirmed for opening rather the vein of the affected ſide, that the Baſilick vein being unloaded, the Arteries of the Arm receive the more ample proviſion of blood; from hence the bloody ſtream of the vein Aorta runs down more ſwiftly from that ſide towards the branches of the Arm, and perhaps in the interim of its quick paſſage it infuſes leſs blood into the vertebral Arteries, for the nouriſhment of the diſeaſe. As to that opinion, that the blood is ſometimes more plentifully carryed from place to place, that from hence the right Lung or Liver being beſet with an inflammation or obſtruction, the right part of the head is in pain, and of the face grows more red; I ſay this ſometimes is brought to paſs, becauſe the patients do conſtantly lie in their bed on the ſide affected; wherefore, the Veſſels being compreſs'd, the blood ſtays longer in other parts of the ſame ſide while it is circulating. But of theſe things we will make a more diligent ſearch when we ſhall render the Hiſtory and Ætiologie of phlebotomy.

Cupping-glaſſes with Scarification ſupply the place of blood-letting.

But if phlebotomy by reaſon of a weak pulſe, and fainting of the animal function, neither ought to be at firſt adminiſtred, nor repeated, though the pain be moſt urging; Cupping-glaſſes with Scarification do well ſupply the turn hereof, being applyed to the place pained. *Riverius*, and *Zacutus Luſitanus* have cited notable Examples of cures effected by this remedy. And ſurely this practice ſeems to lean upon a reaſon ſtrong enough; for the blood being drawn away from the ſide affected, that which is lodged in the neighbouring veſſels, being the conjunct cauſe of this diſeaſe, is moved with it, and partly drawn away, and partly turned to its Circulation. Moreover, to remove an inflammation of the Pleura, beſides withdrawing blood by a free Phlebotomy or Scarification, alſo the ſerous and other excrementitious humours ought to be gently ſolicited and excerned as well out of the maſs thereof, as out of the bowels, by Stool, Urine and Sweat. The more ſtrong purgatives are deſervedly prohibited, becauſe they diſquiet the blood, and conſtrain it to be impacted more deep into the places affected. And that certain renowned Chymiſts, viz. *Angelus Sala*, *Hartman*, *M. Rulandus*, with many others, do audaciouſly exhibit Vomits of Stybium to any afflicted with a Pleuriſie, and magnifie it for the beſt remedy, ſeems to me neither ſafe nor congruous to reaſon; the only reaſon of helping, as I think, and that very uncertain, and full of danger, may be, *viz.* that the medicine operating more vehemently while the patients ſuffer exolution of ſpirits or ſwoonings, all the vigour and turgeſcence of the blood abates, and for that cauſe the nervous Fibres remit their wrinklings or painfull contractions, and the Veſſels carrying blood being much emptyed, do ſuck up the morbifick matter: In the mean time, there is danger leſt the humours being violently diſturbed, ruſh more impetuouſly to the part affected; at leaſt, leſt the Spirits being too much dejected, and the work of Nature diſquieted about the digeſting or ſeparation of the morbific mater, ſtrength ſhould utterly fail, before the diſeaſe be cured. Yet in the mean time, Clyſters are of frequent or daily uſe: yea ſometimes more benigne ſolutive purgatives are allowed, provided that the Feaver be not very intenſe. Julips and temperating Decoctions and things gently moving Sweat and Urine, as we have preſcribed before for a Peripneumonie, are alſo here convenient; but let all hot and ſharp things, whether aromatick, or endowed with a vinous ſpirit be carefully declined.

Whether Purges and Vomits are to be taken in a Pleuriſie.

What other kind of Remedies are convenient in this diſeaſe.

The ſecond Indication preſervatory.

II. The ſecond Indication preſervatory, deſigned againſt the clammineſs and boyling up of the blood, preſcribes Medicines of that ſort which conſiſting of a volatile or alcalizated Salt, do deſtroy the combinations entered into, of the acid and fixed or otherwiſe diſtempered Salts, with the other more thick particles. For which intent the eyes or claws of Crabs, the tooth of a Boar, the Stone of Carps, the jaw of a Pike Fiſh, the Bone in the heart of a Stag, the Priapus of a Hart, Sal Prunella, Salt of Coral, Salt of Urine, or volatile ſalt of Harts-horn, powder of Goats-blood, infuſion of Horſe-dung, Spirit of Harts-horn, of ſalt Armoniack, Spirit of Tartar, the ſimple mixture, mineral Bezoar, Diaphoretick Antimony, flowers of ſalt Armoniack, are very famous Remedies in a Pleuriſie.

The third Indication vital.

III. The third Indication vital which provides that the ſtrength and vital heat be preſerved during the courſe of the Diſeaſe in due tune and ſtate, gives in precept firſt an apt kind of food, and moreover Cardiac and Anodyne remedies, and thoſe which ſeaſonably occur to other ſymptomes, if perhaps they ariſe. Firſt, in a true Pleuriſie, a moſt thin Diet ought to be appointed, *viz.* of meer Oatmeal and Barley; and for ordinary drink, a Ptiſan or Poſſet-drink rather than Beer alone:

alone is convenient: although in an outragious thirſt this alſo is to be allowed of in a moderate quantity. Moreover, for quenching thirſt, Juleps, Apozemes, and Emulſions are taken by turns; to all which adde Sal Prunella. Secondly, let only the temperate Cordials be adminiſtred which mildly do recreate the animal ſpirits, and not at all intend the kindling of the blood, burning out of its due proportion. For theſe intentions, the water of *Carduus Mariæ*, *Carduus Benedictus*, of Balm, Borage, Cowſlips, Black-cherries, are uſually given with ſucceſs: whereto let the powder of Pearls and Coral be added. Thirdly, It behoveth to adminiſter Anodynes, both inwardly, to provoke ſleep in caſe it be very much wanting, and alſo externally, to alleviate the pain of the ſide. Of the former kinde the more uſual are the diſtill'd water, ſyrup and powder of red Poppies, which are eſteemed Specificks in a Pleuriſie and in a Peripneumonie: Moreover, when the pain is very acute, and watchings inſtant upon the patient, they may lawfully drink Diacodiates. Againſt pains, Liniments, Fomentations, Cataplaſmes, and ſometimes the hot bowels of Animals newly ſlain are convenient to be applyed. Theſe are the principal Intentions of healing which ſeem requiſite to cure an exquiſite and ſimple Pleuriſie, before it contracts a Peripneumonie to it ſelf, or paſſes into it, or into an Empyema. It only remains to adapt to each of theſe the more ſelect forms of Medicaments.

Cardiacks.

Anodynes.

Firſt therefore in the beginning of the Diſeaſe, for taking away the Phlegmon, Juleps, Apozemes, Powders, and gentle looſening Clyſters are wont to be preſcribed.

Forms of Remedies.

Take water of Carduus Mariæ eight ounces, red Poppies 4 ounces, Syrup of red Poppies one ounce, ſal Prunella one drachm, make a Julep, the doſe two or three ounces every third hour.

First for the removing the Inflammation. Juleps, & Apozemes.

Take of Graſs-roots 4 ounces, Barly half an ounce, Apple-parings one handfull, Raiſins one ounce, Liquoriſh two drams, boyl them in three pints of Spring-water to two; clariſie the ſtrained liquor, adding Syrup of Violets one ounce and half, Sal Prunella one dram and half, make an Apozeme, the doſe 3 or 4 ounces often in a day.

Take of Sal Prunella two drams, flowers of Nitre one dram, powder of red Poppy flowers two ſcruples, Sugar-candy 4 ſcruples, make a powder, the doſe half a dram three or four times in a day.

Powders.

Take of the Decoction of Mallows, leaves and roots, with Prunes, one pound, ſyrup of Violets three ounces, Sal Prunella one dram, make a Clyſter.

A Purge.

Take Caſſia bruiſed two ounces, Tamarinds one ounce, Damask-Roſe leaves one handful, Coriander-ſeeds two drams, boyl'd in Spring-water to a pint, ſtrain it, and adde Syrup of Chicory with Rhubarb two drams, clariſie it with the White of an Egge, the doſe is 5 or 6 ounces in the morning, continued for two or three dayes.

Secondly, The following are of uſe to diſſolve the clammineſs or coagulating viſcoſity of the blood, in form of a Drink, of a Powder, and of Spirit.

Secondly for the taking away the clammineſs of the Blood.

Take freſh Horſe-dung 4 ounces, Carduus-water one pound and half, infuſe it warm for two hours, after filtre it, to which adde ſyrup of the juice of Dandelyon, or of Chicory, two ounces, Spirit of ſalt Armoniack one dram, let five or ſix ſpoonfuls be given three or four times in a day.

An Infuſion of Horſe-dung.

To this end Water of Horſe-dung wonderfully profits.

Take of Horſe-dung 4 pounds, leaves of Carduus Benedictus, Carduus Mariæ, Scabious, Pimpernel, of each three handfuls, upon them cut and mixt together pour ſix pints of new Milk, diſtill them in common Organs. The Doſe is from two Ounces to three, either with it ſelf, or with other diſtill'd Waters, in form of a Julep.

And diſtilled water.

For the ſame uſe, the Tinctures, or the ſolutions of other Dungs are adminiſtred by ſome Phyſitians, and highly magnified by them. *Helmont* commends the dung of an Oxe, *Panarolus* commends Pidgeons-dung, others the white dung of a Cock, for the Pleuriſie. *Epiphanius Ferdinandus* was wont to give with ſucceſs the Decoction of Tobacco with new Wine; *Valeriola* by experiment as a familiar remedy made uſe of the Decoction of the Flowers of red Poppies: The renowned *Sylvius* preſcrib'd the following mixture to be taken by Spoonfuls, within ſhort ſpaces of time.

Sylvius's Anti-Pleuritick.

Take

Take Parſly and Hyſſop water, of each two ounces, Fennel-water one ounce, Treacle-water ſimple half an ounce, Laudanum Opiate 4 grains, Salt Armoniack half a ſcruple, Syrup of red Poppies one ounce. Mingle them.

Frederick Deckers adds to this the *Powder of Crabs-eyes*, and *Mineral Bezoar, of each one ſcruple.*

Medicines chiefly efficacious for this uſe are wont to be adminiſtred in the form of a powder: for examples ſake,

Powders. *Take Powder of Crabs-eyes two drams, Sal Prunella one dram and half, of the flowers of red Poppies half a dram, mix them and make a Powder, the doſe half a dram, three or four times a day, in a convenient Vehicle.*

Inſtead of Crabs-eyes, the powder of the Jaw of a Pike, or the Tusk of a Boar, or the Pizzle of a Stag, or Bull, are uſed, and if they prove ineffective, try the following.

Take of Antimony Diaphoretick, or the Ceruſs thereof, or Bezoar Mineral, two drams, the volatile Salt of Harts-horn half a dram, the powder of red Poppies two ſcruples, make a Powder; The doſe from one Scruple to half a dram, three times or oftner in a day.

For the ſame intention of curing it was, that *Riverius* gave of the Powder of *Soot* from half a dram to a dram; others the powder of Pidgeons dung, or of a Cock. And indeed by reaſon of this analogie, whereby the dungs of Animals ſtored with volatile Salt, do ſuccour in this diſeaſe; it is probable, the dung of a Dog doth no leſs conduce to cure a Pleuriſie than a Squinancy, and ſo much the rather, becauſe theſe diſeaſes frequently change their forms among themſelves, and one aſſumes the ſpecies of the other. Chymical liquors endued with a volatile Salt do alſo notably help ſometimes in a Pleuriſie.

Chymical Liquors. *Take of Spirit of Blood two drams, Water of red Poppies three Ounces, the Syrup of the ſame one ounce. Let it be given by ſpoonfuls often.*

Take ſpirit of Sal Armoniack, diſtill'd with Olibanum, three drams, the doſe from 12 drops to 15 or 20, twice or thrice a day, in any convenient liquor. After the ſame manner the Spirit of Urine, Soot, or Harts-horn may be given.

Take the Spirit of Tartar 3 drams, the doſe one ſcruple in a convenient vehicle.

Take of the ſimple mixture 3 drams; Doſe from one Scruple to half a dram.

What remedies the third intention requires. As for the third Intention, beſides a thin diet, Cardiac remedies and Anodynes are preſcribed. Examples of the former kinde for the firſt Indication may be ſupplyed by Juleps and Apozemes; for the ſecond Indication they may be ſupplyed by Spirits and Powders. Anodynes are preſcribed to be exhibited inwardly upon watching, and very intenſe pain, according to the following method.

Hypnotick Anodynes. *Take of Poppy-water two ounces, the ſyrup of the ſame 6 drams, Spirit of Harts-horn 12 drops, make a draught to be taken at Bed-time.*

If we muſt proceed higher, *Take Cardus-water two ounces, Diacodium from three drams to half an ounce or 6 drams, Spirit of Sal Armoniac with Frankincenſe half a ſcruple, make a draught: and ſometimes although rarely Laudanum is expedient, which timely given, inaſmuch as it excites ſleep, and moves ſweat and Urine, does greatly profit.*

Take Cowſlip-water two ounces, Tartariz'd Laudanum from 16 drops to 20. the Spirit of Blood half a Scruple, Syrup of Violets two drams, mingle them for a draught.

External Anodynes. Outward Anodynes in form of a Liniment, Fomentation, and Cataplaſm, are uſually preſcribed.

Take Gyntment of Marſhmallows two ounces, Oyl of Almonds one ounce, Dogs-turd two drams, mix them by grinding together.

Take the Plaiſter of Mucilages two ounces and a half, moiſtened with Linſeed-Oyl, and applyed upon Lawn-paper.

Take the tops of both Mallows, the leaves of Mercury and Beetes, of each 4 handfuls, boyl

boyl them in Spring-water, and ſtrain'd, let it be uſed for Fomentation.

Take the Dregs of the herbs after the liquor expreſſed, to which adde the bran of Oats 6 ounces, Linſeed and Fœnugreek-ſeeds, of each two Ounces, Oyntment of Marſh-mallows two ounces, make a Cataplaſme.

An Hiſtory.

There is no occaſion to go far for Hiſtories and Inſtances of patients ſick of a Pleuriſie, for a notable Example of this diſeaſe is now under our hands: to wit, A very lovely Maid, frequently and as it were habitually obnoxious to that diſtemper, is committed to our care. This Virgin being very amiable, of a ſanguine complexion, but of a weakly conſtitution, upon any the ſmalleſt occaſion, *viz.* by taking cold, or by errors in any of the ſix Non-naturals, yea ſometimes from the meer alteration of the year, or the air, has for many years been wont to fall into a feaver; whereupon immediately pleuritick pains, with a Cough and difficult breathing come upon her, and afterwards for the moſt part hideous Convulſions; under which paſſion in time paſt ſhe did ſo grievouſly labour, that frequently every year for or above ſix months ſhe was conſtrain'd to keep within her Chamber. But of late, although ſhe is not acquitted from this hurt, yet ſhe is ſeldomer puniſh'd with it. The laſt year all the Summer, and almoſt the Autumn, ſhe enjoyed her health indifferently; in the beginning of Winter ſhe took her bed with this ſickneſs, and now about the end is again ſick. A pain from the Pleuriſie conſtantly afflicts her right ſide, where the blood ſticking in its paſſage, and being extravaſated about the intercoſtal muſcles, the Fibres being provoked, fall into a moſt troubleſom condition, together with a convulſive motion of Coughing, and almoſt perpetually repeat it: In the mean while her Lungs being ſound enough, and open as to the paſſages, do readily convey the blood without any ſtop by its clammineſs, (which frequently is the author of a Peripneumonie.) No remedies that are uſed will do her good without phlebotomie, which continually is ſo very neceſſary, that upon every return of the ſickneſs, in ſpite of all things, we are compelled three or four times to repeat it, and ſometimes oftener: the blood let out in the Superficies hath conſtantly a viſcous and whitiſh filme. This diſeaſe was ever a ſimple Pleuriſie void of a Peripneumonie, and for cure ſhe with conſtant ſucceſs uſed the following method.

Take Spirit of Sal Armoniack diſtilled with Gum Ammoniacum three drams; take from 15 drops to 20, three times a day, with the following Julep.

Take Carduus and Black-Cherry water, of each ſix ounces, Hyſterical Water one dram Sugar 6 drams. Between whiles ſhe took a doſe of this Powder with three ounces of Apozeme.

Take Powder of Crabs-eyes, of a Boars tooth, Sal Prunella of each one dram, make a powder for 6 doſes.

Take Graſs-roots 3 ounces, candied Eringo one ounce, Shavings of Ivory and Hartshorn of each two drams, the Parings of Apples one handful, Raiſins one ounce, boyl them in three pound of Spring-water to two pound, to it ſtrain'd, adde Syrup of Violets one ounce, ſal Prunella one dram, mix them, and make an Apozeme.

Clyſters of Milk with Syrup of Violets were injected, ſometimetimes every, ſometimes every other day. If Opiates, however mild, were given to allay pain, upon it a pain and drouſineſs of the head, and Convulſions did infeſt her moſt grievouſly.

SECT. I. CHAP. X.

Of an Empyema.

An Empyema is the product of other diſeaſes of the breaſt.

IT is clearly manifeſt from what hath been ſaid before, that a Pleuriſie, and Peripneumonie, are diſeaſes not only akin but commutable among themſelves, and ſucceſſive to one another; Moreover, as well this as that, and frequently both together, not being well cured, doe paſs into an Empyema. For when a Phlegmon rais'd about the Pleura is brought to ſuppuration, at length the Impoſthume being broke, the matter falling into the cavity of the Thorax, produces this diſeaſe. In like manner ſometimes it follows from the Lungs being inflamed: inaſmuch as the ichor accumulated about the place affected, turns into a thick and yellow humour by a long digeſtion, which unleſs it be ejected by a Cough, either ſenſibly corrupting the inner ſubſtance of the Lungs, it cauſeth a conſumptive diſpoſition, or diſſolving the unity of the intire Lungs, and at length corroding the outmoſt membrane, it ſlides down into the breaſt, and ſo engenders an Empyema. Any one labouring with an Impoſthume or ulcer of the Lungs, although he do ſpit out abundant and fœtid matter (as it frequently happens in an Impoſthume of the Lungs,) is not therefore accounted obnoxious to an Empyema. For in truth, by the common acceptation of this Term is ſignified a Collection of rotten matter within the cavity of the Thorax, by which the Organs of breathing are oppreſſed: but that rotten matter is wont to have a conflux thither either by a Pleuriſie or Peripneumonie, (and ſometimes perhaps from a Squinancy) brought firſt to ſuppuration and afterwards broke.

It rarely or never begins of it ſelf.

Foraſmuch as an Empyema never begins primarily and of it ſelf, but for the moſt part is the effect or product of other diſeaſes, not duely cured, it will not be requiſite to make much inquiſition about the cauſes thereof. The formal reaſon or conjunct cauſe thereof is known well enough, (to wit) it is a purulent matter, poured out from the Pleura, or the Lungs, or the Larinx, into the cavity of the Thorax. But the other proper cauſes of the previous effects, appertain to the Etiologies of every of them.

What the morbific matter is.

There is a certain diſpute about the morbific matter; for ſome contend that it is meer corruption, others not that, but that it is a purulent matter, of which opinion is *Johannes Heurnius*, who averring a purulent matter for the conjunct cauſe of an Empyema, diſtinguiſhes between this and mere and pure Pus, affirming this to come to paſs *from a bloody nutritious humour*, i. e. *from the blood it ſelf ſomewhat corrupted, but capable of digeſtion, but that a purulent matter is an excrementitious humour*, viz. *a Serum or Ichor*, which proceeds from the blood obſtructed and hindered ſomewhere in its Circulation. From hence we may obſerve concerning an Impoſthume which affords true and laudable *Pus* or matter, that it is for the moſt part compact, every way ſhut up and wrapt up together either in a bladder, or (as it were) within private Apartments, and then after it is maturated and broken, pours out the contained humour, and is ſoon and eaſily healed. But an Impoſthume affording a purulent matter forms its neſt not ſo bound up and encompaſs'd with walls, but for the moſt part unequal and crooked, and being broken rather pours out filthy blood or gore than matter or Pus, and then by reaſon of the ſucceſſive ſource of excrementitious humour, it is very difficultly healed.

The difference of Pus and a purulent matter.

Moreover, we are to conſider, that each humour as well Pus as purulent matter doth ſometimes ſtink notably, and is alſo ſometimes very free from any bad ſavour. Some maturated and broken Impoſthumes pour out fetid matter, others matter without any ſmell. I have often obſerv'd Impoſthumes of the Lungs, as well as Phlegmons of other parts to have this ſeveral diſtinction. Purulent matter from many Ulcers ſtinks ill; the Spittle of conſumptive perſons which is eſteemed to be very dangerous, for the moſt part is without any ſcent. It is uſual where the ſide is opened by reaſon of an Empyema, that at firſt the matter flows out not unſweet, but after two or three days the air having more frequently enter'd into the orifice, it ſtinks moſt horribly: which ſtench notwithſtanding after an injection of ſome aromatical or vinous Spirit vaniſhes again in a ſhort ſpace. But it would be a thing of much te-

Why both ſometimes with, and ſometimes without ſtench.

diouſneſs

diouſneſs to denote the particular reaſons of each of theſe accidents and alterations, for that never ſo little alteration of the Pus or purulent matter, both cauſes and removes the ſtench from them. When the ſulphureous particles are equally digeſted, and being ſubjugated to the ſalts are contained in a mixture, there is no ſtench; but as ſoon as they being looſed begin to fly away, and carry the ſalt particles with them (whereby they are ſharpened) they diſperſe a very bad ſtench round about. But whereas an Injection or Lotion with vinous and aromatical liquors, being ſometimes adminiſtred to a putrid Ulcer or neſt of an Empyema, frequently removes all ſtench; the reaſon is, becauſe the ſides of an Ulcer, no otherwiſe than as a ſtinking pot, infect the contained liquor as with a certain ferment, and ſo impreſſe a ſtink: but when that ferment of the veſſel or bowel is waſhed or overcome by a well-tempered and ſtrong liquor, then that propagation of a ſtench ceaſeth. From hence follows not always an ill ſign, nor is it ſo very good, if the Spittle of conſumptive perſons, and the Impoſthumes of ſuch as are Empyematical are excerned either with, or without ſtench; for that I have known it to have been to ſome healthful, and to others deadly in either caſe. Moreover a more certain Judgment is not to be taken from thence, that the ſpittle of ſome conſumptive perſons floats upon the water, and that of others ſinks.

Neither the cauſe of an Empyema.

But although we do not much diſapprove of that diſtinction of Pus and purulent matter, notwithſtanding we adjudge neither only this, nor always that, to be a conjunct cauſe of an Empyema. Whenas this diſeaſe ſucceeding a ſimple Pleuriſie, ariſes from an Impoſthume being ſuppurated and broken in the ſide, it is moſt commonly pure and meer Pus, which falling into the cavity of the breaſt, engenders that diſeaſe. But if an Empyema be an Offspring of a Peripneumonie (unleſs an Impoſthume of the Lungs intervene) the ichorous matter being accumulated about the place of the phlegmon, and after thickening by meer concoction, it wounds the Lungs, and at length making a hole through the membrane encompaſſing it, and flowing out into the Thorax, produces an Empyema. That matter is rather to be accounted purulent than meer Pus.

The Signs of an Empyema whilſt beginning.

The ſigns of an Empyema either prognoſticate it while it is in *fieri*, or indicate it plainly done. Some foregoing diſeaſes are eſteemed of the former ſort, whoſe iſſue this uſes to be, of which ſort are the Pleuriſie, Peripneumonie, and Squinancy, alſo ſometimes a ſtroke or wound of the breaſt, and ſometimes other diſtempers thereof, not well cured, nor diſcharged; out of which the ſuſpicion will be greater of an Empyema to enſue, if after one or two weeks without abundant Spittle, the ſhivering of an Ague and fainting of the Spirits overtakes one. Then after fourteen or twenty days, there will be ſigns of an Empyema fully made, as difficult breathing, a heavineſs of the breaſt, a ſwimming to and fro of the matter, and a ſenſe of pain from the poſition of the body chang'd, thirſt and a ſmall feaver almoſt continual, redneſs of the cheeks, diſquietneſs of the whole body, and watching.

When perfect.

An Empyema is diſtinguiſhed many ways, *viz.* Firſt according to the diſtemper going before, whoſe Offspring it is; alſo according to its ſeat, one while in the right ſide of the breaſt, another while in the left, and another while in the whole capacity thereof; and laſtly, as to the morbific matter, which is either meer and laudable pus, or purulent matter, and this one while gentle, and benigne, and another while ſharp and ſtinking.

Prognoſticks of this diſeaſe.

Prognoſticks of this diſeaſe begin as well before as after inciſion; the former determins whether the ſide ought to be opened or not, alſo it preſages of what ſort the event will be, either with or without opening. If an Empyema ſucceeds more ſlow, after the firſt diſtemper, to wit not before the thirtieth or fortieth day, whenas the ſtrength is very much worn, and the Lungs are vitiated, and their ſtructure hurt; and alſo if a feaver remain as it were hectick, the breathing ſhort and painful, the Pulſe weak and quick, with cold ſweat, and with a Diarrhea or waſting looſneſs, and frequent faintings of the Spirits, then the ſtate of ſuch a perſon being evidently deſperate, doth not admit of any opening; let a Phyſician ſuffer him to dye without bleeding, leſt he ſeem to murder him. But if on the contrary, after manifeſt ſigns of an Empyema more maturely perfected, the painfulneſs of the Lungs or ſide, as alſo the feaver and other ſymptomes abate, and the Pulſe, and ſtrength of the Spirits are in vigour, it will be lawfull ſafely to advance to cutting, and thereby to hope a happy ſucceſs. Inciſion being made, if white Pus duly concocted or otherwiſe laudable skip out with eaſe, and thence the heavineſs of the breaſt and difficult breathing

abate, and the patient is better as to the other paſſions, there will not the leaſt doubt remain of his cure: but if no Pus, or that which is bad, if thin, ſomething bloody, or ſtinking, flow from the ſide being opened, we can conceive thereby but ſmall hope of recovery.

What it ſignifies when the Probe is guilded by the Empyematical matter.

Hippocrates among the preſaging ſigns of a mortal Empyema, recounts that of the Probes being coloured by the Pus, as by fire; or what we often obſerve, and ſometimes without any evil event, if the ſilver Probe being put into the orifice of the open'd ſide, be preſently ting'd with a colour as it were of Gold or Copper; which ſurely ſignifies no other thing but that the ſulphureous particles of the pus, or purulent matter are ſo exalted, and looſen'd from the bond of mixture, that eaſily departing they may be affix'd to any other body, and eſpecially ſilver, whereunto they are akin. Sometimes I have ſeen Veniſon kill'd by long and weariſome hunting, preſently bak'd in an Oven for Entertainment, become not only moſt tender, inſomuch that it might be taken out with Spoons, but even to have guilded a bright ſilver Spoon at the firſt touch. The reaſon whereof is the ſame with the former; *viz.* that the fleſh was ſo diſpoſed to putrefaction by too much exerciſe while the animal lived, that the particles of the Sulphur being exempt from Concretion, and apt to fly away, preſently adhere to any other fit ſubject: But this by the by.

The cure of the diſeaſe.

As to what belongs to the curatory part of an Empyema, we ought chiefly to conſider whether the ſigns of this diſeaſe, as being now perfected, be certain, or doubtfull. In the former caſe there will not be much need of Medicine, but the body only being prepar'd before-hand, we may immediately proceed to the opening of the ſide. Wherefore, if from a Pleuriſie or Peripneumonie not rightly cur'd, or from blood poured out after a ſtroke, fall, or inward wound, a fluctuation of Pus or purulent matter, or bloody within the cavity of the Thorax, be perceived, with no Spittle, or with little, there will not be need that we dwell longer on maturing or expectorating Medicines, but the belly being looſened, and the blood and humours rightly temperated by Juleps, Apozemes and Anodynes, either that a bare Section be ordained; or that in tender and fearful perſons a Cautery be applyed between the 6th and 7th Vertebra, and after the Eſchar is rais'd, the Inciſion-knife be obliquely forc'd by little and little, towards the hinder and upper part, untill it penetrate into the very Cavity of the Thorax; afterwards, a little ſilver Pipe being put in, let the contained matter be ſent out by degrees; notwithſtanding in ſuch manner that, if his ſtrength will bear, an evacuation of the whole humour be accelerated; for a portion thereof being left within, often contracts a hideous ſtench, within a few days (by reaſon of the Air, as is aboveſaid, being admitted) which evil, that it may be provided againſt, or ſoon removed, a vulnerary and abſterſive liquor is to be caſt in twice or thrice a day by a Syphon or Syringe. It will not be requiſite to preſcribe particularly the other things belonging to this operation, and the proceſs thereof; for that each of theſe things are evidently known to any of the more expert Chirurgeons, and are uſed in familiar practice. After inciſion and the appertaining adminiſtrations rightly performed, there will not be much beſides left for a Phyſician to doe. It is convenient there be a right courſe of Diet, a frequent looſening the belly (as often as need ſhall be) by Clyſters; and moreover it behoveth us to preſcribe remedies vulgarly called Vulnerary, which hinder the diſſolution of blood, and the profuſion thereof into ſeroſities injurious to the breaſt.

The cutting or opening the ſide.

The Empyematical matter is wont to ſtink by the often admiſſion of the Aire.

Thoſe things which perſwade or forbid a Paracenteſis.

But if the Signs of this Diſeaſe be leſs certain, and (as for the moſt part it is wont to be, from a Peripneumonie and Impoſthume of the Lungs going before) altogether doubtfull, Inciſion muſt not too ſoon or raſhly be made. For I have known ſome ſpitting forth a purulent matter, yea a fetid Pus, with painfull breathing, and heavineſs of the breaſt, to have undergone a Paracenteſis in vain, and not altogether exempt from hurt. Wherefore, until it is apparent by pathognomic ſigns that it is an Empyema confirm'd, expectorating medicines (as are before preſcribed for the cure of a Peripneumonie) as alſo things gently moving evacuation by Urine and Sweat, may be uſed for ſome time: But theſe availing nothing, and the Empyema ſtill remaining or increaſing, (becauſe whileſt there is ſtrength it is better to try doubtful Medicines than none) proceed to a Paracenteſis.

Forms of Remedies.

As to the Forms of Medicines requiſite to the curing an Empyema, before Inciſion, the ſame remedies that are preſcribed in a Peripneumonie are convenient; but the Paracenteſis being made, theſe following will be chiefly in uſe.

Againſt fainting of the Spirits, and ſwoonings which happen in that operation, or afterwards,

afterwards, let the following Julep be at hand to be taken now and then about four or five ſpoonfuls.

Take Balm and Black-cherry water, of each ſix ounces, Aq. Mirabilis one ounce, powder of Pearle one dram, ſyrup of Gilliflowers one ounce. Mingle for a Julep. *Cardiacs.*

The following Decoction to be drunk three or four times a day.

Take of Harts-tongue, Speed-well, Agrimony, Colts-foot, Mouſear, Sanicle, of each one handful, Madder and Chervil-roots of each one ounce, Barly half an ounce, red Vicers half an ounce, Raiſins an ounce and half, boyl them in four pound of Spring water to half, ſweeten it with clarified Honey, or with Syrup of Mouſe-ear as you take it, to your pleaſure. If a Feaver be wanting, the following Pills may be taken from one ſcruple to half a dram, Evening and Morning. *A Vulnerary Decoction.*

Take powder of Crabs-eyes two drams, Flower of Sulphur one dram, Sal Prunella half a dram, Spec. Diarrhodon Abbatis one ſcruple, Venice-Turpentine waſhed, make a maſs formed into ſmall Pills, or omitting the Turpentine take the powder from half an ounce to two ſcruples, twice in a day.

Examples of perſons ſick of an Empyema are not ſo frequent, and thoſe cured of that Diſtemper more ſeldom. I have known two, unwilling to admit of an Inciſion preſcribed by all means by the Phyſicians, to have fatally expired, and their dead bodyes I have diſſected. Alſo I ſaw that operation adminiſtred to two others, whereof one recovered health, the other dyed conſumptive; but the reaſon thereof was, his Lungs being notably corrupted, and his ſtrength utterly loſt, the too late opening his ſide conferr'd no help to him; but did much depreſs his ſpirits, weak enough before, and waſted his ſtrength. He whoſe ſide was opened, had Lungs ſound enough; but from the Impoſthume of the ſide being broke inwardly, the matter falling into the cavity of the Thorax did ſo compreſs the Diaphragma that he could ſcarcely breathe. The Chirurgeon without a Cauſtick thruſt in his Inciſion-knife between the 6th and 7th Vertebra, and having made a hole quite through his fleſh, he put in his Pipe. A bloody ichor firſt flowed out, afterwards being drawn away by a moderate quantity at times for three dayes, it flowed out without any ſtench; but afterwards as often as the Orifice was opened, a moſt horrid ſmell came forth, exceeding the ſtench of any Jakes, though ne're ſo ſtinking, and infected the whole Chamber with the ill ſcent: Moreover it remain'd ſo for many days, untill by injections made of Myrrh and bitter herbs, boyl'd in Water and Wine, and very often adminiſtred every day, at length it was extinguiſhed; by the daily uſe of which, the morbific matter and at length all the ſordidneſs being waſhed away, all flowing out ceaſed; and laſt of all the Orifice being cloſed, the patient recovered his entire health. I diſſected the dead bodies of thoſe who dyed, when by no perſwaſion of Phyſician or Friends they would admit of the opening of their ſide. One I have ſpoke of otherwhere, the reſult whereof was, the Pus ſtreaming from the Impoſthume raiſed in the Pleura, and in the intercoſtal Muſcles, and broken internally, had waſted part of the affected place, and of the contiguous Lung, with a Sphacelus or Gangrene, and ſo corroding the Diaphragma, and a hole being made on the right ſide thereof, it had deſcended into the Viſcera or bowels of the lower belly: and there in the whole paſſage of the Ventricle and Inteſtines, the outer Coats on which the purulent matter had fallen, appeared eaten and diſcoloured; and at length the purulent matter corroding and boring through the *inteſtinum rectum*, it came forth through the fundament together with his excrement. The ſick man being ſtrong and impatient of any medicine, endured the tyranny hereof for about two months, but in the mean while he lived miſerably, afflicted with a light Feaver, thirſt, inquietude, pain of the ſtomack, and frequent tumbling up and down, and almoſt with continual watchings. His body being opened after his deceaſe, a moſt horrid ſtench, exceeding any Jakes, diffuſed it ſelf throughout the whole Chamber. The Anatomy of another who dyed by an Empyema, afforded not ſo vaſt an effuſion of purulent matter. This indeed had its neſt in his ſide, from whence falling into the cavity of the Thorax, and there accumulated in a vaſt heap, and continually defiling his Lungs drenched therein, it cauſed a flow and as it were a hectick Feaver, whereby the patient, being very old, dyed.

An Hiſtory of one troubled with an Empyema, the cutting of whom was mortal.

Of another who recovered by that remedy.

The Hiſtory of one who dyed becauſe he was not cut.

A fourth Hiſtory like the former.

SECT.

SECT. I. CHAP. XI.

Of an Impoſthume of the Lungs.

Vomica Pulmonis a diſeaſe ſeldom obſerv'd.

A *Vomica* of the Lungs is ſomething a-kin to an Empyema or Peripneumonie, conſidering that the morbific matter is always meer Pus, which notwithſtanding is generated in the Lungs without a Feaver and Phlegmon, yea without any great Cough or Spittle, as it were ſilently, and without noiſe; and frequently this evil doth not diſcover it ſelf before it kills the patient. *Galen* makes mention of this in *lib.* 1. *de locis affectis*; but among Authors who have written Syſtemes and the practical parts of Phyſick, mention thereof is ſeldom or ſcarce to be met with. *Tulpius* in *lib.* 2. *chap.* 10. deſcribes this diſtemper after this ſort. *This evil* (meaning an Impoſthume of the Lungs) *lurks in the beginning ſo ſecretly that it ſcarce diſcovers any ſigns of it ſelf, beſides, in the firſt place, a little dry Cough, and preſently moiſt; which continuing for ſome time, the breath is drawn with difficulty, the ſpirit fails, and the body withers by degrees, although in the mean time the Spittle makes no ſhew either of pus or blood; and if the Impoſthume break by way of ſurpriſal, the man is kill'd immediately.* It is wont ſometimes ſo to happen, but I have known many who in an Impoſthume riſing inſenſibly, being maturated, and at length breaking, have ſpit up great plenty of fetid corruption; and though with voiding daily ſuch a Spittle, for many weeks, nay months, they became very weak, and as it were conſumptive, yet at length by the help of Medicines, after the Ulcer hath been mundified, and dryed, they have recovered their health entirely.

The formal reaſon and conjunct cauſe thereof.

This diſeaſe, if we ſearch into the formal reaſon and conjunct cauſe thereof, is in truth a concourſe of ill humours gathered in ſome part of the Lungs; whoſe matter although it be heterogene and an enemy to nature, notwithſtanding from the beginning appears not ſharp, or irritative. For when at firſt being ſeparated from the blood, it is depoſited in ſome hollow place of the Lungs, perhaps in ſome bladdery cell, it doth neither raiſe a Cough nor produce a Feaver; but afterwards when ſenſibly encreaſed it compreſſes the neighbouring Veſſels bringing blood, and moreover inſinuates into the very blood paſſing by, incongruous Effluviums; from thence a ſmall Feaver ſucceeds, with a certain diſquietude, and feebleneſs; and at length being accumulated to its fulneſs, and maturated by a long digeſtion into mere pus; breaking its neſt very much diſtended before, it flows out every where all about. But if the ways are not open for the iſſuing of the pus, it incontinently mingles it ſelf with the blood, and either empoyſons it, or impedes it from Circulation; or ruſhing by heaps into the Tracheal paſſages, it doth fill moſt of them at once, and ſo ſtuffs them, that a ſufficient entrance is denyed to air to kindle the blood, and preſently the vital flame expires: but if this matter find paſſage, and flow by degrees into the Trachea, from whence again it may be preſently carryed away, and ſpit out, there will be then ſome truce of life, with hope and opportunity of cure. And indeed I have known many cur'd of this diſeaſe.

The morbifick matter.

The uſual matter of an Impoſthume of the Lungs is meer Pus, which often ſtinks notably, and by that differs from the Spittle which is ejected in a Peripneumonie or a Conſumption of the Lungs. But whence that matter proceeds in the beginning thereof, and of what diſpoſition it was before it was ripened into pus, I cannot ſo eaſily determine: becauſe the ſeeds of this diſeaſe being privily ſow'd, and growing up ſecretly, ſpring wholly from an occult original; wherefore its procatarctick or more remote cauſes lye conceal'd, yea while it begins and increaſes, can neither be diſcovered by any pathognomical Signs, nor can any prognoſtick be deviſed, before it diſcovers it ſelf with a mortal ſtroak, but the whole procedure thereof is treacherous.

Now if after the Impoſthume is broke, and the ſpitting up of pus with an eaſie diſcharge being begun, with a conſtancy of ſtrength, there be means offer'd for ſome method of cure, the chief Indications according to the common cuſtom in moſt diſeaſes will be theſe, *viz.* Curatory, preſervatory, and vital. The firſt commands the matter of the Impoſthume ſpeedily to be diſcharg'd by Spittle, and that the ſides thereof ſhould be cleanſed and healed as much as is poſſible. The ſecond Indication

dication provides againſt the conflux of new matter to that neſt, or other adjoyning places of the Lungs (whence a Conſumption may be engendred). The third reſtores the languiſhing of the Spirits, the loſt ſtrength, and the fruſtrated Nouriſhment.

1. As to the firſt Indication, remedies commonly called expectorating, and of them thoſe that are more hot and ſharp, and do very much cleanſe and drye, but eſpecially (for that for the moſt part here a Feaver is wanting) ſulphureous remedies are expedient; which alſo may be preſcribed according to the following forms. *First Indication.*

Forms of Remedies.

Take of Tincture of Sulphur three drams, take from ſeven drops to twenty, at bed-time, and early in the morning in a ſpoonfull of Syrup of the Juice of Ground-Ivie.

Or,

Take our ſyrup of Sulphur, as before ſet down, 6 ounces, let a ſpoonfull be taken at the ſame hours.

Take the dried leaves of Ground-Ivy, Germander, white Maiden-hair, Coltsfoot, Hyſſop, white Hore-hound, Savory, of each one handful, Enula-campane, Orris, and Chervil-roots, of each one ounce, Anniſeeds half an ounce, boyl them in 6 pound of Spring-water to three pound and a half, adding towards the end White-wine 6 ounces, clarified Honey three ounces. Let the ſtrained Liquor be clarified, and kept for uſe: the doſe 6 ounces warm, three times a day. Or,

Take of Lime-water 6 pound, put it in a Glaſs with a large mouth, hanging in it the following bag:

Take the dried leaves of Germander, Ground-Ivy, white Horehound, of each one handful, Orris and Enula-campane ſliced one ounce and a half, Anniſeeds bruiſed two ounces, Liquoriſh an ounce and half, Raiſins ſtoned three ounces, let them be ſtopt and ſtand cold. Pour out for uſe, the bag remaining.

Take Lohoch Sanum three ounces, Species Diaireos two drams and a half, flower of Sulphur one dram and a half, of ſimple Oxymel two ounces, make a Linctus to be lickt with a Liquoriſh-ſtick.

Take the powder of Hedge-muſtard, Ground-Ivy, of each half an ounce, flower of Sulphur a dram and a half, ſyrup of Sulphur (or of the juice of Ground-Ivy) what will ſuffice to make a Lohoch.

Take of fine Mirrh, of white Amber, of each half an ounce, Sulphur Vivum, Auripigment, of each two drams, the rinds of Piſtaches one dram and a half, make a powder for Fumigation, to be uſed in a Paper-funnel, morning and evening.

2. The preſervatory Indication, aboliſhing the morbific matter, and ſo providing againſt a Phthiſis prone to ſucceed; endeavors the purifying of the blood, and ſtrengthning the Lungs, to which ends, Purgers, Vulnerarie Decoctions, diſtill'd waters and phyſical Drinks, are convenient. *Second Indication.*

Take of the Decoction of Senna of Gereon (with one dram and half of Agarick) three ounces and a half, purging ſyrup of Apples one ounce, Aq. Mirabilis two drams, make a potion to be taken with government once in a week.

The form of the Wound-drink let be the ſame as was preſcribed for an Empyema after opening, or 4 or 6 ounces of the Decoction common in Shops, three times a day, (becauſe here is no feaver.)

Take of Firre-tops 6 M. freſh Ground-Ivy, Hyſſop, Sage, Rockets, Hedge-Muſtard, St. Barbaries *herb or Winter-creſſes, of each four handfuls, the ſeeds of the Sun-flower 6 ounces, ſweet Fennel-ſeeds two ounces, Enula campane, Orris-roots, of each 3 ounces, being cut and bruiſed, pour upon them 8 pound of* Brunſwick *Mum or Spruce-Beer, diſtill it in a cold Still; let the liquor be all mixt, and when uſed, ſweetned at pleaſure with ſyrup of the juice of Ground-Ivy; the doſe three or four ounces, three times a day.*

Take of the roots of Sarſaparilla ſix ounces, China two ounces, of each of the Sanders ſix drams, Shavings of Ivory and Hartshorn, of each half an ounce, Maſtick-wood one ounce, being cut and bruiſed infuſe them in 12 pound of Spring-water, boyl them to half, adding one ounce of Liquoriſh, Raiſins 4 ounces, let the ſtrained liquor be kept for ordinary drink.

3. The vital Indication preſcribes Cordials, Anodynes, and a convenient courſe of diet. The ſame forms of Medicines for the moſt part are expedient here, which were pre- *Third Indication.*

preſcrib'd for an Empyema after inciſion, and alſo the ſame diet as was ordain'd in a beginning conſumption; beſides, in this caſe Aſſes-milk often-times doth much good. As to the curing this diſeaſe, I have obſerved, that an Iſſue made in the ſide, for the moſt part doth ſignally profit. I remember two ſuffering under this diſtemper, by coughing up plentifully mere ſtinking Pus or Corruption after the Impoſthume broke, to have been heal'd by this Remedy in a ſhort ſpace of time. The Hiſtories of the Cures ſhall be afterwards annexed. In both theſe by a ſhallow orifice made in the ſide by inciſion, meer Pus began within three or four days to flow out, and then the Spittle began to be abated; and after that flowing, encreaſed from day to day, for ſome time continued, the Spittle altogether ceaſed, and the Patent recovered his entire health.

Fontinels in the ſide very often greatly help in this diſeaſe.

The reaſon of this admirable Effect ſeems to be, that the part affected of the Lungs, or that which is bordering upon it, while the diſeaſe was ariſing, or before, grew to the very ſide, and therefore Nature had endeavoured by this way the thruſting forth of the Pus or matter contained in the Impoſthume; and for that cauſe perhaps had made ſecret paſſages even to the ſuperficies of the ſide; wherefore, afterwards an iſſue being laid open by a knife, the excretion of the morbific matter was conducted thither. It is alſo probable, that a certain part of the Lobe of the Lungs at firſt grew to the ſide in the diſeaſed, and by reaſon of the cleaving thereto, afterwards the Impoſthume had its riſe; for whereas that part being almoſt immoveable, could not be ſtirred like to the other parts of the Lungs, the morbific matter was depoſited there, and was the better able to reſide or form its neſt there.

Although the Impoſthume of the Lungs be thought a very rare diſtemper with ſome Phyſicians, and by *Tulpius* judg'd ſo mortal, that when it breaks it kills out-right; yet I have known many to have labour'd under this diſeaſe, and by the help of Medicines to have recovered their priſtine health. We may here deſcribe two or three of the more remarkable Hiſtories of them.

A Gentleman of a middle age, and before ſtrong and continually healthful, finding himſelf not well, without any apparent cauſe, contracted as it were a crazie diſpoſition; for being without pain, without Vomit, Cough or notable Feaver, in a ſhort time grown weak, he became without any appetite, unapt to ſleep, full of thirſt and hot about the precordia; this perſon was handled a long while by ſome Phyſicians as Scorbutical, and by others as hectical; and after various methods of healing were aſſay'd in vain, at length the diſeaſe ſallying out as from an ambuſh, appeared manifeſtly. For whilſt on a certain night being more unquiet than uſual, he toſſed himſelf very much in his bed, all on a ſudden the Impoſthume breaking in his Lungs, a large quantity of ſtinking pus was thrown out by Cough, ſo that in four or five hours he threw off about two pints. Moreover, after his Cough continuing about two months, he daily ſpit out purulent matter, thick and very ſtinking, untill his fleſh being conſumed, and he wholly ſpent, was reduced to languiſhing, and a notable Conſumption. From the ſtench of his Spittle and breath the whole Chamber was ſo filled, that his Servants or thoſe attending him, could not endure the ill ſcent thereof.

After the Impoſthume was thus broken, I and two other well-known Phyſicians being adviſed with, with all circumſpection we preſcribed Medicines to abſterge and heal the Impoſthume, and to cleanſe the Blood and Lungs, and to redeem him from an imminent Conſumption. *A Tincture, and ſyrup of Sulphur, together with Pectoral and Vulnerary Decoctions and Diſtillations were taken; alſo Lohochs and balſamick Pills, day after day in a conſtant courſe, with Clyſters, gentle Purgatives and Diuretick, were taken between whiles:* then theſe, *Vaporations and Fumigations, as well ſulphureous as arſenical, were uſed morning and evening.* After theſe things being long and carefully uſed did help nothing, I often propounded the opening of the Thorax; but the ſick man obſtinately rejecting this operation, ſaid he would rather dye than be murdered; yet at length, when I aſſured him that this remedy, or none, was further to be attempted, he began to deliberate with himſelf, and immediately baring his breaſt, he ſuffered me to ſearch a place where I might apply a Cauterie; the buſineſs was preſently put out of doubt, for a Tumour appeared on the left ſide of the Sternon, between the 5th and 6th Vertebra. Inſtead of a Cautery, I applyed thereto a ſuppurating Plaiſter, and within three dayes the top of that ſwelling became red and ſoft: out of which, being the next day opened, firſt a thin ichor, and a little after a yellow and concocted pus flowed out, and afterwards it continued daily to ſtream out more plentifully: from that

that time his ſtinking Spittle began to abate, and within fourteen days it ceaſed quite; the morbific matter obtaining through that orifice both an eaſie and more convenient iſſue. Although by the effect it was manifeſt, that the paſſage of that orifice lay open into the breaſt, and perhaps into the middle of the Lungs, yet no liquor caſt in by a Syringe, could either penetrate or be forced in thither: ſo ſecret and intricate are the conveyances which Nature forms for her laſt aids; that by the ſame paſſage by which the morbific matter is exterminated, nothing more hurtful can enter. This opening of the ſide was at length chang'd into an Iſſue, and a Peaſe or a wooden pill being put in, there came forth daily for half a year together plentifull ichor; and in the mean time this well-known perſon, all corruption of the breaſt being ſhook off, and the fleſhy habit of his body being recovered, became healthful in all reſpects, and laſtly, that iſſue being removed to his arm, he bears no ſign of that nor any other diſeaſe in his breaſt.

After this Cure ſo by chance accompliſhed, it hapned I performed another like it, on purpoſe, not leſs ſucceſſefully; for ſhortly I was ſent for to a noble Lady which had been for many years obnoxious to the heat of the precordia with a Cough. One day, when ſhe coughed ſhe was throughly ſenſible of ſomething broke in her Lungs, and preſently ſhe voided abundance of meer pus, and that ſtinking; after that, this kind of Spittle continuing with a Cough, for a week, notwithſtanding the uſe of remedies, ſeemed rather augmented than diminiſhed, I adviſed to have an Iſſue cut in her ſide, near the very place whence ſhe perceived the pus to aſcend, which ſhe readily granted: Within three days, from the orifice being opened meer pus began to flow out, like that ſhe diſcharged by Cough. Then after the morbific matter had iſſued out by that Fontinel, both the Cough and the ſpitting of pus wholly ceaſed, and within a Fortnight the patient recovered her firm health.

After this I was ſent for to another, *viz.* a ſtrong man, and as ſtrong a drinker; who being affected with an Impoſthume of the Lungs, alſo ſpit up an abundance of pus and very ſtinking matter. This Patient by a certain rude contumacy abhorr'd any iſſue, wherefore he would not ſuffer any to be made in his ſide; notwithſtanding he took any Medicines offered to him, by a long uſe of which Remedies he eſcaped free from that diſeaſe: the Medicines whereby he chiefly received help were prepared of Sulphur, as our Syrup and Tincture, taken daily and very frequently. To theſe for Vehicles were added one while a Decoction, another while a pectoral Hydromel, another while Lime-water, with an infuſion of pectoral, as well as vulnerary Ingredients. Moreover Fumigations and Smokes, eſpecially of ſulphureous and arſenical Ingredients, did contribute very notable help.

SECT. I. CHAP. XII.

Of an Aſthma.

An Aſthma a moſt terrible diſeaſe.

AMong the Diſeaſes whereby the Region of the breaſt is wont to be infeſted, if you regard their tyranny and cruelty, an Aſthma (which ſometimes by reaſon of a peculiar ſymptome is denominated likewiſe an Orthopnœa) doth not deſerve the laſt place; for there is ſcarce any thing more ſharp and terrible than the fits hereof; the organs of breathing, and the precordia themſelves, which are the foundations and Pillars of Life, are ſhaken by this diſeaſe, as by an Earthquake, and ſo totter, that nothing leſs than the ruine of the whole animal Fabrick ſeems to be threatned; for breathing, whereby we chiefly live, is very much hindred by the aſſault of this diſeaſe, and is in danger, or runs the riſque of being quite taken away.

An Aſthma is denominated from ἄσθμαινω, (which is to breath purſie, or difficultly) and may have this deſcription, that it is a difficult, frequent, and purſie breathing, with a great ſhaking of the breaſt, and for the moſt part without any Feaver.

The cauſes of reſpiration hurt.

The act of breathing depends as well on moving the Lungs, the Structure whereof ought to be of that ſort that its paſſages, and all the pores may perpetually be open, for the free ſucking in and letting out air; as from the parts or organs moving them, which by alternate turns of Syſtole and Diaſtole, do cauſe the hollowneſs of the breaſt, and conſequently the Lungs themſelves to be dilated, and contracted: whereas therefore there are many and divers reaſons of diſturbance, whereby reſpiration is prejudiced, for the moſt part they may all be reduced to theſe two heads; *viz.* that there is a fault either in moving the Lungs, or in the parts or inſtruments that ought to move them, and from hence the differences and kinds of this diſeaſe are beſt of all deſign'd; for according to the various nature and poſition of the morbific cauſe, it is called an Aſthma, either meerly pneumonick, proceeding altogether from the paſſages bringing in aire being obſtructed, or not enough open; or it is meerly convulſive, which only ariſes by reaſon of a defect or fault in the motive organs; or mixt, when either parts conſpire in the fault, which origine every great and inveterate Aſthma is wont to have; of each of theſe we will treat in order.

The Ancients allowed the cauſe of it only from the Bronchia obſtructed:

1. The ancient Phyſicians, and for the moſt part hitherto the Moderns have only acknowledged the firſt kind of Aſthma, judging the next cauſe, and almoſt the only cauſe of this Diſeaſe, to be the ſtraitneſs of the Bronchia, *viz.* inaſmuch as the ſpaces of thoſe paſſages, being either ſtraitned together by obſtruction, or compreſſion, as often as the uſe of breathing is required, do not admit of plenty enough of Aire, wherefore, for the more free inſpiration of aire, as ſhall be needfull, the organs of breathing do moſt difficultly labour, with throes moſt frequently repeated.

Or vapours from the Spleen or Womb, but erroneouſly.

But that ſome are found obnoxious to fits of an Aſthma, without manifeſt taint of the Lungs, it was wont to be aſcribed to vapours from the Spleen, Womb, Meſentery, or ſome other bowel, undeſervedly enough; but ſurely that paſſion, without the ſtraitneſs of the Bronchia, or fault of thoſe bowels we have in another place ſufficiently evidenced to ariſe from Cramps of the moving parts, and ſhall be preſently clearly made out. But in the mean time by what means it may ariſe alſo from the paſſages of the Trachea obſtructed, or compreſſed, it lyes upon me to declare.

After what manner the ſtraitneſs of the Bronchia ariſes.

The ſtraitneſs of the Bronchia, inducing the firſt kind of an Aſthma, is ſuppoſed to come to paſs by an obſtruction, as often as either thick humours and viſcous, or purulent matter or blood extravaſated, are forced in upon them; or that little ſwellings, or Schirrus's, or little Stones, ſtop up their paſſages; or finally that a Catarrh of a ſerous humour ſuddenly diſtills upon them. Moreover the ſame diſtemper is thought to be raiſed by compreſſion, as often as matter of that kind (and of every kind of them) ſhall cleave to the paſſages of the pneumonic Arterie or vein. Surely, an aſthmatical diſpoſition depends upon theſe various cauſes and manners of diſturbance: but all invaſions of the diſeaſe, or at leaſt the greater fits are uſually provoked by reaſon of ſome accidents or occaſions. For while the ſtream of blood ſliding and running down gently can be content with a ſmall breathing, it paſſes through the precordia without great labour either of Lungs or Breaſt. But being boyling and paſſing

paſſing through the Lungs more impetuouſly, it requires a more full inſpiration of aire; for the freer admittance of this through ſtrait paſſages preſently all the breathing organs are alarmed into moſt frequent throes. Whatſoever therefore makes the blood to boyl, or raiſes it into an efferveſcence, as violent motion of the body or minde, exceſs of extern cold or heat, the drinking of Wine, Venery, yea ſometimes mere heat of the Bed doth cauſe aſthmatical aſſaults to ſuch as are prediſpoſed. It is uſual that thoſe who are obnoxious to this diſeaſe oftentimes dare not enter into a Bed, only ſleep in a Chair, or on a bed, being covered with garments. The reaſon whereof is, that the body covered and heated with bed-cloaths, the blood being a little raiſed into a more quick motion, and grown hot, requires a more plentifull ſucking in of air than may be ſupplyed from the paſſages of the Trachea being ſtraitned: for the more blood paſſes the Lungs each Syſtole and Diaſtole, by ſo much, for the enkindling and eventilation thereof, the air ought to be more plentifully and quickly brought in, and ſent forth: to which task (when by reaſon of impediments it is not eaſily diſpatched) yet in ſome manner to be performed, the ultimate endeavors of all the parts appointed for breathing are made uſe of with a great contention of the whole breaſt. Moreover the blood being ſtirr'd, is not only an occaſion, but alſo in ſome part a cauſe in thoſe that are aſthmatically prediſpoſed; for the veſſels bringing blood being thereby more fill'd and diſtended within the lungs, compreſs the Tracheal paſſages being already very ſtrait, and render them much more cloſe.

Whatever cauſes an efferveſcence of the blood is the evident cauſe of an Aſthma.

Why Aſthmatical Perſons are worſe in bed.

II. A convulſive Aſthma (which we judged to be the ſecond kind of this diſeaſe, and to be raiſed without any great obſtruction or compreſſion of the Bronchia, from the mere Cramps of the moving fibres) is not limited to one place, or to any peculiar organ, but being of a diffuſed energy, it is extended to almoſt all the parts employed in breathing (whereof one while this, another while that, or ſome other is in fault.) For a convulſive affection inciting an Aſthmatical invaſion, hath regard to the moving fibres of the veſſels of the Lungs, to the Diaphragma, to the muſcles of the breaſt, to the Nerves, which belong unto the Breaſt, or Lungs, nay to the origine of thoſe Nerves planted within the Brain; and whileſt the morbific matter dwells in every of theſe places, hindering or perverting the work of breathing, it brings on the fits of this Diſeaſe, as in another Tract we have ſomewhile ſince plainly demonſtrated. For the animal Spirits deſtin'd to the function of breathing, if at any time they are very much moleſted and conſtrained into irregular motions, enter inordinately into the Fibres as well nervous as moving of the organs of breathing, and make them for that cauſe one while to be contracted, another while to be diſtended irregularly, as alſo their ſolemn and equal turns of Syſtole and Diaſtole to be variouſly diſturbed or hindered.

A convulſive Aſthma.

Its Seat manifold and diffuſed.

The morbific cauſe or matter provoking the Spirits prepared for the pneumonic work, as in divers places, ſo chiefly in theſe three, is wont to advance its force or power, *viz.* 1. Either in the muſcular fibres themſelves, or 2. In the branches or nervous ſlips, or laſtly within the Brain by the origine of the Nerves.

The morbific matter conſiſts in ſeveral places.

1. As to the former, the heterogene matter being inimical to the Spirits is ſometimes ſhaken off from the Brain into the trunks of the Nerves, and from thence by their paſſages and ſlips, if perhaps it ſhall be in very little quantity, without very great or ſenſible hurt ſlides down to their lower ends. And when it falls in the nervous fibres, and being heaped up daily, ſhall at length ſenſibly increaſe unto a great quantity, it begins to trouble the inmate Spirits, and to provoke them into aſthmatical Convulſions; which forthwith infeſt, and are encreaſed by reaſon of evident cauſes, neither do they utterly ceaſe, untill the ſtock of matter ſo accumulated, be wholly diſpers'd, and conſumed; afterwards when it being renewed ariſes to a fulneſs, the fits of that diſeaſe return, and are for that cauſe moſt frequently periodical, as is manifeſt to common obſervation. According to this account we do deſervedly ſuſpect the cauſe of a convulſive aſthma ſometimes to lurk in the muſcular coats of the pneumonick veſſels, alſo ſometimes in the fibres of the Diaphragma, or the Proceſſes thereof towards the loyns. It is not very probable that the neſt of this diſeaſe conſiſts within the fibres of this or that pectoral muſcle, although in Scorbutical perſons from theſe alſo poſſeſſed with a convulſive matter, we have known pains to have riſen with breathing being hurt.

1. In the muſcular fibres.

2. But truly (even as in another place we have not only demonſtrated by reaſon, but by the obſervations and Hiſtories of the ſick) a convulſive aſthma is often incurred, as often as the morbific matter ſliding down into the pneumonic Nerves, ſticks in

2. Within the Nerves and their enfoldings.

some place within their passages, and especially about their foldings: whence as often as it is accumulated to a plenitude it begins to be mov'd and shaken; wherefore the spirits lying lurking, and flowing into the organs of breathing disturbed, are forced into irregularity, and those spirits presently affect other inmates of the fibres of the Lungs and breast, and provoke them into unequal and asthmatical convulsions. For this cause and the reason of the disturbance, we have declared that not only invasions of this disease, but also the precordia being disturb'd thereby the Cardiack passions do arise.

3. Near the Origines of the Nerves.

3. We have clearly unfolded by anatomical observations that the cause of a convulsive Asthma sometimes consists in the hinder part of the head near the origines of the nerves. Surely I have observ'd some patients, who when, lying sick of other desperate diseases, they were also asthmatick, found it necessary to be whether in bed or chair with their head always erect, or looking down, but lying on their back or leaning backwards incontinently they gaped for breath as if they were dying, and hardly breathed; the cause whereof (as appear'd by dissection after they were dead) was only a huge collection of sharp Serum which was gather'd within the cavities of the brain; which, if by reason of the head inclining backwards, it fell into the origine of the Nerves of the eighth pair, presently the precordia, and chiefly the breathing organs were affected with horrid cramps. Moreover sometimes for this very reason it seems that Orthopnoick persons cannot lie down in their bed without danger of choaking, but are constrain'd to sit up with an erect body.

3. A mixt Asthma or partly Pneumonic and partly Convulsive.

III. Although an Asthma is sometimes simple from the beginning, *viz.* either merely pneumonical, or convulsive, notwithstanding after either disease hath for some time encreased, for the most part it gains the other to it self: hence it may be concluded every inveterate Asthma to be a mixt affection, stirr'd up by the default partly of the Lungs ill fram'd, and partly by default of the Nerves and nervous fibres appertaining to the breathing parts. For when the pneumonic passages being straitned or obstructed from some cause, do not admit of a free sucking in, and breathing out of the air, for that cause also the blood, yea and nervous humour, being hindred in their courses, and compell'd to proceed slowly and to stagnate, do fasten their feculency and dregs upon the nervous parts; whence the passages of the spirits are obstructed, or perverted, and at length a convulsive taint accrues to them. Moreover the blood, being not duly inspir'd and eventilated within the precordia, at length being vitiated in its temperament supplies the brain and nervous stock but with a depraved juice, whose faults do chiefly punish the organs of respiration before hurt and debilitated. In like manner also the evil is reciprocated on the contrary part, as oft as this disease begins by fault of the nervous stock; for as much as the motion of the Lungs is often stopt or hindered, by reason of Convulsions in the muscular fibres, both the blood and the nervous juice being restrain'd from their usual motions, do heap up dregs and filths, fastening them to the parts containing them, by which not only viscous humours and obstructing of the passages, but even Tumours and other more solid concretes vitiating the structure of the Lungs, are produced.

The causes of an Asthma recited.

Therefore if when an Asthma being for some time confirmed and become habitual, shall attain to frequent fits, and those emergent upon every occasion; the conjunct cause thereof, and also the procuring cause is placed as well inwardly in the lung it self, as outwardly in the Fibres and Nerves, and in the spirits imploy'd for the function of breathing. Neither will it be difficult, by seeking diligently each of these things, to find in any case of the patient, as well the chief nests, as nourishment of this morbifick matter. But as to the evident causes they are very many, and also of diverse sorts. For hitherto ought to be referred whatsoever move, either the blood and the other humours, or trouble the animal spirits and force them into irregularities. Asthmatical persons can indure nothing violent, or unaccustomed: from excess of cold, or heat, from any vehement motion of body or mind, by any great change of air, or of the year, or from the slightest errors about the things not natural, yea from a thousand other occasions they fall into fits of difficult breathing.

The Prognostick of the Disease.

As to the prognostick part, an inveterate Asthma is difficulty or scarce ever cured; notwithstanding the medicines and method of healing being rightly ordered, oftentimes great succour is afforded, *viz.* the fierceness of the fits is diminish'd, longer respites are procured, yea, even the dangers of life it self, seeming frequently to be imminent are removed.

This disease growing worse, either threatens a Consumption, or a Dropsie, or some drowzy,

drowzy, or convulſive affect; accordingly as the Serum by reaſon of perſpiration being hindred, being more abundantly accumulated (becauſe the ſick cannot ſleep enough in their beds) it is either fixed in the lungs, or transfer'd into the habit of the body, or into the brain it ſelf. For this very reaſon the diſeaſed do find themſelves better in Summer, when they breath more freely, than in Winter; likewiſe better in hot countries than in cold, the South or Weſt wind blowing, than the North or Eaſt.

Of the curatory method of an Aſthma there will be two chief indications, or rather ſo many diſtinct methods of healing, *viz.* Curatory and preſervatory. The firſt inſtructs what is to be perform'd in the fit it ſelf, that the Patient may be delivered from preſent danger; the other, by what out of the fit, we ought to endeavour the taking away the morbifick cauſe, leſt that diſtemper be repeated more often, or more heavily. *Two chief Indications.*

1. Therefore a fit urging, there will be two chief intentions of curing, *viz.* firſt, that a more free breathing be procured, as well upon the account of air, as of the Lungs, at leaſt ſo far, as may ſuffice to ſupport life; and ſecondly, that the organs of breathing may be withdrawn, and reſtrain'd, as ſoon as may be, from the Convulſions begun, and uſually obſtinately continuing. *What is to be done in the fit.*

1. As to what reſpects the former, let the Patient be placed in an upright poſition of body, in a more open place, and pretty airy, free from Smoak and breath of by-ſtanders; then let it be indeavoured that the Lungs, being made free from all obſtruction, and inward oppreſſion, and alſo external compreſſion, may be able to draw and change the breath more eaſily. For theſe purpoſes leſt the bulk of the nether bowels compreſs or ſtraiten the precordia, the belly is to be looſen'd by a Clyſter, the apparel and what ever binds about the Breaſt to be looſened; alſo when in this caſe either from the blood ſwelling up inordinately within the Pneumonic veſſels, or from the Serum diſtilling out of the Arteries and Glandules into the tracheal paſſages, they are wont to be oppreſſed, the impetuoſity and inſtigations of either humour ought to be reſtraind and appeaſed; inſomuch that if ſtrength endure, and the pulſe be ſtrong enough, Phlebotomy is oftentimes convenient. Moreover thoſe things are carefully to be adminiſtred which diſpatch away the Serum and ſuperfluities of the boiling blood by urine, as well as ſweatings: to which intention, Juleps, Apozemes, commonly call'd Pectorals, do notably conduce; yea, powders of ſhells, millepedes prepared, Spirits and volatile ſalts, are ſucceſsfully uſed. In the mean time beſides let there be adminiſtred whatſoever opens and makes ſlippery the paſſages of the Trachea, and moves expectoration, and whatſoever, if need be, gives ſtop to a Catarrh diſtilling upon the fame; for which purpoſes, Lambitives, Lohochs, pectoral Decoctions and ſuffumigations are good. *1 Intention to facilitate breathing.*

2. As to the other intention of curing in theſe Convulſive fits, *viz.* that the organs of breathing may be reſtrained from the Convulſions begun, and may quietly return to their ordinary task, (unleſs this ſucceeds of its own accord, after the boiling of the blood and Serum in the Lungs be appeaſed) we muſt uſe Antiſpaſmaticks or remedies againſt Convulſions, and Anodynes: for medicines which are uſed to be adminiſtred in hyſterical paſſions, do conduce in a convulſive Aſthma. *2 Intention to free from Convulſions the moving parts. Remedies which diſſipate the ſpirits profit for this end.*

Spirit of Harts-horn, of ſoot, and eſpecially of ſal Armoniac diſtill'd with gum Ammoniacum; alſo the tinctures of gum Ammoniacum, of Sulphur, of Caſtor, of Aſa fetida, Syrups of Ammoniacum, Sulphur; Oxymel of ſquils and ſuch like, which becauſe they are of an ingrateful taſt or ſmell, as it were diſſipate the ſpirits and withdraw them from tumults, do ſometimes help notably. But if the ſpirits being outragious cannot by this means be appeaſed, we muſt aſſay Narcotics, that ſome of them being ſubdued the others may be reduced to order: for ſurely unleſs a ſtuffing up of the Lungs, with a great oppreſſion of the Precordia do hinder, Opiates do ſometimes greatly profit. In the dreadful fits of this diſeaſe, when other medicines had effected leſs, I have often adminiſtred ſucceſsfully Diacodium, as alſo Laudanum Tartariz'd. But theſe may not be exhibited without great circumſpection, becauſe whereas more or leſs they hinder breathing (which already is difficult and too much hindred) they frequently bring the Patient into danger of life. Beſides this, that the Pneumonic ſpirits may be diverted from their Convulſions, it is many times expedient to moleſt the ſpirits in other places; for ſome of the ſpirits being in other places afflicted moſt commonly the reſidue as well as thoſe that are ſmitten do diſmiſs their irregularities: Wherefore Veſicatories, Cupping-glaſſes, ligatures, and painful frictions bring *Or do bring them aſleep.*

help;

help; alſo for this reaſon vomits are ſucceſsfully taken in the midſt of a fit. The ſcope of healing being now deſign'd, after what manner the patients in an urging fit of an Aſthma ought to be handled, it yet remains for us to propound ſome more ſelect forms of Remedies appropriated to the ſame ends.

Forms of Remedies. In the firſt place therefore to give a ſtop to the flux of blood and ſerum, and to diſmiſs their ſuperfluities deriv'd from the Lungs by ſweat and urine, theſe enſuing are preſcrib'd.

Take the water of ground-Ivy eight ounces, of Rue, Pennyroyal, Dragons, of each two ounces, of ſal prunella one dram and a half, Syrup Byzantinus, red Poppies of each one ounce; make a Julep, take it three or more times in a day, the doſe three or four ounces.

An Apozeme. *Take graſs roots three ounces, roots of Kneeholm two ounces, candi'd Enula campane one ounce and a half, barly half an ounce, Raiſons of the Sun, one ounce, boyle them in three pound of water to two pound, adding to your ſtrain'd liquor ſal prunella one dram and a half; ſweeten it, if there be occaſion, with Syrup Byzantinus or of Violets.*

A Tincture. *Take tincture of Sulphur three drams, the Doſe ſix drops to ten, evening and morning in a ſpoonful of Syrup of the juice of ground-Ivy, or Violets.*

Take of facula of Aron and Briony, of each one dram and a half, flower of Sulphur one dram, flowers of Benzoin half a dram, Suger-candy half an ounce, Liquoriſh two drams; make a powder to be taken to half a dram or two ſcruples twice in a day with the former Julep or Apozeme: or,

A Powder. *Take of the powder preſcribed two ounces, hony or Oxymel what will ſuffice, make a Linctus, take about half a ſpoonful evening, and morning, and at other times lick it with a ſtick of Liquoriſh.*

Take Syrup of Horehound, of Garlick of each one ounce and a half, tincture of Saffron, Caſtor, of each two drams mix them, take a ſmall ſpoonful in the fits.

Mixtures. *Take of ſpirit of ſal Armoniack with gum Ammoniacum three drams, of ſnail water, and of Earth-worms of each three ounces, Syrup of Horehound two ounces, mingle them, take by a ſpoonful once in four or five hours.*

Take of the powder of Hedge muſtard, or of ground Ivy gather'd in the heat of the Sun one ounce, of Oxymel ſimple enough to make a Linctus.

2 The Indication preſervatory propoſes what is to be done out of the fit. 2. So much concerning the method, and medicines requiſite in the fit of an Aſthma. The other indication preſervatory deſigning the taking away of the whole procuring cauſes and the morbific matter, contains two parts or diſtinct ſcopes of cure: both which for the moſt part are wont in the practice to be complicated and adminiſtred together. One of theſe endeavours to amend the conformation of the Lungs, if it be any way hurt or faulty, and the other to take off the irregularities of the moving parts and ſpirits, appointed for them. We ſhall beſt anſwer both theſe intentions if the remedies vulgarly call'd pectorals, are mixt with anticonvulſives, and the uſe of theſe with other medicines reſpecting the preparation of the whole body and emergent ſymptomes be apply'd between whiles. For which purpoſes the method and enſuing forms of remedies may be adminiſtred.

Suggeſts two Intentions of healing.

Forms of Remedies. *Take of Aloes roſata a dram and half, flower of Sulphur a dram, ſalt of Amber half a dram, Tar what will ſuffice, make 24 pills, take 4 every, or every other, or every third night. or,*

Pills. *Take of gum Ammoniacum, Bdellium diſſolv'd in vinegar of ſquils of each half an ounce, flower of Brimſtone three drams, powder of hedge muſtard and ſavory of each half a dram, make a maſs with Syrup of Sulphur or Oxymel of ſquils; make ſmall pills, take 3 every evening. or,*

Take Hog-lice prepar'd two drams, flower of Benzoin half a dram, ſalt of Amber two ſcruples, extract of Enula campane half a dram, Caſtor half a dram, Saffron a ſcruple, Venice Turpentine enough to make a maſs, form ſmall pills, take 4 every evening and morning except the times of purging.

But if this form of Pills will not pleaſe, or the above mentioned Medicines profit little, afterwards the enſuing ſhall be eſſay'd to free the Lungs from obſtruction.

Take

Take spirit of gum Ammoniacum distilled with sal Armoniac three drams, the syrup of Ground-Ivy three ounces, magistral Snail and Earth-worm water of each an ounce, tincture of Saffron two drams, mingle them and take a spoonful evening and morning. Or, Mixtures.

Take Tincture of Ammoniacum three drams, the dose from 15 to 20 drops in a spoonful of Oxymel, or of syrup of Ground-Ivy. Or,

Take Tincture of Sulphur three drams, dose from 7 drops to 12 or 20 in a convenient vehicle at the same hours.

In like manner other spirits endued with a volatile salt, and mixt with pectoral Syrups and Cephalick waters, may be prescribed successfully evening and morning.

In place of a mixture or an Asthmathical Julep from distill'd-waters in the shops, let this following magistral be prepared for frequent and several uses.

Take roots of Enula campane, Orris of Florence, *Angelica, Masterwort, of each four ounces, of Bryony a pound, the leaves of white Hore-hound, Hyssop, of Savory, Penny-royal, Ground-Ivy of each four handfuls, Juniper and Ivy-berries of each a pound, Bay-berries half a pound, sweet Fennel, Carue, Annis, Louvage, Dill seeds of each an ounce, Cubebs two ounces, Long-pepper, Cloves, and Mace of each an ounce, all being sliced and bruised pour on them eight pound of* Brunswick *beer, distil it in common organs, mix the whole, and as you use it sweeten it with Sugar, or Syrup of Ground-Ivy, or with Oxymel.* A distill'd water.

Moreover in lieu of Oxymel, or any common pectoral Syrups, the ensuing forms of medicines appropriated to an Asthma are prescribed; and in the first place the Syrup of Enula-campane invented by *Horatius Augenius* and called by his name, and afterwards commended by *Platerus, Sennertus, Riverius* and other renowned Practitioners, ought to be observed in this place, and used frequently.

Take of Enula-campane, Polypodie of the Oak prepared of each two ounces, Currance two ounces, Sebestens 15, Coltsfoot, Lungwort, Savory, Calaminth, of each a handful, a large leaf of Tabaco, Liquorish two drams, Nettle and Silk-worm seeds of each a dram and a half, boyl them in Wine mingled with Hony and diluted to a pound and half, and with a little Sugar make a Syrup: take it by it self in form of a Linctus, or a spoonful evening and morning, or add a spoonfull to the distilled water or Apozeme. Magistral Syrups.

Take Florence *Orris-roots, Enula campane of each half an ounce, Garlick peel'd four drams, Cloves two drams, white Benzoin a dram and half, Saffron a scruple, slice and bruise them and digest them warm in a pound of rectified spirit of Wine for 48 hours; to it strained add fine Sugar a pound, put it in a Silver Bason upon live coals, stirring it till it flame, and let it burn as long as it will, then the flame being out make a Syrup of it to be taken as the former.*

Moreover hither may be referred the decoction of an old Cock so much magnified by renouned Physicians as well antient as modern, for the cure of an Asthma; which although *Septalius* damn'd for gross and of no efficacy, notwithstanding *Riverius* after him vindicates; and to attest the efficacy of this remedy opposes his own experience to the others. These broths are of two kinds, *viz.* either with or without purgers; and various Recipes of each do remain in practical Authors, all which would be tedious to recount here, we shall propose one or two forms. The decoction of an old Cock.

This is the common example without purgers.

Take of Orris and Enula-campane roots of each half an ounce, Hyssop and Hore-hound dryed of each six drams, Carthamus seeds an ounce, Annis and Dill seeds of each two drams, Liquorish scraped and Raisins stoned of each three drams; let them be prepared and sewed into the belly of an old Cock, which boyl in fifteen pound of water until the flesh depart from the bones, strain it and let it settle: of the clear liquor the dose six ounces, with an ounce of Oxymel simple. Or if the remedy be desired to be solutive, dissolve of fresh Cassia and Manna of each half an ounce in each draught, taken for many days together, and sometimes for a whole month. Without purgers.

Riverius prescribes a convenient form of such a kind of purging broth.

Take

Take Enula-campane and Orris roots of each a dram and a half, Hyſop and Coltsfoot of each a handful, Liquoriſh and Raiſins of each two drams, Figgs 4, Senna cleanſed three drams, polypodie of the Oak and Carthamus-ſeeds of each half an ounce, Anniſeeds a dram and a half, boyl them with the third or fourth part of an old cock, make broth for one doſe to be taken in the morning, let them continue it for twelve or fifteen days.

The firſt Hiſtory of a convulſive Aſthma.

Of many examples of Aſthmaticks I ſhall propound only two ſingular ones, *viz.* I will deſcribe the Hiſtory of one who hath been obnoxious to fits of this diſeaſe meerly convulſive, and of another partly convulſive and partly Pneumonic. A Noble perſon, proper and well ſet, and formerly healthful enough, after that by chance he had ſtruck his ſide againſt ſome ſolid body, from that time contracted a hurt, and afterwards an Aſthmatical taint. For we may ſuſpect, a certain folding of the Nerves belonging to the precordia placed near was prejudiced by that accident, and from ſuch a cauſe afterwards this diſtemper derived its origine, *viz.* at ſome incertain times the pain at firſt troubled him about that place, and preſently a moſt painful Dyſpnœa enſued with a laborious and laſting contention of all the breathing parts; inſomuch that while the fit laſted the patient was thought to be in the agonie of death. I was firſt ſent for to him after labouring for two days with ſuch an invaſion of the Aſthma that he was accounted in a deſperate condition; Notwithſtanding finding his Lungs without hurt, our prognoſtic willed as yet to hope well, and immediately by a conſultation of other Phyſicians it was preſcribed as followeth.

The Cure.

Take of ſpirit of gum Ammoniacum diſtill'd with ſalt of Tartar three drams, take from 15 to 20 drops in a ſpoonful of the following Julep, drinking after it five ſpoonfuls, repeat it every ſixth hour.

Take elder flower, camomile, and Penyroyal water of each four ounces, Snail-water two ounces, Sugar one ounce, mingle them, between whiles he took a doſe of the following powder with the ſame Julep or pectoral decoction.

Take powder of Crabs eyes two drams, ſal prunella a dram and a half, ſalt of Amber half a dram, mix them, divide it into eight doſes.

Large veſicatories were applied on the inſide of his arms near the arm-pits, Clyſters daily adminiſtred, and frequent frictions. By the uſe of theſe he received ſudden and unexpected help, and within a few days became wholly free from that fit. Afterwards as often as he had any perception of the firſt motions of this diſeaſe, preſently he took a large doſe of that ſpirit with the ſame Julep 3 or 4 times a day, by which remedy often uſed, one while for preſervation, another while for the cure ſake, he was void of any outragious invaſion from his habitual Aſthma for above two years, in the mean while ſuffering ſome more light aſſaults but eaſily blown off.

The ſecond Hiſtory of a mixt diſeaſe.

A very Honourable old Gentleman dignified by many great Titles, himſelf being greater than all them, after that for ſome years he had liv'd every winter obnoxious to a cough and a moderate ſpitting, and gentle enough, at the end of the laſt Autumn returning from a long journey he was leſs healthful: (as it was thought by cold he had taken) for he complained of a pain in the middle of his breaſt next the ſternon, which growing worſe in an evening, as ſoon as warm in his bed, wholly diſturbed his ſleep, and moſt part of the night was very troubleſome: notwithſtanding without any Dyſpnea or evident ſign of an Aſthma. To take away this pain both Purging and Bleeding were uſed, pectorals and antiſcorbuticks were daily uſed, liniments and fomentations were applied to the place pained, yet without any great ſucceſs or eaſe: for the alteration which happened afterwards declined rather to worſe; for a difficult and obſtructed breath came upon the pain's growing a little more remiſs, ſo that from his firſt ſleep, or inclination thereto he became aſthmatical and gaping for breath, and ſuffering about the precordia he was conſtrained to ſit upright in his bed. Moreover a dyſpnœa of this kind and a convulſive agitation of the breathing parts did not only return every evening, but from day to day were rendred more outragious and laſted a longer time; inſomuch that one night waking from his ſleep, for many hours he was aſſaulted with a moſt painful fit of an Aſthma which had almoſt kill'd him. The Phyſicians being at a great diſtance from him, although deſired about midnight came not while the morning following, mean while by reaſon of bleeding uſed by a Barber this worthy Gentleman revived, being redeemed from the jaws

of

of death; but afterwards by the consultations of Physitians that day a slender diet and loosening the belly by a Clyster were prescribed: In the evening and early in the morning he took of Spirit of gum Ammoniac distilled with sal Armoniac 12 drops in a proper vehicle, and continued the use for many days after; Vesicatories were applyed on the inside of his arms near the armpits; moreover Juleps and pectoral Decoctions, Lohochs, Clysters, and also mild Purges were taken by turns; also Phlebotomie was repeated after two days. Whereas formerly he was used to drink for his mornings draught a pint of Ale with Wormwood and Scurvy-grass, in the room of that about eight a clock he took 15 drops of Elixir Proprietatis tartariz'd in a draught of Coffee made with Sage. By these remedies his asthmatical fits presently abated of their fierceness, insomuch that the beginning and end of every night were quiet enough, but in the middle light troubles about the precordia kept him from sleep, sitting upright an hour or two. Certain other medicines were propounded by the Physitians, and others of diverse sorts privately offered by his friends, which notwithstanding the Honourable Person utterly rejected, or soon loath'd; and that the rather, because, winter then being almost spent, his restauration was hoped for by the coming on of the Spring and enjoyment of the Country air without the help of much Physick. Wherefore of the medicines above mentioned he used one while this and another while that a little by turns, and sometimes kept holy-day from them all; but in the interim although his asthmatical invasions little or nothing troubled him as formerly in the night, yet by reason his Lungs were very much obstructed, and a serous humour fallen down into his feet, he was not able to walk fast or ascend steep places, without a painful dyspnœa, being in danger of choaking; and now (while I am writing this) not so much an Asthma or Consumption, as a Dropsie is feared.

The reason of this case.

The Ætiologie of this case is clearly enough manifest from the above-mentioned things, *viz.* one procuring cause of this Asthma was a lung greatly obstructed, insomuch, that whereas the blood boiling, passed through the precordia more impetuously, the air requisite for its ventilation could not be admitted in plenty enough; wherefore to supply this defect there was necessity that the Lungs and their motive organs should be provoked into more frequent, and more vehement throes. Afterwards from thence ensued a convulsive disposition of the fibres moving the breast: for the heterogeneous matter descending into those parts together with the nervous juice, and being gathered to a plenitude, first excited pain and afterwards fierce and periodical convulsions in the pneumonic organs: and now although this latter disposition cease (because the Elastick and spasmodical matter is blunted or extinguished by the serous illuvies) yet the other procuring cause still remains, and hath got another associate, *viz.* a worse Devil than it self, to wit a Dropsie.

SECT. I. CHAP. XIII.

Of a Dropſie of the Breaſt.

A Dropſie of the Breaſt is eaſily known.

IT is clearly manifeſt by certain and manifold diſcoveries, that the Region of the Breaſt is ſometimes affected with a Dropſie; for the ſenſe and ſound of water fluctuating, do moſt evidently demonſtrate it in living bodies; and Anatomical inſpection in the defunct. But yet concerning the cauſe of this Diſeaſe, and manner of coming to paſs, to wit, by what ways, and after what manner diſpoſed, the accumulation of water firſt begins within the hollow of the breaſt, as alſo how it is ſenſibly augmented, and frequently inſenſibly continued untill the Diſeaſe becomes deſperate, is a thing yet in the dark. Whenas there is a general diſtemper of a Dropſie or an Anaſarca appearing, and hath ſeized on the fleſh and cavities of the bowels every where, or in moſt places, we are not to admire if that illuvies of waters ſeize alſo upon the Pectorals: But beſides, ſometimes it happens, that the Region of the Thorax, is either firſt or only overflown, the other parts in the mean time remaining ſound enough, or only hurt ſecondarily.

Its cauſe is hidden.

About the origine of this Diſeaſe, and the manner of generation it is much diſputed whence, and by what paſſages that illuvies of water being found every where in the hollowneſs of the Thorax, doth come thither. Some Authors do derive it from above, *viz.* that it deſcends from the head by the Trachea; and others deducing its Spring from beneath, from the cavity of the Abdomen, alſo ſometimes from the Liver and Spleen, by I know not what blind ways, judge thoſe waters to be conveyed into the hollowneſs of the Breaſt. But neither of theſe Opinions challenge our aſſent, or deſerve our arguments to diſprove them: for none conſidering the paſſage of the blood and humours will acknowledge either this or that way of commerce. We cannot but affirm, that the ſerous humour, raiſing a Dropſie of the breaſt, does arrive thither either in a kind of vapour, which being exhal'd from the Precordia and ſides of the Thorax, is eaſily condenſed into water; or ſecondly, that the Serum is there depoſited under its own proper form, inaſmuch as it flows into that cavity from the mouths of the Veſſels, *i. e.* of the Arteries being open. We will anon enquire whether the Lymphaducts or veſſels bringing chyle, being any where open, or broke, do ſometimes produce that diſeaſe.

How many wayes it may be produced.

1. By Vapours condenſed there.

1. As to the former, it is ſo very probable that a Dropſie of the breaſt takes ſometimes its origine from vapours condenſed within its cavity, that it is a wonder how it ſhould be otherwiſe at any time, or that any ſhould live exempt from ſuch an effect. For how much is there of vapour that ſeparates from the boyling blood? and when it waxes cold in the precordia, how can it come otherwiſe to paſs but that the abundant vapour ſhould be condenſed in this encloſure into water, even as if ſhut within a Still? And truly it will not be eaſie to determine, when the vaporous ſteams are ſo unceſſantly heaped within the cavity of the breaſt, what may become of them, how they are conſumed, or from thence diſcharged abroad. Surely we muſt affirm, they either penetrate the ſides of the Thorax, or (which rather ſeems to be) they inſinuate into the pores of the Lungs, and ſo fly away in breathing. Certainly by either way, the vapours of the breaſt may exhale: and perhaps if either be defective, or hindred, by that means a Dropſie of the Breaſt may be cauſed.

2. By Serum depoſited there.

2. But moreover, I am apt to think, that this Diſeaſe alſo ſometimes happens in another manner (inaſmuch as the Serum diſtills from the veſſels in its proper form.) For in a cacochymical conſtitution of body, or a perſon very ſcorbutical, where the watery and weak blood every where caſts off its ſuperfluous Serum from its own conſiſtence, and every where ejecting it from the little mouths of the Arteries being looſed and open, excludes it from the clew of circulation, nothing is more uſual, than for the cavities not only of the Bowels, but alſo of the Precordia, yea the Brain it ſelf, to be overflown with that watery collection; moreover in ſo general a diſpoſition to a Dropſie, that one while this region, another while that, or another ſhould be firſt and almoſt onely poſſeſs'd; and that alſo ſometimes the inmoſt parts being untoucht,

Which ſometimes breaks out from the Arteries.

the

the outward fleſh, *viz.* the muſcles and their interſpaces are overflown with that ſerous illuvies.

3. Among the veſſels that pour in the dropſical matter into the cavity of the breaſt, the Lymphaducts and parts bringing the chyle, do juſtly fall under a ſuſpicion. What relates to the former, it appears by anatomical inſpection, that a great company of theſe do creep thorough the whole Lungs, and do tend from their outer parts, ſtretching out themſelves inwards towards the paſſages of the breaſt, and for the moſt part pour out into them their liquour, which being ſuperfluous, they every where ſuck up from the arterious Blood. Therefore whenas theſe veſſels are obſtructed, or are by any means impeded from diſcharging their function, it muſt needs be that a heap of water be accumulated in the Lungs, which afterwards falling into the cavity of the breaſt, will excite a Dropſie in that region. For in truth, this Lympha reſtagnating within the conſiſtence of the Lungs, it often happens that the little bladders called Hydatides, in the outer ſuperficies of the Viſcera are raiſed up, which afterwards being broke, diſcharging the waters into the cavities of the Thorax, they produce there an Aſcites. A diſtemper of this kinde is often diſcovered in Sheep, when they dye by heaps of a Dropſie, by reaſon of a moiſt ſeaſon and watery paſture. And ſurely the following Hiſtory doth clearly ſeem to argue, that the Aſcites of the breaſt proceeds from the like cauſe ſometimes in a man, (there being yet a living example of this diſeaſe.) Lately a young man healthful enough and ſtrong, having accuſtomed himſelf to hunting and inſatiable riding, and other exerciſes of the body very immoderate, a while without detriment, at length he perceived a fulneſs in his Thorax as if it were a kind of ſwelling; inſomuch that the left ſide of his Lungs ſeem'd to begin to ſwell, and his heart to be thruſt out of its place towards the right ſide; for that he perceived the pulſation thereof to be on that part chiefly. After he had been for ſome time in this condition, on a certain day he felt as if a Veſſel had been burſt aſunder within the cavity of the Thorax, and from thence for the ſpace of half an hour, in that place, as it were the dropping of a humour falling from above into the bottome of his breaſt, was not only felt by himſelf, but could be heard alſo by the ſtanders by. *A*lthough he was at firſt ſurprized with the rarity of this affect, yet for that he was well enough as to ſtrength, appetite, ſleep, and other natural functions, immediately after he became ſecure, and negligent of Medicines; But afterwards by any motion, bending or ſtirring of his Body, a fluctuation of water gathered within on his left ſide, was felt by him; moreover, the motion and ſound was evidently perceived by others, either by handling, or by the ear. *A*s without doubt this Gentleman was affected with a Dropſie of the Breaſt, ſo it ſeemed moſt probable that the diſeaſe had its original from thence, in regard the lymphaducts relating to the left ſide of the lungs, being firſt obſtructed near their inſertions into the paſſage bringing the chyle, did ſwell up to a great bulk, and afterwards being broken diſtill'd their humour into the cavity of the Thorax.

3. And ſometimes from the Lymphaducts.

A remarkable hiſtory of the like caſe.

When now an Inundation of the Precordia, and ſo of the vital Fort, was imminent, this Gentleman at length, thinking it time to provide for himſelf, entered into a courſe of Phyſick, and carryed certain Medicines into the Countrey for his cure, yet without any ſignal ſucceſs. Afterwards coming to *London*, he firſt conſulted the worthy Dr. *Lower*, being of his former acquaintance. He propoſing the opening of the Thorax for his only remedy, took care that the worthy Dr. *Micklethwait* and my ſelf ſhould be ſent for to the conſultation. Immediately an inciſion was appointed by the conſent of us all: wherefore, after proviſion for the whole being made, a Chirurgeon applyed a Cautery between the ſixth and ſeventh Vertebra, and the next day he put his Pipe into the Orifice cut into the cavity of his Breaſt; which being done, immediately a thick liquor whitiſh like Chyle, and as it were milkie, flowed out. There was about ſix ounces only taken from him the firſt time, and the next day as much more. The third day when a little greater quantity was ſuffered to come out, being affected immediately with great fainting, and afterwards being feaveriſh, he was ill for a day or two. Wherefore it ſeemed good to ſtop the iſſue of that matter till he recovered his temperament and ſtrength: but afterwards a ſparing evacuation of the ſame matter being daily made, the cavity of his breaſt was wholly emptyed: but as yet he wears a pipe in the orifice with a tap, which being opened once in a day and a nights ſpace, a very little of the humour flows out; in the mean while, being well in ſtomach, viſage, and ſtrength, he walks abroad, rides, and performs all exerciſes he was formerly ac-

The reaſon thereof.

The Cure by a Paracenteſis of the breaſt.

cuſtomed to, vigorouſly enough. He uſed not (neither was there need of) much medicine, only after the Inciſion we adviſed temperate Cordials, *viz.* powder of Pearles, Juleps, and ſometimes Hypnoticks, and afterwards a vulnerary decoction to be taken twice a day.

By this method, and theſe forms of Medicines ſometimes continued, this worthy perſon ſeemed to recover his temper, and his ſtrength, and the habit of his body, and his breaſt exempt from the Dropſie. Notwithſtanding he ſtill wore a ſilver Pipe in the orifice of his ſide (out of which ichor daily flowed): and when after ſome months this being withdrawn, the Iſſue was ſhut up, a gathering of the ſame humour was made within the hollow of his breaſt, perceivable by the ſound and fluctuation thereof: but when that the diſeaſe returning, the ſame medicine was to be uſed, and inciſion of his ſide appointed, (Nature by chance diſcharging the function of a Chirurgeon) the matter being prone to burſt out, and flowing to the place made its own way. He is now neceſſitated (for preventing the illuvies of his Breaſt) to keep that orifice conſtantly open like a ſink.

From theſe things I think it manifeſt enough, that an Aſcites of the Breaſt, ſometimes ariſes from the lymphatick veſſels burſt aſunder within the Lungs; neither doubt I leſs but that the ſame affection may be cauſed from the chyliferous paſſages being broke within the Thorax; notwithſtanding, this chance ſo rarely happens, that as yet I have not known it by my own obſervation, or others relation. Moreover, it little avails to make inquiſition into the Ætiologie of ſuch a diſeaſe, becauſe it is not only apparently incurable, but in a ſhort time mortal; becauſe the Precordia are incontinently overflown by the inundation of the chyle, and alſo the blood and the animal ſpirits being defrauded of their wonted ſupply of nutritious Juice, are immediately diſſolved.

The differences of this diſeaſe. From the various cauſes of this Diſeaſe even now ſet down, it will be eaſie to collect its differences: For firſt a Dropſie of the Breaſt, is either ſimple and primary, peculiar to this Region; or ſecondary, coming upon a general Dropſie, as it is wont often to be in cachectic perſons. Secondly, this Diſeaſe is diſtinguiſhed as to the places affected, *viz.* foraſmuch as water is either collected in the whole breaſt, or only in one ſide thereof. Thirdly, as to the matter accumulated in a pectoral Aſcites, which one while is limpid and plainly wateriſh, another while more thick, whitiſh, and as it were milkie, ſuch as we have deſcribed in the foregoing Hiſtory.

The Diagnoſtick ſigns. The diagnoſtick ſigns do manifeſtly enough diſcover this diſeaſe: *viz.* the fluctuation of water is perceived by handling, and by feeling at every bending of the body, and the ſound is clearly heard. Moreover they are affected much with a dry and empty Cough, as alſo with a Dyſpnœa almoſt continual and painful, eſpecially while they aſcend ſteep places; Beſides, they have a thirſt, with a little feaver, and in the night after the firſt ſleep, great diſquiet and toſſing of the body, proceeding from the vapours being elevated by the heat being more intenſe. Sometimes there comes upon theſe a Palpitation of the heart, an intermitting or diſturbed Pulſe, and frequent faintings of the ſpirit. As to the prognoſtick, this diſeaſe is always difficult to cure, and among the vulgar accounted incurable. And ſurely if it come upon an Aſcites of the Abdomen or an Anaſarca throughout the whole body, it is judged not without cauſe deſperate; But if the affection be primary, and happen to a body otherwiſe ſound, we are not altogether to deſpair of Cure.

The Cure. What relates to the curatory part of this Diſeaſe, the chief Indications will be three, Curative, Preſervative, and Vital, according to the common method of curing in moſt other Diſtempers.

The firſt has regard that the water heaped up in the cavity of the Breaſt by any means be evacuated. The Second provides, that afterwards a new illuvies be not gathered in the ſame place. The Third procures the reſtoration of ſtrength, and the ſymptoms impairing it to be removed with expedition.

What Intentions of healing the firſt Indication ſuggeſts. To ſatisfie the firſt Indication, and that an Aſcites of the Breaſt may be emptyed, there are but two ways or means of evacuation to be met with, whereby this collection of waters may be drayn'd, *viz.* Either that the veſſels of the Breaſt, and the paſſages of the humours, being emptyed, might ſuck up that Lympha being rarified, and afterwards by the paſſages of the blood or air convey them forth: or ſecondly, that by an inciſion of the ſide, thoſe waters may be drained forth plentifully in their own Species.

That

That former manner although more ſeldom, yet ſometimes ſucceeds; which I can atteſt out of my own obſervation. For the conſiſtence of the Lungs being ſpongy within, and externally very porous, while by every turn of the Diaſtole, they are drenched in the underlying waters, they ſometimes imbibe them being turn'd into vapour; and ſo diſpatch them to the blood, or continually exhale them with aire coming out at the mouth. That an effect of this ſort may more eaſily happen to cure this diſeaſe, medicinal aids are taken: For that intention therefore the paſſages of blood, aire, and humours ought to be emptyed as much as may be, and to be kept ſo empty. For this purpoſe, Purges, Diureticks, and more mild Diaphoreticks are methodically, and alternately exhibited; alſo remedies for the breaſt, and expectorating, challenge here their place; let the Diet be ſlender and warming, and a government appointed as to all other things of that nature, that the blood may be made to exhale the more, and all the ſuperfluous humours to evaporate. I think good to annex ſome forms of Medicines accommodated to theſe uſes. *The firſt Intention.*

Take of Chervil-roots, Knee-holme, Polypodie of the Oak, of each an ounce, Agrimony, white Maidenhaire, Oak of Jeruſalem, Ground Ivy, of each one handful, Carthamus-ſeeds one ounce, Florence-Orris half an ounce, ſeeds of Danewort 5 drams, Calamus Aromaticus half an ounce, boyl them in four pound of Spring-water, to the conſumption of a third part, adde to it being ſtrained Senna one ounce and a half, Agarick two drams, Mechoacan and Turbith, of each half an ounce, yellow Sanders a dram and a half, Galangal the leſs one dram, boyl them two hours gently, and cloſe covered, afterwards ſtrain it and adde of Honey two ounces, clarifie it with the white of an Egge, make a purging Hydromel. The Doſe is from ſix ounces to eight, in the morning, twice or thrice in a week. Or, *A Purging Hydromel.*

Take Mercurius Dulcis one ſcruple, Reſine of Jallap half a ſcruple, Balſam of Peru what ſuffices to make four Pills, to be taken in the morning, and to be repeated within five or ſix dayes.

Take Tincture of Sulphur three drams, take from ſeven drops to ten, at night and in the morning, in a ſpoonfull of the following mixture, drinking after it three ſpoonfulls. *Tinctures.*

Take of the water of Snails, Earth-worms, and compound rhadiſh water, of each four ounces, water of Elder-berries fermented one pound, Syrup of Juice of Ground-Ivy two ounces, mix them for a Julep. Or, *Julep.*

Take of Tincture of Ammoniacum, or Galbanum, take twenty drops evening and morning in the ſame mixture. Or,

Take of Hog-lice prepared two drams, flower of Sulphur two ſcruples, flower of Benzoin one ſcruple, powder of wild Carrot and Burdock-ſeeds, of each half a dram, Turpentine of Venice, enough to make a maſs. Make ſmall Pills. Take four evening and morning, drinking after them a ſmall draught of the Julep. *Pills.*

At Nine a Clock in the Morning, and Five in the Afternoon, let him take four onces of the Compound Lime-water, by it ſelf, or with any other proper remedy. *A Lime-water.*

For ordinary drink take the following Bochete.

Take Sarſaperilla ſix ounces, China two ounces, white and yellow Sanders, of each ſix drams, ſhavings of Ivory and Hartshorn, of each three drams, Calamus Aromaticus half an ounce, Raiſins half a pound, Liquoriſh three drams, boyl and infuſe them in twelve pound of Spring-water to ſix pound, ſtrain it. *A Bochet.*

Formerly about twenty five years ſince, when I reſided at *Oxford*, I was ſent for to a young Scholar, who ſuffered for three weeks ſpace under a pain of the Thorax, and a moſt grievous Dyſpnœa conſtantly troubling him in the evening, moreover, from a more quick motion of body, or going more haſtily than uſually up any ſteep place, he laboured extreamly, he could not ly down long on either ſide, but was neceſſitated to lye in his bed ſupine, and his head erect; if perhaps he attempted to lye on either ſide, immediately pain followed that poſition of body, and if perhaps he roll'd himſelf from one ſide to another, the pain being alſo preſently tranſlated, he felt as it were water to wave from place to place. Hence I had a juſt ſuſpicion of a Dropſie of the Breaſt, whereof that I might be more aſſured, I order'd that lying upon his back on his bed, he would ſuffer his head to bend backward from the bed-ſide to the floor, immediately he had a plain perception *A Hiſtory of a Patient.*

of

of water running towards the Clavicles, together with a change of the pain thither. Moreover if at any time he grew more hot than uſual, from motion, or in his bed, or by the fire, he preſently felt ſenſibly in his breaſt, as it were water boyling over the fire, and alſo complained of a Vertigo, and a ſmall decay of Spirits. Wherefore, when we might lawfully collect out of theſe things rightly conſidered, that he was affected with a dropſie of the breaſt, I preſcribed the following method and medicines with ſucceſs.

The Cure of him.

Take of Mercurius Dulcis fifteen grains, Reſine of Jallap half a ſcruple, Syrup of Roſes ſolutive what ſuffices, make three Pills. He took them early in the morning and had twelve ſtools with great eaſe; afterwards on the third day by the ſame Medicine he had but four, but with greater benefit; he took afterwards for many dayes ſix ounces of the Pectoral and Diuretick Apozeme twice in a day, and laſtly repeating the Purge he perfectly recovered.

SECT.

SECT. II.

Of Splanchnick remedies, or thoſe which reſpect the bowels of the lower Belly.

CHAP. I.

Of the Jaundies and the remedies thereof, and the manner and reaſon of their operations.

HItherto we have largely enough unfolded the Pathologie and curatory method of the Thorax; now it follows next to finiſh our task in like manner about the lower Belly. But we have in our former tract for the moſt part deſcribed already the medicines belonging to this region, and the manner and reaſons of their working, together with the Anatomy of the Stomach and Inteſtines: we have treated of remedies ſtomachical, dyſenterical, and others belonging to the inteſtines, as alſo diureticks together with the reaſons of them: Moreover we have ſufficently elſewhere handled the ætioligie of Hypochondriack, and Hyſterical remedies. What therefore remains, of Hepatical diſtempers as well proper, as of thoſe vulgarly aſcrib'd thereunto, and of their remedies we will diſcourſe in this Section; notwithſtanding in each of theſe, we will beſtow more labour, about the curatory, than pathological part.

Diſeaſes of the Liver.

The chief diſeaſes by which the Liver and the appendix thereof, are wont to be incumbred, are the Jaundies, and a Tumour, and under this latter many other affects, *viz.* obſtruction, inflammation, induration, and ſchirrus are numbred; to all which are vulgarly appointed remedies commonly called Hepaticks, and which make up a great part of the Diſpenſatory.

The Jaundies is either a diſeaſe by it ſelf, primarily beginning, which is here properly treated of: or it is an effect or product of another diſeaſe; as when it ariſes upon an intermitting Feaver, which oftentimes it puts an end to, of which alſo we will preſently treat by the by.

The Jaundies.

An Icterical diſtemper by the common conſent of moſt is judged to ariſe in as much as the yellow choler, not at all, or not enough received, from the ends of *vena porta*, into the paſſages of the cholerick pore, overflows into the maſs of blood and pollutes it with its greenneſs, whereby alſo the very skin is diſcolour'd.

The cauſe of it.

That obſtruction is wont to happen after many manners and in various places. For ſometimes it happens near the extream ends of either kind of veſſels, *viz.* the end of the *vena porta*, and the *porus bilarius*; the interſpaces whereof happen frequently to be compreſſed, and ſtopt by reaſon of the Parenchyma of the Liver being tumefied, or otherwiſe vitiated; wherefore the humour of the gall not being transferred out of the ſeparating veſſels of the *porta* into the other receiving veſſels, turns back upon the blood. Secondly, the paſſage of the humour of the gall is ſometimes intercepted in the middle paſſages of the cholerick pore; for that the cavities of theſe are filled either with a viſcous, or ſandy, and ſometimes with a ſtony matter; as is plainly diſcerned in the Livers of beaſts in the winter ſeaſon, while they are fed with hay and ſtraw. Thirdly, it is alſo manifeſt by Anatomical obſervation, ſometimes an obſtruction in the very bladder of the gall, or in the cyſtic paſſage is the cauſe of the Jaundies; for if at any time, it being filled with ſtones, receive not the choler, or being here ſhut up, or grown together, it reſtrains the deſcent of the choler towards the guts, that humour although well ſeparated from the blood, is conſtrained to flow back into the maſs thereof, and ſo propagates the Jaundies.

The opinion of Sylvius of the cauſe of the Jaundies.

Againſt this moſt received opinion, by which it is judged, that the cauſe of the Jaundies for the moſt part conſiſts on this ſide the *veſica fellis* or about it towards the Liver: the moſt Renowned *Sylvius* altogether places it without this, *viz.* in the Cyſtic

Cyſtic or common paſſage. For ſuppoſing the choler not to be ſeparated from the blood, within the paſſages of the Liver, but in the very bladder of the Gall to be propagated of a humour brought thither by the Arteries; He judged the greateſt part, being carried upwards by the paſſage of the *pori bilarii*, to be poured into the blood for ſome notable uſes, and alſo another part to deſcend beneath to the Inteſtines, alſo for neceſſary uſes: wherefore if this latter ſluce be ſhut, all the choler is carried upwards into the blood, and filling it too much with this humour, perverts it from its genuine temper, into an Icterical.

But truly leſt the ſtopping of the paſſage of the bladder, or of the common paſſage, (neither of which eaſily happens, or from any light occaſion) may ſeem leſs efficacious to excite any Jaundies; therefore, *whether ſuch an obſtruction hath place, or no*, the moſt Renowned man ingeniouſly ſuppoſes beſides, *The choler while it is generated in the bladder does undergo ſometimes a notable change, by which it is moved, and is born about more plentifully and impetuouſly*, towards the blood, *with which yet it is leſs mingled than it was wont to be, but only confounded together with it, and ſo more eaſily departs from it and infects and tinges the ſolid parts with its colour.*

But that the *choler in the Jaundies may be rendred unfit to mix with the other humours, or to be nearly united*; he determines it to be done, *by a ſpirit too valatile, mixed plentifully with it, and ſo making it more ſpirituous and immiſcible with others.* He confirms this aſſertion by two inſtances, *viz.* in as much as the moſt ſpirituous poiſon from the biting of a Viper, and the too much uſe of the more generous drinks, *viz.* Wine and Strong-waters, cauſes ſometimes the Jaundies. Moreover he endeavours to procure credit to this Hypotheſis, for that this diſeaſe is wont to be cured, not only by medicines opening obſtructions, but by them which blunt the force of a raging volatile ſalt (of which *ſort are the decoction of Hemp-ſeeds, alſo* Venice *ſoape* with many other things of the ſame ſort.)

It belongs not to this place, neither is it to our purpoſe to deſcend to end this contention, nor dare I now raſhly determine it (ſince it hath tired ſo many Renowned Wits of the Moderns) whether really the choler be made in the bladder of the Gall, or whether it be only ſeparated from the blood in the Liver, the great organ of ſeparation; I confeſs this latter opinion beſt pleaſes me. And weighing theſe things ſeriouſly I am induced to think the cauſe of the Jaundies to conſiſt chiefly in this, that the choler being ſever'd in the Liver, is not, by reaſon of the ways being obſtructed, at all, or not enough conveyed to the bladder of the Gall, but that it muſt of neceſſity regurgitate into the maſs of blood; notwithſtanding in the mean while we deny not, but this affect may ſometime ariſe (although more rarely) from the Cyſtic paſſage or common pipe being obſtructed. But alſo we think the fault of the blood to preceed in part and perhaps ſometimes wholly for the morbific cauſe; when to wit from its ſulphurous and fixt Saline Particles above meaſure exalted, the choler is more plentifully, or quicklier generated in the maſs of blood, than can be ſeparated or diſcharged forth by the ordinary ways; wherefore this, ſeparating every where from the blood with the Serum, is affixed to the ſolid parts, and impreſſes its tincture upon them. And without doubt it is for this reaſon that ſome poiſons, and chiefly the biting of Vipers, and the dayly uſe of more generous drinks, induces the Jaundies in bodies before ſound, for whoſe cure ſometime Phlebotomie, and medicines reducing the blood to a right temper, are wont to profit more than thoſe opening obſtructions. Moreover it ſeems for this reaſon, that a tertian intermiting Feaver ſo frequently terminates in the Jaundies; for we may not ſuſpect the paſſages of the Liver can be by any means obſtucted, ſince in all fits, ſo great an agitation of the blood and humours, by cold, and heat, and ſuch an evacuation of them happens either by vomit or ſweat: and truly even as feaveriſh fits are cauſed, inasmuch as the ſulphurous part of the blood being too much advanced, in the firſt place perverts the nutritious juice into a morbific matter, and afterwards being inflam'd conſumes and exterminates it; ſo when the fixt ſalt is at laſt exalted together with the ſulphur in the blood, and for that cauſe meer choler is abundantly engendered, the feaveriſh enkindling of the blood ceaſes, by reaſon of the reſtrictive force of the fixt ſalt, and in place thereof the diſtemper of the Jaundies doth ſucceed. But as the blood being too much advanced to a ſulphureo-ſaline diſtemperature cauſes the Jaundies in any, though leaſt prediſpos'd to it; ſo in others very much diſpoſed thereto, having the ways of choler obſtructed & the ſulphur of the blood being too much depreſſed, it produces a freedome from that diſeaſe; for I have known many cachectick and phlegmatick perſons, to have been free from the Jaundies

The Authors opinion.

The cauſe of this diſeaſe ſometimes in the blood.

dies, though they have ſuffered under obſtructions and indurations of the Liver, as to moſt of its paſſages.

It is not worth our labour to make more ample diſquiſition about the ætiologie of this diſeaſe; as to what reſpects the cure, there will be three primary indications, all which (for what may be the chiefeſt of them, and firſt to be exhibited, for the moſt part is concealed) we ſhall proſecute together; wherefore the intentions of healing ſhall be, 1. That the obſtructions of the paſſages or choler-bearing veſſels be opened, if perhaps any ſhall be either in the *porus bilarius*, in the Cyſtic paſſage, or in any place about the Liver. 2. That the blood be reduced to its due temperament and mixture, leſt it ingender choler above meaſure, or render it unapt to be voided. 3. That the ſtrength may be ſuſtain'd, and the ſymptomes chiefly hurting them may be withſtood. *The cure of the Jaundies.*

1. That we may ſatisfie the firſt indication, cathartic evacuations notably conduce, as well by vomit, as ſiege, whereby the choler's deſcending towards the inteſtines may be furthered, and veſſels obſtructed, by the great ſhaking of them, freed from their obſtruction. 2. Sharp, bitter, ſalt medicines and others indued with a certain briskneſs ought alſo to be given, which provoke the motion of choler gathered in the Liver, and ſtagnating; hither alſo ought to be referred, what by ſimilitude of ſubſtance, and as it were ſignature, in as much as they are indued with a yellow juice, have the report to help againſt the Jaundies; notwithſtanding many of theſe may fitly be numbred under the ſame claſſis of evacuators, as the former, becauſe they move urine or ſweats. *The 1. Indication.*

The ſecond indication altogether requires alteratives, *viz.* medicines which may depreſs the exaltations, or ragings of the Sulphur and fixt ſalt, and in the mean time provoke the reſtitution of the volatile ſalt depreſſed; for theſe ends remedies endued with an acid or volatile ſalt, beſides chalybeats do principally bring help; from hence ſpirit of ſalt, of vitriol, juice of Lemons, alſo ſpirit of Harts-horn, alſo dung of Sheep, and Geeſe, *crocus Martis* and diverſe other preparations thereof, are frequently uſed with ſucceſs in the Jaundies. *The 2. Indication.*

The third indication vital ſuggeſts more and ſundry intentions of cure, procuring the ſtrength to be reſtored, and the removing the ſymptomes whereby it is prejudiced, all or the chief particularly to enumerate, and preſcribe would be a vaſt and tedious work; wherefore we will annex only certain general rules about diet, and ſome cordials and anodynes appropriate in this condition. *The 3. Indication.*

The curatory indications being appointed after this manner, it next lies upon us to acommodate the moſt ſelect medicines, *viz.* as well the ſimple as the compound, to theſe now propoſed intentions of curing, and to unfold the manner and reaſon of the operating of remedies which are accounted of ſpecial note in this diſeaſe. Therefore firſt we propound the forms of evacuating medicines appropriate in the Jaundies. *Forms of Remedies.*

1. *Vomits.*

Vomiting medicines are frequently wont to help in the recent Jaundies, while the tone and ſtrength of the bowels are firm; in as much as they alleviate the ſtomach always oppreſſed in this diſeaſe with an unprofitable burden of viſcous phlegm; and moreover do free their infarctions by irritating the *vaſa choledocha*, and by much ſhaking all the paſſages of the Liver, and make eaſie the paſſage of the choler by the former accuſtomed ways. *Vomits.*

Take of the infuſion of Crocus Metallorum half an ounce to ſix drams, Wine of Squils an ounce, Oxymel ſimple half an ounce, make a vomit to be taken with government.

Sometimes it is convenient to exhibite, the evening before, the following preparatory medicine for the eaſier vomiting.

Take of the powder of Aſarum roots, faculæ Aronis of each a ſcruple, of Tartar vitriolated half a ſcruple, of Oxymel of Squils an ounce, mix them.

Take of Sulphur of Antimony ſeven grains, Scammony ſulphurated eight grains, cream of Tartar half a ſcruple, make a powder, give it in a ſpoonful of panada.

Take nine Aſarabacca leaves, cut and bruiſed put them into three ounces of white wine, preſs out the liquor, let it be taken in the morning with regiment.

Take of Gambugia prepared eight grains, Tartar vitriolated ſeven grains, make a powder.

2. Cathartick.

Purgers. Purgers take place in this diſeaſe, be it recent or inveterate, *viz.* that as well a more plentifull ſtore of Excrements may be now and then withdrawn from the firſt paſſages, as that the *vaſa choledocha* may be excited to Excretions.

A Bolus. *Take of Electuary of juice of Roſes three drams, Rhubarb a dram, Salt of Wormwood, Cream of Tartar, of each half a Scruple, Syrup of Rhubarb, make a Bolus.*

Apozems. *Take of the roots of ſharp-pointed Dock prepared one ounce, the tops of Roman Wormwood, of Centaury the leſs, of each P. ij. Gentian and Turmerick roots an. two drams, yellow Saunders one dram, boyl them in a pinte and a half of Spring-water to a pinte, adding towards the end Senna ſix drams, the beſt Rhubarb three drams, Agarick a dram and half, Coriander-ſeeds two drams, White-wine two ounces, let them boyl cloſe two hours, after ſtrain it and clarifie it by ſettling; the Doſe from four ounces to ſix, with one ounce of Syrup of Rhubarb, the water of Earth-worms three drams; make a potion to be repeated every or every other day, for three or four dayes.*

In a weaker Conſtitution.

A Potion. *Take choice Rhubarb two drams, Agarick trochiſcated, half a dram, Cinnamon half a ſcruple, Ginger half a ſcruple, make an infuſion in White-wine and Cichory-water, of each three ounces, for three hours, in it ſtrained diſſolve one ounce of Syrup of Rhubarb, water of Earthworms two drams. Or Rhubarb from half a dram to a whole one, Salt of Wormwood a ſcruple, make a powder.*

Pills. *Take pil. Ruffi a ſcruple, Extr. Rudii half a ſcruple, make 4 Pills, take them in a morning with government, after 4 or 5 dayes repeat them.*

Deoppilative Medicines. In the third place follow Deoppilatives, which are alſo Diureticks, or Diaphoreticks, ſome whereof are accounted ſpecifick, by reaſon of ſimilitude of ſubſtance; Medicines of this ſort, both promote the ſeparation of choler from the blood, and urge the paſſage of it, being ſeparated, through the paſſages and pores in the Liver open but little. Moreover, in the mean time, by diſſolving the blood, they carry off the ſeroſities and cholerick recrements thereof, ſometimes by ſweats and urine.

Elixir. *Take of Elixir Proprietatis one ounce, take 20 drops in the morning, and at Five in the afternoon, with a convenient vehicle: after the ſame manner are taken, Tincture of Antimony, or of Salt of Tartar, and the ſimple mixture in a greater Doſe: for vehicles, Apozemes, diſtilled Waters, and Juleps for this Intention of curing are convenient.*

Apozems. *Take of the roots of Celandine the greater, ſtinging Nettles, Madder, of each one ounce, tops of Roman Wormwood, white Horehound, Agrimony, Germander, of each one handfull, Worm-ſeeds two drams, Shavings of Ivory and Harts-horn, of each two drams, yellow Sanders a dram and a half, Coriander-ſeeds two drams, boyl them in three pound of Spring-water to two pound, adding of White-wine four ounces, ſtrain it, and adde Syrup of Chichory with Rhubarb two ounces, water of Earth-worms, an ounce and a half, make an Apozeme, the Doſe four or ſix ounces twice in a day.*

Take of white Horehound dryed, Centaury, of each one handful, Gentian and Turmerick-roots, of each three drams, Cinamon one dram, Saffron half a dram, being ſliced put them into a Glaſs with two pound of White-wine or Rheniſh-wine; make an infuſion, the doſe three ounces.

To this we will adde *Geſners* famous Antictericum.

Take of the roots of ſtinging Nettles a pound, Saffron one ſcruple, bruiſe them well, and draw off the tincture with White-wine, the doſe three ounces 4 or 5 dayes.

Empirick Remedies. Like to the former is that of *Fr. Joel. Take the Roots of Celandine the greater, two handfuls, Juniper-berries a handfull, bruiſe them and pour on them a pound of Rheniſh-wine, and draw out the juice, the doſe four ounces twice a day.*

The juice of white Horehound is mightily commended by Dioſcorides, *and the Syrup of the ſame by* Foreſtus, *for curing the yellow Jaundice.*

In

In lieu of an Elixir, and other chymical liquors, which to avoid nauſeouſneſs are to be taken in very ſmall quantity; to others endued with a ſtronger Conſtitution, Electuaries, Powder and Pills may be adminiſtred with better ſucceſs.

An Electuary.

Take of Conſerve of Roman Wormwood, of the yellow Rinds of Oranges and Limons, of each two ounces, Species Diacurcumæ one dram and half, powder of Ivory, yellow Saunders, of Lignum-Aloes, of each half a dram, Troches of Capers one dram, of Rhubarb half a dram, Salt of Wormwood two drams, with Syrup of Cichory with Rhubarb, make an Electuary, the doſe the quantity of a Cheſnut twice a day, drinking after it three ounces of the following Julep.

Diſtilled Waters.

Take of the greater Celandine-water, Fumitory, Wormwood, Elder-flowers of each five ounces, Snail-water, water of Earth worms, compound, of each two ounces, Sugar half an ounce, mingle them and make a Julep. Or,

Take of the roots of ſtinging Nettles, Angelica, Gentian, of each four ounces, the greater Celandine leaves and roots, ſix handfuls, Wormwood, Tanſie, Southern-wood of each four handfuls, the outer rinds of twelve Oranges and four Limons, prepared Worms and Snails of each one pound, Cloves bruiſed two ounces, being all cut and bruiſed pour upon them eight pound of White-wine, let them be diſtill'd in a cold ſtill, and the whole water mixt. Or,

Take of filings of Steel one pound, freſh Strawberries ſix pound, put them into a glazed pot, ſtirring them together, and let them ſtand a day, afterwards adde of Engliſh Rhubarb ſliced one pound, the rinds of four Oranges ſliced, pour upon them of White wine ſix pound, and diſtill them according to Art; let all the liquor be mixt together. The doſe of this and of the former is three ounces twice in a day after the Electuary or any other medicine.

Take of Turmerick-roots, Rhubarb, of each one dram and a half, the Bark of Caper-roots, of Aſarum-roots, of each half a dram, Extract of Gentian, and Centaury, of each one dram and a half, Salt of Wormwood four ſcruples, Water-creſs-ſeeds half a dram, of Rocket half a ſcruple, Elixir Proprietatis one dram, gum Ammoniacum diſſolved in the water of Earth-worms what will ſuffice to make a maſs, form it into ſmall Pills, the doſe is half a dram evening and morning, drinking after it three ounces of the diſtilled water.

Sylvius *his Empirical Remedies.*

Sylvius doth much magnifie for cure of the Jaundies, the Decoction of Hemp-ſeed in milk, and the ſolution of Sope, and from thence endeavours to eſtabliſh his own Hypotheſis (as we have above intimated) whereby he endeavours to deduce the Ætiologie of the Jaundies, rather from an alienation of the choler, than from the obſtruction of its paſſages.

The ſecond Indication.

2. The Second Indication reſpecting the altering or tempering of the blood, by which it may breed but moderately, and duly ſeparate the choler, requires Medicines of that ſort, which depreſs the Sulphur and fixt ſalt too much advanced. For theſe ends, I know not by what chance or conduct Medicines endowed with a volatile ſalt, as Worms, Snails, Millepedes, yea Lice, Dungs of fourfooted Beaſts, and Fowl, are brought into practice for curing the Jaundies, and not only preſcribed by Empiricks, but the more famous Phyſicians: Theſe ſometimes by themſelves, but oftener joyn'd with Purgers and Deoppilatives, become the chief Ingredients in Compoſitions againſt the Jaundies.

Remedies againſt the Jaundies endowed with an animal volatile Salt.

Fonſeca preſcribes Gooſe-dung gathered in the Spring-time and dryed, as alſo the white excrement of Pullets, of both which let the Powder be given in a convenient vehicle from half a dram to a whole one.

Various forms of them.

Take powder of Earth-worms prepared, of Gooſe-dung, of each three drams, Ivory, yellow Sanders, of each half a dram, Saffron one ſcruple, make a powder, divide it into ſix parts. One to be taken every morning with ſome appropriate liquor. To the Apozeme, or Anticterical Tincture preſcribed above, Earth-worms, Gooſe-dung, *and alſo* Sheeps-dung *are profitably added.*

Take Millepedes freſh and alive from 50 to 100. Saffron half a Scruple, Nutmeg a ſcruple, bruiſe them together, and infuſe them in Water of Celandine four ounces, of Earth-worms two ounces, expreſs them ſtrongly, and drink it: after this manner take it firſt once, then twice in a day for a week.

The vulgar and Empirical remedy with us is, that Nine quick Lice be taken in a morning for five or ſix dayes, by which remedy they report to me many to be cured (whenas other remedies effected little) which truly can help by no other means than by reſtoring the volatile Salt depreſſed in the blood.

Alſo ſuch as are endued with a mineral volatile Salt.

Upon the ſame account of ſuccour even in this diſeaſe the flowers of Sal Armoniac, the volatile Salts of Amber, Harts-horn, Soot, in like manner their Spirits are frequently adminiſtred with great ſucceſs.

Take powder of Earth-worms prepared two drams, Species Diacurcumæ one dram, flower of Sal Armoniac half a dram, Salt of Amber a ſcruple, Extract of Gentian one dram, Saffron one ſcruple, Gum Ammoniacum diſſolved in water of Earth-worms what ſuffices, make a maſs, and form it into ſmall Pills; the Doſe is three or four, morning and evening, drinking after it three ounces of the Julep before preſcribed.

Take Spirit of Harts-horn tinctured with Saffron three drams; Doſe from 15 drops to 20. with the diſtilled water preſcribed above.

Steel remedies of ſeveral kinds.

In this Claſs of Medicines by which the icterical diſtempers of the blood are to be corrected, ſteel'd remedies do alſo challenge their place by right; for theſe afford notable help, not ſo much by unlocking the obſtructions of the bowels, as by depreſſing the rage of the Sulphur, and fixt Salt, and by volatilizing the blood, in the Jaundies, no leſs than in other cachectical diſtempers.

Wherefore, to the Decoction, or Tincture, or Infuſion above preſcribed, is properly added the filings of Iron, or the prepared powder thereof (its mineral conſiſtence being ſome wayes opened) or the vitriolic Salt extracted; from hence it is, that Medicinal waters heal even to a miracle thoſe ſick of the Jaundies, that had been deſpaired of; although theſe drunk in a very large quantity, inaſmuch as they paſs through all the veſſels, do alſo open the paſſages of the Liver, however ſhut up.

Therefore alſo even Preparations of Steel are added to the Electuary, Pills and Powders above recited, one while this, another while that, in due proportion. Moreover the Syrup thereof given twice a day to one ſpoonfull, in three ounces of Apozeme or water againſt the Jaundies; alſo tincture of Steel to twelve or fifteen drops may be adminiſtred in the ſame manner.

Outward and Sympathetick remedies againſt the Jaundies.

In the laſt place we may annex to this claſſis of altering Medicines thoſe things which not taken inwardly, but outwardly applyed, and by contact, uſed to the very urine of the Patient are held to cure this diſeaſe.

As to the former, a remedy often tryed by the vulgar, is a living Tench-fiſh, whoſe Scales and outer ſuperficies do reſemble a yellow colour, applyed to the right Hypochondria, or Stomach according to ſome, (to the ſoles of the feet, according to others) whence a ſudden flight of this diſeaſe is expected; hence although many promiſe themſelves a ſure cure, it hath often deceived me.

Another cure of the Jaundies at a diſtance is ſaid to be done by I know not what ſympathy or ſecret manner of working.

Take the freſh Urine of the Patient made at one time, of the aſhes of the Aſh-tree ſearced, as much as ſuffices to reduce it into Paſte, which may be formed into three equal balls, to be placed in a place ſhut, near the hearth or Stove; as theſe dry and harden, the Jaundies will vaniſh; after this courſe, I have known this inveterate diſeaſe happily cured, although reſiſting many other remedies; the practice thereof is very familiar with the Vulgar.

The reaſons of ſome of them.

If of a certain it could be made manifeſt that this effect doth for the moſt part happen, and the reaſon of it be inquired into; in the firſt place we ought to ſuppoſe a conſent or ſympathy of the ſpirits and other particles in the animated blood, with other ſymbols inmates of the freſh urine; and that they immediately are affected in the like manner with theſe. Notwithſtanding it is evident enough that a lixivial Salt mingled with urine, doth preſently ſet free the volatile ſalt formerly ſubdued or enwrapt in other particles; as is plainly ſeen in diſtillation of Urine, which if you urge by it ſelf with a ſand-heat, nothing but phlegm will ariſe; but adde the calx of Tartar, or Aſhes, immediately the Spirit and volatile Salt will come forth: wherefore, that Empirical adminiſtration being adminiſtred, at the ſame time, both in the Icterical urine, and alſo in the blood of the Patient, the volatile Salt eſcapes out of the power of the fixt Salt and the Sulphur, and for that cauſe the icterical

rical diſtemper of the Blood is put to flight. Alſo upon the ſame reaſon is built another ſympathetical cure of the Jaundies, whereof *Phil. Grulingius* and *Felix Platerus* do make mention, *viz.* the ſick party piſſing upon Horſe-dung while it is hot, hath cured many of the Jaundies; inaſmuch as the fixt Salt of the Urine, and thereby the fixt Salt of the icterical blood of the patient, is altered by the volatile Salt of the freſh dung, and reduced into its due temperature.

3. The third Curatory indication vital inſtitutes a convenient courſe of Diet, and moreover Cordials and Anodynes, of both which there is frequent need. *The Third Indication vital.*

As to what relates to the former, Food in this diſeaſe, more than in any other ought to be medicinal. For Vegetables and their parts, ſtyled commonly Hepatick remedies, are boyled in the broths of theſe Patients. And theſe alſo are wont to be made inſtead of other fleſh, of Worms, or Snails, (which are accounted Antidotes againſt the Jaundies.) Moreover Ale, and other ordinary drinks are impregnated with infuſion of Medicaments.

Take of the roots of ſtinging Nettles, of Strawberries, of each an ounce and half, Eri-go-roots candied one ounce, Ivory and Harts-horn, of each two drams, Earthworms cleanſed twenty, a Cruſt of White-bread, Mace two drams, boyled in two pound of water to one pound, ſtrain it through Hippocrates *ſleeve, to which adde Diaſantalon half a dram, make broath, whereof take from four ounces to ſix, twice in a day: for ordinary drink, fill a Tub of four Gallons with Beer, after it hath wrought, put in the following Bag.*

Take the tops of Roman Wormwood, white Horehound dryed, of each two handfuls, the roots of ſharp pointed Docks ſix ounces, of the Bark of Aſh, of Barberries, of each 3 ounces, the outer Rinds of eight Oranges, and of four Limons, being ſliced and bruiſed, let them be prepared according to Art.

Since many ſick of the Jaundies are uſually affected with a great languiſhing, and frequent faintings of the Spirits, they have alſo need of cordial Remedies. *Forms of Cordials.*

Take of ſmall Aqua Mirabilis eight ounces, water of Earth-worms four ounces, Syrup of Orange-peels two ounces, mingle them, the doſe two or three ounces.

Moreover, they who are troubled with this diſeaſe, do very much ſuffer with pain ſometimes very troubleſome in the night, and are often obnoxious to waking; wherefore alſo Anodynes come into uſe for adminiſtration.

Take of Aqua Mirabilis, water of Earth-worms, of each one ounce, Diacodium ſix drams, Tincture of Saffron half an ounce, the doſe one or two ſpoonfuls late at night, if ſleep be wanting.

Take of Laudanum tartarizated two drams, Aqua Mirabilis two ounces, Syrup of Clove-gilly-flowers one ounce, mix them, the doſe is one ſpoonfull after the ſame manner.

SECT.

SECT. II. CHAP. II.

Of other Hepatick Remedies.

THe Liver is ſeldom or never found obnoxious to an Atrophie or extenuation, ſince truly it performs the office of a ſtrainer, and according to ſome, of a mingling bowel; but on the contrary by reaſon of many cauſes and occaſions, it runs the hazard of being encreaſed as to its bulk, and to be ſtufft and ſwell'd with divers things gathered therein, and with concretions. Hence no ſmall account of health conſiſts in this, that the Liver having right conformation may freely convey the blood every where, without keeping back too much Cuſtome or proviſion for it ſelf.

The Kinds of Remedies aſſigned to the Liver.

Truly many faults, and indeed not altogether undeſervedly, are imputed to this Bowel, as alſo unto the Spleen; the chief Kinds of which we ſhall touch upon. The Liver frequently and chiefly is wont to be faulty in one of theſe two, *viz.* Firſt that intercepting the nutritious juice appointed for other parts, it beſtows it to its own proper uſe; this is plainly diſcerned in Children affected with the Rickets, and moreover in many others that lead a ſloathful and idle life. Anciently there was an art with the *Romans* ſo to feed a Gooſe that the Liver prodigiouſly encreaſed might weigh more than the whole body. Secondly, the other fault of the Liver is, that it too eaſily receives all the excrements and feculencies whatſoever of the depraved Blood, brought into its inward receſs, and by retaining them there, doth not only grow large, but is obſtructed in its paſſages, whence frequently comes the Jaundies, or a Dropſie; it contracts alſo tumours and preternatural Concretions of divers kinds of matter.

Two general intentions of curing this bowel.

Many and divers diſtempers of the Liver ought to be referred to theſe two heads: of each of which it is not our purpoſe to inſtitute particular pathologies. As to what appertains to the general pharmacie of this bowel, there will be one principal ſcope of curing, that its income be diminiſhed as much as may be, or altogether cut off. Wherefore it will behove us to procure theſe two things, *viz.* That the Liver augment not above meaſure, by taking the nutritious juice too much unto it ſelf; and that it retain not the feculencies of the Blood, whereby it may be affected with obſtructions and preternatural Tumours.

It will be much eaſier to prevent than cure either of theſe faults of this bowel. For truly the former may be done, reſpect being had only that the blood be well conſtituted in its Temperament, and enjoying a free Circulation, it may both diſpenſe its nutritious juice to the parts, and eſpecially its outward parts, and driving forth all its excrements to the particular Emiſſaries, it may put them away there. And ſurely, the Medicines vulgarly called Hepaticks, do firſt and more immediately exert their power by purging the blood, rather than by correcting of the Liver: thoſe namely conſiſt of particles of ſuch a kind, which entering into the blood, and not mixing with it, do ſo ſtirre up the maſs thereof, and break it into pieces, that all the Coagulations and Concretions being taken away, all its dregs and impurities may eaſily depart, and being carryed to their proper Emunctories may be caſt out of doors.

Medicines vulgarly called Splanchnick, firſt and chiefly operate upon the blood.

For truly all remedies which are called Splanchnick, firſt work upon the blood, and incite its conſtitutive parts into a kind of effervescency, and ſo toſs, divide, and move them rapidly to and fro, that the vaporous effluviums being ſent into the habit of the body, the ſerous excrements into the Kidneys, the cholerick into the Liver, the melancholy into the Spleen, and others to other Emiſſaries for which they are fitted, may be ſhut out, without impediment or adheſion.

What ſuch they are which more eſpecially reſpect the Liver.

Wherefore the ſame Remedies which help the Liver, help alſo the Spleen, the Reins, the Lungs, and other the Bowels in their ſeparations; and for the moſt part move ſweating and urine. If any be found to reſpect one part before the reſt by any ſpecifick power, it is therefore becauſe their particles being more ally'd unto the excrements to be ſeparated within that bowel, and from thence aſſociated to them are conveyed thither together with them. For this reaſon Rhubarb, Turmerick, the greater Celandine, with many others adjoyned to the bilious humour, do the more eaſily reach the paſſages of the Gall, and are wont to ſuccour in the Jaundies. We have obſerved before

before, the energies and manners of operating of Medicines of this kind. As to what appertains to the other, vulgarly called Hepaticks, firſt we will annex briefly certain forms of thoſe which are reported either to prevent or remove the unnatural augmentation of the Liver, and then thoſe which are held to provide againſt or take away the obſtruction and preternatural Tumours thereof.

1. Againſt the too much encreaſe, or improportionate nutriment of the Liver, firſt a more ſparing and thin diet, ſhort ſleeps, and moderate and frequent exerciſes are convenient: wherefore we preſcribe for Infants, and Children, when they are diſcovered obnoxious to this diſtemper, as in the Rickets, that they ſuck thin and ſerous milk, that they be ſhaken or toſſed in their Nurſes arms, and tumbled quickly to and fro, or be carried ſwiftly in a Chair or Coach, and as ſoon as may be, learned to go and to uſe their feet.

Some forms of Hepaticks.

Take of the water of Snails, of Earth worms, of each three ounces, Syrup of Chicory with Rhubarb two ounces, ſpirit of Sal Armoniac with Gum Ammoniacum one ſcruple, mix them, and take a ſpoonfull evening and firſt in the morning.

Take of the roots of Maleferne, Chervil, candied Eringoes, of each one ounce, the leaves of Agrimony, Harts-tongue, male Speed-wel, of each one handful, Shavings of Ivory, Harts-horn, of each two drams, white and yellow Sanders, of each one dram, Raiſins ſtoned one ounce and a half, Barly three drams, boyl them in three pounds of Spring-water to two, to it ſtrained adde of Snail and Earth-worm water, of each one ounce and half, Syrup of Chicory two ounces, make an Apozeme, take two or three ounces in a day.

Take Powder of white and yellow Sanders, Crabs-eyes, Lignum-Aloes, of each half a dram, Salt of Wormwood one Scruple, make a powder, the doſe half a Scruple to a whole one twice a day.

Take Empl. Diaſaponis, Cerate of Sanders, of each what will ſuffice, make a Plaiſter to be applyed to the Hypochondrion.

Take Unguentum Splanchnicum two ounces, Oyl of Wormwood one ounce, mixe them, and make a Liniment for the region of the Liver.

Hither many other methodical as well as Empirical Medicines being uſed for the Rickets may be referred, but we haſten to other things.

2. Remedies ordained for moſt other diſtempers of the Liver are either ſimple or compound. Very many of the former ſort are reckoned by Authors, as if they were procreated for this particular uſe. *Heurnius* ſays, *That God Almighty hath offered to the World the greater plenty of Remedies of this kind, by reaſon of their notable neceſſity.* And to this Rank may be referred in the firſt place all kinds of Chichories, the Sorrels, the ſharp pointed Docks, and almoſt all Vegetables endowed with bitterneſs and ſomething of ſharpneſs, (wherein the deoppilative vertue is reported to conſiſt) as Wormwood, Germander, Ground-pine, Fumitory, Tanzy, Agrimony, Liverwort, Lignum Aloes, all the Sanders, Tamarisk-bark, and Aſh-bark, the roots of Capers, with many others, which commonly make up the greateſt part of Herbals; ſo that whilſt the Liver like a certain Goddeſs ruled ſanguification, very many Medicines were uſed to be aſcribed for its ſafeguard and ſuccour.

Their numbers enumerated.

Firſt Simples.

The fixt Salts of herbs, the acid Spirits of Minerals drawn by diſtillation, belong by right to this number, as they do chiefly exagitate the maſſe of blood, diſſolve the Concretions thereof, diſpatch their obſtructions, and cauſe it every where to be paſſable, as to all the parts thereof.

If I here omit Chalybeates, moſt Chymiſts will cenſure me very unjuſt to the Liver; for truly as the Prerogative of *Venus* is vulgarly attributed to this bowel, ſo as to conſtrain to Love, we may hence expect that *Mars* will be perpetually kinde unto it. And really it is manifeſt by Reaſon, as well as Experience, that Preparations of Steel are convenient in hepatical affects, as chiefly in the Jaundies, and oftner in the Dropſie; wherefore theſe are put into the Receipts of the Ancients and modern, and among curatory Compoſitions. For what reaſon the Preparations of Steel as in like manner the medicinal waters from Iron, as well natural as artificial, do purifie the maſſe of blood, and by conſequence do relieve many diſtempers commonly call'd Hepatical, is ſhewn by us largely enough in another place, ſo that here is no need for repetition.

Chalybeates.

Medicines that are appointed by Phyſicians for the Liver are divided into vari-

ous

ous forms, but firſt into hot and cold, and alſo into moiſt and dry; accordingly as the temper of this bowel is ſuppoſed to conſiſt after divers manners: when in truth it is only a dyſcraſie of the blood, which being ſo diverſly faulty, deſires ſo various an energy of medicines. Neither is it a leſs vulgar error, that in the eſtimating of mens conſtitutions, the various temperament of every one due to the blood, is aſcribed chiefly to the Liver, as hot or cold, or otherwiſe diſpoſed.

The Shop-compoſitions of Hepaticks. In the Antidotaries of the Ancients there are many Shop-compoſitions extant, which ſeem to be deſigned for the Livers ſake only, of which ſort are *Rhaſis* his Electuarie of the droſs of Iron, *Crocus ferri* of *Balchuſis*, which being mixt with Treacle is commended for hepatical affects; the *ſpecies Diatrion ſantalon, Diarrhodon Abbatis, Trochiſcs* of *Rhubarb, of Agrimony, of Capers, Diacurcuma, Dialacca, Syrup of Wormwood, Coicorie, of the five roots, Byzantinus*, with many others, unto all whoſe forms, a vaſt Catalogue is annext for curing all the diſeaſes of the Liver. But theſe paſſed over, it pleaſes me now to propound ſome Kinds and Examples of Medicines which are counted deoppilative according to the practice of the Moderns.

Therefore for an opening Decoction,

Magiſtral Compoſitions. *Take of the roots of Ferne, Chervil, ſtinging Nettles, Dandelyon, of each one ounce, the leaves of Agrimony, Harts-tongue, Speed-well, Oak of* Jeruſalem, *Liver-wort, of each a handfull, white and yellow Sanders, of each three drams, Ivory half an ounce, red Cicers an ounce, Coriander-ſeeds three drams, Raiſins two ounces, boyl them in four pound of water to two pound, adding towards the end White-wine four ounces, ſtrain it through* Hippocrates *Sleeve, to which adde Species Diarrhodon Abbatis one dram, of our prepared Steel two drams, Syrup of Chicory with Rhubarb two ounces, the Water of Snails and Earth-worms, of each one ounce, the doſe ſix ounces twice in a day after a doſe of the following Electuary.*

Electuary. *Take of Conſerve of the yellow of Oranges and Limons, of each two ounces, of Wormwood and Fumitory, of each one ounce, ſimple Powder of Aron-roots, yellow Sanders, Lignum Aloes, of Caper-roots of each one dram and a half, Crabs-eyes one dram, Salt of Wormwood two drams, Syrup of Fumitory what ſuffices, make an Electuary, the doſe the quantity of a Walnut twice in a day, drink after it a draught of the Apozeme now preſcribed, or of the following diſtilled water.*

A diſtilled Water. *Take the leaves of Wormwood, Centaury, Tanſie, both ſorts of Southern-wood, Tamariske, of each four handfuls, of green Walnuts four pound, of Aſhen keyes green two pound, the Rinds of ten Oranges and four Limons, Snails and Earth-worms prepared, of each one pound, all being ſliced, pour on them of White-wine eight pound, diſtill it in a cold Still, let all the liquor be mixt together, the doſe three ounces, ſweetning it with Sugar or a fit Syrup.*

If a form of Pills will pleaſe better, the enſuing Extract called in the Shops *Extractum Ecphracticum*, ſeems profitable.

Pills. *Take of white and clear Tartar, and of freſh Filings of Iron, of each 4 ounces, let them be ground together into powder, after boyl them in Fountain-water from four pound to two (ſome uſe White-wine) to the ſtrained liquor adde the tops of Centaury, of Roman Wormwood, of Carduus, of each one handfull, Gentian-root half an ounce, Species Diacurcumæ an ounce and half, let them boyl ſhut cloſe for three or four hours, ſtrain it, and evaporate by the heat of a Bath to the conſiſtence of Pills, adding roots of Rhubarb or Species of* Hiera Picra *two drams; the doſe is from one ſcruple to half a dram made into Pills, in the evening, with an appropriate vehicle.*

For the ſame intention, *viz.* to prevent or to remove the obſtructions of the Liver, a medicated purging Ale, to be taken many dayes in Spring and Autumn, is by ſome very much magnified, and exactly obſerved every year during their lives.

Take of the roots of ſharp-pointed Docks prepared, Polypodie of the Oak, of each 3 ounces, Madder-roots two ounces, Engliſh Rhubarb two ounces, of leaves of Senna four ounces, Epithymum two ounces, yellow Sanders one ounce, Carthamus and Coriander-ſeeds, of each one ounce and a half, ſlice them and bruiſe them according to Art, make a bag for 4 gallons of Ale, after ſix dayes let him take to 12 ounces more or leſs in the morning, expecting four or five Stools without regiment.

SECT.

SECT. II. CHAP. III.

Of Remedies for the Dropſie called Aſcites.

After the Jaundies and the Remedies thereof, our method leads us to treat of a Dropſie; not becauſe of the Vulgar opinion, that it always ariſes from the fault of the ſame bowel; but becauſe that former diſeaſe having long continued, for the moſt part concludes in this: which happens ſo, not ſo much from the fault of the Liver, as from the whole Blood, for this and not that perform ſanguification. Wherefore, when the maſſe hereof hath for a long time been filled with cholerick excrements, and at length degenerating from its temper, accumulates alſo watery humours, then doth a Dropſical Diſpoſition come upon the Jaundies.

The more remote cauſes of an Aſcites.

But whereas three ſorts of Dropſies are vulgarly ſuppoſed, viz *Aſcites*, *Tympanites*, and *Anaſarca*, we will at preſent handle only the two former, appertaining to the Splanchnick or Pathologie of the nether Belly. And firſt what relates to an Aſcites, this diſeaſe as to its matter and formal reaſon is manifeſtly known by the ſign of even many ſenſes together, *viz.* it is a Tumour of the Abdomen, from a wateriſh tumour contained within the cavity thereof. The water making this tumour, ſometimes encreaſes to a huge inundation, and ſcarce credible quantity. I have once ſeen a Tub would hold 15 gallons filled with water taken out of the Abdomen of a woman dead of a Dropſie. But whence that humour proceeds, alſo by what manner, and from what cauſes it gathers together in the belly firſt, and afterwards is ſenſibly augmented; and laſtly by what paſſages, and by what vertue and operations of Hydragogue Remedies, it may again be taken from thence, and evacuated, ſeems moſt difficult to be unfolded.

Firſt in reſpect of blood.

It doth not always proceed from the Liver & Spleen.

As to the former, *viz.* the encreaſe of water, ſome have thought it to deſcend from the Liver, and others from the Spleen diſtempered, into the cavity of the Abdomen; and ſo this bowel or that being vitiated, always to be the cauſe of an Aſcites. But that this is otherwiſe, Anatomies of many dead of this diſeaſe, do manifeſtly declare: when after the inundation of the belly, the Liver and Spleen are found often without fault. And truly theſe bowels do not ſeem the Springs of any ſuch illuvies, being endowed with no cavityes, wherein waters might be accumulated together: wherefore the origine of an Aſcites, as of a ſtanding Pool or Lake, is to be derived from a River, or at leaſt a glutt or inundation of ſome Humour.

The humours by which it is produced are,

The humours that flow within the paſſages, or Veſſels as Brooks, are chiefly theſe three, *viz.* the Blood, the milkie Humour, and the Lympha. The ſhowering or diſtilling of water may come to paſs from the nervous Liquor which ſometimes ſlowly and inſenſibly ſweats out of the fibres and membranes, and from vapours condenſed within the hollowneſs, or ſome Cavity of the Body. Whether by theſe wayes an Aſcites doth rather, and oftener proceed, we will now ſearch.

Firſt the Blood.

And in the firſt place as to what relates to the blood, it is without doubt, the Serum falling from the maſſe thereof, too much diſſolved, as it doth excite Fluxions and Catarrhs of various kindes, ſo it ſometimes ſtirs up the greater illuvies of waters, *viz.* Dropſical: wherefore when an Anaſarca proceeds altogether from this cauſe, and when oftentimes an Aſcites comes upon that diſeaſe not immediately healed, we may well enough inferr that either diſtemper is induced from a watery humour, every where poured out from the little mouths of the Arteries. Moreover, it is not much improbable, that the Serum of the diſſolved Blood is firſt and ſolitarily poured out of ſome end of the Cœliac and Meſenteric Arterie being open into the Cavity of the Abdomen, and ſo brings on an Aſcites without an Anaſarca going before; and ſo eſpecially if perhaps it happen, that ſcirrhous Tumours, Ganglion's, little ſwellings, or preternatural Concretions of another manner, are firſt raiſed about the Meſentery, the Spleen, the Liver, the Womb, or any of the other bowels of the nether belly: for, becauſe the Circulation of the blood is hindred in thoſe places, that the blood being carryed through the arteries, may be ſome way brought back, the ſerous part being thruſt out from its company, falls into the cavity. For truly it is moſt evidently manifeſted, that it ſo comes to paſs, by this Experiment mentioned by us in another place, *viz.* If in a living animal, the jugular veins being taken up and bound

with a thred, the reduction of the blood be ſtopt, the whole Region of the head ſwells in a ſhort ſpace, with a water between the skin, and clearly hydropical. And truly I have more frequently obſerved that an Aſcites hath followed upon ſecret tumours gathered and raiſed in ſome place in the lower belly: which certainly happens for the reaſon above recited. When the courſe of blood being obſtructed, the watery part is extravaſated in a ſhort ſpace, that humour is not meerly ſerous, but beſides, the nutritious Liquor, ordained to nouriſh all the ſolid parts, is emptyed into the belly: wherefore, while this Region ſwells up, the members are extenuated, and the Lympha taken out from an Aſcites, with heat thickens and grows white, like the white of an Egge.

2, & 3. The milkie and watery humour.

It is alſo very probable, that the milkie Veſſels being burſt aſunder, pour out their humour into the cavity of the abdomen. Truly the moſt renowned *Sylvius* thought this diſeaſe moſt frequently engendred from ſuch a cauſe. And truly as out of the milkie or watery Veſſels, *viz.* one of them or both together, being divided, or opened, we may well ſuſpect the illuvies of water or chyle ſometimes to overflow the bowels of the nether belly; ſo the following obſervation ſeems to confirm the ſame thing. Of late one that had been long ſick of the Jaundies, and in the mean time temperate and abſtemious of drink (to which he was not prompted by thirſt) contracted an Aſcites, increaſed in a ſhort time hugely. After that medicines were adminiſtred in vain, a Paracenteſis is attempted according to the manner of *Sylvius*, with a hollow Needle; out of the orifice, not icterical water, but limpid and thin flowed out abundantly; from whence we may inferre, that hydropic humour flowed not out of the maſs of blood, for then it had been coloured, but diſtill'd out of the lymphic or milkie veſſels into the cavity of the abdomen. We have joyn'd together as akin the ways of the milkie and lymphic Veſſels in propagating an Aſcites, becauſe both veſſels do convey the chyle, or what is analogous to it, to the common Receptacle; and many branches or leading Pipes of either kind, are diſtributed about the bowels of the nether belly; in the mean time, it is not improbable but that a ſolitary fault of either veſſel may ſometimes produce an Aſcites.

As to the other ways of generating an Aſcites, propoſed in the beginning, I am ſcarce induced to think, ſuch an inundation of the belly can eaſily ariſe from the diſtilling of a nervous humour, or by reaſon of vapours there condenſed: although perhaps in a Tympany where the cavity of the abdomen is enlarged, and tranſpiration hindred, the effluvia that were wont to exhale, being forced inwards, are changed into Lympha or water, wherefore for the moſt part an Aſcites is ever conjoyn'd with that diſeaſe.

An Aſcites often the product of the Jaundies.

The immediate or conjunct cauſes of an Aſcites being deſign'd after this manner, which indeed ſeem to be, either a watery humour poured out of the Veſſels bringing Blood, or Lympha or Chyle poured out of the proper paſſages of them both; now we muſt in the next place inquire about the more remote cauſes of this diſeaſe, *viz.* for what occaſions, and after what manner, the veſſels affected of either ſort depoſite their burdens into the cavity of the belly.

The kinds of a Dropſie.

Firſt therefore, that the watery part of the blood ſweats out into the *Aqualiculum* or belly, either the very Blood, or Veſſels containing it, or both together, are in fault. The Blood is in fault, when being depraved in its Craſis it doth not rightly contain within its conſiſtence the conſtitutive parts, but being apt to be diſſolved, it every where rejects its ſeroſities from the mixture; which either it drives out by Urine or Sweat, or permitting them to reſide within, pours them out into the pores of the fleſh, or the cavity of the bowels. The veſſels bringing blood grow faulty for a ſecond reaſon, for that their extremities or little mouths either are too much looſe, or altogether ſhut up. In the former ſtate the clew of Circulation of blood is not entirely and firmly continued; but the thinner and more crude part of the blood being apt to depart, is ſuffered to flow out near to the interſpaces or inoſculations of the Arteries and Veins; likewiſe on the other ſide, when the courſe of blood is hindred, by reaſon of a tumour or obſtruction of ſome veſſels, their little mouths being throughly cloſed; to this being ſo ſtraitned that a paſſage may be made open by ſome means, that which is thin and watery is extravaſated, and ſent away into the neighbouring places, as we have ſhewed above.

The Deſcription of an Aſcites.

2. In reſpect of the Lympha-ducts.

2, & 3. But an Aſcites beginning alone, doth often ariſe, by reaſon of the milkie or lymphatic veſſels being depraved; wherefore ſeeing we ſuppoſe the cauſe of this kind of diſeaſe to be oftentimes conjunct, we muſt enquire, by what means, and for what occaſions, theſe veſſels are wont to be ſo opened or burſt aſunder, that they pour out their liquor into the cavity of the belly.

Firſt

Firſt therefore as to what belongs to the Lymphaducts, theſe veſſels may be in fault after a diverſe manner, but chiefly, either that being obſtructed or compreſſed near their origine, they do not receive the humour, or being burſt about the middle or extream parts, do pour it out into the belly. There are many cauſes and reaſons of effecting of either of theſe, for it may be a viſcous matter obſtructs their beginnings, or glandulous, ſcirrhous, and other preternatural Tumours compreſs them, as alſo a vaſt inundation of Lympha flowing out, moreover vehement motions of the Body, or paſſions of the mind, may burſt them aſunder.

2. The milkie Veſſels, no leſs than Lymphatick, are in danger to be broke, and ſo by pouring out their liquor into the cavity of the Belly, do excite the Dropſie called Aſcites; and truly they are wont to be hurt for the like reaſon, in regard their middle paſſages, or their ends, either are obſtructed by a more viſcous chyle brought into them, or by Phlegme from the inteſtines, or they are compreſſed by Tumours bred in the Meſenterie: for forthwith the chyle entering into the beginnings of the veſſels, and not finding a paſſage, firſt very much diſtends them, and afterwards breaks them. There are many cauſes and occaſions, for which the thicker and obſtructing humours are driven forwards into the milkie Veſſels; for beſides an irregular Diet, and for the moſt part from meats hard to be digeſted, this evil is frequently cauſed by too much drink, or immoderate exerciſe immediately after Food, alſo from cold drink while the Bowels are very hot; for ſo the paſſages of the Veſſels before gaping are ſuddenly ſhut, and afterwards more narrowly cloſed, wherefore the chyle ſticking within their ſtraitned chanels, doth throughly fill and obſtruct them in a ſhort ſpace. *3. In reſpect of the milkie veſſels.*

As to what belongs to the differences of this Diſeaſe, beſides them already cited, *viz.* that it comes after an Anaſarca, or comes ſolitary; that this alſo is manifold and after a diverſe manner, according as the Veſſels bringing blood, or water, or milk, are found in the fault; Moreover we obſerve, that the Dropſie called Aſcites ſometimes proceeds from a meer watery humour filling and diſtending the parts of the nether belly; but ſometimes there happens to this deluge an extenſion of the membranes, or inflations made by the irregularities of the inmate ſpirits, and ſo they do encreaſe the ſwelling of the Abdomen; and in this caſe a certain Tympanites comes upon an Aſcites, even as more frequently on the contrary, this is the offspring of that. *The differences of this diſeaſe.*

Moreover, in an Aſcites meerly watery, ſometimes the Lympha only fluctuates within the Cavity of the Abdomen, ſo that in the mean time the bowels being ſoakt in it, continue ſtill entire, and little or nothing encreaſed in their bulk; but ſometimes beſides the inundation of the Lympha in the hollow of the belly, the blood being ſlowly circulated there, and almoſt ſtagnating it is much diluted with water; Moreover the Parenchyma of the bowels, and the ſides of the Veſſels and of the membranes, and chiefly the Glandules every where numerous, being moiſten'd, do ſwell with the flowing water, and ſo the tumour of the belly conſiſting as it were of many pools of water and mooriſh Contents, riſes into a vaſt bulk.

The Prognoſtick of this Diſeaſe, is always ſuſpected and accounted of an ill omen: for none of the vulgar but will pronounce the obſtinate tumour of the belly to be very dangerous and difficult to cure: If any ſeem to be affected with a Dropſie, or a Conſumption, with them preſently the next queſtion is, Who ſhall be his heir. *The Prognoſtick.*

An Aſcites beginning after an Anaſarca (which proceeds commonly from the whole maſs of blood being pour'd forth into ſeroſities, and ſweating them out of the little mouths of the Arteries into the cavity of the Abdomen) is accounted of eaſier cure, or at leaſt of more promiſing hope, than that ſolitary diſeaſe coming from tumours about the bowels, or from the Lymphatick or lacteal Veſſels being burſt aſunder; for as well the conjunct as procatarctick cauſe of the former Diſeaſe, oftentimes is uſed to be removed wholly, or in part; but in the other caſe, both for the moſt part exiſt incurable. A reddiſh Urine, lixivial, and little, in an Aſcites is of ill ſignification, for 'tis a ſign that the maſs of blood, being repleated with a ſcorbutick Salt and Sulphur boyled together, is too much bound up in its ſubſtance; inſomuch that it doth not well ſeparate the feculencies, nor diſcharge them by fit and convenient Sinks, which notwithſtanding it doth evilly diſpoſe by conſtraint into the Cavity of the Belly, foraſmuch as it is hindred in its Circulation in the very ſame place. For in an Aſcites the blood is not always diſſolved as in an Anaſarca, but ſometimes appears too much compacted in its temper, yet ſo, that the ſalt Serum being denyed to the pores of the skin,

and to the Urinary paſſages, by reaſon of the Obſtructions of the bowels is forced to break out within the abdomen.

If in an Aſcites, by a Purge taken, the waters are evacuated with eaſe plentifully by ſtool, and from thence the ſwelling of the belly is ſomewhat diminiſhed, we are not to deſpair of the Cure; but if Purgers bring out little or nothing of the Serum, or Lympha, and thence by reaſon of the Nervous fibres being irritated, and driven into extenſions or inflations of the bowels and membranes (as it uſes frequently to be) the belly ſwells the more, and grows like a Drum, we may expect only a fatal event of the Diſeaſe.

The Cure of an Aſcites. About the curing of the Dropſie called *Aſcites* it behoves us chiefly to conſider by what ways the waters heaped within the abdomen, may be thence brought out, and evacuated, for ſuch an evacuation ought to be attempted only by poſſible ways. And here preſently is to be obſerv'd, that the remedies uſed for Hydragogues according to the ordinary practice of Medicine, intend to accompliſh that end by purging, by Urine, by Sweating, and by inſenſible tranſpiration: In ſome caſes of the Sick you ought to proceed by this way, and in other caſes rather by that way, or another, and if none of theſe ſeem feaſible, or ſucceed well, let mature conſultation be had for a Paracenteſis. It will be worth our labour to weigh every of theſe kinds of Medicines, and the reaſons of every one, and the manner of their operations, and with how much vertue Hydragogues are endowed.

By what and how many remedies the eduction of the water is to be endeavoured.

Firſt by purging. Firſt, therefore as to what relates to purging, we have in another place ſhewed that, from the irritation of the Phyſick made in the belly and guts, as well the Contents and winde of theſe bowels, as moreover the humours driven into their Coats and Glandules, and which are heaped up in the Veſſels and Pipes of the neighbouring parts, are diſquieted, and partly ſtreined into the paſſages of the guts, and partly returned into the maſs of blood; inſomuch that the tumour of the abdomen ariſing from the ſtoppage, and as it were a wateriſh affection of thoſe kind of Parts, is often abated by Purgatives ſeaſonably adminiſtred, and ſometimes wholly removed; but it doth not ſo ſucceed when it proceeds from a Lympha fluctuating within the cavity of the abdomen, or from an inflammation of the membranes, or from a tympanitic extenſion: becauſe Hydragogues do little or nothing bring out thoſe waters, and if they be of the ſtronger ſort, they encreaſe this paſſion and exaſperate it by inflaming the part.

Catharticks are either Vomits or Purges. Catharticks uſed for Hydragogues, are either Vomits, or Purges; they exert their power in the ſtomach, and theſe rather in the Inteſtines; inſomuch that they powerfully provoke and twitch the Nervous fibres; and together pour forth the blood and nervous liquor by a certain ſeptick force, and do cauſe the ſerous humours wherevet impacted to be ſtirr'd, and do cauſe them plentifully to be ſent away by the paſſage granted. Either are reckon'd of a various kinde, *viz.* either ſimple or compound, gentle or ſtrong, by the Ancients as well as by the Moderns; ſome of which that are moſt chiefly noted, we will here briefly obſerve.

1. *Emetick Hydragogues*, chiefly famous, are Gambugia, Eſula, Spurge, and their ſeveral Preparations, as alſo the *Hercules* of *Bovius*, and the *Pilulæ Lunares*.

The chief medicines of either kinde. 2. *Purgers* are Elder, and Dwarf-Elder, Soldanella, Gratiola or Hedge-hyſſop, the Juice of Orris, and Elaterium. We will briefly preſcribe ſome methods either of preparing or compounding or adminiſtring each of theſe.

1. Gummi guttæ. 1. *Gambugia*, firſt an *Indian* Medicine, being from thence brought by our Countrey-men, from the Painters Shops coming to the Apothecaryes, began to be in uſe, and is much magnified for purging out ſerous humours. But foraſmuch as taken by it ſelf it vehemently diſturbs the Stomach, and often weakens it, therefore, that its outragious and violent vomiting force may be ſomewhat abated, there are divers ways of its Preparation invented; but truly it is beſt corrected with an acid Spirit, or with an alcalizate Salt, or by throughly mixing and correcting it with aromaticks.

Its various Preparations. *Adrian à Mynſicht*, extolls the magiſtery thereof, which is made by a diſſolution in Spirit of Wine, and after drawing it off, and precipitating it with Spring-water; alſo diſſolving it with Spirit of Wine vitriolated, and with Tincture of Roſes, and red Sanders, and after by evaporating it: others prepare it with the fume of Sulphur after the manner of Scammonie ſulphurated; others grinde it on a Marble, moiſtening it with Oyl of Cinnamon, or Cloves, or other chymical Aromaticks. I uſe moſt the *Solution thereof made with a tincture of Salt of Tartar, the doſe from* 15 *drops to* 20 *or* 30.

Take

Take of Gum-gutta, gr. 6. Mercurius dulcis gr. xv. Conſerve of Violets, a dram and a half, make a Bolus. *The forms of Hydragogues prepared thereof.*

Take of Gambugia twelve grains, Salt of Wormwood fifteen grains, Oyl of Mace one drop, Conſerve of Damask-Roſes one dram, make a Bolus: and it is wont to be given with Tartar vitriolate, or Cream of Tartar, and powder of Rhubarb.

Take of Gum-gutta ſulphurated, or vitriolated, fifteen grains, Cream of Tartar half a ſcruple, Extract of Rhubarb one ſcruple, Oyl of Cinnamon, gut. 2. make 4 Pills.

Lately, a woman afflicted with a moſt painfull Aſcites, and moſt deſperate, as it ſeemed to me, the enſuing Medicine being taken for 6 days ſucceſſively, ſhe began to be much better, and in a ſhort time afterwards recovered her health entirely.

Take of powder of Gum-gutta twelve grains, Oyl of Cinnamon one drop, with ſyrup of Buck-thorn, make a Bolus, the doſe daily to be augmented, aſcending from twelve grains to twenty.

Take of our Tincture of Gum-gutta one ſcruple, water of Earth-worms one ounce, Syrup of Rhubarb half an ounce, mix them, and let it be taken with government.

2. Whereas there are ſeveral ſpecies of Spurge, or *Tithymalus*, and all of them work more violently either by Vomit or Stool, by reaſon of the notable provocation they make in the bowels; and for that cauſe do abundantly bring out ſerous humours; yet by reaſon of the too outragious force of many of them, the leſſer Spurge for the moſt part only is now in uſe, and the preparations thereof moſt of all magnified are, the powder of the bark of the Roots, and the Extract, and we think fit to adde the tincture inferiour to none of the reſt. 2. *Spurge. The Preparations thereof.*

Take of Spurge with the Roots cleanſed four handfuls, Lignum-Aloes, and Cloves, of each one dram, bruiſe them and boyl them in four pound of Spring-water, to half, the ſtrained Liquor clarifie by ſeparation or ſettling in a long glaſs, afterwards evaporate the clear liquor in a Bath heat, to the conſiſtence of an Extract, the doſe one ſcruple.

Take of this Extract half an ounce, pour upon it into a matraſs of the Tincture of Salt of Tartar 6 ounces, digeſt them in a Sand-bath to the Extraction of a Tincture, the doſe from 20 drops to 30 in a convenient vehicle. *Forms.*

Take of the Powder of Spurge from ſeven grains to ten, Cinamon half a ſcruple, Salt of Tartar eight grains, mix them together in a glaſs mortar, give it by it ſelf or mixed with a fit Conſerve, or Syrup, make a Bolus or Pills.

2. *Precipitate* of Mercury with Gold, or the *Hercules* of *Bovius* which is much extolled by the Author for curing Dropſies; it is deſcribed in a former Treatiſe in the Chapter of Vomits, and the manner of preparing, and the working thereof, and the Reaſons are there delivered. This Medicine, inaſmuch as it twitches the ſtomachical fibres by its acrimony, and pours out the blood by reaſon of the mercurial and ſalt particles, cauſes or ſtirs up a fierce Vomit, and thereby cauſes the ſerous humours, violently ſtrained into the Cavities of the bowels, to be ejected. *The* Hercules *of* Bovius.

3. The Pills called *Lunares* produce the ſame effect in like manner, by reaſon of the vitriolate particles of Silver ſharpened with other ſaline menſtruums, *viz.* by wrinkling of the fibres of the Bowels very much, they force the ſerous humours to be ſtrongly ſtrained into their paſſages, and ſo to be evacuated. *Pilulæ Lunares.*

A Solution of Silver made in Stygian water, and well cleanſed, and by a little evaporation is reduced into pleaſant Cryſtals, which by themſelves (or with an addition of Salt Nitre to abate the fierceneſs of the Lunar Vitriol) are made into Pills with crums of bread: the doſe is one Pill, ſometimes two or three, reſpecting the ability of ſtrength and working. Medicines of this kinde are exhibited ſometimes with ſucceſs in a ſtrong conſtitution, and bowels ſtrong, and a good habit; but they are ſcarce ever conveniently or rarely without prejudice taken by tender and cachectical perſons.

Hydragogues meerly or chiefly purging, are either of a more mild ſort, as Elder, Dwarf-Elder, Soldanella, and juice of Engliſh Orris, which ſeldom being adminiſtred by themſelves, do want the ſtirring up of ſharper Medicines, and on the other ſide they blunt their too much fierceneſs; or they are of a ſtronger ſort, as *Gratiola* or Hedge hyſſop, Jallap, and Elaterium. *Purging Hydragogues.*

The

Elder and Dwarf-Elder. The ſeeds or grains of Elder and Dwarf-Elder being dryed, are reduced into a powder, which being taken to the weight of one dram, doth gently bring forth ſerous humours by ſiege; Water and Spirits are diſtill'd of the juice of either ſorts of Berries fermented, alſo Robs and Syrups are made of them; which with many other Preparations of thoſe Vegetables, are much magnified for all hydropical Diſtempers.

Soldanella. *Soldanella* and *Gratiola*, are rarely uſed by themſelves in our age, neither are any neat and very efficacious Medicines prepared out of thoſe Simples; they are frequently mixt with certain other Hydragogues, and chiefly are ingredients in compounding Apozems.

The juice of Orris. The Juice of *Engliſh Orris* is a very profitable Medicine, and becauſe to be eaſily procured for the poor, is the more to be eſteemed: It is given from ſix drams to an ounce and a half, or two ounces, either by it ſelf in a fit vehicle, or with other things appropriated thereunto. Jalap is a moſt known Medicine againſt every Dropſie, and common enough. Any one of the common people ſuffering under that diſeaſe, preſently takes of the powder of the root of Jalap a Pennyworth, mixt with Ginger and White-wine, and the deſired effect doth frequently follow this remedy uſed with intermiſſion.

Elaterium. *Elaterium* is rightly eſteemed the moſt powerful Hydragogue, for that it moſt painfully provoking the ſplanchnick fibres and together melting the blood and humours by a certain corroſive force, compells whatſoever ſeroſities the Coats of the Bowels, Membranes, Veſſels, alſo the Glandules, and fleſh do contain in themſelves, to be poured out into the cavities of the Stomach and guts: by which Medicine happily working, the aſſwaging of the Abdomen doth ſometimes ſucceed. Truly this is the chief weapon of the Empirical Magazine againſt any Aſcites; which they notwithſtanding uſing in all caſes, do oftener adminiſter to the hurt than benefit of the Patient: the doſe is from three grains to ten or fifteen, taken either by it ſelf, only with correcting ſpices added, or it is given with other hydragogues in form of a Powder, Pills, or Electuary. The tincture and eſſence of it are extracted with Spirit of Wine, or with tincture of Salt of Tartar.

The forms of Hydragogues. Theſe are the chief ſimple Hydragogues, from which being prepared with the addition of others, many compounded ones as well Magiſtral as common in Shops are made, and are every where in uſe; moreover, very many more might be preſcribed extemporarily, as occaſion ſerves. Of theſe we will here annex a few more ſelect forms, and chiefly thoſe that are taken in the form of Potions, Powders, Electuary and Pills.

A Tincture. *Take of Dwarf-Elder, Engliſh Orris, of each an ounce and half, leaves of Soldanella and Gratiola, i. e. Hedge-hyſſop of each one handful, Aſarum, and Aſſe Cucumber-roots of each two ounces, roots of leſſer Galangal ſix drams, choice Jalap half an ounce, Elaterium three drams, Cubebs two drams, ſhred and bruiſe them, and pour upon them three pound of ſmall Spirit of Wine tartarizated, digeſt it ſtopt cloſe in Sand for two days, ſtrain it clear and depurate it by ſettling. The doſe from two ſpoon-fuls to three, in a convenient vehicle.*

Powders. *Take of Elaterium, Soldanella, Ginger, of each one ſcruple, Galangal, Cloves, Cinamon, of each half a ſcruple, Salt of Tartar fifteen grains, make a powder for two doſes.*

Take powder of Jalap one dram, Ginger one ſcruple, Cream of Tartar 15 gr. make a powder to be given in a draught of White-wine.

Pills. *Take of Rhubarb one ſcruple, Elaterium 5 grains, Tartar vitriolated half a ſcruple, Spicknard three grains, with Syrup of Buckthorn make four Pills.*

Take of pill Aloephanginæ half a dram, Elaterium half a ſcruple, Oyl of Cloves gut. 3. make four Pills.

Bontius hydropick Pills are given from half a ſcruple to half a dram, prepared thus:

Take of Aloes two drams and a half, the preparation of Gum-gutta one dram and a half, Diagridium corrected one dram, Gum Ammoniacum diſſolved, one dram and a half, Tartar vitriolated half a dram, make a maſs, and form it into Pills.

Electuaries. Certain hydragogue Electuaries are now every where in uſe and celebrated by practiſers. Of which ſort are, 1: One deſcribed by the renowned *Sylvius*, and the other by *Zwelfer*. This following pleaſes us.

Take

Take of Reſine of Jalap two drams, Tartar Vitriolate one dram, Extract of Rhubarb two drams, of Spurge a dram and a half, leſſer Galangal one dram, beat them in a mortar, and laſtly adde of Conſerve of the flowers of Engliſh Orris, four ounces, and with Syrup of Peach-flowers make an Electuary, the doſe from half a dram to a dram and a half, or two drams.

I might here ſet down or deſcribe many other purging Hydragogues, but Catharticks do not always cure an Aſcites, yea often-times exaſperate it, and (if they be long continued) render it incurable; hence it is neceſſary to have recourſe to other Remedyes for the Cure of this diſeaſe. Wherefore, let us next enquire whether Diureticks do here profit or not? *2. Diuretick Hydragogues.*

And truly any one may eaſily think that Remedies moving Urine conduce very much for draining waters out of every place or cavity of the body. In truth it is manifeſt by frequent experience, theſe do often cure an Anaſarca before any other Remedy; let us ſee what they may effect for the emptying the Cavity of the Abdomen.

As to this it firſt appears, that there is no paſſage immediately open from an Aſcitick pool to the Reins, although contiguous; but that whatſoever waters are transferred from hence thither, muſt of neceſſity firſt be drunk up into the maſs of blood, and from thence be poured out of its boſom into the ſink of Urine; and truly it is but a little which the gaping little mouths of the veins about the ſuperficies of the bowels can receive (if perhaps they are open at all) and Diureticks can but effect this one thing, that by pouring forth the blood, and forcing its ſeroſities more plentifully to the Kidnies, they cauſe the waters fluctuating in the belly to be allured to it being ſo emptyed; in the mean time there is no leſs danger, leſt Diureticks being unſeaſonably adminiſtred, while they diſſolve the blood too much, they conſtrain the ſerum to depart into the ſeat of the Aſcites, more than into the Reins, and ſo rather augment than remove the inundation of the belly. For that it ſometimes ſo happens, I have often found by experience; wherefore when Diureticks are preſcribed to cure an Aſcites, we muſt chiefly provide againſt ſuch a contrary effect. For this reaſon indeed Aſtringents and Corroboratives are always mixt in Remedies for the Dropſie (founded on experience, and the Authority and Practice of the Ancients) not that ſuch (as is commonly ſaid) do confirm the Tone of the Liver, but conſerve the temperature, and mixture of the blood, leſt it be wholly diſſolved by too great a fuſion. Wherefore in an Aſcites which chiefly or in part happens by reaſon of the frame of the bowels and veſſels, and chiefly the Coats, Glandules, and their little ſtrings, and their interſpaces being ſtuffed by a ſerous humour, and therefore very much ſwell'd up, as Catharticks ſo alſo Diureticks profit, and are frequently taken with ſucceſs; foraſmuch as by the uſe of theſe the maſſe of blood being emptyed (the ſerum being more plentifully derived to the kidneys) doth eaſily receive unto it ſelf thoſe waters every where ſtagnating about their little mouths, and conveys it towards the urinary ſink: but on the contrary, in a meer Aſcites where the heap of waters do overflow the Cavity of the Belly, the Textures of the bowels being free from the ſerous ſtuffing; Diureticks are given in vain, or incommodiouſly; inaſmuch as they expreſs nothing from this Lake of the belly, and moſt frequently by diſſolving the blood more impetuouſly drive together the waters apt to be inſtill'd there. *What Profit they bring in an Aſcites.*

Not all Diureticks of every kinde are equally convenient in an Aſcites, neither ought they indifferently to be adminiſtred; for we muſt obſerve, the affected in this diſeaſe for the moſt part make a little, reddiſh Urine, and as it were lixivial; which truly is an indication that the temperature of the blood is too much bound in them, by reaſon of the fixt and ſulphureous Salt exalted and combined together: and therefore that the Serum is not duely ſeparated within the reins; which notwithſtanding is ſhook off about the windings of the obſtructed bowels, and ſo is depoſited in the Cavity of the Belly. Wherefore in this Caſe it will be convenient to drink only thoſe things to excite Urine, which ſo reſtore and amend the Conſtitution of the blood, that the enormities of the fixed Salt and Sulphur being taken away, the ſerous part might be ſeparated within the reins, and more plentifully diſcharged; for which purpoſe, not acid or lixivial things, but thoſe endowed with a volatile Salt are appointed. For I have often obſerved in Patients of that kind, when the Spirit of *With what choice and difference they ought to be adminiſtred.*

of Salt, and other acid drops of Minerals, and when the diſſolutions and Deliquiums of Salt of Tartar, Broom and other things, have done more hurt than good, that the Juice of Plantane, Brooklime, and other Herbs abounding with a volatile Salt, have much helped, as alſo the expreſſions of Millepedes: for the ſame reaſon Salt of Nitre throughly purified or Cryſtal Mineral doth often profit. Forms of Medicines more accommodate for this uſe are extant in our former Treatiſe, where, *viz.* examples of Diureticks are deſcribed, in which both volatile and nitrous Salts are the Baſis. Moreover, hither ought to be referred the notable experiment, by which *Joannes Anglus* affirms himſelf often to have cured the Aſcites from a hot cauſe, which Medicine alſo that expert Phyſitian Dr. *Theodore Mayern* was wont to magnifie and preſcribe in the like caſe.

John Engliſh his Empyrical remedy.

Take of the juice of Plantane and Liverwort, and fill an Earthen pot to the top, which being ſtopt cloſe, put in a hot Oven after the Bread is drawn, and make a little fire on the ſides of the pot to continue the heat of the Oven; after it is ſo boyl'd ſtrain it, and being ſweetened with Sugar, drink of it Morning and Evening, and it cures. In imitation of this I have often with ſucceſs preſcribed as followeth.

Take of green Plantane-leaves four handfuls, Liverwort, Brooklime, of each two handfuls, bruiſe them together, and pour upon them half a pound of ſmall compound Radiſh-water, or other appropriate Magiſtral, expreſs it ſtrongly, the doſe three ounces three times in a day.

How beneficial Diaphoreticks are in an Aſcites.

Although Diaphoreticks are moſt efficacious in an Anaſarca, yet in an Aſcites they are rarely or not at all uſed: for being unſeaſonably offered, they impreſs oft-times great hurt on the Patient without any avail; foraſmuch indeed as by heating the blood, they cauſe the fluctuating waters to grow hot, and as it were to boyl in the hollowneſs of the belly; ſo that the ſpirits and humours are diſturbed by vapours raiſed from thence; and ſo a diſorder of all the functions follows, and the very bowels being as it were boyled, are much prejudiced. Moreover from ſweating unadviſedly inſtituted, the blood being forced into a fuſion and precipitation of the Serum, throws it off the more into the neſt of the Aſcites. Wherefore when ſome preſcribe fomentations, and liniments, and bathing, to be applyed to the ſwelling Paunch of the Belly, for the moſt part it turns to the worſe in ſuch Patients; for beſides a little Feaver, a Vertigoe, fainting of the ſpirits, and other ill ſymptomes of the brain and heart, being moſt frequently ſo raiſed, even the belly alſo doth from thence ſwell the more: foraſmuch as the Blood being agitated and poured out, depoſits in that place more largely the Serum; and for that cauſe the mouths of the Veſſels are more looſened and opened, ſo that they may more readily let fall water prone to depart from the maſs of blood. But the Remedies which are chiefly wont to be adminiſtred with ſucceſs near the places affected (when a Cure is intended without a Paracenteſis) are Clyſters and Plaiſters.

Glyſters and Plaiſters.

The former draw the Serum out of the Veſſels and Glandules of the Guts and Meſentery without fuſion of the whole maſs of blood, (which the ſtronger purging Medicines do excite,) which being ſo emptyed do imbibe a little the extravaſated Lympha. For this purpoſe the enſuing Clyſter, wont to be preſcribed by us in this caſe, is moſt fit, in regard it contracts the inteſtinal fibres together, and draws the Serum imbibed by the blood, or contained formerly therein, towards the Reins.

Forms thereof.

Take a pint of Urine of a ſound man that drinks Wine, Venice *Turpentine diſſolved with the Yolk of an Egge, an ounce and a half, Sal Prunella one dram and a half, make a Clyſter, which repeat daily.* Sometimes Plaiſters yield help in an Aſcites, yet let them be ſuch, as by a certain reſtringent and comfortable virtue ſtrengthen the bowels and bind together the mouths of the Veſſels, leſt they too much ſpue out their ſeroſities: for this purpoſe, I uſe to apply the Plaiſter *Diaſaponis* with ſucceſſe. Or,

Take of the Plaiſter of Minium, Paracelſus *Plaiſter, of each what ſuffices, make a Plaiſter to be applyed to the Abdomen.* If this diſeaſe is accompanyed with a Tympanie, Epithemes of another manner are fit, as we ſhall hereafter declare.

The great and moſt preſent remedy of an Aſcites, is, that the waters may be drawn out by a Paracenteſis being made; which adminiſtration however doth not oftner cure the diſeaſe, than kill the Patient; wherefore there is need of exact caution

to

to whom, and at what time of the diſeaſe it ought to be adminiſtred: to perſons of an ill habit, who have been long ill, in whom the conformation and temper of the bowels is wholly depraved, it will be in vain to have the Lympha drawn out by the Paunch being pierced; for thereupon immediately the Spirits faint and the ſtrength is diſſolved, and after a while a new illuvies of the morbific humour ſucceeds. But thoſe who being formerly of ſound bowels, and healthful enough, as to other parts, when they fell into an Aſcites from ſome great and evident cauſe, as we are not at firſt preſently to make a Paracenteſis, ſo neither if it be needfull ought we to deferre it too long: for an incorrigible depravity of the Bowels is contracted by a longer delay, while they remain a long while drowned, and as it were boyled in water. *When and to whom a Paracenteſis is convenient in an Aſcites.*

It is beſide our purpoſe to deſcribe here the adminiſtration of a Paracenteſis, whether it be done after the ordinary manner, or by a hollow Needle according to *Sylvius*; this part of Chirurgery, as dangerous, when Phyſitians ſeldom preſcribe, yet Quacks and Empiricks raſhly and unluckily eſſay it, Artiſts not being conſulted: we will relate here for concluſion the Hiſtory of a true and huge Aſcites, lately cured without any Paracenteſis.

A young Woman wife to a Merchant, being ſlender and proper, while ſhe gave ſuck to her Child, to encreaſe her milk day and night did immoderately guzzle one while plain Ale, another while Poſſet-drink. After having uſed this kind of dyet for a fortnight, ſhe contracted a vaſt Aſcites in a ſhort time, the beginning whereof ſhe was not in the leaſt ſenſible of; for her Abdomen being great with water fluctuating within, did much ſwell up, and its bulk when ſhe turned from one ſide to the other, fell without the Ileon and borders of the reſt of the body: when in the mean while the fleſh of all her Members was very much conſumed, that ſhe ſeemed no leſs in a conſumption than a Dropſie. *A hiſtory of a cure.*

The Child being weaned, and a better courſe of Diet being appointed, ſhe betook her ſelf to Medicines, and took in the firſt place the more mild Hydragogues, as well purgative as diuretical, but without any advantage; alſo ſhe was worſe after every purge; but being committed to our care, and almoſt deſperate, I handled her after the enſuing method.

I preſcribed theſe Medicines, for the moſt part forbidding Ale, and any potulent liquor (medicines excepted.)

Take of the leaves of Plantane, Brooklime, Clivers, of each 4 handfuls bruiſed, and pour upon them of water of Earth-worms and Rhadiſh compound of each three ounces, preſs them, take it twice a day, viz. *at Eight in the Morning, and at Five in the Afternoon. She continued long in the uſe of this Medicine, but did ſometimes vary the Compoſition, ſometimes changing the herbs, ſometimes the Liquor poured on them.*

Take of the reddeſt Tincture of Salt of Tartar an ounce and a half, ſhe took 20 drops at night, and early in the morning, in two ſpoonfuls of the following Julep, drinking ſeven ſpoonfuls after it.

Take water of Elder-flowers, Saxifrage, of each ſix ounces, water of Snails, Earth-worms, and Rhadiſh compound, of each two ounces.

She wore a Plaiſter of Minium and Oxycroceum upon her Belly.
The following Clyſter was given firſt daily, afterwards every two or three days.

Take Urine of a healthy man one pound, Turpentine diſſolved with the Yolk of an Egg an ounce and a half, Sugar an ounce, Sal Prunella one dram, make a Clyſter.

By the conſtant uſe of theſe things her Belly aſſwaged within a fortnight, but her fleſh daily waſting, a Conſumption was threatned. Wherefore, going into the Countrey to avoid this, ſhe drank Aſſes milk; by the benefit of which Nutriment and of purer Air, continually taking the above-mentioned Medicines, ſhe recovered her entire health within three or four weeks, and lives yet in health.

SECT. II. CHAP. IV.

Of a Tympanie.

A Tympany not properly a kind of Dropſie.

A Tympany vulgarly, although not properly, is eſteemed a kind of Dropſie, from which rank, *Proſper Martianus* alleadging the teſtimony of *Hippocrates*, rejects as well this Diſeaſe, as an Anaſarca. But the former infeſting the region of the Abdomen, and raiſing it up into a bulk, now comes under conſideration next after an Aſcites, (to which it is ſomething a-kin): where firſt of all it is obvious, that this Diſeaſe as it is moſt difficult to cure, ſo alſo to be known; for although its outward form, *viz.* a ſomewhat hard ſwelling of the belly, very ſtiffe and yielding a ſound like a Drum, upon touching it, is evidently perceived by many ſenſes together; notwithſtanding what may be the morbifick matter inducing that Tumour, or after what manner it is generated in the belly, or from what place it comes thither, is altogether unknown: therefore thoſe who have a Tympanie, as though they were big with winde, are ignorant both of the manner and time of its conception. Truly I therefore judge the nature and cauſes of this diſeaſe to lye concealed, becauſe whereas its firſt beginnings are not obſerved, it ſuddenly augments prodigiouſly; ſo that they who are affected, do ſcarce ſooner perceive themſelves to be ſick, than that they are become almoſt incurable. Moreover, a Tympanie, its ſtation being accompliſhed, degenerating into an Aſcites, or rather procuring it to its ſelf, ſeems to loſe its own nature; and truly after death Anatomical inſpection ſcarce diſcovers any thing more in bodies dying with a Tympany, than with an Aſcites. But that many Phyſical Authors do readily declare this Diſtemper to be raiſed by wind encloſed within the cavity of the abdomen, doth not at all ſatisfie a mind deſirous of the truth; becauſe it ſeems altogether improbable that winds ſhould be produced ſo ſuddenly, and in ſo great plenty in that place; or admit they were, that ſo hard, unmovable and conſtant a tumour ſhould be raiſed.

Wherefore its cauſe is occult.

Commonly aſcribed to Winde.

Authors do not agree about the ſeat of the Windes.

Moreover they do not eaſily agree concerning the ſeat of the diſeaſe, where the wind is ſuppoſed to be included; for ſome affirm that this place is determinate in the concave of the Peritonæum, and by the convex ſuperficies of the Inteſtines, and other bowels of the lower part of the belly; but after what manner ſuch a heap of winds can be therein collected, in my opinion it cannot be manifeſted by any reaſon, example, or parallel inſtance. Beſides, if the caſe were ſuch, it might be more eaſily cured by pricking, than an Aſcites by a Paracenteſis; which yet I never heard accompliſhed. *Helmont* reports a ſtinking wind was vented by a Paracenteſis, in one eſteemed Hydropick; that ſuddenly his abdomen ſunk, and the man dyed immediately. But *Platerius* and *Smetius*, no leſs worthy of credit, do affirm, *They diſcovered in ſome who were thought to have the Tympanie, and diſſected after death, that no wind broke forth out of the hollow of the belly, neither that it fell, but that eſpecially the ſmaller guts being diſtended, and ſtrutting with winde, burſt out ſo, that they could not be put up again into the ſame belly.*

Not without the guts in the cavity of the Abdomen.

Nor within their paſſages.

But truly neither is this obſervation an argument to me, that the cauſe of the diſeaſe (of which we treat) remains within the Cavities of the guts, and that the winds accumulated in that place, do often or moſt of all raiſe a Tympanitick ſwelling of the belly. For beſides that, a diſeaſe taking riſe from ſuch an occaſion, would not be ſo immovable, and frequently incurable; moreover, I am induced to think, that the Inteſtines are not ſo greatly dilated by winds ſhut up in them, but that they often of their own accord ſwelling out, give occaſion to thoſe winds conſequently and ſecondarily to be produced, by which the ſpaces enlarged might be filled, as we ſhall by and by more clearly demonſtrate.

Not between the coats of the bowels.

But what is aſſerted by others, that the windes which are the cauſe of a Tympany, are engendered among the Coats of the Meſentery, and Guts, ſeems yet much more improbable; becauſe when there is no cavity in that place preexiſtent, after what manner can the winds ſo tear thoſe parts and ſeparate them from one and another, ſo that from ſuch formed Denns, the whole region of the Belly ſhould grow into ſo vaſt a bulk by accumulated windes there laid up? Certainly ſo many and ſo great divulſions could not be made without continual torment and moſt ſharp pains.

Where-

Wherefore, omitting theſe opinions already ſpoken of about a Tympanie, let us proceed another way to the more aſſured ſearching out its Pathologie; *viz.* by thorowly weighing by what means, and by what evident cauſes, the Abdomen is wont to ſwell up. Wherefore, we advertiſe there are four kinds of things contained, from which proceeds a tumour in the nether Belly of the living, (why the Abdomen ſwells in dead perſons, the reaſons follow hereafter) which kinds are, ſolid, humid, wind and Spirits. *By what and how many cauſes the Belly ſwells.*

Firſt, It is obvious enough, that the inward tumours of the bowels, *viz.* ſcirrhous, ſtrumous, cancrous and glandulous, and ſome perhaps of another kinde, when they riſe to any notable bulk, do ſwell the whole belly; yet in the mean time as long as they are ſimple, and new, they may be perceived and circumſcribed by the touch; yet afterwards growing inveterate, they cauſe other evils to the neighbouring parts, yea over the whole Region of the Abdomen. Truly theſe as they are ſometimes the procuring cauſe of an Aſcites, ſo of a Tympany from the beginning, to which afterwards for a complement of either diſeaſe, another conjunct cauſe gains acceſs, *viz.* an illuvies of waters, or an irregularity of the Spirits. *1. From tumours of the Bowels in that place.*

Secondly, a watery humour gathered within the Cavity of the abdomen, or being impacted in the membranous or glandulous parts thereof, frequently produces an Aſcites, the reaſons whereof, and the manner of its coming to paſs, are at large ſet down before. *2. From waters gathered as in an Aſcites.*

Thirdly, Winds within the bowels of Concoction being raiſed from crudities, ill concoction, or fermentation of heterogeneous humours, do frequently puff up the Cavity of the guts, and for the moſt part produce a ſhort and tranſitory tumour of the belly. For the fermentation of the Juices ceaſing, and eruption of wind being procured, immediately ſucceeds an aſſwaging of the Belly. To this cauſe, both the Colick and Tympanie, not only by the vulgar but by Phyſicians of great note are imputed; but in our judgement, when it is ſolitary it produces neither of theſe diſtempers. *3. From winds.*

Fourthly, There yet remains another ſudden, and vaſt ſwelling of the belly, which the animal Spirits, (not for nothing ſtyl'd by *Hippocrates* violent) ſeem to procure. For when theſe in heaps, and inordinately, ruſh into the nervous fibres belonging to the bowels of the lower belly, preſently the parts that theſe weave together are cauſed to be puffed up, and extended every where round about. For truly, from this cauſe (as we have often ſhewed in another place) a ſwelling, and as it were a tympanitical puffing up of the whole abdomen, as well in the Colick as in Hyſterical fits vulgarly ſo called, doth often happen. And truly theſe diſtempers are ſo allyed to a Tympany, that they frequently end in it; for I have oft obſerved, that thoſe who have been obnoxious to the Colick and hyſterical paſſion long and grievouſly, unleſs they receive cure, do become Tympanitical. And then the greateſt of the difference will be, that the ſwelling of the belly, which before was a wandring Symptom, and ſoon paſſing over, at length grows to be a fixt and permanent diſeaſe. *4. From the inflation of the Fibres, by reaſon of the Spirits being diſturbed.*

Wherefore, it ſeems material in this Caſe, to accommodate the Ætiologie of thoſe paſſions delivered by us in another place, to unfold the Nature and Cauſes of this preſent maladie.

Which truly will not be of any great buſineſs or difficulty. For ſuppoſing (what we have in another place more largely ſet down) the extenſions and inflations of the membranes and hollow bowels, take their origine from the impetuous invaſions of the Spirits into the nervous fibres (of which they are interwoven) it will be obvious enough to conceive even a Tympanie to be produced from ſuch a cauſe, but being more fixt, and longer, or unceſſantly in the act; into the reaſon of which difference, we will by and by inquire. *An Affection of what ſort a Tympany is.*

In the mean time I am induced to believe a Tympanie not to be ſtirred up from winds ſhut up within, or without the Cavity of the guts, (for ſuch an accumulation of winds in thoſe places, is an effect, but not a cauſe of this diſeaſe) but that it does ariſe, inaſmuch as the animal Spirits, in the bottom of the belly, belonging to the membranous bowels, being forced into diſorder by ſomething incongruous, do tumultuouſly ruſh every where into the nervous fibres, and puffe them up, neither do they immediately recede back from them: from hence the Peritonæum ſwells, and the guts being blown up and enlarged, they are as it were inflated, the Meſentery, and other membranous bowels, being turgid with an impetuous Spirit, are as it were raiſed up into a bulk; moreover, while theſe come thus to paſs, that the vacuities cauſed from the ſwelling of hollow bowels might be filled, a portion preſently *Its cauſe and formal reaſon explicated.*

of every humour within contained, being rarified into vapours, forthwith turns into wind, wandring about thoſe empty ſpaces.

And proved by arguments and inſtances.

Truly, we have clearly enough ſhewn, by reaſons and inſtances in our Pathologie of Convulſions, that the animal ſpirits puff up the membranous parts by their irregularity, and ſo produce as it were this windie Diſtemper. Moreover the ſame is demonſtrated by Anatomical obſervation made in diſſecting a living Creature; *viz.* inaſmuch as the Trunk of the eighth pair of Nerves, deſcending on each ſide by the Neck, if it be taken out and bound with a thred, forthwith all the ſtomach ſwells up, as if it were puffed with winde; which certainly can proceed from no other cauſe than that the animal Spirits of the fibres of that bowel, and others flowing through the nervous paſſages, (inaſmuch as they being cut off from their origine, are driven into confuſion) do tumultuouſly enter thoſe parts, and puff them up. Beſides theſe, for the further illuſtrating of this Hypotheſis, I will relate a Hiſtory cited by the moſt renowned *Smetius*, of an univerſal Tympany (as he calls it) in a certain young man of *Liege: Who when he had received, in a conflict, under his right arm-pit, a wound, made by a prick, penetrating into the Cavity of his breaſt, next day and night being paſt, he appeared in the morning after ſwell'd throughout his whole body, not only in his breaſt, but alſo in his back, belly, loins, and in the cods, beſides both in his arms, ſhoulders, neck and face, that he could not open his eye-lids, alſo on the crown of his head, the skin being every where ſwolne and tumefied, the tumour was every where extended with great pain.* The Author calls this wonderful affection, an Univerſal Tympanie. The moſt renowned *Sennertus* relates a Caſe like this from his own knowledge: Moreover, I remember I have heard or read of the like from a wound of the breaſt being received near the arm-pit.

An univerſal Tympanie.

The Cauſe of an univerſal Tympanie enquired into.

Notwithſtanding, the reaſon of this Symptom, deliver'd by *Smetius*, and approved by *Sennertus*, doth not at all pleaſe me: for they aſcribe the cauſe of that general Tympanie *to the puffing up of the breaſt, by the axillary wound, made all that night under the skin, as we ſee a new and moiſt bladder to be blown up by boyes with a quill:* which truly doth not only ſeem improbable, but alſo we think ſcarce poſſible, that the wind to be blown out of a wound of the Thorax, by reaſon of the hole one night ſtopt, can enter the skin, and from thence paſſing through the whole body, ſhould make it become every where Tympanitical: For beſides that the wind cannot ſo ſuddenly paſs from thence into all parts, although it ſhould be blown with a quill from the mouth, under the skin; beſides, while the orifice of the wound is ſtopt, no wind can altogether be blown out from the Cavity of the breaſt, becauſe none in the mean time enters. But aſſuredly the cauſe of that wonderful affection is this; (whence alſo the formal reaſon of a Tympanie is illuſtrated) In the Breaſt near the Arm-pits, are many and eminent foldings of Nerves, (as we have deſcribed in our Treatiſe of Nerves,) by which the nerves of the whole body communicate among themſelves: *viz.* the Trunk of the eighth pair unites with the intercoſtal Nerve, and both with the nerves of the *Spina Dorſi*, by branches and ſprigs ſent here and there. Wherefore, this nervous folding, perchance being pierced by the point of the Sword, firſt of all the ſpirits reſiding in that place being provok'd, run into diſorders, afterwards a conſent being immediately made thorow ſo many notable Nerves, and tranſmitted to and fro every where, other Spirits, and then again others, are ſenſible of the like irregularities, and puffing up the membranous and nervous Fibres (which every where they enter tumultuouſly) they induce as it were a tympanitical affection through the whole body. By reaſon of the like fury or virulent madneſs impoſed upon the Spirits, in any place, and from thence immediately diffuſed far and wide, certain Poyſons being drunk, the ſtrokes of weapons, or of wild Beaſts, or a venemous bite, do frequently induce a ſwelling together of many parts, or of the whole body; which ſwelling diſtemper of the Spirits, is ſtyl'd by *Helmont* to be *Indignatio Archaus*. There are many other Caſes and Inſtances, by which it is moſt clearly evinced, that the Animal Spirits being provok'd, and driven into angry inclinations, inaſmuch as they do more impetuouſly enter into the nervous Fibres, are wont firſt to ſwell the membranous parts, and to excite many paſſions out of thoſe, which are vulgarly but falſely aſcribed to windes: ſo that in truth no other cauſe of a Tympanie can be aſſigned more like truth.

The true cauſe aſſigned.

Why the belly ſwells in the dead.

If it be objected, that the Paunches of the defunct after ſome time are raiſed by winde into a bulk, and ſwell like as in a Tympany: I pronounce this to proceed from the putrefaction of humours, and the extream diſſolution of the mixture, wherein all

all the active particles depart, being freed one from the other, and flying about ſeek vent in every place, and diſtend greatly all obſtacles, and chiefly the ſides of the Cavities, (which doth not at all happen in living bodies;) wherefore, as all Carkaſes do not putrifie alike, ſo their bellies ſwell ſooner or later, more or leſs: But while life endures, no rottenneſs or diſſolution of particles is made in an animated body, that can bring about a ſplanchnick fermentation or ſwelling. In the mean while we deny not, that winds are generated within the offices of concoction, ſanguification, and ſeparation, yea within all the particular cells and receſſes of our whole body; notwithſtanding from them all, unto the winds whereſoever engendred (whileſt the Spirits have their due influence, and actuate the nervous as well as moving fibres, that the ſides of the bowels be not kept diſtended and rigid) an eaſie vent does every where lye open. And the truth is, in a Tympany, we allow the wind to fill up the empty ſpaces, but the ſpirits, inaſmuch as they extend the bowels by their irregularity, do firſt cauſe thoſe vacuities, (wherein the winds ſecondarily and conſequently are engendred) and they (inaſmuch as the ſame bowels are ſtill kept ſtrutted and diſtended) do hinder thoſe winds from being removed.

The Animal Spirits and not winde the cauſe of the Tympanie.

And now I judge it is plain enough by what we have ſaid, that the animal ſpirits rather than the wind do raiſe ſwellings of the belly in that ſort; at leaſt ſuch ſhort and tranſitory ones, as happen in Hyſterical and Colick fits. Notwithſtanding there yet remains a great difficulty, after what manner the Tympanitical ſwelling of the Abdomen, which is fixt and permanent, yea for the moſt part immovable, can proceed from any ſuch cauſe; eſpecially, becauſe the Animal Spirits being of their own nature active and very apt to motion, do for the moſt part ſo affect removal, that unleſs they be wearyed or become defunct, they ſcarce ever lie ſtill.

That I may looſen this knot by reaſoning, it becomes us to conſider the Nervous Juice together with the ſubſtance of the Animal Spirits, which is every where a vehicle to them, and alſo a bridle: for the Spirits enjoying the moſt ſubtile ſtream thereof, do freely expatiate, and leſt being diſſipated from one another, they might fly away, they are contained in an entire ſeries. When therefore that Juice is faulty as to its temper or motion, immediately the animal ſpirits become diverſly delinquent, or are perverted in the exerciſes of their functions, as we have at large expounded in our Treatiſe of Paſſions. And leſt by repeating them now I ſhould make long Preambles, I will contract into a few words what belongs to the preſent purpoſe.

This happens by the fault of the Nervous juice.

Wherefore in the firſt place, it is to be obſerved, that the contents of the nether belly (excepting only the Liver, Spleen, and Kidneys) are furniſhed with many membranous bowels, (which the nervous fibres for the moſt part weave together) whence it follows that the nervous Juice (whoſe journey is longer, and the paſſages ſtraiter in theſe parts) doth find here many remora's: which alſo may be proved from the effect, foraſmuch as the convulſive invaſions, every where ſtirr'd up in the Hypochondriack, Colick, Nephritical and Hyſterical Paſſions, do ſo grievouſly infeſt the Abdomen. When therefore that Juice watering the nervous fibres of theſe parts, ſhall be either viſcid or tenacious of it ſelf, or fill them with very many feculencies, for that cauſe it will come to paſs, that all the animal ſpirits will not eaſily return from thence as oft as they are hurl'd into theſe fibres, in ſome part obſtructed: and when in this manner there is a full incurſion, and a ſmall return of them, at length it will happen that great abundance of the ſpirits remain in theſe fibres every day more and more impacted, and hold them always diſtended and very much pufft up; and at length by reaſon of the ways of their ingreſs and regreſs in thoſe fibres being obſtructed, they become immovable in that place, and keep the affected parts always extended and ſtiffe: in the mean time becauſe theſe Spirits there impacted within the nervous paſſages, and cramm'd thick, have commerce with others that flow to them in their dens, therefore the affected part although it be ſtiffe and almoſt immovable, yet however enjoys ſenſe. This Pathologie although it may ſeem to ſome a Paradox, and uncouth, I doubt not but it will deſerve aſſent from many, if it be throughly weighed, that thoſe who have been a long time obnoxious to Hypochondriack, Colick, and other convulſive diſtempers of the nether Belly, do at length become ſick of a Tympany.

By the obſtruction whereof the Spirits within the fibres are detained and made immovable.

The formal reaſon and conjunct cauſe of a Tympanie being delineated after this manner, before we proceed to trace out diligently the more remote cauſes thereof, it may be lawfull for us from what we have ſaid to deliver a definition, or at leaſt a certain

A deſcription of the diſeaſe.

certain deſcription of this diſeaſe, viz. *That it is a fixt and conſtant Tumour of the Abdomen, equal, hard, ſtiff, and yielding a noiſe upon ſtriking, taking its origine from a convulſive inflation of the parts and membranous bowels, by reaſon of the Animal Spirits being driven into thoſe fibres in too great abundance, and through the fault of the nervous juice obſtructing, being hindred from their return back; to which diſeaſe conſequently an accumulation of winds in the empty places, accrues as a complement.*

Its procuring cauſes.

As to what appertains to the procuring and evident cauſes of this diſeaſe, it very ſeldom happeneth that they are altogether obſerved, but that inſinuating it ſelf by ſilent beginnings, it frequently is finiſhed, or becomes deplorable before it is perceived; inſomuch that againſt this diſeaſe ſcarce any antidote can be appointed; for while the ordinary functions are not much prejudiced, the ſwelling of the belly is preſumed only to have its origine from winde, and while it is expected to vaniſh ſpontaneouſly, it often grows into a Tympanie. Wherefore that we may have timely notice of its beginning, we may take notice, that ſome previous affects diſpoſe to it; of this ſort is firſt an Hypochondriack, Colical and Hyſterical diſpoſition, yea and ſometimes an Aſthmatical; whoſe fits when they are uſed to be frequently raiſed, if at length a tumour of the Abdomen follow it, though it be ſmall in the beginning, a Tympany forthwith may be feared. Of the former of theſe affects caſes every where are to be met with, and ſtand fair to common obſervation: of the later

Other previous convulſive affections.

The caſe of an Aſthma ending in a Tympanie.

Scherichius reports, *That a man of Sixty years of age was infeſted with this ſymptome ſome months before his Belly was ſwell'd into any manifeſt tumour, that as often as he ſate at meat, beginning to eat, alſo when compoſing himſelf for ſleep, he began to ſleep ſoundly, he was ſurprized with ſuch a difficulty of breathing, that the frequency of it threatned the danger of choaking; at which time alſo he perceived a certain palpitation about the Hypochondria, as if ſome living Animal were underneath the midriff; this diſtemper afterwards ended in a Tumour of the Abdomen, by which he dyed.* In this and other caſes now cited the ſame reaſon holds, *viz.* that the animal ſpirits being uſed to make irregular excurſions into the nervous Fibres of the lower belly, at length do not only more often and abundantly enter into them, but being impacted and hindered they abide in them, and ſo at length induce tympanitic inflations of the bowels. Truly this morbific beginning happens ſooner or later, if thereupon do come the evident cauſes, which diſturb the Spirits in the bottom of the belly, and compel them to frequent diſorders, and alſo do either ſtop the motion or pervert the temperature of the nervous Juice flowing within thoſe Fibres; in which rank are accounted irregularities in the ſix Non-naturals, immoderate Paſſions, and chiefly of grief, and uſual evacuations ſuppreſs'd, drinking of cold water after ſome great heat, or any ſudden cold induced on the belly, either from air or water.

The evident cauſes of this diſeaſe.

The Prognoſticks thereof.

As to the Prognoſticks, this diſeaſe is always accounted of ſo bad an omen that commonly the name is abhorr'd, inſomuch that frequently when there is no ſuſpicion of ill from the tumour of the belly, if perhaps that ſwelling be call'd by the Phyſitian, a Tympanie, forthwith it is concluded deſperate. Notwithſtanding this Diſeaſe rarely kills of it ſelf, but being protracted a long ſpace of time, that it may at length more certainly kill, it gains to it ſelf an Aſcites, as a Harbinger of Death. That we may ſearch into the reaſon thereof, it will be obvious enough to conceive, while all the bowels are diſtended in the lower belly, and are held as it were ſtiffe, the paſſages of the blood, and nervous and lymphatic humours, being too much extended, or compreſſed are much ſtraitened, and for that cauſe cannot freely and readily tranſmit its Juice; from whence it follows that every humour being ſtraitned in the paſſage, that at length it may paſs by ſome means, it ſhakes off a certain ſeroſity from its maſſe wherever way is given; and thoſe droppings of the humours falling into the hollow of the Abdomen, excite an Aſcitick Dropſie.

The Cure.

What relates to the Curatory part of this Diſeaſe, the whole ſcope of healing is commonly bent againſt wind, *viz.* Indications inculcated by practical Authors ſuggeſt the matter to be evacuated, from whence the winds are raiſed, and to remove the cauſe that lifts them up, and the winds to be diſcuſs'd and diſſipated, which do already diſtend the belly.

For theſe ends Purgers appointed againſt the humour chiefly ſuſpected are wont to be preſcribed with great confidence, although with ſmall or ill ſucceſs; that is to ſay, Phlegmagogues ſo called, another while thoſe that purge Melancholy, another while thoſe that purge Choler, whereto alſo are joyn'd purgers of water (as weapons intended againſt every enemy.) For this diſeaſe (as is manifeſt by our obſervation) is

wont

wont for the moſt part to be exaſperated with ſtrong Purgers, and ſeldom alleviated; the reaſon whereof is evident enough, becauſe the nervous fibres being provok't by a ſharp Medicine, the animal Spirits renew their irregular excurſions, and do every where more and more ſtretch them out, rather than give any remiſſion to them; wherefore, although frequent and abundant watery and flatulent ſtools are procured, notwithſtanding the Belly ſwells the more. Moreover, to diſpell, diſcuſſe, and bridle the winde, there is a more than Æolian power preſcribed; Medicines commonly call'd *Carminatives*, almoſt of every kind or form are ſedulouſly adminiſtred, within and without, above and beneath, and upon the part affected; notwithſtanding this diſeaſe for the moſt part is untamed by all theſe; whence we may ſuſpect, that the true cauſe of the diſeaſe lyes as yet conceal'd, becauſe Medicines profit not that are adminiſtred, indicated or ſuggeſted according to the ordinary Ætiologie or reaſon of it.

Remedies deſigned againſt Wind profit not.

Although I cannot challenge a better ſucceſſe in curing this diſeaſe, or a more certain method of healing, atteſted from experience, notwithſtanding in the mean while we will here proffer another way of curing, accommodated to our Hypotheſis, and eſtabliſhed by reaſons ſtrong enough.

Wherefore in a Tympany, as in moſt other affections, there will be three chief indications: Whereof the firſt, and chiefly inſiſted on, is the Curatory, that by recalling the animal Spirits from their convulſive affection, and reducing them into order, endeavours the removal of the ſwelling of the Belly. The ſecond Preſervatory, which reſtrains thoſe or other Spirits from their irregular excurſions into the lower Belly, and together corrects the faults of the nervous liquor, watering it, both as to its temper, or motion. The third Vital, by removing the Symptoms urging, doth ſuccour and ſuſtain all the functions oppreſſed or weakened, as much as poſſible may be.

3. Curatory Indications.

I. The firſt Indication is of greateſt moment, on which the hinge of the whole Cure turns, but it is moſt difficultly performed, for it doth not eaſily appear by what remedies or wayes of adminiſtration it ought to be attempted, when moſt weapons or medicines do little or nothing prevail againſt this inviolable enemy. Phlebotomie aſſumes no place here, but is declined for the moſt part as prejudicial; alſo Catharticks, inſomuch as they provoke the affected fibres, and diſturb the Spirits, and hurry them more impetuouſly, do increaſe rather than diminiſh or cure the Tumour of the Belly; in like manner Diaphoreticks impell the Spirits and the morbific particles deeper into them, whereas they ought to be allured, and call'd out of the Fibres. The chief order of healing ſeems to be placed in Diureticks and the uſe of Clyſters; and alſo great things are expected from topical Applications, becauſe they are more immediately exhibited to the diſeaſe, and as it were by contact, and becauſe they do beſt diſcuſſe Tumours in other places. Yet not all Diſſolvents are here fitting, nor thoſe which profit moſt in other Tumours; for the more hot being given for diſcuſſing, whether they are applyed by fomentation, Liniments, or in the form of a Cataplaſm or Plaiſter, oftner afford hurt than ſuccour in a Tympanie; for they both open and dilate the paſſages of the fibres, that from thence they may lye more open to the incurſion of the Spirits; and alſo rarifie the particles impacted, ſo that while they occupy a larger ſpace, an inflation and intumeſcency of the Belly is augmented. Laſtly, what appertains to Alteratives which ſuccour againſt other affections of the nervous kinde, only a certain few are fit in a Tympanie; for where the morbific matter ſticking within the ſtraiter paſſages cannot be impell'd ſtraight, or throughly, Elaſtick medicines render the ſtoppage greater and more fixt, by enfixing the matter deeper; wherefore Spirit of Harts-horn, of Soot, of Sal Armoniack, yea alſo Tinctures, Elixirs, and other Medicines endowed with a volatile Salt, or active particles of another kind, do not only acquire heat, and a troubleſome thirſt in the ſick perſon troubled with a Tympanie, but alſo cauſe the Abdomen to ſwell the more, inaſmuch as they melt the blood and nervous Juice, and ſtirre the Spirits, inſomuch that the particles depoſited by each of theſe, are compell'd into the parts affected.

The firſt Indication hardeſt.

What, and what ſort of Medicines are good or hurtful in this Diſeaſe.

But truly although Medicine doth ſo little avail againſt this diſeaſe, it is not altogether to be neglected, (as if either it effected nothing, or what is ill,) but it behooves us to turn every ſtone, that by ſome means we may ſuccour the Patient, and at length may obtain a cure for him, or at leaſt an alleviation. Wherefore in the firſt place (becauſe it is the cuſtom to begin with Purgatives) although the ſtronger do ever hurt, and the gentler ſcarce ever prevail to diſcharge the conjunct cauſe, notwithſtanding theſe latter, inaſmuch as they do ſomething ſubſtract the nouriſhment of the diſeaſe, alſo

Only mild Purgers and Clyſters are convenient.

alſo make a way by which other Medicines do exert their powers, they ought to have their turns in phyſical practice once in ſix or ſeven dayes; and at other times let Clyſters (whoſe uſe is much better) be frequently adminiſtred. Hydroticks being prohibited, we muſt reſt upon moderate Diureticks, whereto are adjoyned things reſpecting the alteration and reduction of the Spirits and Humours, which truly make up the Tympanitical pharmacy. Moreover in the mean time the uſe of Topicks is not to be neglected. We will annex certain ſelect forms of Medicines appropriated for every of theſe purpoſes. For a Medicine mildly ſolutive, let the laxative Wine be uſed, preſcribed by the renowned *Greg. Horſtius* for a Tympanie, in his book of Obſervations, *lib.* iiij. *Chap.* xxx. or in its place let the following be preſcribed with greater eaſe.

Forms of Medicines.

A ſolutive liquor.

Take the leaves of Peach-flowers, of Damask-roſes, of each two Pugils, Broom, Elder, Centaury the leſſer, of each Pugil 1. *the leaves of Agrimony, Roman Wormwood, of each one handful, Senna one ounce, Rhubarb ſix drams, Carthamus-ſeeds half an ounce, Dwarf-Elder two drams, yellow Sanders three drams, Galangal two drams, ſlice them and bruiſe them, put them into a ſilk Bag in a Glaſs, with* 2 *pound of White-wine, Saxifrage-water one pound, Salt of Tartar one dram and a half, let them ſtand* 48 *hours, let the patient drink from four ounces to ſix, every third or fourth day.*

In a hotter Conſtitution let the following form be taken, which I have proved with ſucceſs in this diſeaſe.

Take of purging Mineral waters eight pound, Salt of Wormwood two drams, let it evaporate in a gentle Bath to two pound. To this I uſe to adde four ounces of water diſtill'd from Purgers with Wine; the doſe from four ounces to ſix.

Or to the two pound of evaporated water adde of Mechoacan, Turbith, of each half an ounce, Rhubarb ſix drams, yellow Sanders two drams, Cloves one dram, digeſt them cloſe and warm for two hours: filtre it through Paper, the doſe 3 *or* 4 *ounces.*

Clyſters are of frequent uſe in this Diſeaſe, inaſmuch as they looſen the Belly without any great irritation of the fibres.

Clyſters.

Take of the Infuſion of Stone-horſe dung with Cammomile-flowers a pound, Mellis Mercurialis two ounces. After the ſame manner Decoctions and Infuſions are prepared, with Carminatives, from Dogs-dung.

Take of the Emollient Decoction one pound, Sal Prunella, or Sal Armoniack from one dram to a dram and a half; make a Clyſter.

Take of ſound Urine one pound, Sal Prunella one dram, Venice *Turpentine diſſolved with the yolk of an Egge, an ounce and a half: make a Clyſter.*

Diureticks. 2, Diureticks if any other Remedies promiſe help in this Diſeaſe.

Take of Millepedes living and cleanſed three ounces, one Nutmeg ſliced, bruiſe them together, and pour upon them one pound of the Diuretick-water preſcribed below: Preſs them ſtrongly, the doſe from three ounces to four twice a day.

Diſtilled waters.

Take of green Juniper-berries, and Elder-berries, of each ſix pound, of Firre-tops four pound, green Walnuts two pound, Cortex Winterani four ounces, the outer Rinds of ſix Oranges and four Limons, Seeds of Ameos, Rockets, Creſſes, of each an ounce and half, Dill-ſeeds two ounces, ſlice them and bruiſe them, and adde of Poſſet-drink made with White-wine 8 *pound, diſtill it in common Organs, let the whole liquor be mixed.*

Pills.

Take of Cryſtal Mineral half an ounce, Volatile Salt of Amber, two drams, the powder of Carrot-ſeeds one dram, Turpentine of Venice *what ſuffices to make ſmall Pills, the doſe Numb.* 3. *in the evening and morning, drinking after it three ounces of the diſtilled water.*

Spirits.

Take of the ſweet Spirit of Salt half an ounce, take ſix drops to twelve, twice in a day, in a draught of the ſame water, with a ſpoonful of Syrup of Violets.

Take of ſpirit of Salt of Tartar one ounce, take one ſcruple to half a dram, twice a day, after the ſame manner; So alſo ſpirit of Nitre, and Tincture of Salt of Tartar may be taken.

An Expreſſion.

Take of Plantane, Chervil and Clivers-leaves, of each four handfuls, bruiſe them, and pour

pour on them a pint of the former diſtilled water. Preſs them ſtrongly, the doſe three ounces, twice or thrice in a day with other Medicines.

Take of Graſs-roots three ounces, of Butchers-broom two ounces, Chervil and Eringo candied, of each one ounce, ſhavings of Hartſhorn, Ivory, of each two drams, of burnt Hartshorn two drams and a half, Burdock Seeds three drams, boyl them in three pound of Spring-water to two pound, in it ſtrained hot, infuſe the leaves of Clivers, Water-creſſes, bruiſed, of each one handful, adding of Rheniſh wine ſix ounces, make an infuſion cloſe and warm for two hours, after ſtrain it again, and adde of Magiſtral-water of Earth-worms two ounces, Syrup of the five opening Roots an ounce and a half. Make an Apozeme, the doſe four ounces twice a day, with ſome other medicine. *Apozems.*

While theſe are taken inwardly, alſo Topicks and outward Applications may be carefully adminiſtred; not thoſe which are hot and diſcuſſing, but thoſe which are endowed with particles of a volatile Salt, and Nitrous, to wit, thoſe which deſtroy the Combinations of other Salts, and diſſolve the impactions of the Spirits, for which we propound the enſuing things. If Fomentations ought at all to be admitted into uſe, let them not be applyed too hot, alſo let them be prepared not of thoſe that are uſually call'd Carminative, but chiefly of Salts and Minerals. *Gabrotius* (cited by *Helmont*) ſays, *That he cured one of* 80 *years of age, whoſe Belly he fomented twice a day with a Lye, in which he boyled Salt, Alum and Sulphur, and after applyed Cow-dung for a Cataplaſm.* I uſe to preſcribe theſe enſuing. *Topicks.*

Take of flowers of Sal Armoniack one ounce, Cryſtal mineral two ounces, Spirit of Wine ſmall and imbued with much Phlegme two pound, mixe and diſſolve them in a glaſs. *A fomentation.*

Let a woollen Cloth dipt into this warm be applyed upon the whole Abdomen, and then let it be changed, wetting it again; let it be done for the ſpace of half an hour twice a day, afterwards let there be applyed a Cataplaſm of Cow-dung, with the powder of Dogs turd, or the following Plaiſter.

Take Empl. Diaſaponis, that is, de Minio, *with* Venice *Soap, let it be ſpread thin upon limber Leather, and applyed to the whole Belly, to be renewed once in ten or twelve dayes.* *A Plaiſter.*

II. The ſecond *Indication* requires moſtly alterative Remedies, to wit, thoſe which ſtop the fermentations of the humours in the bowels of the nether Belly, and the Orgaſms and irregular excurſions of the Spirits, alſo thoſe which procure equal mixtions and due motions of the Chyle and nervous Juice: for which end Chalybeates are chiefly in uſe. And truly it is wont not only in this, but in many other ſplanchnical Diſeaſes, to have reſort to the Medicines of Iron, as if from thence to fetch the ſharpeſt weapons; whenas many Empiricks and Quacks, who preſcribe theſe things confidently and dogmatically, obſerve not by what way ſuch a Medicine doth operate, or what alterations for the better may be lawfully expected from thence: wherefore, while Iron, changed into Medicine, although the Sword of *Goliah*, is ſnatcht and brandiſht by a blind man, it is no marvel if it prove in vain, or if in the ſtead of the diſeaſe, which is an Enemy, Nature it ſelf is ſometimes hurt; and truly frequently it happens ſo, when Chalybeats, of which there is great variety, and diverſity of operations, are adminiſtred without any choice or difference either of the temperament or conſtitution in the Patient, and reſpect to the ſtate of the Diſeaſe. *The ſecond Indication.* *Of Chalybeate Medicines.*

Of Medicines prepared of Iron or Steel, and of their vertues and manner of working, we have in another place treated, and there is no need here to repeat the ſame things. For this diſeaſe, if any of them, not all of them are fit; for thoſe in which the frame of the mixture being opened, the Sulphur remains ſtill, and being looſened predominates over the reſt, they are altogether to be excluded from this number; for they do much ferment the Juices of the bowels with their notable fermentation, and do ſo exagitate the Blood and Spirits, that the whole Region of the nether Belly is lifted up into a greater bulk, as if by a certain Spirit thronging violently into it. *What preparations of Iron are not convenient.*

Neither here are they fit, from which the ſulphureous particles together with the ſaline are chaſed away, as in *Crocus Martis* prepared by long and ſtrong Calcination. For this Medicine as it is conducing to ſtop all fluxes, rather fixes any impaction of Humours and Spirits, and renders them more obſtinate.

What ſort may be admittd. But there remains a Martial Remedy of a middle kind, wherein the Sulphur being wholly or for the moſt part expell'd, a vitriolic Salt remains and predominates: as indeed it is in the ſolution of the filings of Iron, or in a ſimple Infuſion, or in Mineral water, in the Salt or Vitriol of *Mars*, in our preparation of Steel, with many others; out of which medicines, being prepared or compounded, we find by often Experience that in ſome caſes, they contribute notable help. For theſe deſtroy the exotick ferments of the bowels, and reſtore the native ferments; they open their obſtructions, they fix the blood, and reſtrain its conſiſtence from too much diſſolution; wherefore Chalybeate remedies, after the ſame manner as certain other alteratives, do perhaps ſomething profit againſt the procatarctick, and more remote cauſes of a Tympany; but as to the conjunct cauſe, they contribute little or no ſuccour.

Forms of Chalybeates. *Take of our Steel finely prepared two drams, the diſtilled water above preſcribed two pound, Syrup of the five Roots two ounces, mix it in a glaſs, let it clarifie by ſettling, the doſe three or four ounces, in the morning, and at five afternoon.*

Take of the Powder of Aron-roots, Crabs-eyes, of each three drams, Cryſtal Mineral two drams, Vitriol of Mars *a dram and a half, Sugar of Roſemary-flowers two drams, mix them, the doſe half a dram twice in a day with a convenient vehicle.*

A liquor of the flowers of Tapſus Barbatus. *Hartman* doth wonderfully magnifie the liquor of the flowers of *Tapſus Barbatus* or Mullein, as a ſpecifick remedy in this diſeaſe, by putting the freſh flowers into a Veſſel, being ſtrongly preſs'd, and put into an Oven with bread being cloſe ſtopt, afterwards the Liquor being ſtrained, let it be diſtill'd *in Balneo*, the doſe one Scruple in the Decoction of Fennel-ſeeds and Roots. Surely this Medicine, if it doth effect any thing, ought to be given in a larger doſe.

Johannes Anglus commends an Electuary of *Roſata Novella* with *Diatrion Santalon*, and *Egges of Ants*, which remedy ſeems to promiſe ſomething probable enough. In imitation of this I here propound this enſuing.

An Electuary. *Take Conſerve of Chichory flowers, of Indian Creſſes, of each three drams, powder of Aron-roots, Lignum Aloes, yellow Sanders, of each one dram, Crabs-eyes one dram and a half, Salt of Wormwood one ounce, Ants Egges one ounce, the liquor of Tapſus Barbatus half a dram, with a ſufficient quantity of Syrup of Citron-rinds make an Electuary, the doſe two drams twice in a day, drinking after it of the former diſtilled water, or of the following Julep three ounces.*

A Julep. *Take the water of the leaves of Aron, of the Juice of Elder-berries, of the water of Juniper and Elder-flowers, of each ſix ounces, the magiſtral water of Snails, and of Earth worms, of each two ounces, Syrup of the Juice of Elder-berries two ounces, mix and make a Julep.*

Third Indication. III. The third Indication Vital preſcribes Remedies againſt fainting of Spirits, and difficult breathing, and againſt Watching and Thirſt. We will briefly annex certain forms of either kind.

1. Cardiacks.

Cordials. *Take of the water of* Napha, *Marygolds, Camomile, of each three ounces, of Dr.* Stephan's *water two ounces, Tincture of Saffron two drams, Sugar one ounce, Pearls one dram, make a Julep, the doſe four or five ſpoonfuls three times a day or oftner in faintings.*

Take Conſerve of Marygolds two ounces, Confection of Alchermes, and de Hyacintho, *of each two drams, prepared Pearl one ounce, Syrup of the juice of Citrons, enough to make a Confection, take the quantity of a Nutmeg evening and morning, drinking after it a draught of the Julep.*

2. Hypnoticks.

Hypnoticks. *Take of* Aqua Hyſterica *ſix drams, Syrup* de Meconio *half an ounce, mix them, and take late at night.* Or,

Take of ſmall Cinnamon-water one ounce, Diacodium three ounces, Tincture of Saffron two drams. Mix them, and take one ſpoonfull at night, if ſleep be wanting. Or,

Take

Take Syrup of Cowſlip-flowers three ſpoonfuls, compound Pœony-water one ſpoonful, Laudanum tartarized one dram, take one ſpoonful, if Watchings require it.

3. Extinguiſhers of Thirſt, in this Diſeaſe being very thirſty, ought frequently and in ſmall quantities to be adminiſtred, that that troubleſom ſymptom may be reſtrained without much drink, which is perpetually pernicious. For which purpoſe, *Things mitigating Thirſt.*

Take of Conſerve of Wood-ſorrel paſſed through a Sieve three ounces, Pulp of Tamarinds two ounces, Sal Prunella one dram, with a ſufficient quantity of Syrup of the juice of Wood ſorrel, make a Lohoch, of which let him lick often.

SECT. II. CHAP. V.

Of an Anaſarca.

NOw two kinds of Dropſies, *viz.* Aſcites and Tympanie (according to common reckoning) being finiſht, although the third, to wit an *Anaſarca* (for that it is an affection rather of the whole body, than of the nether Belly) appertains not properly to this place, notwithſtanding the Pathologie thereof having ſome affiance with the former, we think fit to deliver here alſo its Cure in ſhort. An Anaſarca is deſcribed after this manner, *That it is a white ſoft Tumour of the whole outward Body, or of ſome of its parts, yielding to the touch, and leaving a dent upon compreſſion*, proceeding from a watery humour extravaſated, and accumulated as well within the interſpaces of the Muſcles, as within the pores of the fleſh and skin, yea of the Glandules and Membranes. *The deſcription of an Anaſarca.*

It differs from an Aſcites as to its outward form and appearance, yet not as to its morbific matter, which being the ſame in both diſtempers, as it is heaped within the greater or leſſer hollowneſſes, it gains divers Appellations of the Diſeaſe. *How it differs from an Aſcites.*

The watery humour procuring an Anaſarca, doth proceed altogether or for the moſt part from the blood; for it being continually produced within the maſs of blood by the fault and defect of ſanguification, it is poured out in greater abundance from the extremities of the Arteries, than can be received, or brought back by the Veins, or the Lymphaducts, or can be diſcharged by the Reins or pores of the skin, and other vents of the ſerous Juice. *The Original from the blood.*

From theſe it follows, that the material cauſe of this Diſeaſe is a watery humour, and the efficient is blood, which engenders waters and depoſits them in the places affected. We will exactly weigh the reaſons of either of them, and the manner of becoming and effecting it, and firſt we will treat of the efficient Cauſe of an Anaſarca. *The material and efficient cauſe.*

1. The affection of the Blood, or rather the Hydropical brood, conſiſts in theſe two things, to wit, Firſt by reaſon of a failure or fault of ſanguification, it doth not rightly aſſimilate the nutritious Juice perpetually infuſed into its maſs, but ſuffers it to degenerate into a watery humour: Then ſecondly by reaſon of the too looſe mixture thereof, it doth not retain that humour, ſo degenerated, ſo long within its conſiſtence, untill it might be diſcharg'd through fit Emunctories or Emiſſaries, but lets it out every where near to the ends of the Arteries, into the inter-ſpaces of the Veſſels, and there leaves it. Either of theſe vices of the Blood we will conſider a little more. *The Blood its efficient cauſe in a double reſpect.*

In the firſt place as to the former, for the moſt part it is confeſſed by all, that the Blood it ſelf and not the Heart or Liver ſanguifies, by what of late is plainly underſtood concerning the functions of theſe parts; yet by what means the Blood aſſimilates Chyle infuſed to it ſelf, and converts it into freſh blood, to be beſtowed to ſo many and diverſe ſorts of uſes, doth not eaſily lie manifeſt to us. But what ſome affirm, that it is made only by the exact comminution and commixtion of particles, and for that cauſe the particles of either kinde being confuſed together, they think, that within the *Firſt that it doth not rightly ſanguifie.*

ſtraiter paſſages of the Liver and Lungs they are kneaded and wrought together as it were with little peſtils, ſeems little probable to me; but on the contrary, I think theſe bowels (as I have ſhewed already) are conſtituted the Organs rather of ſeparation than of mixture; but the reaſon of ſanguification altogether conſiſts in this, that the active particles of the old blood, to wit, the ſaline and ſulphureous, being placed in vigour with the ſpirituous, immediately act upon the like particles of the infuſed Chyle as yet exiſting in an inferiour ſtate, and do ſo ſtir them up and ferment them, that thereupon being extricated from the coverings of the thicker parts, they are carryed into a like degree of exaltation or perfection with the former, and being at length aſſociated with them, and made alſo homogeneous, they put on the ſame nature of Blood; the more thick and heterogeneous particles being removed thence to another place, from thoſe which they had deſerted and gone away from. For truly Sanguification is altogether finiſht by Fermentation, even as the maturation of the Muſt into Wine or Ale; but the reaſon of the difference is, that Wine being ſhut up in the Tub, ſtill remaining entirely in the ſame Maſs, is ſlowly fermented, as to its whole conſiſtence, and is not accompliſhed but in a long ſpace of time; but the Blood conſtituted in a perpetual flux by the loſs of ſome parts and the reparation of others, is fermented by the parts ſtill received freſh, and is generated anew.

The reaſon whereof inquired into.

The reaſon and manner of ſanguification explained.

The old Blood for the moſt part affords the ſame thing towards the freſh Chyle, as Ferment from the flower or fæces of old Ale, being put into new Ale; notwithſtanding as it were by a contrary manner; becauſe the huge maſs of blood being formerly fermented, doth ſuddenly ferment and alter the ſmall portions of the Chyle continually brought in; but the fermenting liquor in Ale in a very little quantity is put to the great maſs of the other liquor to be fermented; which it brings not to maturity under a long ſpace of time. After the rudiments of blood are ſo caſt by fermentation, the concluſion and perfect aſſimilation into blood, is acquired by accenſion; (for ſurely that it is ſo enkindled (as I think) I have formerly ſhewed by demonſtration, which arguments chiefly taken from its proper paſſion, although many have cavil'd at, none have been yet able to overthrow.) Wherefore, while the whole maſs of blood conſiſts of Blood and Chyle confuſedly mixt together, it is fermented while it is circulating; and being divided into moſt minute portions, is ſpread through the whole Lungs, that it might be kindled ſucceſſively according to all its parts, by the nitrous air ſuckt in: for by that means both the vital flame is continued, and all the particles of Blood having as it were paſſed the fire, become more purified, and more agreeable among themſelves; moreover, they are ſo diſpoſed of whileſt they are kindling, that while ſome go into Nouriſhment of the Spirits, of the Nervous Juice and the ſolid parts, and others leſs uſeful depart into the ferments or recrements of the bowels; mean while others being more fixt, abide longer in the maſs of blood, and ſuſtain its conſiſtence, and by fermenting the Nutritious Juice, ſtill engender new Blood, untill themſelves being impoveriſhed, are at length diſcarded, and give place to others that are freſh and luſtie.

An Hydropick temper of the blood ſprings from a double reſpect.

Having ſhewed after this manner by what courſe Sanguification ought to be finiſhed, as well by fermentation as accenſion of the Blood; it will be eaſie to conceive wherein the fault conſiſts producing an Hydropick diſpoſition: To wit, this uſually aſſumes its riſe whenſoever either or both thoſe Conditions requiſite to Sanguification, ether fail, or are perverted.

Viz. Firſt from the defect or fault of its Fermentation;

Firſt therefore this happens more frequently and rather, for that the blood being depraved in its temperature, doth not rightly ferment the Nutritious Juice poured into it, that ſo it might be changed into laudable blood. For when the watery particles predominate with the earthy in the maſs of Blood, the Salt and Sulphur being depreſſed with the Spirit, as all the functions, both Vital and Animal, from thence languiſh and waver; ſo eſpecially Sanguification it ſelf fails and is perverted. For the Juice of the Chyle commixt with the Blood, when it cannot be diſſolved and fermented, with the particles thereof, (after the faſhion of other liquors, as often as being mixt they want ferment,) it degenerates perhaps into a watery, acid, or ropy, or otherwiſe faulty humour, which being afterwards daily encreaſed, and at length riſing to its fulneſs, lyes heavy on the blood, and oft-times almoſt ſtifles its heat; from whence there is a neceſſity that it be forthwith diſcharged by ſome means, and whereſoever it can get vent; but afterwards for that the offices of ſeparation fail in their functions (the ſtock of the animal Spirits languiſhing by reaſon of the diminiſhed proviſion from the influxe of Blood,) the abounding Serum is depoſited

every

every where into the pores, and next vacuities whether greater or leſſer, out of the little mouths of the Arteries; from whoſe daily and great encreaſe, after all the pores are filled, ariſes that as it were fenny habit call'd *Anaſarca* of the whole body outwardly, or of ſome of its members.

Secondly, not only the defect or fault of Fermentation, but alſo of the accenſion of the Blood, induces ſometimes an Hydropical diſpoſition on the maſs thereof: which is clearly diſcern'd, inaſmuch as ſome perſons inhabiting Maritime or mooriſh places, fall into the Dropſie without any other cauſe or occaſion, than that they draw a thicker air endowed with heterogeneous vapours, by which the Nitre is either driven away or obſcured. Therefore the blood becoming degenerate, and vitiated as to its temperature, becauſe it is not duely kindled, nor perfected by efflagration within the Precordia, doth not rightly diſſolve and aſſimilate the Juice of the Chyle, but ſuffers it to be perverted into a watery liquor. But although in the firſt place, the blood being depraved for this reaſon, ſometimes loſes its fermenting vertue, and therefore the rather and more immediately procures a Dropſie; notwithſtanding it is manifeſt, the firſt fault thereof aſſumes its origine from unwholſom air ſuckt in, and not duely enkindling the Blood; becauſe ſuch Hydropicks removing their reſidence into Sunny and Mountainous places, recover their health without any other Medicines. *Secondly, from defect of Accenſion.*

Hitherto of the neareſt Cauſes of an Anaſarca and which are conjoyned to the Diſeaſe it ſelf, which namely are the depravation or defect of the maſs of blood, chiefly as to its fermentation, and in ſome meaſure as to the enkindling thereof; which latter is ſcarce wont to be effective but when it follows the former: But what remains as to the more remote and procuring cauſes of this Diſeaſe, to wit, from which the defermentative affection ariſes (that I may ſay no more of the defect or depravation of its enkindling;) I ſay that theſe appear ſo diverſe and many, that I judge it hardly poſſible to recite them all particularly; notwithſtanding, very many or at leaſt the chief may be reduced to theſe three heads: to wit, For that the watery diſtemperament of the blood doth ariſe, inaſmuch as its active Principles, *viz.* Spirit, Salt and Sulphur, are not inveſted with their fermenting and ſanguifying force or vertue, I account this to come to paſs, either Firſt becauſe thoſe particles are too much waſted by their great expences; or Secondly becauſe they are not repaired by convenient and proportionate Refections; or Thirdly, for that they are overwhelmed or obſcured by ſome other duller or heterogeneous Particles being too much accumulated in the maſs of Blood: We will a little weigh the Reaſons and ways of each of theſe their coming to paſſe. *Reduced to three heads.*

In the firſt place, the former of theſe is evidently diſcerned in frequent and inordinate Hæmorrhages, whereby many men, although ſtrong and formerly healthy, are immediately enclined to a Dropſie, more than from any other accident or occaſion; the reaſon whereof is, that the blood is ſo impoveriſhed, through its more noble Particles iſſuing out in great abundance, that afterwards it can neither duely ferment nor enkindle the Juice of the Chyle brought into it. Moreover, ſometimes the ſame effect ſucceeds (although in a more ſlow degree) from Feavers and other long maladies and languiſhings; to wit, inaſmuch as the blood ſuffering under a long depreſſion, is ſo extenuated and robb'd, that at length it becomes watery and defermentative. *Firſt, becauſe the active particles of the blood, are too much conſumed.*

Secondly, the Blood ſometimes deſerting its genuine diſpoſition, declines into an Hydropical one, for that the nouriſhment being more ſlender than it was wont, or ought to be beſtowed upon it, its active and ſanguifying Particles are not enough repaired within its maſſe; for ſo we have obſerved, that ſome who have uſed themſelves to Wine and ſtronger Drink, after they have been reduced to homely Diet, and ſmaller drink, of water or ſmall beer, ſuddenly have become Hydropick. It is a common obſervation, and frequently true, although of ill omen, that Drunkards, and daily drinkers, if that wild Cuſtom be left, at length becoming ſober and abſtemious, are much in hazard, leſt by reaſon of the uſual fermentation of the blood being depreſſed, they become obnoxious unto that Diſeaſe. I knew a notable Drunkard, who declared that a Prieſt very learned and Pious was guilty of his death, becauſe he gave him admonition to Temperance, and to leave his Drunkenneſs, and he complying therewith, incontinently fell into a mortal Dropſie. *Secondly, becauſe they are not enough repaired.*

But the third cauſe or occaſion diſpoſing to that Diſeaſe, the moſt common and notable, conſiſts in this, that the active Particles of the Blood, being involved with other *Thirdly, becauſe they are buryed in duller particles.*

other more dull or heterogeneous ones, or being diſſipated from one the other, loſe their fermentative power, or cannot enough exerciſe it. But ſuch an affection of them, as it is wont to be raiſed from various cauſes and accidents, ſo chiefly from theſe, three, one while ſolitary, another while united together; to wit, Firſt from the Non-naturals immoderately received: Secondly from the Naturals unduely retain'd; or Thirdly, from the Preternaturals corruptly generated in the body.

Whereof there are three cauſes.

Firſt from Non-naturals immoderately ingeſted.

The errors of Diet deſervedly may be referred to the firſt rank of theſe (whereby the ſtock of that Diſeaſe is always moſt abundant) For it is a common Prognoſtick and in every bodies mouth, that Gluttons and great Drunkards dye at length of a Dropſie: to which moreover, not only Surfeits and immoderate and daily Tiplings incline, but alſo frequent and unſeaſonable Treats; and moreover the continual pouring in of abſurd and hard to be digeſted Nouriſhment. For from the evil courſe of Diet of each kind uſed any while, whenas the Juice of the Chyle, oftentimes crude, incongruous, and above meaſure plentiful, is poured into the maſſe of blood, it of neceſſity follows, that it is firſt burdened, and afterwards its Conſiſtence being looſened, the more noble Particles being forced aſunder, it is ſo involved, or abated by the other heterogeneous ones, that being hindred, it deſiſts from its fermentative or ſanguifying virtue; inſomuch that the bowels being in a ſhort time hurt by its aſſaults, a Cachexia, and then a Dropſie followes, whereof that is alwayes a forerunner.

Secondly, From Naturals unduely retained.

Secondly, in this place are put all ordinary, accuſtomed and ſolemn Evacuations ſuppreſſed. It is obſervable enough, that a Cachexie, and often a Dropſie, doth ariſe from a menſtruous or Hemorrhoidal flux diminiſhed or ſtopt, no leſs than from a too immoderate one, (by reaſon of the fermentation of blood impeded by the heterogeneity of Particles.) Moreover, the ſame is often wont to be effected from Iſſues ſuddenly ſtopt, or eruptions of the Skin ſuddenly repercuſs'd. Laſtly, ſuppreſſion of Urine, and ſweating much hindred, do render the blood more watery, by an immediate and neceſſary affection, and incline to the Dropſie. Alſo it is an obſervation frequent enough of healthful Perſons, who being compelled for ſome time to abſtain from going to Bed, that their feet have ſwoln.

Thirdly, From Preternaturals generated in the Body.

Thirdly, Preternatural things generated within the Body, but eſpecially Tumours and Humours do hinder the motion of the blood, or pervert its temper, and ſo induce an Hydropical diſpoſition. Tumours ſtirred up in ſome place about the Bowels, inaſmuch as they hinder or ſtraiten the circuit of the Blood, do cauſe its Serum to be there extravaſated, and poured out; by the accumulation whereof within ſome cavity, in the firſt place an Aſcites (as we have ſhewn above) and at length an Anaſarca a conſequent of that doth frequently enſue. Moreover, Humours of divers ſorts being engendred in divers places within, and transferred into the blood, do firſt pollute the maſſe thereof, and defile it with heterogeneous Particles, whereby at length it is ſo depraved in its temperament, that it perverts the Juice of the Chyle brought in (when it cannot further ferment and aſſimilate it) into an hydropical liquor. For this reaſon, nothing is more uſual than that Conſumptive perſons, and thoſe that are affected with ſtrumous and cancrous Ulcers, nay of any ſort within the Reins, Meſentery, Guts, or other Bowels of the lower Belly, after they have been long conſuming, dye at length hydropical.

Different manners hereof are reckoned.

The material cauſe of an Anaſarca is partly the Serum of the Blood, and partly the nutritious Juice.

Hitherto concerning the next efficient cauſe of this Diſeaſe, alſo of the chief remote ones, as well procuring, as evident. But as to what appertains to the material cauſe, it is obvious unto the Senſe, that it is a meer Lympha accumulated within the pores of the Skin, and of the other outward parts; which being depoſited there by the blood (the liquor thereof being partly ſerous, and partly chylous Juice) but failing in Sanguification and Nouriſhment of the body, to which it was deſtinated, it is caſt off like recrements into the vacuous ſpaces of every veſſel. And though the matter of the Dropſie proceed from the Blood and Chyle, yet it is no wonder if it appear neither like blood, nor milkie, but only limpid; becauſe the Urine even of healthful people, after more plentiful drinking, is rendred crude as well as watery; and therefore it is manifeſt, it is nothing changed by the blood, but leaves in that place, whatſoever of colour or thicker conſiſtence it brings to its maſſe. And although a reaſon may be given in either caſe, that the Urine, inaſmuch as it is ſtreined through the Kidneys, and the hydropic matter thorough the pores of the ſolid parts, even ſo become limpid and watery; notwithſtanding it is evident by obſervation, that the watery part of the Chyle, even while it is confounded with the blood, is not intimately mixt with it, but being deprived of its colour and conſiſtency, it remains under the

the form of Lympha, within the pores of the blood; the ſure ſign of which is, that the blood taken from any Animal by Phlebotomy, after being cold it is divided into parts, exhibits a watery liquor (which conſiſts of Serum and Nutritious Juice) plainly limpid, and ſeparate from the other blood. It will be from our preſent purpoſe to enquire any further into the reaſons hereof, and manner of being ſo, and wherefore blood, which being poured into water doth preſently tinge the ſame, and bloodies all ſolid bodies whenſoever it is ſprinkled thereon, yet dyes the Serum of no colour with which it is intimately confounded and a long time circulated.

Why the hydropick humour is limpid and not milkie nor bloody.

From the Ætiologie of this diſeaſe now delivered, the differences of it may eaſily be collected; to wit, firſt it is either univerſal, when the whole habit of the body and all the members ſwell up; or it is particular, wherein for the moſt part the inferiour members only ſuffer, in the mean time the reſt of the body pining away for want of Nouriſhment, which kind of diſtemper, and not a Tympanie, *Froſper Martianus* will have *Hippocrates* ſtyle the dry Dropſie, in which what is reported of the Syren, the dry is joyned to the watery.

The Differences of the Diſeaſe.

Secondly, an Anaſarca whether univerſal or particular, is either ſimple or complicated with an Aſcites; and then either an Anaſarca enſues an Aſcites, or this diſeaſe follows that. Moreover an Anaſarca may be diſtinguiſhed many ways in reſpect as well of the procatarctick as evident cauſes, as we have before intimated; and ſuch differences thereof are found to be frequently of great moment about duely inſtituting the Prognoſtick and Cure.

Wherefore, what relates to the prognoſtick part, this diſeaſe while it is ſimple, proves leaſt dangerous among all the kinds of Dropſies; and a particular one ſeiſing only the inferiour members, ſo that the belly doth not together ſwell with them, is much ſafer than an univerſal one.

The Prognoſticks of it.

An Anaſarca bringing on an Aſcites, wherein for the moſt part the Urine is plentiful enough, and the thirſt not very intenſe, is far more ſafe than an Anaſarca brought in by an Aſcites, wherein the diſeaſed do very much thirſt, and make little, red, and thick, and for the moſt part a lixivial Urine. In like manner it is, or worſe, when an Anaſarca comes upon a Tympanie or a Phthiſis (as ſometimes 'tis wont.) Laſtly, no ſlight Prognoſtick of this diſeaſe is taken from the complyance, or the obſtinateneſs of the Patient, about Diet and Medicine. For whatſoever the condition of the diſeaſe may be, if the hydropick perſon refuſing medicine will indulge his fancy, we may not hope any good from thence.

About the Curatory part to be deſigned in order, two chief Scopes of Healing do occurre, *viz.* Firſt, that the water between the skin be conſumed by ſome means; Secondly, then proviſion muſt be made, leſt it be continually generated and accumulated afreſh; for which purpoſe a Phyſitian is to employ his labour, both that the bowels of Concoction being emptyed of their Superfluities, and free from obſtructions, may always procure laudable Chyle, and ſupply the maſſe of blood in due plenty; as alſo that the blood (the principles thereof being reſtored to its fermentative power) may orderly ferment the Juice of the Chyle continually poured into it, and aſſimilate it into Blood. The vital Indication ſeems not at all neceſſary in this diſeaſe as in many others, for that very rarely in this appear ſwoonings of the Spirits, or Watchings, for which Cordials and Hypnoticks are required; and there is little need of reſtoring Diets, becauſe Faſting and Abſtinence rather help, and oft-times make up the greateſt part of the Cure: the reaſon whereof is, that the Veſſels being emptyed through want, do ſwallow up the waters between the skin, or ſtagnating in other places, and do diſcharge them forth partly by the Kidnies, by the pores of the skin and other Emunctories, and partly do advantageouſly employ them being yet turgid with alimentary Juice, to the nouriſhing of the body.

The Cure of it. Two Indications.

Firſt, That the firſt *Indication* being Curatory, intending an Evacuation of the morbific matter, may be performed, there ought to be exhibited all Hydragogue medicins, as well ſimple as compound; and alſo the forms of medicines recounted and preſcribed in the former Chapter of an Aſcites. Moreover, hereto belong not only Catharticks and Diureticks, but alſo Diaphoreticks, which though in other ſorts of Dropſies they are very much forbidden, often take place in curing of an Anaſarca.

The firſt intends the evacuation of the morbific matter.

In a ſimple Anaſarca we may lawfully adminiſter ſtrong Purgers, and frequently they much profit. And truly this Diſeaſe being cured ſometimes by means of a Cathartick, Empiricks do much glory of their Cures, and certain of their medicines become much cryed up for curing hydropical perſons; for if at any time it happens

By Purgers.

that

that they have healed one or two labouring with an Anaſarca, by their ſpecifick Hydragogues and Elateriums, it is enough wherewith they may always magnifie themſelves and their Art, although by the ſame medicine they have murdered a hundred Aſcitical perſons. Wherefore, although Preparations of Spurge, or *Elaterium*, *Pilulæ Lunares*, *Hercules Bovii*, and other Hydragogues, have ſometimes profited in ſome caſes; notwithſtanding if they be indifferently exhibited to all Hydropicks, or at all to any endowed with a weak Conſtitution, and Bowels of a brittle tone, or of evil conformation, they oftener cauſe death than remedy: wherefore let it always be committed to the judgment of a prudent Phyſitian, the time when, how long, and what ſort of Catharticks are to be uſed.

Strong Purgers are convenient but not to all.

We have before deſcribed forms of Hydragogue Purgers of every ſort, to wit, thoſe that exerciſe their power upwards and downwards, and as well mild as ſtronger workers, ſo that they may be referred hither, and accommodated to the method of healing now propoſed.

The manner of their working.

But if the reaſon be enquired, after what manner Purgers do operate in this diſeaſe, and why they more happily, and much more efficaciouſly bring out waters than in any other ſorts of Dropſie; I ſay, in an Anaſarca the morbific matter (which is the Lympha) ſubſiſts partly in the maſs of blood, partly in the habit of the body, within the pores and vacuities between the ends of the veſſels; wherefore, a ſtrong Cathartick being adminiſtred, preſently troubles and diſſolves the maſs of blood, and ſtirres it up to the excretion of any ſuperfluous or heterogeneous thing; and irritates alſo the little mouths of the Arteries gaping towards the Cavities of the Inteſtines, that the humour ejected from the blood may eaſier find vent through theſe Emunctories. From hence in the firſt place, the waters fluctuating within the blood are abundantly drained out, afterwards the veſſels being emptyed, do preſently ſwallow up again the waters between the skin, and preſently diſcharge them forth partly by ſiege, and partly by Urine, or Sweat; in the mean time there is no fear leſt, as in an Aſcites, the morbific matter being driven and poured from the blood, by the Medicine, ſhould be further forced into the places affected, whence not eaſily flowing back again, it ſhould be more largely encreaſed; nor leſt, as in a Tympany, by reaſon of the Fibres of the Stomach and Guts being too much irritated by the Phyſick, thoſe bowels might be provok'd into convulſive ſwellings. For as long as the bowels are firm and well conſtituted, the particles of the Medicine inflict them with no hurt; but preſently being brought into the blood, they do not only allure waters out of it, but by exagitating the maſs thereof, they raiſe the active particles formerly overwhelmed, and diſpoſe them towards their fermentative power.

Secondly, By Diureticks.

Secondly, Hydragogues working by Urine, as well ſimple as the compound, as alſo forms of Medicines prepared from either of them, and the manner of their adminiſtration, we have alſo deſcribed above, which alſo may be transferr'd hither to ſave repetition. But becauſe not all Remedies of this kind do help alike in all the Diſtempers, it is here obſervable, that for curing an Anaſarca *Lixivials* (as has been frequently manifeſt by our obſervation) do far excell other Diureticks. For indeed now it is a common and thredbare Remedy, for any one having ſwell'd members, after a previous Purge, to take twice or thrice in the day, from ſix to eight ounces of a Lye made of the Aſhes of Wormwood or Broom, made in White-wine, and to continue the uſe of it for ſome dayes. This Medicine moves potently the Urine as I have obſerved in many, yea ſometimes in ſuch abundance, that piſſing the quantity of half a gallon in a day and a night, the Patients have recovered their healths in a ſhort time even to a miracle.

And chiefly] Lixivials.

The reaſon and manner of their operation enquired into.

We have unfolded in a former Treatiſe, by what manner and faſhion Diureticks of ſeveral kinds do operate, and after what manner they affect the bowels, blood and other humours: But that in thoſe that labour under an Anaſarca, Medicines endowed with a fixt and lixivial Salt, expell Urine more than thoſe of an acid, alcali, or volatile Salt, the reaſon as I judge is this, *viz.* in thoſe affected with this diſeaſe, after the fermentation and ſanguifying vertue of the blood failing, the watery and crude humours heaped up as well in its maſs as in the habit of the body, do there remain almoſt immovable for a long time, till at laſt they (as the manner is of watery Juices long ſtagnating) do wax ſoure; wherefore the lixivial particles of the Medicine ſpread abroad in the blood preſently boyl up with the acids of the waters, which while they ferment and move, they ſtirre up in the whole maſs of Blood, a notable and excretive fermentation; inſomuch that all the particles being put into motion,

not

not only the watery and ſuperfluous being thruſt from the reſt, are diſcharged by the Reins; but alſo the innate and active particles of the blood it ſelf, unfold themſelves from the more groſs with which they were involved, and laſtly riſing up, they begin to reſume their fermenting power, and to ſanguifie.

Take of the Aſhes of Broom or Wormwood, or of the twigs of a Vine calcined to whiteneſs and ſifted, four ounces, put them into a glaſs bottle with a quart of White-wine, let them digeſt cloſe ſtopt and warm for three or four hours, after ſtrain it; the doſe from ſix to eight ounces twice a day. Forms of lixivial Diureticks.

Take of white Tartar calcined with Nitre, and after melted in a Crucible to blueneſs three ounces, ſmall Spirit of Wine a pound and a half, water of Snails and Earth-worms, of each four ounces, digeſt them in a Sand furnace for two days: the doſe of the clear liquor from two to three ounces, with four ounces of the decoction of Kneeholm and Burdock-roots in Ale.

For ordinary Drink:

Take of the white Aſhes of Broom cleanſed two pound, put them into a little Bag, with three ounces of Saſſafras, one ounce of leſſer Galangal, an ounce and a half of Juniper-berries, and as much of Carrot-ſeeds, make a bag for four gallons of Ale, after ſeven or eight dayes begin to draw it.

3. *Diaphoreticks* do often very notably help in a Leucophlegmatia (which is the commencing or declination of an Anaſarca) but in this diſeaſe confirmed, they are wont to be more convenient than in other kinds of Dropſies. And although from the beginning they cannot cauſe Sweats, by reaſon of the habit of body ſurrounded as it were with a more thick marſh, however while they exagitate the blood, they cauſe the innate active particles thereof, being before dormant, and half overwhelmed, to be raiſed up and diſpoſed towards fermentation, and alſo they cauſe all the excrementitious, and chiefly the watery, to be raiſed into motion, ſo that preſently flowing out of their Receptacles, they may the more readily and eaſily find way by ſiege or Urine, and oftentimes in ſome part by tranſpiration. But truly after the waters being poured out by purgation, the morbific matter is diminiſhed ſo much, that the bulk of the body and the ſwelling of the members begin to abate, the reliques of the humour are beſt conſumed by a moderate tranſpiration and conſtant ſweating. *Diaphoreticks.*

We have deſcribed before the number and forms of Hydroticks; as to the preſent purpoſe for curing an Anaſarca, thoſe chiefly are fit which are given in a larger doſe; for they whoſe quantity is very ſmall, their active particles being overwhelmed in the waters, are loſt before being infuſed into the blood they can exert their ſtrength. Wherefore, Spirits, whether armoniack or vinous, as alſo Tinctures and Elixirs, yea and powders, are more rarely uſed in this diſeaſe, becauſe they effect little in a leſſer doſe, and if they be exhibited in a very large one, they often hurt the bowels by their outrage; But thoſe things are rather choſen, which being taken hot, and in a full draught, are able to paſs into the whole blood not weakned; of which ſort, in the firſt place are Decoctions of Woods, and Roots, whoſe particles being agreeable enough to the Blood, and not to be tamed thereby, do paſs through the whole maſs thereof, and do exert their Elaſtic power by moving together all the humours. *Diaphoreticks profit which are taken in a larger doſe.*

Take of the Shavings of Lignum Vitæ ſix ounces, Saſſaphras two ounces, of each of the Sanders ſix drams, ſhavings of Ivory, Harts-horn, of each three drams, let them be infuſed and boyled in eight pound of Spring-water to half; adding of Calamus Aromaticus, leſſer Galangal, Burdock and Butter-Bur-roots, of each one ounce, the leaves of Sage, Germander, dryed, of each two handfuls, let the ſtrained liquor be kept for uſe; the doſe from eight to ten ounces twice in a day warm; to every doſe may be added 20 or 25 drops of Spirit of Sal Armoniack drawn with Amber, or of Spirit of Soot, or half a dram, or a dram, of Tincture of Salt of Tartar. Forms thereof.

Hitherto of inward Hydragogue Medicines, which cauſe the Lympha to be drawn forth, either by alluring it inwards towards the guts, or by driving it forth to the Reins or pores of the skin. Beſides, there are certain outward adminiſtrations in uſe, by which the water accumulated within the habit of the body are moved toge- *External Hydragogues.*

ther, and ſo are either generally diſpoſed to go forth by ſweating, or Urine, or particularly are ſent out forthwith, a vent being made in ſome private places.

The chief Kinds of them, and the manner of their Adminiſtration.

In the firſt rank are placed Frictions, Liniments, Fomentations and Baths as well dry as moiſt: Then thoſe particular things that bring out waters are, Veſicatories, and things that bring the Skin to an Eſchar, and prickings by a Needle. We will treat briefly on each of theſe, or at leaſt of the principal of them, as far as they have reference to this diſeaſe.

1. *Frictions.*

1. Frictions do frequently afford advantagious ſucceſs in a Leucophlegmatia and an Anaſarca: for when the habit of the body is not only filled with a watery illuvies gathered there together, ſo that nothing can evaporate, but that the extern parts grow cold by reaſon of the approach of blood towards them being ſtopt, often and ſtrong frictions do move together the ſtagnating waters, and diſſipate them from thence in ſome meaſure, and alſo recall again the blood by opening the paſſages into thoſe parts from whence it was baniſhed; wherefore, not only the ſwoln members, but alſo the whole body once or twice in a day, is expedient to be rubbed with a courſe Cloth, or with a little Bruſh now ordinarily prepared for that purpoſe.

2. *Liniments, and,*
3. *Fomentations.*

2. 3. With or after Frictions, Liniments and Fomentations are ſometimes convenient. They are prepared either of Salts, and other Minerals diſſolv'd, or from hot and diſcuſſing Vegetables, with the fæces of Wine boyl'd in water, the hot application whereof opens the pores, moves together more amply the accumulated waters, and diſcuſſes them, and alſo enlarges the compaſs of the bloody Circuit, the watery heap being ſomewhat diſſipated. Let the Liniments conſiſt of Sulphur, and Salts of a diverſe kind, or of Quick-lime, and other Minerals, which being powdered and mixed with the mucilaginous Extracts of ſharp Herbs, are reduced into the form of an Unguent; to which let a fit quantity of Oyl of Scorpions be added, for the better conſiſtency. Moreover this Oyl (ſo it be genuine) applyed by it ſelf, doth frequently afford notable help. I knew a Boy much ſwell'd with an univerſal Anaſarca, who was cured by this Remedy alone: for his mother (I know not by whoſe advice) anointed his whole body morning and evening with Oyl of Scorpions, ſtrongly rubbing all the parts with her hot hand; by which act within three dayes he began to pour forth abundance of Urine, and when he had continued piſſing ſo for ſome dayes, the ſwelling vaniſhing by little and little, he became ſound.

4. *Baths.*

4. Baths are not convenient in any Dropſie but an Anaſarca, and not for this unleſs in a Diatheſis or Declination. For ſeeing the Blood from the heat thereof, encompaſſing the whole Body, being made boyling and ſtirr'd up, every where puts in motion the waters formerly ſtagnating, and ſwallowing them up into it ſelf, conveys them variouſly away; the danger is, leſt (as frequently it falls out) receiving them out of the habit of the body into its own maſs, it ſhould depoſe them preſently into the Præcordia or the Brain: for there is nothing more uſual than an affection of thoſe parts, *viz.* an Aſthma or Apoplexie to come upon Hydropicks by unſeaſonable bathing. But when the conjunct cauſe of the diſeaſe (*viz.* a Swelling) becomes moderate, or not much, a Bath of water impregnated with Salts and Sulphur, or a Hot-houſe, by which a gentle Sweat is promoted, is frequently adminiſtred with ſucceſs: As for the Stew it is more expedient, and oft-times notably helps, that the Patients be placed in fitting Seats in Salt-houſes, near the Furnaces wherein Mineral Waters are boyled into Salt.

5. *Veſicatories.*

5. Veſicatories ſend out abundantly the waters between the skin, and often too profuſely. Touching the manner how they operate we will treat more ſpecially hereafter; in the mean time we adviſe, that they are very cautiouſly to be exhibited to Hydropicks, for that Epiſpaſticks of this kind, applyed to the ſwell'd places, do make the Emiſſarie too open, by which apertion the water in the firſt place burſting out, draws oftentimes a great illuvies after it from the neighbouring parts, whence immediately enſues a great proſtration of the Spirits. Moreover, ſometimes the place is ſo ſuddenly emptyed, that being deſtitute of heat and ſpirits, it is in a ſhort time ſphacelated or mortified; wherefore this Medicine is ſeldom applyed to the Legs, or the Feet of Hydropical perſons, where the heat is weak, and the humour greateſt, but ſometimes to the Thighs and Arms with ſecurity (as often as there ſhall be need.)

6. *Eſcharoticks.*

6. *Eſcharoticks* are adminiſtred a little ſafer than Veſicatories, to the ſwell'd places, becauſe from this Emiſſary the flux of waters happens not ſo headlong and abundant at firſt: but commencing moderately grows up by little and little to a great ſtream,

ſtream, which Nature (after that by degrees it is accuſtomed thereunto) endures the better. Moreover, there is leſs fear of a Gangrene from an Eſcharotick than from a Veſicatory, becauſe in that application the part, whoſe union is diſſolved, is defended by the Eſchar againſt the loſs of heat. I have known ſometimes an illiterate and rude Empirick, who frequently by an Eſcharotick did evacuate with ſucceſs the members of hydropick perſons, however ſwell'd, by the enſuing manner: to wit, he fomented the legs evening and morning with the Decoction of Dwarf-Elder, Wormwood, Cammomile and other hot herbs put into the Lees of Ale or Wine; and between the times of the Fomentations he applyed a Cataplaſm prepared of the maſſe of that Decoction with Bran; after he had uſed theſe for three dayes, he covered both legs and feet with a Plaiſter of *Burgundy* Pitch, leaving only a ſmall hole on each Calf, about the bigneſs of a Nut, in which places he put an Eſcharotick, on the bare skin, of the Aſhes of Aſhen-bark: which after twelve hours being removed, a ſmall Eſchar was left, from whoſe pores water was wont at firſt ſlowly to ſweat out, afterwards day by day a little more plentifully to drop out, and afterward (the Eſchar falling off) it uſed to flow out more abundantly as from an open Spring untill it had drein'd the whole leg both beneath and above.

The empirical manner of Eſcharoticks.

7. There remains another manner (not inferiour though leſs uſed than the former) of draining out the waters between the skin, *viz.* by the pricking of a Needle; which likewiſe ought cautiouſly, and minutely to be uſed, leſt a headlong and too great efflux of waters be provok'd thereby. Take an ordinary Needle (ſuch as Taylors uſe) and let it be thruſt into the skin, pricking over the place chiefly ſwelled, only ſo far that blood follow not: and ſo at one time let ſix or ſeven little holes be made, a thumbs breadth diſtant from each other; from every little hole the water will iſſue forth by drops, and ſo it will contiually drop out untill all the ſwelling vaniſh about the place ſo pricked; afterwards, the next time after twelve hours, another while after 18 or 24 hours, let the ſame pricking be exerciſed in another part of the ſame thigh, or of the other; and afterwards once or twice a day in this or that member, or in both together, or in more places, let ſuch Emiſſaries of the water between the skin be excited. For in truth after this manner the hydropick illuvies may be exhauſted more plentifully and ſafely than from any other outward Chirurgery; In the mean time if the new proviſion thereof be provided againſt by inward Phyſick, the diſeaſe will be the eaſier cured. Moreover in a deſperate Dropſie life is beſt prolonged by ſuch an adminiſtration, for that the waters being exhauſted continually by thoſe outward Emiſſaries, the inner inundation of life is longer protracted. Not long ſince an old man aged ſeventy years, overwhelmed with a Dropſie over his whole body, by the help of this Remedy only, remained living for many moneths beyond expectation, and raiſed his head above the waters.

7. Pricking with a Needle.

Hitherto of the Kinds and Forms of Remedies ſuggeſted by the firſt Indication, *viz.* the Curative; what belongs to the other, to wit the Preſervatory, which reſpects the temperature and ſanguifying power of the Blood to be reſtored, it offers Medicines of that ſort which being endowed with more hot and Elaſtick particles, revive the active or depreſſed Principles of the maſs of blood, or cauſe thoſe conſumed to be repaired, for which end Remedies commonly called Altering are wont to be preſcribed under the form of an Electuary, Powder, Pills, diſtilled Water, Julep, Apozeme and Diet, to which alſo Spirits, Tinctures, Elixirs, are ſometimes added, for the better efficacy. We will propound one or two Examples of each of theſe.

The ſecond Indication preſervatory what kind of Remedies it ſuggeſts.

Forms of them.

1. *Take of Conſerve of Roman Wormwood, Scurvy-graſs, the yellow Rindes of Oranges, of each two ounces, Winters-bark two drams, Species Diacurcumæ a dram and a half, of Steel prepared with Sulphur three drams, Syrup of Citron-peels what ſuffices to make an Electuary, the doſe two drams morning and evening, drinking after a draught of the Julep, or three or four ounces of the diſtilled water.*

1. Electuary.

Chalybeate Medicines notably help in this Diſeaſe, as in the green ſickneſs of Virgins, infomuch that frequently the whole or chief ſcope of curing depends upon this kind of Remedy; yet we are to obſerve, that not all Medicines of this kind are equally convenient in theſe caſes: for thoſe which are chiefly in uſe, *viz. Salt of Steel*, or *Vitriol of Mars*, and others prepared with acids, and deprived totally of Sulphur, do not help, inaſmuch as they do not promote the fermentation of the blood, but rather on the contrary fix it, being too wild or elaſtick. But for an Anaſarca or any watery

Chalybeats profit much in this Diſeaſe.

But only thoſe endued with Sulphur.

watery tumours, in a cachectick habit of the body, Chalybeates of that ſort are given, wherein the ſulphureous particles are left, and are predominant; as in the firſt place the Filings of Iron, and the Scales, reduced into a fine Powder, alſo Steel diſſolved with Sulphur, and powdered. The powders of this being taken, are preſently diſſolved by the acid Salts within our body, whence the ſulphureous metallick particles being ſet free, and brought into the blood, they ferment the whole maſs thereof, and revive the like particles in the ſame, which before lay dormant, and being conjoyned therewith, they give vigour to the blood, and renew its ſanguifying power being formerly depreſſed. Wherefore we may obſerve by uſing but a little Chalybeates of this ſort, the green and yellow colour of the face is converted into a florid.

2. *Powders.* 2. *Take of the compound Powder of Aron-roots, of Winters bark, of each three drams, leſſer Galangals, Cubebs, of each a dram and a half, of Steel prepared with Sulphur half an ounce, Sugar of Roſemary flowers ſix drams, make a Powder, divide it into twenty parts. One part is the doſe, morning and evening, with a draught of the ſudoriferous Decoction before preſcribed.*

3. *Pills.* 3. *Take half an ounce of the gummous Extract reſiding after the diſtillation of the Elixir Vitæ of Quercetane, powder of Earth-worms two drams, leſſer Galangal, Winters-bark, of each one dram and a half, Salt of Wormwood two drams, of Ruſt of Iron two drams and a half, Balſam of Peru one dram, Tincture of Salt of Tartar two drams, Balſamum Capivii what ſuffices to make a maſs to be formed into ſmall Pills, the doſe half a dram evening and morning, drinking after it three ounces of the Julep or the diſtilled water following.*

4. *Julep.* 4. *Take of the water of Elder-flowers, of the juice of their Berryes fermented, of each one pound, water of Earth-worms magiſtral, of Rhadiſh compound, of* Aqua Mirabilis, *of each two ounces, Syrup of the juice of Elder-berries two ounces, mix them and make a Julep.*

5. *Diſtilled water.* 5. *Take the leaves of Garden Scurvy-graſs, of Hedge-Muſtard, of Pepper-wort, of each ſix handfuls, of the Roots of Calamus Aromaticus, Galangal, of* Zedoaria, *Orris of* Florence, *of Elder, Aron, of each ſix ounces, Winters-bark,* Jamaica *Pepper, of each three ounces, Juniper-berries four ounces, Cloves, Ginger and Nutmegs, of each one ounce, ſlice and bruiſe them, and pour upon them eight pound of old Rheniſh-Wine; diſtill it in common Organs, let the whole Liquor be mixt.*

6,7. *Decoction.* 6, 7. An Anti-hydropick Decoction is deſcribed above, among the Diaphoreticks. A Diet-drink is to be taken inſtead of Ale, and is to be made according to the enſuing form.

Diet-drink. *Take of Shavings of Guaiacum, Saſſafras, of each four ounces,* Florence *Orris-roots, Calamus Aromaticus, Galangal, Enula-campane, of each one ounce and a half, of Juniper and Bay-berries, of each two ounces, Anniſeeds, Carue, Sweet-fennel, Coriander and Dill-ſeeds, of each one ounce, long Pepper and Cubebs, of each an ounce and a half, Cloves, Nutmegs and Ginger, of each half an ounce,* Jamaica *Pepper two ounces, the dryed leaves of Sage, Wood-ſage, Calamint, Agrimonie, of each one handful, Liquoriſh four ounces ſliced and bruiſed, boyl it in four gallons of Spring-water to half, the ſtrained liquor being cold, let it be kept in glaſs Bottles for uſe; with the conſtant uſe of this drink, I have known many laborring with a deplorable Anaſarca to be made well. Among many Examples of Dropſies cured, I ſhall propound but one.*

An Example of the Cure of an Anaſarca Dropſie. A certain ſtrong man of a middle age, after he had contracted an Epidemical Quartan Feavour, and being evilly handled from its beginning, had laboured with it above a year, and in the mean while had uſed an ill courſe of Diet, fell into an Anaſarca, which afterwards in a ſhort ſpace augmented hugely, by reaſon he indulged himſelf more freely to drink for quenching his thirſt (which was outragious) ſo that all his members being ſwollen from head to foot, and over the very Abdomen it ſelf, he could not turn in his bed from ſide to ſide without help.

The Prognoſtick and Cure of the Diſeaſe. When I firſt viſited this man, and deſpairing of a Cure (as the Phyſitian in *Celſus* lib. 3. Chap. 21. *who denyed that any intemperate Hydropick could poſſibly be cured*) I immediately affirmed this Prognoſtick, *That he would dye in a ſhort time unleſs he abſtained from drink.* Whereunto he replying, profeſt he would not drink in a weeks

weeks ſpace, provided he might be helped; and indeed did as he ſaid, although being very thirſty, for ſix or ſeven dayes he ſcarce took any liquid thing in his mouth, but what was Medicine; and during that time, when in the mean while he took Hydragogues, Catharticks and Diureticks, and any other things preſcribed carefully, he became much better, and afterwards the method (before deſcribed) ſomewhile being adminiſtred, he was reſtored to his entire health, and even now though five years ſince lives and continues ſound.

There remain certain other ſplanchnical Affections, touching the Remedies whereof, according to the enſuing method, we ſhould here have treated, notwithſtanding I have performed this task already for the moſt part under other titles; for as is above intimated, Remedies which concern the Kidnies we have for the moſt part unfolded under the rank of Diureticks, and thoſe which concern the Stomach and Guts, under that of Vomits and Purges; what relates to the Spleen we have finiſhed in the Hypochondriac Pathologie; and what to the Womb in the Hyſterical. As to what appertains to the Genital parts and their Diſeaſes, and help, I reſerve for another time and place; it behoves me now next of all, after treating hitherto of the inward Pharmacie, to diſcourſe ſomething of the outward, and of the Reaſon or Ætiologie of the adminiſtrations thereof, which ſhall be done in the next Section, beginning with Phlebotomie, that great Remedy.

SECT.

SECT. III. CHAP. I.

Of Phlebotomie.

Phlebotomie a very general and ancient medicine.

AMong the universal Documents of Philosophie, or aids of Physick, none either in Theory or Practice hath been more ancient or general than the speculation of the Blood and letting it out by opening a Vein. As to the former we have in other places often explicated the nature and constitutive parts of the Blood, we have unfolded the Virtues and Energy of the same, and have demonstrated that it is in truth enkindled, and that from the burning thereof the flame of animal life, as of a Lamp, doth begin and receives continuation: But as to what relates to Phlebotomie, all Authors of every age have made mention thereof: Moreover the same was ever in Medicinal use with all Nations howsoever barbarous or rude. Neither is it a wonder, for truely Nature it self in the first place hath taught the necessity, and way of that part of Chirurgery; Even the Divine Law commanding the Rite of Circumcision, as a Symbol thereof, seems to intimate that the innate impurities of Humane Nature ought to be purged in some manner by letting out the blood.

Nature shews it by Hæmorrhagies.

That we may methodically discourse of this great Remedie, we ought first to consider, by what means, also for what causes and ends, the letting of blood either happens spontaneously to Nature, or is indicated by the Physitian; then secondly we will annex the chief effects of this Evacuation, as well good as bad, whether advantageous or disadvantageous, and together propound certain Rules and Cautions to be observed, about due administration of Phlebotomie.

As to the former, spontaneous Hæmorrhagies (which suggest the use of Phlebotomy) whereas they are manifold and of diverse kinds, they are usually reduced to these two heads or ranks: to wit, they are denominated either critical, Nature endeavouring something good and wholsome; or symptomatical, which for the most part happen, she being dejected from her government, and being altogether out of order. The bloody eruptions of the former kind are again distinguished; that they are either raised without a Feaver, and are either periodical, which happen often at set seasons, as the Flowers in Women, and the Hemorrhoids in some, and in others the solemn or otherwise accustomed opening of the Nostrils; which very often succeed according to the great changes of the Year, or alterations of the Air: or they are fleeting and uncertain, as when blood doth advantageously break out of those places, and of many others, one while in this part, another while in that part of the body. Moreover, bloody Crises do sometimes happen in a Feaver, and do often put an end to it, as *Hippocrates* long ago observed, and is now manifest by very common observation. The blood breaks out in all these cases, inasmuch as being turgid, and above measure rarified within the vessels, it desires a larger space, wherefore, unless some portion thereof give way, the whole mass runs the hazard of being constipated, and as well the motion thereof to be hindered, as the enkindling to be suffocated, and the temperature to be perverted.

Critical either with or without a feaver.

The causes thereof proceed either,

For there are two chief Reasons or Causes, wherefore such turgescencies of the Blood do arise: inasmuch as its liquor is as well inflammable, as fermentative.

1. From the kindling of the blood.

1. As to the former of these, that the Blood may be duely enkindled for the supporting Life, and the due exercise of the functions thereof, it behoves that the innate sulphureous particles of it be proportion'd unto the Nitrous adventitious ones from the Air. Therefore as often as the Blood being very boyling and rarified, is much opened and loosened in its own consistence, so that the Sulphur being dissolved, is kindled in greater plenty, there is a most frequent and painfull breathing instituted for the drawing in of a more plentifull Nitre. Now if the Sulphur abounding in this manner, cannot be wasted by burning, nor the vital flame regulated, the next course immediately to diminish the sulphureous fuel, is, that a certain portion of the rarified Blood have vent. From hence, not only in Feavers, but after drinking Wine, Bathings, being in the Sun, and other accidents by which the Blood grows very turgent, either an Hæmorrhagia of its own accord succeeds, or there is often need to supply the defect of such a spontaneous evacuation by Phlebotomie. But that such kind

kind of effuſions of Blood, whether made by Nature or Chirurgery, are commonly reported to bridle its heat or raging; really they do this only inaſmuch as they diminiſh the kindling of the blood, by withdrawing part of the ſulphureous fuel, as Oyl from a Lamp.

2. But moreover in the ſecond place, the Blood, inaſmuch as it is a fermentative liquor, it is apt alſo to be extravaſated. Namely, if at any time any heterogeneous thing, and not miſcible, be confounded with its liquor, it grows hot very much, like Wine in a Veſſel, and boyls up in the Veſſels to exclude that diſagreeable thing, which if it can neither ſubdue, nor turn off by Sweat, Urine, or otherwiſe, the Blood it ſelf excludes part of it ſelf as a Vehicle for carrying that matter forth, whereſoever a vent is to be found. For this reaſon (*viz.* that any diſagreeable or indomitable thing may be turn'd out of the maſs of blood) divers ſorts of Hemorrhagies happen, as well in Feavers as without them; all which are excited by Nature for an intention of good, as alſo thoſe by which the too much enkindling of the Blood is depreſſed: But that frequently it happens otherwiſe, ought to be imputed to divers accidents and circumſtances. But for the moſt part the failure about the ſpontaneous Hemorrhagies critically inſtituted, is either in the firſt place becauſe the blood while it is boyling knows no meaſure of flowing out, and therefore being ſtirr'd into violence, it flows out too much; or ſecondly, becauſe the mouths of the veſſels once opened do not preſently cloſe again, nor are able to be ſhut; or Thirdly, becauſe Nature endeavouring an excretion of blood, doth it by places more open, but often inconvenient; as when an Hemorrhage happens through the Lungs, the Kidneys, Guts, or other Bowels, which therefore paſs from a Critical into a Symptomical and often into a malignant Hæmorrhage.

2. From its Fermentation.

1. Critical Hemorrhagies ſometimes turn into ſymptomatical.

Neither only by theſe means, but by many other failings of Nature, or impediments, do Symptomatical Hæmorrhagies happen, in all which either the Blood it ſelf, or the Veſſels containing it, or both of them together, are wont to be chiefly in fault.

2. Symptomatical Hemorrhagies ariſe either,

1. In the firſt place, the Blood, beſides the reaſons above mentioned, (to wit, forasmuch as it becomes inflammable or fermentable above meaſure) is apt alſo to be extravaſated, becauſe either its liquor being empoiſoned, or otherwiſe corrupted, cannot retain its due mixture, but being apt to coagulate or putrifie, divides it ſelf into parts; and whilſt ſome of them being here and there planted, ſending forth ſpots, wheals, and other brands of Malignity, do diſcolour the Fleſh and the Skin, and obſtruct the proper paſſages; others otherwiſe running out and breaking forth whereſoever there is a vent found, do produce bloody Excretions in divers places, as is commonly diſcerned in the Plague, Small-pox, Meaſles, and malignant Feavers; yea perhaps this in ſome meaſure is the reaſon why in ſcorbutick Diſtempers, as ſpots and marks, ſo alſo Hæmorrhagies are ſo familiar.

Firſt by the fault of the blood.

2. Secondly, The veſſels bringing Blood being faulty many and divers ways, but chiefly in theſe three, do appear the cauſe of a ſymptomatical Hæmorrhage, *viz.* In the firſt place, if perhaps any where ſome of them are obſtructed, as often as the blood aſſumes a more rapid motion, either in the ſame place, or in the contiguous parts, and alſo ſometimes in remote parts it is conſtrained to burſt out. Frequently from ſuch a cauſe an Hæmoptoe proceeds; moreover Spitting of blood, and the Hæmorrhage of the Noſtrils do often follow the ſuppreſſion of the Terms and Hemorrhoids. Secondly, the little mouths of the veſſels (by reaſon of the fleſhy Fibres being looſened or reſolved by which they are clos'd) ſometimes are ill formed, ſo that when the ends of the Arteries do gape too much, the little mouths of the veins do cloſe. By reaſon of this affection, Scorbutical and Cachectical perſons, are found obnoxious to Hæmorrhagies, as we have remarkt in another place. But Thirdly, it frequently comes to paſs that the Veſſels, being ſo evilly formed, are alſo convulſively affected, and ſo the morbific cauſe being as it were doubled, this evil is much encreaſed, inſomuch that the muſcular fibres of the Veſſels being inordinately contracted, cauſe ſudden and violent fluxes of the blood, one while towards the upper parts, another while towards the lower; and ſo their little mouths being open in the mean time, they provoke prodigious Hæmorrhagies. For I have obſerved in ſome perſons, when the current of blood was ſmall enough, with a ſmall and weak pulſe, the Convulſions of the Veſſels generated in ſome place, and propagated under the likeneſs of wind running to and fro in the body, to drive more impetuouſly the blood, however ſlow of it ſelf, and to conſtrain it into violent eruptions; and in caſes of this ſort,

Secondly, The fault of the Veſſels, for that they are ill formed.

Thirdly, Forasmuch as they are convulſively affected.

ſort, when Phlebotomies and Medicines refrigerating and tempering the blood have not at all profited, the greateſt relief hath been found from Narcoticks, Antiſpaſmodicks and Ligatures.

3. From the blood and veſſels being both in fault.

3. Thirdly, If perhaps it ſhall happen that theſe faults of the Blood and Veſſels are complicated, and put forth their miſchiefs joyntly at once; from thence it will be of neceſſity that this evil will be more intenſe, and more frequent and prodigious Hæmorrhagies will be raiſed; the reaſons of which as they appear plain enough by what goes before, it will be neither neceſſary nor ſeaſonable here longer to dwell upon explicating of them; but rather, whereas we have deſigned hitherto the acts of Nature about ſpontaneous effuſion of Blood, and its courſes both rightly inſtituted, and alſo wrongfully and evilly conſtrained; now it behoves us next to declare, how far Art (for the moſt part the Ape of Nature, and ſometimes Miſtris or Moderatrix thereof,) can act likewiſe well, or better about letting of blood, and how ſometimes it is wont to ſucceed worſe.

Emiſſion of the Blood procured by art.

We advertiſe of theſe things in general, that a Phyſitian imitates Nature in ſome caſes of letting blood, exceeds her in other caſes, and frequently regulates and reduces her when acting amiſs. Moreover, there are ſome caſes wherein Nature excells far the efficacy of Art concerning bloody excretions; briefly of each of theſe.

1. It either imitates Nature.

Therefore in the firſt place, in whatever affects, ſpontaneous Hæmorrhagies are wont to bring help, when theſe are wanting, Phyſick the Handmaid of Nature rightly ſubſtitutes Phlebotomie. Therefore, if perchance the Blood be immoderately kindled by reaſon of its Sulphur being too much looſened and advanc'd, by breathing a vein, what is ſuperfluous of that inflammable fuel will flow out, as alſo the immoderate turgeſcency of Blood, by reaſon of ſomewhat untamable being mixed with it, will be allay'd by this courſe. Wherefore letting of blood is advantageouſly adminiſtred, as well againſt continual Feavers, which proceed from the former cauſe, as intermittent Feavers, whoſe fits proceed from the latter cauſe. Alſo in like manner, as often as an accuſtomed evacuation being ſuppreſſed, or a humour driven back from the ourward parts, or a ſudden ſtoppage of the pores, or if a Surfeit, drinking of Wine, or other accidents of this nature, cauſe a turgeſcency of blood (inaſmuch as they daſh heterogeneous particles againſt it) Phlebotomie is uſually the moſt ready Remedy.

2. Or excells and regulates it.

Secondly, Phyſick in Blood-letting, not only imitates Nature, but often excells it; and alſo ſuccours her being weakened, and reduces her often erring. For if at any time the blood ſtruck with violence, ruſhes in a heap againſt any part, and either preſently breaks out in the ſame place, or abundantly gathered together engenders an Inflammation, a vein being pierced in a remote place, ſtops that preternatural tendency of the blood, and frequently carryes away the bleeding, or inflammation. Wherefore, in a Pleuriſie, a Squinancy, a Peripneumonia, in ſpitting or vomiting of blood, when Nature is vanquiſhed, or being outragious, ſeems to caſt violent hands upon her ſelf, Chirurgery recalling the blood to another part, and ſending it out, reſtores the matter that was almoſt deſperate.

Moreover Phyſick frequently reſtrains or reduces Nature, when too prodigal or prevaricating in pouring out of the blood: for in truth all immoderate Hæmorrhagies do want Bridles, not Spurs. But in the Plague, Small-pox and Meaſles broke out, and in malignant Feavers, ſometimes the blood ſpontaneouſly flowing out, portends for the moſt part evil; therefore in thoſe affects ſtyptic Remedies, or things ſtopping the eruption of blood, are more convenient than breathing of a Vein.

3. Or Art outdone by Nature.

Thirdly, Notwithſtanding on the contrary there are caſes of ſhedding blood by Nature, which Phyſick can no way imitate, neither if they chance to fail, can be ſupplyed by Phlebotomy. In Feavers about the Criſis of the Diſeaſe, to wit, after the digeſtion of the matter, that is to ſay, the preparation for Excretion, ſpontaneous Hæmorrhagies if coming in time, do far excell any Phlebotomie which none knows the beſt ſeaſon of; Moreover, the Fluxes of the Terms and Hæmorrhoids happening by Natures inſtinct, are more advantageous than the miſſion of blood provok'd by Art in any of thoſe places.

Phlebotomy and ſpontaneous Hemorrhagies differ as to the ſubject and matter.

Between Phlebotomie and ſpontaneous Hæmorrhagies, there is yet a notable difference, (although not of great moment in Phyſical practice) *viz.* both as to the Subject and Matter of either of them; for in this the blood being florid, and throughly Scarlet, doth for the moſt part only flow out of the Arteries, but in the other Evacuation the Blood being of a black purple with a Scarlet Cream, is only drawn out of the vein.

vein. Whence the ſtream of Blood, which is one within all the veſſels and throughout continuous, acquires ſuch a diverſe kind of appearance, ſeeing we have ſhewed in another place, it is not our preſent purpoſe to make any further ſearch into this Ætiologie; becauſe it concerns not much to the curing any diſtemper, out of what veſſel the blood be let, provided it flow out largely: But that the ancients do in ſome caſes commend Arteriotomie, and prefer it to an inciſion of a vein, the Circulation of Blood not being then known, we have elſewhere diſcourſed how well it may be done.

The uſe and effects of Phlebotomy.

Hitherto of Phlebotomie compared with a ſpontaneous Hæmorrhage; now our next buſineſs is, to deſcribe the uſe and effects thereof, as well good as bad, in Phyſical practice. Wherefore we will firſt ſhew in general what alteration of the maſs of Blood this Evacuation brings; then what diſeaſes it more immediately reſpects, either of the whole body, or its particular parts.

How it affects and alters the Blood.

About the former, it is obvious enough that the blood is altered by breathing a vein, both as to its quantity and temperament, and as to its diſpoſition and motion.

1. Diminiſhes its quantity.

The firſt and moſt common Indication of Phlebotomie, is, that the plenty of blood be diminiſhed by this Adminiſtration. And truly this is a vulgar Remedy, to remove or provide againſt a Plethora. Any one, though of the vulgar ſort, growing to a full habit of body, lets blood without the advice of a Phyſitian; Moreover Ruſticks and Countrey-men for healths ſake, once or twice in a year cauſe blood to be drawn from themſelves and their Beaſts. But although this cuſtom is grown ſo much in uſe with ſome prodigal of their blood, that they breathe a Vein on the ſmalleſt occaſion, and ſometimes without any manifeſt cauſe; notwithſtanding we may find many others no leſs obſtinate againſt this cuſtome, inſomuch that for no cauſe will they loſe any blood, unleſs the greateſt neceſſities be urgent.

Emiſſion of the Blood is not to be either too prodigally, or too ſlenderly made.

Upon this matter (whereas Arguments are alleadged on either part,) that I may in few words determine what ſeems fit to be ordained, in the firſt place it is requiſite we grant, that letting blood is convenient againſt a Plethora either made, or beginning: for by no other Remedy are the evils of that Affection wont to be better removed or provided againſt. Notwithſtanding, the neceſſity of this evacuation ought to be declined as much as may be; becauſe from thence (as we have intimated elſewhere) the blood becomes more ſulphureous, and leſs ſalt, and for that reaſon it moſt commonly diſpoſes all men to be feaveriſh and to be fat. Moreover the Great Remedy Blood-letting, if it be proſtituted to every little occaſion, becomes leſs efficacious to any grand affections when need requires: To which we may adde, that according to the vulgar obſervation, by how much the more familiarly any one uſes Phlebotomy, he will the more frequently ſtand in need of it: for blood being emitted to avoid a Plethora, the reſt of the maſs will the ſooner riſe to a Plethora: far otherwiſe than is the opinion of ſome, who dread leſt the ſtore of blood be conſumed by frequent Phlebotomie; for that on the contrary by this means the quantity is more encreaſed, although the Craſis be the worſer: for ſo the blood having loſt much of its balſamick Salt, and preſervative againſt putrefaction, inſtead thereof, is filled with a pinguifying and more fiery Sulphur.

The reaſons of the former hinted at.

2. Phlebotomie amends the mixture of the Blood.

Secondly, Phlebotomie doth frequently correct the mixture and temperament of the blood in a manifold reſpect. For in the firſt place, if any thing heterogeneous be confounded with its maſs, which cannot be rightly digeſted, nor eaſily excerned and ſent away: a Vein being opened, the blood flowing out conveyes frequently much of the portion of that matter forth with it, inſomuch that the reſt may be either ſubdued or expell'd. For the orifice of a veſſel being opened, preſently the blood fermenting gathers together the extraneous particles as much as poſſible, and excludes that portion of it ſelf wherein many of them are heaped up: From hence we may obſerve the blood flowing out firſt and laſt to be well enough, when that emitted between appears corrupt. Alſo ſecondly, the blood declining from its temperament, is frequently reſtored by Phlebotomie. For when the maſs thereof by the Sulphur or fixt Salt, or both together being exalted, ſhall degenerate into ſharp, ſalt, or ſaline-ſulphureouſneſs, a portion of the blood being withdrawn, immediately a new fermentation thereof ariſes, and very often there is a tranſpoſition made of all the particles of that ſort, that afterwards the Spirits may a little emerge with the volatile Salt, and recover their dominion, the Sulphur, and fixt Salt (as is fitting) being ſubdued. For this reaſon it is that letting Blood doth not only confer great

It reſtores its temper.

help in Feavers, but alſo in the Scurvy, Jaundies, and beginning Conſumption; for the blood after the veſſels are emptyed, like the Stomach disburden'd, doth better digeſt and aſſimilate any humours ingeſted, and the more eaſily throws off and ſeparates whatever is heterogeneous.

Some diſtempers of the blood admit not Phlebotomy.

But if the mixture of Blood begins to be much looſned and become very bad, as in the Plague and malignant Feavers, we muſt altogether abſtain from Phlebotomie; for the blood being withdrawn, the ſtore of Spirits (whoſe only part it is to vindicate the maſs of blood from putrefaction and corruption) is diminiſhed, ſo that immediately all things tend to a deadly diſſolution. Moreover, if the Dyſcraſie of the blood ſhall be of that manner, that the more noble Principles, to wit, the Spirit, the volatile Salt and Sulphur, being depreſſed or conſumed, the watery and earthy particles predominate, the blood ought not to be ſent out, but preſerved even as the treaſure of life; for when the abundance of Spirits are ſo ſmall, any loſs of them doth cauſe all the functions to ſtagger, and gives way to the diſeaſe; wherefore in a Dropſie, Cachexia, Conſumption, and other Diſtempers, where the active Principles are greatly depreſſed, the opening a vein is almoſt the ſame thing as cutting the mans throat.

In ſome caſes about Phlebotomy it is very doubtfull.

In the before-mentioned caſes, where the temperament of blood is reſpected, it is eaſie to determine, whether Phlebotomie be convenient or not; but in ſome others, as in a putrid continual feaver, when upon this hinge Life and Death are turned, there is need of the greateſt deliberation: and ſo much the rather becauſe the event of the Diſeaſe, and the ſucceſs of all the accidents in its whole courſe, whether good or bad, is uſually imputed to Blood-letting, or its omiſſion: and from hence it is, that Phyſitians being ſolicitous to preſerve their own repute, do chiefly raiſe doubts in their conſultations of this matter. But truly in this difficult knot that we may not be led by the rumour of the vulgar (as it chances to happen) one while approving, another while condemning Phlebotomie, but with more certain advice: we muſt conſider the ſtate of the Blood, the tendency of the morbific matter, and the ſtrength of Nature. Firſt as to the former, if in a putrid Feaver, the blood very much growing hot ſhall raiſe a great heat, with thirſt, watchings, and burning of the Jaws, and no eruption of abundant ſweat, nor puſhes appear, or is ſuddenly expected, opening of a vein is ſo clearly demonſtrated, that it is a wickedneſs to omit it; but on the contrary if in a languid body, a ſlow and remiſs Feaver, but continual, ariſes, with a weak Pulſe, let Blood-letting be ſpared, and the cleanſing thereof be procured by breathing Sweats, Urine, and bliſtering. Notwithſtanding, in a middle ſtate of Blood, and of a Feaver, Phlebotomy almoſt indifferent in it ſelf, is determined by other things. Therefore ſecondly we muſt weigh the tendency or flux of the morbific matter, which if it remain dull in the maſs of blood, and unfit to be ſeparated, and ſo (as it is frequently wont to be) inſtead of a Criſis, a tranſlation towards the head be made, and threaten the brain and nervous ſtock, the cutting of a vein ought ſeaſonably to be adminiſtred, whereby theſe evils may be provided againſt. Notwithſtanding, if that this matter being ſoon raiſed into a rage, and either ruſhing inwardly to the bowels of the nether Belly, provokes a huge Vomiting, or Dyſenterical affections, or being driven outwardly, ſeems to be about to bring the Small-pox, Meaſles, and other puſhes, every ſuch force of Nature, if good, ought not to be diſturbed, if evil, not to be made worſe by Phlebotomie; for in theſe caſes it is not only dangerous to let blood, but alſo very ſcandalous. Thirdly, about Phlebotomy to be adminiſtred in a doubtful caſe, we are to take heed to the ſtrength of the Patient; for in a healthful Conſtitution, a vigorous Age, the commencing of a Diſeaſe, and the functions both vital and animal being yet in a florid or indifferent eſtate, we may confidently preſcribe letting of blood, unleſs ſomething indicates the contrary. Notwithſtanding, when it is otherwiſe, as to thoſe conditions, we may not raſhly proceed to that Evacuation.

And chiefly in a continual putrid Feaver.

How the doubt is to be determined.

Thirdly, Phlebotomy corrects or ſtays the inordinate motions of the Blood.

Thirdly, the inordinate motions of the Blood, when being very much moved, as it were with fury, it either ruſhes impetuouſly one while into theſe parts, another while into thoſe, or transferres the noxious matter, are beſt reſtrained or reduced by Phlebotomy; wherefore in great Cephalalgies, in all ſoporiferous or convulſive invaſions, for Catarrhs, Ophthalmia's, and a Cough, Aſthma, fits of the Gout, and Stone, or Phlegmons, Eryſipelas's, alſo for many other Diſtempers, raiſed by the flowings of the Blood or Serum, an inciſion of the vein is commonly preſcribed, and indeed for the moſt part as with good ſucceſs, ſo alſo upon right Reaſon; for the Veſſels being emptyed,

emptyed, the blood having obtained a more free ſpace, is circulated pleaſantly and undiſturbedly, beſides, whatever is extravaſated of the Blood or Serum, is wont to be ſuckt up again and reduced into its courſe.

What Diſeaſes, and of what parts Blood-letting chiefly reſpects.

The Effects as well good as bad being thus ſhewn, which happen to the blood in the manifold ſtate thereof, by Phlebotomie, we will next make ſtrict examination what Diſeaſes chiefly, either of the whole body, or of any private Region that kind of Remedy doth more immediately regard. And firſt as to what relates to general Diſtempers, it is commonly enough known, that letting blood is indicated by a hot and dry temperament, and interdicted by a moiſt and cold. It is uſually propounded in every Feaver, but never in a Dropſie. Moreover, if we conſider particular Diſeaſes, there is no region or part of the Body, but as they rejoyce in the influence of vital as well as nutritious blood (as long as it is well) ſo as often as it is diſturbed in any place, or reaches out any diſagreeable or provocative thing, in place of benign Juice, it requires avocation and a letting out thereof. If I ſhould take notice of every ſingle caſe of this Indication, we ſhould here rehearſe almoſt the whole Pathologie of the humane body. An aking Head, a Brain oppreſs'd with blood, or overflowed with Serum (whence ſpring a world of evils) burning of the eyes, inflammation of the face, mouth and throat, all the diſeaſes of the Breaſt and Præcordia (inaſmuch as the diſorder of Blood affords a riſe or fuel to each of theſe) likewiſe obſtructions or inflammatory affections of the Liver, Spleen, and other Bowels; moreover, as a Plethora, and Athletick habit of the whole body, ſo alſo the tumours of each member, painful and convulſive paſſions, ſeem to accuſe the blood as Author of all the evil, and require its ſending out, as a certain kind of revenge.

After Phlebotomy being indicated theſe four things following ought to be conſidered.

In theſe and very many other diſtempers, if at any time Bleeding be clearly indicated, before it be performed four things ought to be conſidered, *viz.* In what place, by what manner and inſtrument, at what ſeaſon, and in what quantity the Blood ought to be taken away.

Firſt the place from whence Blood is to be taken.

Firſt, as to the former, although according to the Laws of the Circulation of the Blood, as oft as the maſs ſhould be diminiſhed, it differs little from what veſſel a part thereof be taken, provided it be large enough; notwithſtanding, for that beſides a general evacuation of the blood, ſometimes a particular one properly called Derivation (as when the blood is to be brought out of a private place where it is accumulated) and moreover a Revulſion, when it is to be called into this or that part, are intended; for that reaſon, in a humane Body there are appointed as it were various Boundaries, out of which, now by this, now by that, or by another vein, the blood may be emitted as occaſion is given, and for the uſes chiefly requiſite.

In ſome caſes from the Arm.

If therefore at any time an univerſal Evacuation of the blood be indicated, the median vein of the Arm is beſt to be opened, for this is eaſily opened being large enough, and whereas it equally flows from the whole body to the orifice thereof being open enough, by whoſe more free efflux not only a Plethora is taken away, but the greater veſſels being every where emptyed after this manner, the blood ſtagnating in any place, is brought into motion, and being extravaſated is again ſwallowed up into the veins; wherefore, in great diſtempers when the blood being heaped in the Brain, or Præcordia, does threaten ſudden deſtruction, the beſt way not only of general Evacuation, but of a Revulſion, is to ſend the blood by a full current out of the vein of the Arm, being largely open'd.

In others from the vein of the Forehead, Temples or Throat.

But if without any great Plethora the blood ought to be evacuated from the whole, and pulled back from the upper part of the body towards the inferiour, as in the ſuppreſſion of the menſtrual flux or Hemorrhoids, it will be rather fit to bleed in the Foot or ſedentary veſſels by Leeches. But if after the blood being evacuated from the whole, it be alſo to be derived from any private part where it is accumulated, let its drawing off be near the place affected. Hence in Cephalick Diſeaſes, we open the vein of the Forehead, of the Temples, or of the Throat. To cure Tumours, or pains raiſed in the Joynts, we cut a veſſel either beneath or near them, or draw out the blood by Cupping-glaſſes or Leeches. In like manner in diſtempers of the Thorax and nether Belly, either Cupping-glaſſes are applyed to the region ſuffering, or Leeches to the ſedentary veſſels.

The Cephalic Vein of the Arm, the Liver Vein, or the Salvatella erroneouſly ſo called.

But that ſome Veſſels are reported to bear a peculiar reſpect to certain Bowels, and that they ought to be lanced in their diſtempers; *viz.* ſuch are the outward brachial vein, which is ſaid to reſpect the head, and the inward the Liver, alſo the outer vein of the Hand tending to the Ring-finger, which is ſaid to reſpect the Spleen, and for

that cauſe this is called the Salvatella, and the former of them the Cephalick, and the other the Jecorary; all this is meerly a vulgar error, which being propt by no reaſon or Anatomical obſervation, I am ignorant whence it took its origine: Therefore as ſoon as it is agreed on to cut a vein and its place, let a large Veſſel be choſen, and very conſpicuous, that it may the more eaſily be opened; and being remote from an Arterie, Nerve, and Tendon, may be the more ſecurely lanced; wherefore in the Arm the median vein is commonly choſen, although the Cephalick being leſs environed with other Veſſels, is the more ſafely opened.

The jugular Vein is moſt ſafely opened.

The Jugular Vein is almoſt always opened as often as blood is let in Beaſts, it is a wonder it hath not obtained the ſame Cuſtom in Man, when the large and eminent Pipe hereof may moſt eaſily and ſafely here be cut, becauſe it neither hath an Arterie for its companion, and lies a great way from any Nerve. Moreover, from this veſſel as from any other whatſoever opened, an univerſal evacuation of blood is made from the whole body, and together the beſt derivation thereof from the head, ſo that all the ſtagnations or aggeſtions of the Blood and Serum are diſcharged thence.

Of Veins in the hand or feet.

Concerning Veſſels in the foot or the hand there is no great reaſon of choice, but take the vein which chiefly ſwells: it matters little concerning the Place, unleſs that if inciſion be made above, or near the Ankle, there is great care to be taken leſt a Tendon be hurt, which ſometimes by unskilful or raſh Chirurgeons happens to the damage of the Patient. Moreover, let care be taken leſt a vein be cut near its Anaſtomoſis with an Artery, for if this be committed, the blood being entirely Scarlet, will impetuouſly skip out, and the flux thereof is not eaſily ſtayed, nor the orifice of the veſſel ſoon ſtopt.

We ought to conſider by what means or by what inſtrument the Blood ought to be drawn forth.

The chief places being thus deſigned of letting forth the blood, and the choice of the veſſels being ſhewed, we ought next to treat of the Manner or Inſtruments by which blood is drawn out; which is uſed to be done either by a Lancet, in cutting the vein, or by ſuction by Leeches, or by Cupping-glaſſes after Scarification. But there is no need of diſcourſing theſe, becauſe each of theſe parts of Chirurgerie are every where in familiar uſe by Quacks, Barbers and Women, and all things relating to them ſo commonly known, as a man his own houſe; wherefore we will ſpeak but one word.

Some of the Ancients as well as Modern have ridiculouſly exclaimed againſt letting of Blood.

Helmont of late, and ſtill certain followers of him, Pſeudochymiſts and Fanaticks, have ejected Bleeding out of all Phyſick, becauſe they think this evacuation to be a great injury to Nature, (which being aided either by her own ſtrength, or by their Panacea's, they will have to overcome every offenſive thing of her ſelf;) Surely, this is no leſs ridiculous a thing than that long ſince *Chryſippus*, *Apamantes*, *Strato*, and ſome others, (as *Galen* reports) damn'd this remedy, becauſe a vein is difficultly known from an Artery. Truly it is manifeſt enough by ſad experience, that in cutting a vein ſometimes an Artery hath been pierced; whence either death or loſs of the member ſometimes enſues: the reaſon whereof is, not as is commonly alleadged, that the coats of an Artery being more nervous or membranous than the coats of a Vein, can ſcarcely or not at all be healed; when in truth that Veſſel is endowed with more and thicker fleſhy fibres; but the cauſe is, that an Artery like the Heart it ſelf, ought inceſſantly to ſhake and beat, the fibres thereof repeating perpetual turns of Syſtole and Diaſtole; wherefore, a little hole being made in its Pipe for the moſt part remains uncurable by reaſon of the continual motion of the Veſſel, and the efflux of blood. It is otherwiſe in a Vein whoſe opening is immediately ſtopt of its own accord; for but little of contractive work lies in its Coats, yea this only, that its fibres being lightly opened as occaſion ſerves, the blood flowing back of its own accord, is gently moved forwards; and after Phlebotomy, the veſſel being empty, they are permitted to be quiet, ſo that in the mean time the little hole made by inciſion is eaſily glewed together. Whenever Phyſitian or Patient do dread the opening of a vein to be adminiſtred, drawing of blood by Leeches or Cupping-glaſſes, will aptly enough and with like advantage ſupply the defect hereof. Moreover theſe adminiſtrations to remove the conjunct cauſe of a diſeaſe, where there is need rather of partial than general Evacuation or Derivation, are frequently preferr'd to Blood-letting it ſelf. There is no need to dwell longer on explicating the manner and reaſon of the effects of either of theſe operations, commonly enough known, but proceeding to other things, we will next throughly weigh the Time and Quantity of letting Blood.

Wherefore in opening a Vein the pricking of an Artery is ſo dangerous.

The

The opportunity of letting blood is often of ſo great moment, that whereas this Evacuation ſucceeds well at one time, at another it highly prejudices: But there are diverſe reſpects of time to be conſidered about the due performance of Blood-letting, but chiefly theſe four: The Time of the Diſeaſe, the Age, the Year, and Day: The firſt concerns chiefly the Cure of the Patient, the others the Preſervation of him.

Thirdly, The Time of letting Blood comes in to conſideration.

Firſt therefore if blood ought to be let in any Diſeaſe, it will be chiefly ſeaſonable about the beginning or encreaſe thereof, but not at all or very cautiouſly in the ſtate or declination. For at that time whilſt Nature is buſied, endeavouring a Criſis, ſo that the Spirits are in great labour, and the blood ferments very much, that great endeavour of it ought not to be diſturbed; and in the height of the diſeaſe, either Nature being Conquereſs doth not want ſuch a relief, or being ſubdued will not endure ſuch an Evacuation.

1. *In reſpect of the diſeaſe.*

Secondly, If at any time for preſervation it be deliberated touching letting blood, Infants, Boys, and Old men, by the Cuſtom of all Nations obtain an exemption; alſo this evacuation was wont to be interdicted to pregnant Women, but now moſt commonly preſcribed. Men of a vigorous Conſtitution and middle Age, do well enough endure Phlebotomy, and often times want it. Notwithſtanding the firſt and ſecond time it ought not to be done without great occaſion, for that being once begun and afterwards repeated, it will ſoon proceed into an inevitable Cuſtom.

2. *In reſpect of age.*

Thirdly, Hence they who uſed to let blood Spring and Autumn, afterwards cannot omit this evacuation without hazard. But to whom it will be either profitable or neceſſary to breath a Vein once or twice a year, the chief ſeaſonable times will be in the beginning of Spring and Autumn, *viz.* when the Blood being prone to ferment anew, is in danger to change its Craſis. Phlebotomy ſeaſonably adminiſtred, provides leſt the Sulphur and Salts being exalted, it ſhould contract a feaveriſh, ſcorbutical or other peccant diſtemper; likewiſe, leſt ſuffering a flux, it ſhould pour forth the ſerous Recrements, and other Feculencies upon the Brain, the Lungs or Bowels of the nether belly. About the Solſtices, when our bodies are very cold, or hot, the blood, as the juice of all Vegetables, conſiſting in a more fixt ſtate, and unapt to ſwell up, ought not to be let out, unleſs upon ſome urgent cauſe.

3. *In reſpect of the Year and its parts.*

But whereas ſome preciſely, or rather ridiculouſly, obſerve about Phlebotomy, (even as the Countrey-men about Gelding Cattle,) the poſition of the Heavens, and the Aſpects of Moon and Stars, it appears altogether frivolous; and for that chiefly is this Cuſtom condemned, inaſmuch as counterfeit Aſtrologers have a Figure in their Almanacks wherein every ſign of the Zodiack, is allotted to every particular member of our bodies; and for that cauſe, under what ſign the Moon is converſant, they forbid blood to be drawn from the reſpective part of man. They who obſerve without reaſon the Heavens, do erre (as the ſaying is) the whole compaſs of the Heavens. Moreover, this vulgar error is not only abſurd, but frequently malevolent, inaſmuch as many of the common people will abſtain from Phlebotomy whatever indication makes for the ſame, if (as they ſay) the Sign be in the place of letting blood.

The Aſpect of the Moon and Stars are here of no moment.

Fourthly, As to what relates to the time of the Day, in acute Diſeaſes, when a Phyſitian is ſent for, and there be indication for Phlebotomy immediately to be performed, after the body is prepared, he may preſcribe that operation any hour in day or night; but otherwiſe, if any interval may be allowed, then breathing a Vein rather is to be celebrated in a morning when the Stomach is faſting, the veſſels emptyed by ſweat in the night, the ſtream of blood being quieteſt, and appearing free from any ſerous filth. Yea although neceſſity urge, it may be deferr'd a little untill the new Juice of things eaten be paſs'd into the blood; for the veſſels being emptyed will not only ſnatch the crude Chyle into themſelves, but frequently what is diſagreeable or unproportionate unto the blood, whence not only its motion is diſordered, but alſo the vital flame runs the hazard of being extinct. I have known ſome by Phlebotomy adminiſtred preſently after plentiful Drinking, or pouring in of vinous liquors, to have fallen into dreadfull ſwoundings away, which have laſted very long, untill the vital ſpirit being almoſt overwhelmed recovered it ſelf again.

4. *The time of the day about letting of Blood.*

Moreover, in the fifth place, the opening the vein being indicated, and its time appointed, there remains ſtill no little conſideration to be had, what Quantity of blood is to be let out, in which point there is moſt commonly a fault committed, while ſome being too audacious, and others no leſs timerous, they affix thoſe bounds on this or that ſide of which for the moſt part conſiſts the Right. For that I may omit

5. *The Quantity of the Blood to be taken away ought to be conſidered.*

Too much Phlebotomy to be avoided.

omit thoſe who ſcarcely or not at all admit of Phlebotomy (as I have before hinted) ſo I cannot eaſily aſſent to their practice who fear not to draw blood to ſwounings: Beſides, an error of no light moment is committed within the moderate bounds, while in ſome caſes blood is drawn by too ſparing a hand, and in others with too free. In a burning Feaver, Pleuriſie, Peripneumonia, Squinancy, Frenzie, Apoplexie, and other great diſeaſes, that have their origine from a turgeſcency or phlegmonic incurſion of the blood, a ſparing Phlebotomy doth always more prejudice than advantage. For beſides that it doth not remove the antecedent cauſe of the diſeaſe, to wit, the Plethora, it further cauſes the conjunct cauſe, *viz.* the inflammation and burſting out of the blood to be augmented. For truly it is a conſtant obſervation, that upon blood too ſparingly drawn, the whole maſs doth boyl up more notably, and doth acquire a new flux into the part affected; the reaſon of which is, that in a great Plethora many portions both of the Blood and Serum being thruſt forward into receſſes and ſtrait places, are there conſtrained to abide; which, after the Veſſels being a very little emptyed, do impetuouſly regurgitate into the maſs of blood, and do much diſturb it, and force it more impetuouſly to and fro. Wherefore alſo in this reſpect the veſſels ought to be very much emptyed, *viz.* that beſides freeing the former Juice from ſtraitneſs, alſo ſpace may be given to the Juice reduced from exile, which otherwiſe being not congruous, coming upon the blood, troubles it, and provokes it into efferveſcencies and eruptions. From hence we may obſerve, that almoſt all men grow more hot preſently after Phlebotomy, and yet the blood being ſufficiently evacuated, a little after they enjoy a more temperate condition.

But a more ſpare Bleeding often hurts, and fixes a feavour.

The Reaſon of which is declared.

But as a ſlender withdrawing of blood in ſome caſes is not only vain, but is performed with prejudice, ſo in other caſes too much effuſion is rarely committed ſcot-free, and ſometimes brings notable detriment of health. For when either ſtrength languiſhes, or the body labours under a notorious Cachexia, we muſt ſpare Blood-letting, and its taking away is either prohibited, or being indicated by ſome accident, is allowed but in a ſmall quantity. Wherefore in men endowed with a weak, tender and cold Conſtitution, and in conſumptive perſons, thoſe affected with a long or malignant Feaver, alſo in Hydropicks or Cacochymicks a vein is not raſhly to be breathed, at leaſt if it be, much blood is not ſuffered to be taken away. It will be an impoſſible thing to preſcribe general Rules, according to the particular caſes of every individual perſon, whereby the quantity of letting Blood may be exactly proportion'd according to the ſtrength of the Diſeaſe and the ability of the Patient; but let this be left to the judgment of the prudent Phyſitian preſent, and let his Commands be ever exactly obſerved; And let not (as it every where is) ſuch leave be given to Quacks, Empiricks and Barbers to play with humane life, who every where raſhly and wickedly uſe Phlebotomy; and if the blood ſpring more freely and appear diſcolour'd, therefore bragging of the veſſel being well pierc'd, they ſay it muſt be let out more plentifully, becauſe it appears bad, when oftentimes on the contrary it ought to be ſpared.

In ſome caſes the miſſion of Blood muſt be altogether avoided.

Phlebotomy ought ever to be done with a large orifice.

As ſoon as the Quantity of Blood to be taken away is determined, our next care ought to be, that a more large orifice being made, the blood equally mixt may flow out as ſoon as may be; for otherwiſe, if it go out from a ſmall hole, or drop by drop, or with a little ſtream, the maſs of blood fermenting will ſeparate into parts, and what is more ſubtile and ſpirituous will burſt out, the thicker and feculent remaining behind. Hence it is to be obſerved, that the blood being let out of a large orifice with a more full ſtream, if it be a little ſtopt with the finger clapt on it, and a little after ſuffered to flow out, the blood going out the ſecond time becomes much purer and brighter than the former, becauſe in the interval of flowing, the more ſubtile particles being unfolded from the thicker, and accumulated together, have prepared themſelves to fly away. Wherefore, if *Hippocrates*'s Precept ſhall be obſerved, *viz.* to let it run to the change of its Colour, it behoves us to procure that it ſpring out quickly, with a full and not interrupted ſtream. Beſides all this, as to what appertains to the alteration of the blood let out, and cold, and to the inſpection and the judgment thereof, for that we have often diſcourſed it in other places, we now paſs it by, haſtening to other things; and now the thread of Method leads us to entreat of Remedies oppoſite to Blood-letting, to wit *Iſchæmones*, that is, thoſe which are convenient to ſtop immoderate Hæmorrhagies, whether engenderd by Nature or by accident.

SECT.

SECT. III. CHAP. II.

Of Remedies reſtraining or ſtopping of Blood.

EVen as Art imitates Nature in letting forth the blood by Phlebotomy offending in plenty, or temperament, or in its motion, ſo it ſuccours her being diſeaſed or working wrong, by ſtopping the flux of blood whenſoever it is immoderate or hurtfull. Whereas there are various and many ſpecies of an Hemorrhage, there is no need of Phyſick for them all. If perhaps a great effuſion of blood happens by a ſolution of unity, excited by an outward accident, as a wound, or ſtroke, Chirurgery ſuggeſts the manner of Adminiſtrations whereby it ſhould be reſtrained. Moreover, an Hemorrhage as long as it ſhall be Critical, ought to be diſturbed by no Medicine, but left to the meer government of Nature (as long as ſhe does aright uſe her power;) and as to the Symptomatic, whileſt it is little or not much troubleſome, there is required no Phyſick: notwithſtanding there is great need of it, if at any time the Flux of blood be either immoderate, or flow out by unapt places. *Every Hemorrhage is not to be ſtopt.*

Eruptions of blood of this laſt kind chiefly challenge a Cure, if perhaps the blood be caſt upward by Coughing or Vomit, or downwards by ſeige, or thrown off through the Ureters. For in theſe caſes, though the quantity of the Blood excreted, be not much to be dreaded, notwithſtanding becauſe often a dangerous or mortal Ulcer enſues the ſolution of the Unity ſo made in the Lungs, or in the Stomach, Guts, or in a Vein; therefore we muſt induſtriouſly rancounter thoſe Hemorrhagies from their firſt appearance. Therefore among the Diſeaſes of thoſe parts, ſuch bloody excretions are accounted; but we have already in another place delivered the Theories of Spitting Blood, and of the affection Dyſenterical, and the reaſons of healing them, ſo that there is no need to repeat them here; neither alſo to propound here a remedy for bloody Urine, for that it belongs to the Nephritic Pathology; wherefore we will paſs to thoſe Paſſions, for which by reaſon of an immoderate efflux of blood, there is great need of reſtraining Medicines. *But only the immoderate and inconvenient.* *The chief Caſes of the latter are reckoned.*

The kinds of theſe Affections are chiefly three, *viz.* Hæmorrhage of the Noſtrils, of the Flowers, and the immoderate Flux of the Hemorrhoids: The Cure of which laſt doth belong more to Chirurgery than Phyſick, and I think it beſt to referre the other to the hyſterical Pathologie. Here properly belongs to this place the blood flowing out of the Noſtrils, being the moſt general kind of paſſions of that ſort, and common to every Age, Sex and Temperament, ſo that from the Diagnoſtick and Therapeutick of it duely aſſign'd, the uſes and efficacies of Medicines ſtopping blood will beſt appear: for what we proffer for the unfolding the Cauſes and Cure of this bloody eruption, may be accommodated unto all other dreadful Hemorrhagies. *And alſo of the former.* *For the preſent the Cure of the Hemorrhage of the Noſtrils is only propounded.*

It is obſervable enough, that the Flux of blood from the Noſtrils doth happen to moſt men from extraordinary occaſions; for as oft as the blood, about to break out through its own turgeſcency, or through laxity of the veſſels, is apt in ſome place to make or find its way, it is, by a certain inſtinct of Nature, very often directed to the Noſtrils, as to the part moſt eaſily opened. The veſſels from whence it flows in that place, are ſlips of the arterial Branch going from the Carotides, after having paſs'd the Cranium, it comes to the baſis of the Cerebrum; for this proceeding near to the mammillary Proceſſes, ſends very many twigs from it ſelf every where about, of which ſome eminent ones paſſing the hole of the Sieve-like Bone with the ſmelling Nerves, are diſtributed through the glandulous membrane, inveſting the windings of the top of the Noſe. Theſe naſal Arteries departing firſt from the Trunk of the Carotides within the skull, anticipate part of the blood chiefly ſerous from the brain, and lay aſide the Serum it ſelf and other watery recrements into the glandules of the Noſtrils, as into the proper Emunctories of that Region, whence they diſtill into the cavity thereof. Wherefore, if the mouths of thoſe little Arteries do alwayes gape ſomewhat by reaſon of the ſweating out of the Serum, it is no marvel if the blood it ſelf being made more turgid, opening them a little more (which often are too looſe of themſelves) burſts forth of dores. Indeed this Emiſſary both of the Serum and of the Blood, being apt ordinarily to open, or on any occaſion, *A deſcription of the Veſſels from which Blood flowes.*

prevents

prevents or cures great incommodities of the brain, or of the Præcordia, yea and ſometimes of the whole body.

They are the ſame by which the Serum diſtills to the Noſtrils.

For in the firſt place, this way the Serum (as I ſaid) is derived from the head, and when the mouths of thoſe Veſſels are vellicated or provoked by any ſneezing Medicine put into the Noſtrils, the Serum is from thence more abundantly drawn out; which yet doth not deſcend from the Brain (as is commonly thought) but is anticipated by theſe naſal arteries, leſt it ſhould go to it; from which when it is more plentifully drained and brought forth by the uſe of Errhines, for that cauſe the Brain becomes more ſerene and exempt from vapours. Then ſecondly, leſt the Brain ſhould be overwhelmed at any time by blood more impetuouſly overflowing, a portion hereof paſſing through theſe veſſels and breaking out, eaſily prevents it.

The Blood flowing forth in too great plenty from theſe Veſſels, is very hurtfull.

But ſometimes it happens that an Hæmorrhage of this kind, rather becomes a Diſeaſe than a Remedy; for whenſoever the blood flows out more often and more abundantly than is fit from the Noſtril, if life be not immediately hazarded by reaſon of too great loſs, yet the remaining maſs of the blood being impoveriſhed thereby, and loſing its temper, acquires a cachectick and frequently an hydropick diſpoſition; even as we have clearly intimated before, where we alſo have ſhewn the Ætiologie of this diſtemper in common with other too great Hemorrhagies, either to conſiſt in the fault of the blood, or of the veſſels, or of both together.

The cauſes of ſuch an immoderate flux.

Firſt, the blood bringing an Hemorrhage of it ſelf, offends either in Quantity or Quality; and therefore while occaſionally it boyls up, it cannot be contained within the veſſels, but either opening their mouths by diſtending them, or unlocking them by its acrimony, it skips out: To which happens that the blood being ſometimes diſſolved in its conſiſtence, and as it were infected, becomes unfit to continue the courſe of Circulation, inaſmuch as portions thereof ſeparating from one another, are partly fixed in the fleſh or skin, having ſuffer'd death; and partly breaking out, ſtirre up frequently dreadful, and ſometimes mortal Hæmorrhagies, as every where is diſcovered in malignant Feavers, and ſometimes in the Scurvy. Notwithſtanding the blood offending by meer Quantity or Acrimony, unleſs the fault of the Veſſels happening thereon provoke the flux thereof, or too eaſily permit it, ſeldom breaks out into a great Hemorrhage.

1. From the fault of the Blood.

2. From the fault of the Veſſels.

Therefore ſecondly, the veſſels bringing blood, as often as they conſpire to produce that affection, are uſually in the fault, either firſt inaſmuch as their ſmall mouths gaping, by reaſon of the fibres being too looſe and weak, do not readily enough tranſvaſate the blood out of the Arteries into the Veins; which fault happens to ſcorbutick and cachectical perſons; or ſecondly inaſmuch as by reaſon of the ſame moving fibres being affected with the Cramp and Convulſion, the blood being ſnatcht impetuouſly to and fro, and chiefly towards the Head, is conſtrained to break out to continue the thread of circulation, even as it will plainly appear in the caſe of a Patient which ſhall be ſhewn below.

Prognoſticks.

1. As to the Prognoſticks, although an immoderate flux of Blood, in the Small-Pox, Meaſles, malignant Feavers, and in the Plague, doth ever preſage evil, and is expedient to be ſtopt; notwithſtanding it ought to be reſtrained not by meer cooling or revulſory things, but to be chang'd by temperate Hydroticks into ſweating.

2. An Hæmorrhage of the Noſtrils, though not great, is more dangerous in Cachecticks with a weak Pulſe, and a cold ſweat, than a plentifull Hemorrhage in men endued with a Pulſe ſtrong enough, and blood very fervent.

3. They who are obnoxious to this Diſeaſe, by reaſon of a Dyſcraſie of blood and looſneſs of the veſſels, if there come upon both theſe a convulſive diſpoſition of the fibres of the little Arteries, they receive a far more difficult Cure, and frequently are reduced to extream languiſhings by reaſon of the great loſſes of blood.

4. From thoſe who are feaveriſh, when much blood ſhall flow out of the Noſtrils, and does not terminate the diſeaſe, often-times in the place of a Criſis a delirous or a ſoporiferous affection ſucceeds. There are many other prognoſticks about a Hemorrhage accurately remarkt by *Hippocrates*, which notwithſtanding properly belonging to the diſcourſe of a Feaver, we omit in this place; for truly, the Cure in general of this Diſtemper is here almoſt only intended.

Three primary Indications of Cure.

About which there will be three primary Indications, to wit, *Curatory*, *Vital*, and *Preſervatory*; the two former reſpect immediately the ſymptom to be ſtopt, as often as it ſhall be urgent; and the laſt is buſie about removing the Cauſe of the Diſeaſe,

that

that ſo the aſſaults of the Hemorrhage may be ſmall, or not at all. Beſides, an Hemorrhage ought to be handled one way without a Feaver, and after a different manner if preſſed with a Feaver.

Therefore whenſoever without a feaver much blood ſhall flow out of the Noſe, preſently as there ſhall be need of ſtopping Remedies, there will be three chief intentions of Curing, all being together aſſumed into practice, *viz.* Let the turgeſcency of blood be bridled, that it may be leſs diſpoſed into inordinate tendencies. Moreover in like manner let it be endeavoured, that as well its fluxion being withdrawn from the Noſtrils may be diverted to another place, as that the mouths of the Veſſels gaping within the Noſtrils be ſhut: for which purpoſe Remedies as well external as internal very many and of diverſe kinds are wont to be exhibited; of the former we will entreat in order briefly. *The Curatory Indication ſuggeſts three intentions of healing.*

Firſt therefore let the Patient be quiet, plac'd with his head upright, then let many of the Joints of his Arms and Thighs, but not all, be bound with ſtrait Ligatures, which ought now and then to be looſened and removed to other parts; for all being bound together and long, by reaſon of the blood being held in the outward parts, and too much detained from the heart, hath cauſed moſt dreadful ſwoundings; but otherwiſe this Remedy being prudently adminiſtred, frequently helps. For when the blood by this means running into the members by the Arteries, is ſtopt, that it preſently returns not by the veins, its more impetuous ſpreading it ſelf into the head is impeded. Moreover, by the painfull Ligatures of the Joints, the muſcular Fibres of the Carotides Arteries are preſerved from Cramps which oftentimes come upon them. *Outward remedies to ſtop the flux of blood.* 1. *Ligatures.*

Secondly, For diverting the tendency of blood from the Noſtrils, it is ſometimes expedient to breath a Vein in the Arm or in the Foot. For by how much more blood is carryed by the Arteries to the vein cut, by ſo much leſs will the afflux be towards the Noſtrils. Yet this adminiſtration does not always ſo help, but ſometimes a contrary effect thereof happens, as we have already obſerved in ſpitting blood. The reaſon whereof is, that the veſſels being ſuddenly and not ſufficiently emptyed, ſuck up again the diſagreeable humours formerly ejected, and ſtagnating within the pores, whereby the blood incontinently is ſtirred up into a greater eruptive turgeſcency. 2. *Bleeding.*

Thirdly, Cold things applyed to the Forehead and Temples, alſo to the Nape of the Neck, where the vertebral Arteries aſcend, cauſe the veſſels to be bound together, and the flux of blood to be ſomewhat ſtopt or repelled. Notwithſtanding it is ill which ſome adviſe, that cooling Topicks be applyed to the Jugular Veins; for ſo the blood being retarded in its recourſe, flows the more plentifully out of the Noſtrils. Moreover, what is uſual, to apply linty Cloaths, or a Spunge moiſtened with Vinegar, to the Pubes and Teſticles, helps by no other means than the ligature of the members, to wit, inaſmuch as the flowing back of the venous Blood is impeded. A ſudden and unexpected ſprinkling of cold water on the face, frequently ſtops an Hæmorrhage, inaſmuch as it gives an impreſſion of terror. 3. *Application of cold things.*

Fourthly, Cupping-glaſſes applyed upon the Hypochondres, Flanches, inner part of the Thighs, and the ſoles of the feet, are accounted a famous remedy as well with the ancient, as with modern Phyſitians, for diverting a tendency of the blood from the Noſtrils. And the reaſon is plain, *viz.* becauſe a Cupping-glaſs being put on, the impulſe of air being prohibited by the ſpace of the orifice, and encreaſed every where about, preſently the blood and humours, yea and vapours, and ſolid parts, being call'd from any other tendency, are driven towards the empty ſpace of the Glaſs. 4. *Cupping-glaſſes.*

Fifthly, Rubbing of the extream parts are commended in this diſtemper by ſome Practitioners, which we judge not always uſeful, nay ſcarce ſafe; becauſe, although they ſolicit a greater appulſe of the blood to the feet or hands, yet they ſo haſten the return thereof, that the whole maſs of blood being raiſed into an effervescence, it hazards a more violent tendency towards the Noſtrils. 5. *Frictions.*

Sixthly, *Zacutus Luſitanus* among his revulſory Remedies, propounds an actual Cautery to be applyed to the ſole of either foot; and *Crato* the bending the little finger of the ſame ſide, which becauſe done with no trouble we may try; but we adviſe not ſo of the former, unleſs the way of helping were more certain, which might compenſate the pain and lameneſs that would enſue thereon. 6. *Cauteries.*

Seventhly, Swounding raiſed by any means, preſently ſtops an Hæmorrhage, how- 7. *Faintings.*

ever contumacious it be; wherefore when ſuch bleeding perſons are taken out of their beds, or when they do timorouſly admit of Phlebotomie, though but ſparingly, or have their members bound for a longer time, or are ſuddenly affrighted with ſome feigned rumour, or by ſome other occaſion fall into a ſwouning or fainting of the ſpirits, the flux of blood ceaſes thereon preſently. The reaſon whereof is evident enough, for that as ſoon as the motion of the heart fails, preſently the blood and ſpirits ruſh thither, and ſo every outward flux is ſtopt on a ſudden, and what was immoderate before, doth not again return.

Remedies by Sympathy and Antipathy.

1. Sympathetick powder.

2. Young Aſh wood.

Eighthly, In the laſt place, for repreſſing the flux of blood from the Noſtrils, Remedies ought to be recited, which are ſaid to operate after an occult manner, by Sympathy or Antipathy, of which ſort firſt is the ſympathetick powder, made of Roman Vitriol calcin'd to a whiteneſs by the Summer Sun; alſo a piece of wood cut from a young Aſh firſt ſprouting about the time the Sun enters *Taurus*; the efficacy of which remedy in the late Civil Wars many worthy of credit atteſt to have been approved for ſtopping the Hemorrhages of wounded Souldiers: Yea ſome ſtill with much confidence preſcribe it in all eruptions of blood. I confeſs the reaſons of effects of this kind are concealed from me, if ſo be they happen often. Beſides, it ſeems not a leſs Empirical and irrational Remedy, that a ſilk Bag with a dry Toad in it, worn on the pit of the Stomach, ſtops any kind of Hemorrhage, and prevents its return: unleſs (according to the Ætiology of *Helmontius*) that the application terrifying the *Archæus*, compells the blood being aſtoniſh'd, either to go back, or deſiſt from its inordinate excurſion.

3. A dry Toad.

4. A Blood-ſtone.

5. Moſſe.

There remain very many famous Medicines whoſe Operations are wont to be referred to hidden Cauſes and ſecret vertue; as are Necklaces of Blood-ſtone hung about the Neck, alſo the moſs of a humane Skull carryed in the hand; Epithemes of the leaves of Nettles bruiſed and applyed to the ſoles of the feet, and the Palms of the hands; the Empirical adminiſtrations of which kind, when they may be adminiſtred without trouble or coſt, we make no refuſal of; ſince in a dangerous caſe every thing is to be attempted; and applications of that ſort do help ſometimes in reſpect that they fortifie the imagination of the patient.

Topicks cloſing the mouths of the Veſſels.

While ſuch like outward Adminiſtrations are uſed, for repreſſing or calling aſide the flux of blood out of the Noſtrils, alſo other Topicks are put up into the Noſtrils, which may ſhut the gaping mouths of the veſſels, for which uſe the injections of liquid things, Pledgets, Powders to be blown in, and Fumes are wont to be preſcribed, which not helping, in the laſt place we deſcend to Eſcharoticks.

6. Eſcharoticks. The injection of Vitriol water.

Ninthly, Among Liquids, not only firſt, but as good as all others is eſteemed the ſolution of Vitriol in Fountain-water. Some boaſt this for a great ſecret, and a moſt certain Remedy. Indeed the ſame being applyed to a freſh wound, foraſmuch as it ſhuts the ends of the cut veſſels, by wrinkling them up, it reſtrains and preſently ſtops the flux of blood. But that application in Hemorrhages of the Noſtrils, where the blood being brought to the gaping mouths of the little Arteries, ought to be received by the Veins, in regard it ſhuts them as well or rather than thoſe, it ſucceeds little, and ſometimes not at all, as I have known it frequently experimented. This Medicine is prepared of Green Vitriol, *viz.* of *Hungary*, or of our Countrey, alſo of the fictitious Vitriol of *Mars* diſſolved in a ſufficient quantity of Spring-water. I know ſome commend the ſolution of Roman Vitriol, which they not only apply by injection, but alſo to a linnen cloath dipt in the blood are wont to adminiſter it ſympathetically. Moreover the water of the infuſion of white Vitriol prepared with Bole and Camphire, I have known to be uſed ſucceſſefully as well in wounds, as often in other Hemorrhagies.

10. Pledgets.

Tenthly, Since water caſt into the Noſtrils, doth not adhere enough to the mouths of the Veſſels, but is waſhed away by the breaking out of the blood, before it can exert its Virtue, it is therefore more expedient either that a Styptick powder be blown in, or that a Pledget dipt in the water of Vitriol, either by it ſelf, or ſtrewed with an aſtringent powder, be thruſt into the upper part of the Noſtril. For this purpoſe many and ſeveral kinds of ſtyptick powders have been preſcribed, I have frequently uſed either *Crocus Martis* calcin'd to the higheſt redneſs, or the powder of Camphorated Vitriol, or the vitriolic Soot ſcrap't from the bottom of an old Braſs Pot, the powder whereof I have often uſed with ſucceſs in this caſe. In obſtinate Hemorrhagies not yielding to other remedies, let Pledgets, whoſe tops are dipt in Cauſtick Colcothar, be put up deep into the Noſtrils, that the mouths of the Veſſels being

being burnt, and covered with an Eſchar, all flux of blood may be preſently ſtopt. Many other Errhines to ſtop bleeding are accounted famous with Practitioners, as Hogs-dung, thruſt into the Noſtrils, which by the meer ill ſavour is thought to repell the blood; alſo the ſmoak of Blood dropping on hot Iron, repercuſs'd into the Noſe, the Powder being burnt is alſo taken inwardly. The moſs of a humane Skull unburied, put into the Noſtrils, is commended by many for this effect: but theſe latter applications ought to be referred to the ſympathetick Ætiologie, if they avail any thing.

Hogs-dung.

Burnt Blood.

Theſe things concerning outward Remedies ſtopping blood, the vertue and efficacy of which ought at the ſame time to be promoted by intern Remedies, ſeaſonably exhibited and cooperating.

Therefore a ſlender Diet being inſtituted, and the Patient ordered to keep himſelf in an upright poſture, or not much ſupine, while the aforeſaid Adminiſtrations are orderly adminiſtred, medicines appropriated to the ſame end are alſo preſcribed to be taken inwardly. There will be two ſcopes of Remedies of this ſort, *viz.* 1. That the effervescency of Blood whether incentive or fermentative being ſuppreſſed, the liquor thereof being reſtrained within the veſſels, may pleaſingly circulate. 2. That the more impetuous motion of the heart driving about the blood too rapidly, may be depreſſed by apt Sufflamina's.

Inward Remedyes, whereof are two intentions.

1. The firſt Intention requires Medicines that ſuppreſs the too much kindling of the blood, and appeaſe the undue fermentation thereof, for which intents I uſually preſcribe the enſuing Remedies.

1. Things appeaſing the effervescency of the blood.

Take of the water of Plantane, red Poppy, Purſlain, and frog-Spawn, of each four ounces, Syrup of water-Lillies two ounces, Sal Prunella one dram, mix them for a Julep, the doſe three ounces three or four times a day.

Juleps.

Take Barly-water two pound, Red-roſe leaves one handfull, Spirit of Vitriol what ſuffices to make it gratefull, or about half a dram, make an Infuſion warm for extracting the Tincture, adde Syrup of St. John's-*wort two ounces: the doſe three or four ounces, as oft as they pleaſe day or night.*

Take leaves of ſtinging Nettles, of Plantane, of each three handfuls, pour upon them being bruiſed Plantane-water 6 ounces, preſs them ſtrongly, let the ſtrained liquor be taken.

Tinctures.

2. For the ſecond Intention, to wit, for the cooling of the heart too vehemently beating, Hypnoticks and Opiates are convenient.

2. Intention, to cool the motion of the Heart,

Take water of red Poppies three ounces, Syrup of Diacodium half an ounce, make a draught to take at night. Or,

Is done by Hypnoticks.

Take Conſerve of red Roſes an ounce and a half, Powder of Henbane, and white Poppy-ſeeds of each two drams, Syrup of Poppyes, enough to make an Opiate. The doſe the quantity of a Nutmeg every ſix or eight hours.

Take of Laudanum Cydoniatum one dram, the doſe fifteen drops twice a day in a convenient Vehicle.

Theſe things touching an immoderate Hemorrhage, and the Remedies thereof, when it happens without a Feaver: but that which coming in a feaver ought to be ſtopt in regard of the too great loſs of Blood, is either Critical making an immoderate excurſion, by reaſon of ſome accident, for which the Method and Medicines even now preſcribed with caution and reſpect had to the Feaver may be accommodated; or meerly Symptomatical, which being excited in a malignant and Spotted Feaver, Small-pox, Meaſles, or the Plague, neither ſcarcely can, nor ought to be ſtopt with the Remedies above recited. For letting of blood is not convenient, repelling Topicks, alſo cooling Juleps, or Decoctions, and Narcoticks, have no place here: The chief intention of Healing will be to change the Hemorrhage into Sweating, for a gentle Sweat being raiſed, the flux of Blood often ceaſes, if it be not very dangerous.

Of a Hemorrhage in a malignant Feaver.

Take water of Meadow ſweet, Tormentil, of each four ounces, Saxons cool Cordial two ounces, Treacle water an ounce and a half, Acetum Bozoardicum three drams, Syrup of Coral an ounce and a half, Confection of Hyacinths two drams, make a Julep, the doſe ſix ſpoonfuls, every third hour.

Remedies.

Take of the Powder of Toads prepared half a dram, Camphire two grains, take it every ſixth hour, with the forementioned Julep. Or,

Take Powder of Scarlet-cloth from half a dram to two Scruples, as before.

Take Confection of Hyacinths three drams, Powder of Scarlet-cloth one dram, Syrup of Corals enough to make a Confection; the doſe the quantity of a Nutmeg every other hour.

Take of Biſtort and Tormentil-roots, of each one ounce, the leaves of Meadowſweet, Pimpernel, Wood-ſorrel, of each one handful, burnt Harts-horn two drams, Shavings of Ivory and Hart-horn, of each two drams, boyl them in Spring-water from three pound to two, adding about the end Conſerve of red Roſes three ounces; the doſe three ounces being ſtrained, often in a day.

Second Indication vital.

2. Hitherto of the firſt Indication Curatory, together with the ſcopes of healing, and forms of Remedies, appointed for a Hæmorrhage of the Noſe happening with or without a feaver. The ſecond Indication Vital only preſcribes a ſlender Diet, temperate Cordials, and a fit handling of the Patient. The Proviſion of the firſt is ſo ſmall and eaſie, that there ſeems no need to appoint a Meaſure and Rules for it particularly. About the latter the chief queſtion is, whether we ought to retain them within or out of their beds. Without doubt the languiſhing, and thoſe obnoxious to often ſwounings, are not to be rouſed up, unleſs (as we have already hinted) it be for a Curatory attempt: as to others leſs weak, it ſeems ſo to be determined.

The Poſition of the Sick.

Sometimes in bed, and ſometimes out.

Thoſe whoſe Blood does not eaſily tranſpire by reaſon of the conſtipation of the pores, and is incited into a greater turgeſcence from the heat of the bed, and proner to break out, it will be expedient they not only remain out of bed while bleeding, but alſo ſometimes through extern applications to be cooled in the whole habit of their body, or at leaſt in moſt of their members. Wherefore, *Fabritius Hildanus* relates he ſuddenly cured one of a great Hemorrhage of the Noſtrils, after many things tryed in vain, by putting him into a veſſel of cold water. Alſo with like ſucceſs *Riverius* cured another affected in like manner, being taken out of his bed, and laid on a woollen Matte on the Pavement, he bathed his whole body with Linnen dipt in Oxycrate. Yet this method is not alike convenient for all perſons, or at all ſeaſons; but on the contrary, thoſe whoſe blood is halituous, and enjoying more open pores, doth evaporate eaſily, and being wont to be diſſolved by a more moderate heat encompaſſing them, into ſweat, and from thence find themſelves more quiet, it is more convenient that they remain within the bed, not only while the blood breaks out, but as long as there is danger of its return. For this reaſon it is, that many obnoxious to dreadful Hemorrhagies, during the Summer, when they tranſpire more freely, live exempt from that diſeaſe, but the Winter cold preſſing them, by reaſon of their pores being bound up, they ſuffer under more frequent and dreadful Invaſions.

Third Indication Preſervatory hath two intentions of healing.

3. The third Indication Preſervatory, which regarding the removing the Cauſe of that diſeaſe, either ſtops the eruptions of blood, or renders the ſame more rare, or leſs, and ſuggeſts theſe two Intentions of healing, *viz.* 1. That the blood being reſtored to its due temperament and mixture, may quietly circulate within the veſſels, without turgeſcency and breaking out. 2. That the Veſſels carrying Blood, as to the ſtructure of their little mouths, and the tenours of the muſcular fibres, may be contained in their due ſtate; ſo that they neither cauſe thoſe inordinate tendencies of blood towards the Head, nor ſuffer effluxes out of the noſe: For both theſe ends too great plenty and impurity of the Blood are carefully to be provided againſt by Phlebotomy and Purgation ſeaſonably uſed; afterwards for procuring and conſerving its good temperature, the following Alteratives may be given at fit ſeaſons of healing.

Forms of Remedies.

Take of Conſerve of red Roſes, of Hipps, an. three ounces, powder of all the Sanders an. half a dram, Coral prepared one dram, of the reddeſt Crocus Martis *two drams, Sal Prunella four Scruples, with Syrup of Coral, make an Electuary, take the quantity of a Cheſnut early in the morning and at night, by it ſelf, or drinking after it three ounces of the following water.*

Take the tops of Cypreſſe, Tamaris, an. eight handfuls, St. Johns-wort, Tamariſk, Horſetail an. four handfuls, of all the Sanders bruiſed an. one ounce, of the Crum of White-bread two pound, ſlice them ſmall, and pour on them of new milk eight pound, diſtill

in

in a cold Still, ſweeten each doſe when taken with Syrup of the juice of Plantane.

Take leaves of Plantane, Brooklime, ſtinging Nettles, of each four handfuls, to them bruiſed pour half a pound of the foregoing water, of ſmall Cinnamon-water two ounces, preſs them ſtrong, the doſe three ounces to four, at Nine in the Morning, and at Five in the Afternoon.

Medicines of this ſort are taken in Spring and Autumn for twenty or thirty dayes, with ſometimes a gentle Purge coming between. In Summer let them drink Mineral Steel-waters for a Month, than which in this caſe there is not a better Remedy. Out of many Examples of perſons labouring with an Hemorrhage, we only propoſe this one ſingular caſe.

An Example of a rare Hemorrhage.

I was lately conſulted at a diſtance for a certain Gentleman that had ſuffered frequent and great eruptions of blood, one while at the Noſtrils, another while at the Hemorrhoid Veſſels. He had frequently uſed Phlebotomy by perſwaſion of his friends, without benefit; yea frequently falling into cold Sweats and Swounings after breathing a vein, and notwithſtanding obnoxious to eruptions of blood, he was wont to be much worſe. I preſcribed Juleps (having not yet ſeen him) and cooling Decoctions, and Anodynes, alſo the juicy expreſſions of herbs, and other things cooling the blood, but even from theſe, (as if all ſtill far enough from the ſcope) he was nothing the better. At length being ſent for into the Countrey to viſit him, I found the affection under which he ſuffered to be meerly or chiefly convulſive; for whereas he daily bled, his Pulſe was weak, the extreme parts cold, and all his Veſſels as being too much emptyed fell flat; alſo the patient was affected with a continual Vertigo and trembling of heart, and by and by with a ſwouning or fear of it. Really the blood was ſo far from breaking out by reaſon of turgeſcence, that rather the ſtream thereof being depreſſed and ſmall, it ſeemed ſcarce enough to ſuſtain the current of Circulation. Notwithſtanding the truth of the matter was, he was often ſenſible of ſomething in his body creeping one while upward, another while downward like wind, and for the moſt part the flux of blood out of his Noſtrils or Hemorrhoids, followed the tendency of that motion: hence it was eaſie to conclude, that the moving fibres of the Veſſels carrying blood, by which they are contracted, being affected with a Convulſion, did diſorderly convey the ſtream of blood however ſmall and low, to and fro, and ſo compell it into Eruptions: which alſo happen'd the eaſier, inaſmuch as the mouths of the veſſels being laxe and gaping, ſuffered the blood forc'd into them to flow out without any due reſiſtance. The inſtituted method of Curing did plainly approve of this Ætiology, inaſmuch as it happily ſucceeded, leaning on this ſuppoſition; for Blood-letting, and the uſe of Medicines ſtopping blood being at laſt omitted, I preſcribed the uſe of the enſuing Powder, a doſe whereof he took every ſixth hour with a fitting Julep.

Its Ætiologie.

His Cure.

Take the powder of male Pœonie, red Coral, Pearles, of each one dram, Ivory, Crabs-eyes, Blood-ſtone of each half a dram, Lapis Prunellæ one dram, make a Powder, the doſe half a dram.

Take of Black-cherrie water eight ounces, Balm, Barly Cinnamon-water, of each two ounces, Treacle-water one ounce, Syrup of Coral an ounce and a half.

But I commanded that Ligatures ſhould be applyed to certain places by a conſtant courſe, and by and by to other places as occaſion ſhould be given, as well to ſtop as to intercept the Convulſions of the Veſſels; and by remedies of this kind, and means of adminiſtration, he recovered his health in a ſhort ſpace, without any return of the diſeaſe.

SECT.

SECT. III. CHAP. III.

Of Vesicatories.

OF losing Blood by Phlebotomy, whensoever it is troublesome and injurious, and swells too much, and tumultuates within the vessels; also of retaining it by Medicines stopping Blood, as often as being outragious it rages too much of its own accord and flows out, we have hitherto largely discoursed. There remain other certain humours, *viz.* Nervous and Nutritious, as also Serous, and other recrementitious ones which are wont to flow within the Brain and Nerves, and as well in the nervous fibres, as the fleshy, yea and within the Pores of the skin and of the solid parts, which being often depraved or hindered in motion, require emission, being otherwise about to raise great troubles or pains, and frequently dangerous Diseases. Wherefore, that we may seasonably rencounter distempers that are about to rise or take their origin from thence, Physick hath found out certain other Emissaries, mediately or immediately deriving the forecited humours out of the parts and places where they shall offend. And those are either continual, *viz.* Fontinels of diverse kinds, which are as it were perpetual Drains, and pour out continually the Ichor; or they are temporary, when as occasion requires, the Scarf-skin being taken away in some part of the body, the extremities of the vessels in the skin are made naked, and withall so provok'd, that they spue out in great abundance the serous humours of a various descent and disposition, and so continue to evacuate the same for some time, one while longer, another while shorter. But such a manner of drawing out the serous humours from the outward superficies of the body or any part thereof, is wont to be procured by Medicines called by the Ancients *Phœnigms*, or *Sinapismus*, by Moderns *Vesicatories*; of which in the first place we will treat here, (because the knowledge of these leads the way to the Doctrine of Fontinels) and we will chiefly insist on unfolding these three things; *viz.* First, It shall be shewn, from what Bodyes, and after what manner disposed, Vesicatories are wont to be prepared. Secondly, Whereas they are of diverse kinds, it shall be declared what is the manner and reason of their operation in every one, or at least in the chief of them: Thirdly and lastly, we will make search for the curing of what sort of Distempers they ought to be appointed, and in what places applyed.

Vesicatories antiently called Phenigms and Sinapisms.

1. *Of what prepared.*

1. As to the first, the most simple Blisterers are either Fire, or solid Bodies, or Liquors endued with fiery particles; (which are seldome administred for this use by reason of the terror which they impress, and the imminent danger, lest being more strongly apply'd, they do not only blister the Scarf-skin, but burn the skin and other parts.) Let therefore what is safer and less dreadfull, Epithemes out of Concretes having more sharp and (as as is affirmed) potentially fiery particles, be applyed to the places to be blistered, which are either milder, and by the Ancients were call'd *Phœnigms*, because they made the part red, the Scarf-skin taken away; or were call'd *Sinapisms* in respect of the matter, and were wont to be prepared of Mustard, Pidgeons dung, Squills masht, Garlick, Milk of Figs, and the like; or they were stronger, and consisted of *Euphorbium*, *Cantharides*, *Flammula Jovis*, Crows-foot, greater Plantane, with many others, which being endued with a certain burning and caustick quality, are used outwardly for the use above recited, but taken internally, they prove venemous and frequently mortal.

1. *From actual Fire, or things imbued with it.*

2. *From things potentially burning.*

The Composition and forms of things drawing blisters are reported to be manifold and of sundry kinds, although one or two may here suffice, and by how much the more simple, the better; and in most cases for the most part 'tis all one which you use: notwithstanding we shall after our manner annex some select Prescriptions of these kinds of Remedies. And that we may say little of *Dropaces*, *Sinapisms*, and *Phœnigms*, whose use is almost exploded; almost all Vesicatories now in use have Cantharides for their Basis.

Forms of Vesicatories.] *Take powder of Cantharides half a dram, to a dram, powder of Ameos seeds one scruple, of old Leaven kneaded with Vinegar, enough to make a Plaister, spread some of it on Leather,*

Leather, apply it twelve hours to the place to be bliſtered. This works certainly and ſtrong enough: but becauſe it is leſs compact and ſticking, and may fall from the place to which it is put, or is apt to crumble, therefore for the more commodious application, this following is very convenient, and now in uſe with moſt.

Take of Cantharides three drams, Euphorbium half a dram, powder of Ameos-ſeeds one dram, let be incorporated with Melilote-Plaiſter by a warm hand, as much of this powder as it is capable to receive, then ſpread it on Leather, and apply it for twelve or ſixteen hours.

A more delicate Veſicatory with a Dropace.

Some do uſe to incorporate the foregoing powder with *Burgundy* Pitch, and ſpread it upon Leather, afterwards to cover the ſides with red Sanders incorporated with *Burgundy* Pitch, and ſo adminiſter both a Dropace and a Veſicatory. Alſo by applying ſtill the ſame Plaiſter, the Scarf-skin being bliſter'd and taken off, and the place being red, and ulcerated, and only wiping it once or twice in a day, and putting it on again, they cauſe the little Ulcer raiſed by the Veſicatory, to flow at pleaſure, yea ſometimes above a month, and to throw off a plentiful Ichor.

Others incloſe Cantharides bruiſed, and ſprinkled with Vinegar in Silk, and apply to the place.

Some Empiricks uſe in the room of Cantharides a maſs of the leaves of Crow-foot, or *flamula Jovis* bruiſed on the place, by which the Scarf-skin being bliſtered, or rather eaten, the skin it ſelf, as if toucht with an actual fire, is much inflam'd and deeply ulcerated; whence not only a profuſion of Ichor but an inflammation of the whole member, and a feaveriſh diſpoſition ſometimes follow: wherefore theſe things are not to be uſed raſhly.

2. How they operate.

2. If it be enquired of the manner and reaſon how theſe and other Veſicatories operate: in the firſt place we ought to ſhew by what manner actual Fires, and things endued with particles proceeding from Fire, do raiſe a bliſter; then by an eaſie Analogy the force and manner of working of thoſe ſorts of remedies will be known, which are reported to be endowed with a potential fire. Wherefore we obſerve of the former, that the fiery particles not being too vehemently applyed, penetrating the Scarf-skin without diſſolution of unity, enter under the skin it ſelf, where the extremities of the veſſels bringing blood, of the Nerves, and of the nervous Fibres are terminated; and there do variouſly twiſt together theſe, altering them from their poſition, and pervert the ſtructure of the whole texture of the skin: inſomuch that from all the veſſels being made angry in a high degree, the watery humour being imbued with igneous particles, and therefore rejected, as well by the blood as by the nervous Juice, is ſpued out in great abundance: This Lympha, becauſe it cannot paſs through the Scarf-skin, ſeparates it from the skin, and raiſes it into a bladdery bulk, from which at length being broke of its own accord, or occaſionally, it flows out. Moreover as long as the igneous particles adhere to the skin, and the mouths of the Veſſels, being covered with an Eſchar, are not cloſed up, theſe being continually twitched by them, do continue to ſpue out the Ichor. This kind of ichorous flux will the ſooner ceaſe, if immediately upon the hurt inflicted, the fiery particles be drawn out, by the application of ſome proper Antipyretick, as Fire it ſelf, Nitre, Soap, Onions, and the like. Moreover it runs the longer, if omitting an Antipyretick, medicines hindering the generation of a Cicatrice, or of the outer-skin, and unlocking the mouths of the veſſels, be worn upon the place affected.

Shewed by the example of Fire.

How Cantharides excite Bliſters and draw forth water.

By theſe it is eaſie to underſtand by what manner Veſicatories perform their operation, *viz.* Cantharides (as likewiſe any other of the ſame vertue) being outwardly applyed, and being heated by Effluvia's of the parts ſubjected, and ſo being provok'd to exert their power, do plentifully diſpatch ſharp and as it were fiery particles from themſelves, which penetrating the Scarf-skin without any tearing it, they are daſhed againſt the *Cutis* or other skin, where firſt they act upon the Spirits, and then by the affecting theſe, upon the Humours and ſolid parts. They very much provoke the Spirits, and drive them into painful Convulſions of the fibres, diſſolve the Humours, and conſtrain them to ſeparate into parts, ſo that the watery part being very much embued with thoſe ſharp, and as it were venemous particles, is rejected every where by the other Juice; and when in the mean time the ends of the Veſſels and Fibres are either eaten by the burning, or opened by twitching, and as it were drained, that Ichor conveying the hurtful particles is plentifully ſpued out of their little mouths; which then ſeparates the impervious *Cuticula* or the Scarf-skin, from the other

other skin or *Cutis* it ſelf, and raiſes it into a little bladder, and after this being broken and taken away, it is for ſome time poured out by the ulcerated skin (as we ſhewed it to come to paſs by reaſon of the particles of fire.)

Why they bring a fervent Dyſurie.

But this is not only done, becauſe the ſerous Juice imbibing the ſharp parts of the Medicine, and conveying them out, doth not always bear them all back the ſame way by which they entred, but ſometimes this being endued with theſe ſtings, regurgitates into the maſs of Blood; and afterwards being circulated with it, and ejected with its infeſtous burden through other Emunctories, offends ſome weak or tenderer Channels in its paſſage or going forth; from whence very many contract a Strangury, from great or many Veſicatories, by reaſon of the urinary paſſages being affected for that cauſe with Acrimony or Eroſion, which in ſome becomes moſt ſharp and intolerable. Alſo that application ſometimes brings bloody Urines to others afflicted with the Stone; hence a ſuſpicion alſo ariſes, that thoſe who have tender Lungs, or who are ſubject to a Conſumption, are much endangered by this Medicine outwardly applyed; which notwithſtanding I have not known happen to any; but can rather atteſt by frequent experience on the other ſide, that it redounds to advantage rather than hurt. For the more ſharp particles of Cantharides, if they be long applyed, being ſometimes imbibed more plentifully by the blood, infect its whole Serum: which Juice ſo ſharpened, as long as it is confounded with the Balſamick blood, hurts no part; but being ſeparated from it by the Kidneys, it ſometimes brings hurt to them, and frequently not only twitches the neck of the Bladder by its Acrimony, but ſometimes corroding it, cauſes filth, and little skins, nay and blood to come away: but in the maſs of blood, the ſame more ſharp, ſaline-volatile particles do often moſt notably help; inaſmuch as they deſtroy the fixt or acid Salts in it, and unlock the conſiſtence of the blood too much bound up, and ſo do cauſe the ſerous and other morbific recrements before wrapt up with it, to be ſeparated from it, and to be more eaſily diſpatched by Urine and Sweat; hence Veſicatories being applyed long in Feavers do call forth plentifull Urine and a more eaſie Sweat. Alſo they open the obſtructed wayes, and move together the portions of Blood or Serum, ſtagnating or being extravaſated in any place, and reſtore them to their Circulation. Wherefore they are not uſed only to help in ſerous maladies, but alſo in thoſe of the blood, yea in a Pleuriſie, Peripneumonia, and in any other Feavers.

Veſicatories move Sweat and Urine.

Having hitherto ſhewed after what manner Veſicatories operate firſt on the Spirits, and then on the Humours and ſolid parts, it is now our buſineſs in the next place to ſhew both the good and evil effects of them, as alſo the manners of uſing them. But that they in the firſt place operate on the Spirits is manifeſt from hence, that they exert no power on the deceaſed, and it is an ill Omen in thoſe that are languiſhing, when Veſicatories have no operation, becauſe it is an Indication that the Animal Spirits are much dejected, or abundantly diminiſhed.

The effects of Veſicatories.

Therefore, it behoves to conſider about the due unfolding the energy, force or virtue of this remedy, what humours it either immediately or mediately evacuates or alters; and afterwards in what Diſeaſes, and bodies how diſpoſed it either profits or hurts.

1. *As to humours of the Skin.*

Firſt, As to the former, the humours that are immediately ſent out by a Veſicatory, drop forth partly from the pores and glandules of the Skin, and partly out of the mouths of the little Arteries, and partly out of the extremities of the Nervous fibres; perhaps ſome little of the Juice newly received, out of the mouths of the veins, though not much, ſeems to be carryed back. The humours mediately drawn out by a Veſicatory are thoſe which the aforeſaid parts being emptyed receive elſewhere, and derive them forth.

1. The Skin is a thick Membrane conſiſting of a double Coat, very porous, alſo thick ſet about with moſt numerous glandules, with fat, as alſo the ends of the Veſſels and fibres being terminated therein, and thickly woven one within another. Wherefore, while a portion of it is made bare, the Scarf-skin being taken off with a Veſicatory, and the nervous fibres being twitched, do bind together, and wreath the glandules and pores, the ſerous humour contained in both, is moſt plentifully ſqueezed out. And whereas ſome pores are pervious into others, the Serum doth not only flow out of the place bliſter'd, but ſometimes into the little holes firſt ſo emptyed, a portion of the Serum coming from the neighbouring pores ſucceeds, and thence by and by ſweats out: wherefore in Patients affected with an Anaſarca, the little

ulcers

ulcers raiſed by a Veſicatory, exhauſt the waters every where in great plenty, and draw them out of the neighbourhood, yea and ſometimes at a great diſtance.

2. The little mouths of the Arteries being uncovered and twitched about the bliſtered place, do not only vomit out a portion of the Serum brought to them, by ordinary cuſtom, but the ſerous liquor being imbued with the Stimula of the medicine in the whole maſs of blood, immediately is ſeparated more plentifully from the blood; and at every turn of Circulation a greater plenty thereof is thrown out by the ſame mouths of the Arteries continually irritated: Moreover together with the Serum as it were ſo ſtagnating, and therefore removed from the whole blood into the little ulcers of the skin, other recrements and ſometimes the morbific matter it ſelf depart in plenty, and are diſpatched forth by the ſame Emiſſaries; and for this reaſon in malignant feavers, yea in ſome putrid, that are difficult to be judged of, when the recrements and corruptions of the blood, unapt to be thrown off, do threaten the Præcordia or Brain, Veſicatories continually and leiſurely draining it, do frequently yield notable relief; whereunto we may adde, that they do alſo alter and reſtore (as we before mentioned) the blood degenerate or depraved as to its Salts, and alſo by opening or ſubtilizing its conſiſtence, diſpoſe it towards an Eucraſie; wherefore, not only in a feaveriſh ſtate of Blood, but alſo in a ſtate otherwiſe peccant, or of ill Juice, this kind of remedy is often extreamly convenient.

2. In reſpect of the blood.

which they purge and alter.

3. Both reaſon and experience have enough proved, that Veſicatories evacuate a certain humour from the Nerves and nervous Fibres, and for that cauſe profit very much in convulſive diſtempers: For ſurely we have in another place clearly enough demonſtrated, that the watery liquor of the Brain and Nervous ſyſtem, doth ſometimes abound with heterogeneous Particles. Alſo it is manifeſt by frequent and familiar obſervation, that the impurities and recrements of that liquor, together with the watery Juice, do ſpontaneouſly ſweat out from the Nerves and nervous Fibres, when the fluor is raiſed, and either reſtagnating within the maſs of blood, are carryed off by Urine or by Sweats, or being depoſited within the Cavities of the bowels, are diſpatched by Vomit or Stool. Wherefore, when a Veſicatory is applyed, the extremities of the Nerves and nervous Fibres being made bare, and very much angred, immediately a humour abounding near their ends is voided; and alſo the whole Juice planted within their paſſages by a long ſucceſſion, is chafed, and delivered from ſtagnation; and the heterogeneous particles mixt with that nervous Juice, being every where agitated and derived from the Brain, ſlide towards their newly opened Emiſſary, by degrees, and at length are removed wholly forth.

3. In reſpect of the Nerves and of the humours abounding in them and in the nervous parts.

From theſe things we may collect, for the Cure of what Diſeaſes this kind of remedy doth chiefly conduce; for by reaſon of its evacuation out of the pores and glandules of the skin, as often as any ſerous, ſalt, ſharp, or otherwiſe hurtful humour is collected in thoſe parts, or their neighbourhood, and being excluded from the Circulation of blood, ſhall obſtinately ſtick in that place, ſurely there is no more ready or eaſie way afforded for drawing it forth, than by applying a Veſicatory, upon or below the place affected. Wherefore, it is not only indicated by an Anaſarca, or by any foulneſs or eruptions of the Skin, but moreover a Veſicatory is required for pains either arthritical or ſcorbutical, fixt any where in the extern habit of the body, or in any certain member.

For the curing of what Diſeaſes Veſicatories are convenient.

1. In all cutaneous Diſtempers.

Secondly, In reſpect of the Blood, Veſicatories are always uſed in malignant Feavers, as well to purge out leiſurely any heterogeneous or morbific matter, as to change it from a diſpoſition either too acid, or ſalt, or otherwiſe peccant, into a right temperament; yea they are of moſt excellent uſe in all putrid feavers of ill habit and hard to be judged of. Alſo for that cauſe in the Scurvy, Leucophlegmatia, *Pica Virginum* or Green Sickneſs, alſo in any other ill habit of body, this kind of remedy affords frequently notable help. Moreover not only for the ſake of correcting the blood it ſelf, but beſides as often as it being depraved ſpreads its corruption on other parts, and ſo doth firſt beget diſeaſes in the Head, the Cheſt, the nether Belly, or Members, and then excites their Fits, Veſicatories are uſually exhibited with ſucceſs. Wherefore it is a common remedy in Head-aches, a Vertigo, and ſoporiferous affections, no leſs than in a Catarrh or any defluxion either into the Eyes, Noſe, Palate, or Lungs, in which every one without conſulting a Phyſician, will preſcribe to themſelves Cantharides for Revulſion. I confeſs, when I have often been ſurprized with a great Cough, with abundant and thick Spittle (whereto I am originally obnoxious) I have received relief from no other Remedies more than from Veſicatories; wherefore I am wont, while

2. They take away the impurities and ill temperament of the blood.

This Remedy is profitable in thoſe Diſeaſes which the blood produces in other parts.

that diſtemper doth urge, to apply Medicines drawing bliſters firſt upon the Vertebra's of the Neck, then thoſe little Ulcers being healed, beneath the Ears, and afterwards if need require it upon the Scapula's; for ſo the ſerous filth looſened from the conſiſtence of the blood ſweating forth, is derived from the Lungs, and alſo the mixture of the blood ſooner recovers its temper, inaſmuch as after this manner its enormous ſalts are deſtroyed.

3. Alſo in all Diſtempers of the Brain and of the nervous Stock.

Thirdly, In reſpect of the Humour, *Epiſpaſticks*, as they are of moſt common uſe, ſo they are wont to confer great help, in ſoporiferous, convulſive and painful diſtempers, for deriving and evacuating it out of the nervous ſtock and the brain it ſelf. Was ever any ſurprized with a Lethargy, Apoplexie, or Epilepſie, but that immediately Friends and Attendants however unexpert, have tormented his Hide with the application of Cantharides? In ſtupendious convulſive motions, aſcribed uſually to nothing leſs than Witchcraft, I have applyed Veſicatories with great benefit in many parts of the body at once, and I have continued them above a Month, preſently renewing them in freſh places. And alſo pains that are fixt and moſt fiercely tormenting in the membranous parts, are ſeldom cured without this adminiſtration. For ſometimes morbific humours and Particles which being deeply radicated, yield nothing at all to Purgers or ſweating Medicines or Diureticks, yet have ſeemed to have been pulled up by the roots by Veſicatories, as it were remedies laying violent hands on the diſeaſe.

For what Diſeaſes Veſicatories are intended.

But this Remedy although moſt general is not uſed to operate ſo eaſily and happily in ſome Diſeaſes and Conſtitutions; wherefore we may not raſhly or indifferently uſe it towards all perſons. For thoſe who are Nephritick and obnoxious to a frequent and painfull Strangury, ſcarce ever endure the application ſcot-free; wherefore, on thoſe that are ſo affected we muſt not uſe Veſicatories, unleſs in malignant Feavers, or acute Cephalick Diſeaſes, for avoiding the greater Evil.

In what Conſtitutions they agree beſt.

As to what relates to the various Temperaments and Conſtitutions of men in reſpect of which Veſicatories are uſed to be more or leſs convenient or advantageous: Concerning theſe, this threefold notable difference occurs. In the firſt place, ſome perſons for the moſt part endure well the uſe of this Medicine, and the little Ulcers raiſed thereby in the skin, ſweat out an Ichor ſufficiently plentifull without any Dyſurie, or great Inflammation of the place bliſtered; and then heal of their own accord; which effect ſucceeds only in blood of a good temperament, where, to wit, the Salt and Sulphur being moderately and rightly conſtituted, there is preſent an abundant plenty of Serum; whoſe Juice eaſily and more largely ſeparating from the reſt of the blood, carryes away the ſharper particles of the Medicine imbibed with it ſelf, and partly ſweats them out through the place bliſter'd, and partly conveys them out without prejudice by the Urinary paſſages; therefore alſo the advantagious effects now recited are produced in the maſs of blood.

Alſo in whom not.

2. But ſecondly this remedy with ſome doth neither well agree, nor operate profitably; becauſe it rubifies the place very much to which it is applyed, or rather excoriates it with moſt fierce pain and great inflammation; notwithſtanding the little ulcers made in the ſame place, although they do for ſome time torment the patient, yet pour out very ſmall or ſcarce any Ichor: Alſo to theſe always bliſter'd with torment, for the moſt part a violent Strangury happens. The uſe of theſe Veſicatories being troubleſome and unſucceſſefull, doth frequently happen to men of a cholerick and hotter temperament; whoſe blood is endowed with a plentiful Salt and Sulphur, and a ſmall quantity of Serum, being more throughly concocted with the reſt. Wherefore, when the Juice that ought to carry away the more ſharp particles of the Medicine, doth neither eaſily nor plentifully paſs from the reſt of the blood, (that it may ſpeedily waſh them out) thoſe particles ſticking ſtill in the skin, do as it were infect and impoyſon the blood it ſelf, paſſing through, and for that cauſe being impeded from its circuit, they cauſe it to ſtagnate, and to be gathered together about the extremities of the Veſſels, whence they are inflamed. Moreover the ſerous Juice being ſeparated by the Kidneys when of it ſelf it is little and ſharp, and beſides becomes ſtinging from the particles of the Medicine, it irritates the Neck of the Bladder, and frequently corrodes it by its acrimony.

In men of a more hot temperament they torment the part and do not draw forth the water.

In others, inaſmuch as they draw forth too much Ichor, they are not profitable.

3. There remains a third Caſe although more rare, relating to bliſtering, to wit, in whom little Ulcers being raiſed in the skin, preſently pour out the ſerous humour in ſo great abundance, that in a little time it will be neceſſary to give repelling Medicines, and that ſhut the mouths of the Veſſels; otherwiſe, from too much flowing out of waters,

waters, a diſſolution of ſtrength, and a fainting of the Spirits are in danger to enſue. This I have known ſo conſtantly happen to ſome Patients, that afterwards I was fain to reſtrain their uſe of Cantharides although there was need of them; the reaſon whereof ſeems to be, that the blood being endowed with a ſalt Serum, and more ſharp than it ought to be, hath a conſiſtence too eaſily diſſolved: wherefore, that ſerous juice being ſharp, and fretting of it ſelf, as ſoon as it is provok'd by the particles of the Medicine looſening the conſiſtence of the Blood too eaſily diſſolved, immediately breaking out with violence from the maſs of blood, whereſoever there is a paſſage afforded, it flows out with a full torrent through the mouths of the veſſels gaping in the bliſtered place. Beſides this too much flowing out of the Serum, raiſed from the firſt application of the Veſicatory, ſometimes happening late in malignant Feavers, and in others ill, or not at all judged, and remaining a good while, wholly conſumes the morbific matter, and delivers the Patient from the jaws of Death. In ſuch a Caſe after the little Ulcers for the firſt days have poured out little or a very ſmall quantity of Ichor, at length Nature attempting a Criſis by this way, a vaſt Illuvies of Serum flows out from the ſame; and ſo ſometimes for many dayes, nay weeks, continues to flow out, untill the Patient before accounted deſperate, recovers his entire Health. Little Ulcers ſo abundantly flowing, as it is not eaſie, ſo it is not ſafe to ſtop them before the whole Mine of the Diſeaſe be conſumed. Not long ſince, a famous Doctor of Phyſick in *London*, ſcarcely recovering from a malignant Feaver, did copiouſly ſweat out Ichor daily from places bliſtered in ſeveral parts of his body; after ſome time (they being troubleſome and tedious) he did apply ſtronger Repercuſſives to them all, and immediately reſtrained their flux. Thoſe ſluces were ſcarce two days ſtopt, but his diſeaſe revived, and on the ſudden he was affected with fainting of Spirits, and often ſwooning, a cold Sweat, and a low weak Pulſe: and whereas he could not be relieved by any Remedies, however cordial they were, he dyed within three days; the cauſe of which ſeems to be, that the malignant matter being ſuddenly repercuſſed, fell into the Cardiac Nerves, whoſe action being hindred, the vital function quickly failed.

The Ulcers of Veſicatories do ſometimes plentifully flow in Feavers, and give Judgment of the Diſeaſe.

They are not to be cured.

An Example is ſhewn.

SECT. III. CHAP. IV.

Of Fontinels, or Iſſues.

BEſides Veſicatories, which being as it were the extemporary Emiſſaries of the Serum, and other humours externally to be brought forth, are only raiſed upon ſome occaſions, and then after their efficacy a little ſhewed, are permitted to be dryed up; there are others eſteemed as it were continual Fountains, therefore named *Fonticuli* or Iſſues, out of which the Ichor or ſerous humour flows with a conſtant Spring. Thoſe former, as they are requiſite for the moſt part for Cure-ſake in acute or other Diſeaſes, whoſe morbifick matter requires a quick diſpatch, in the firſt place reſpect the conjunct cauſe of the Diſeaſe to be removed; and therefore being more broad, are made only ſuperficial, that ſuch little Ulcers being large, may evacuate much, and then eaſily be healed: but on the other ſide, Iſſues being chiefly indicated for preſervation, are ordained to remove or vanquiſh the procatarctick cauſe of the Diſeaſe: wherefore they conſiſt of a more narrow orifice, but made more deep through the thickneſs of the whole skin, to the end, that while they ſend out the morbifick matter in leſſer quantity, they may derive it further, and continue longer to purge it out.

Iſſues rather a preſervatory than curatory Remedy.

There are three chief heads of diſquiſitions concerning Iſſues, *viz.* Firſt, what humours theſe Emiſſaries chiefly evacuate, and whence they bring them: Secondly, in what Diſeaſes or Conſtitutions they better or worſe agree: Afterwards Thirdly in what places, in what form, and with what inſtruments they ought to be made.

About theſe, three things are to be enquired into.

1. As to the former, Iſſues, like Bliſters, purge out all humours fixt within the skin, (although in a leſs compaſs,) or brought through it as well by the ſanguiferous, as nervous Veſſels, not only as they provoke, or as it were ſuck the outer ſuperficies of the skin, but by piercing through the whole hide or skin, they convey

1. *What humours they evacuate.*

out whatſoever flows from the ſides of the orifice through the broken Veſſels, alſo whatſoever ſlides down elſewhere beneath the orifice. Wherefore not only humours accumulated within the pores of the skin, or glandules, or brought thither by the Arteries, or Nerves, have conflux to Iſſues; but moreover the ſerous recrements under the skin, that are wont to be tranſferr'd, or creep between the interſpaces of the muſcles and membranes from place to place, tend every where unto them and find paſſage. Moreover an Iſſue appointed in the way anticipates morbifick humours, which were formerly wont to be conveyed to other weak and long afflicted parts, and by ſuch means exempts one while this part, another while that, from their invaſion. Hence either a Gouty, or Nephritick, or Colick matter, and ſometimes a Paralytical, or otherways ſcorbutical, are frequently intercepted by Fontinels, in their paſſage from their Source to their neſts or places of reſidence, and ſo are conveyed forth, and the uſual aſſaults of a diſeaſe declined: Neither doth this Emiſſary leſs purge from thence by degrees the humours impacted in any part or region of the body, and there cauſing prejudice, than water-furrows made for derivation of moiſture, and ſo prevent or cure a ſickly diſpoſition.

2. In what diſeaſes they chiefly prevail.

2. From theſe ſeveral accounts of aſſiſtance, whereby Iſſues in general are wont to help, it is eaſily collected, for what diſtempers they are chiefly required; for although there is ſcarce any diſeaſe happens, wherein this remedy is either hurtfull or unprofitable, notwithſtanding it ſeems rather more neceſſary in ſome caſes than in others. It is commonly preſcribed for almoſt every diſeaſe of the head, whether outward or inward: Every one of the ordinary people procures an Iſſue as equal to all other Remedies, for the Convulſions of Infants, or Youths, for Sore-Eyes, Kings-Evil, as alſo for Head-ache in perſons adult or ancient, for drouſie, vertiginous or Cramp-like diſtempers. Neither is it leſs celebrated againſt diſeaſes of the Breaſt; As who is obnoxious to a Cough, bloody or conſumptive Spitting, or an Aſthma that long enjoys his skin whole? In like manner Iſſues are commended in affects of the lower Belly; ſcarce any Hypochondriacal perſon or Hyſterical woman, in like manner no Gouty or Cachectical perſon, but hath his skin pierc'd in many places like a Lamprey. It would be a vaſt work to recount here particularly all the Diſtempers for which Fontinels are helpfull.

3. In what Bodyes they agree not.

3. But really this remedy, however advantagious and benign of it ſelf, doth not agree with all perſons, nor is it indifferently to be preſcribed to every one. For there are two ſorts of men, which though ſick, are to be excuſed from Iſſues, inaſmuch as this Emiſſary evacuates too much in ſome, and too little in others, or leſs than is convenient; and in the mean while remains very painful and intolerable.

Viz. *Firſt where they evacuate too much.*

Sometimes a Fontinel is not convenient, becauſe it too much evacuates or conſumes the humour or Spirits. For I have obſerved in ſome, that an Iſſue made in any part of the body, pours out an immoderate quantity of Ichor, and peccant in quality: for out of it by often turns, if not continually, a watery, thin and fetid Juice, oftentimes diſcolouring the Pea and Coverings with blackneſs, flows out in great abundance, and ſo the ſtrength and fleſh is impaired by too great an Efflux thereof.

Why they often pour out the humour too much.

The reaſon whereof ſeems to be this, that in ſome perſons endued with an ill diſpoſition of blood and humours, a wound being made and hindred from healing up, degenerates ſtraightways into a filthy and malignant Ulcer; the ſides whereof put on the nature of an acid corruptive ferment, whereby the portions of blood continually forced thither, are ſo tainted and diſſolved, that the Serum thereof imbued with the diſſolved Sulphur, and other Corruptions, being refuſed by the Veins, flows out there copiouſly. Moreover, this putrifying pollution of an Iſſue being communicated to the blood, depraves in ſome part the whole maſs thereof, and ſo at leaſt (as alſo by too much loſs of the ſerous Juice) it is rendered leſs nutritious: Beſides, from the Sulphur of the blood diſſolved near the ſides of the Iſſue and flowing out with the Serum, the ſtreaming Ichor doth ſo ſtink, and black the Covering. Sometimes an Iſſue pouring out the ichor not immoderately, conſumes the ſpirits and ſtrength more than it ought, which really we take cogniſance of from the effect, and ſometimes not till afterwards; inaſmuch as ſome, while they bear about them one or more Iſſues, remain feeble and lean; but they being ſtopt preſently become vigorous and more plump. Moreover, it is a common obſervation, that many from an Iſſue raiſed near the head, have been preſently ſurprized with a certain defect, and weakneſs of ſight, inſomuch that they have been conſtrained immediately to heal it up: which ſeems to happen

Why they expend the Spirits too much.

happen for this cauſe, for that where the proviſion of ſpirits is ſmall, and their conſiſtence very thin, the ſmall loſſes of them, or of the Juice from whence they are procreated, if ſo be they are conſtant, are difficultly endured.

Iſſues are likewiſe inconvenient when they evacuate leſs than they ſhould doe.

But in another and different reſpect, Iſſues like Veſicatories are forbid to ſome, or very cautiouſly preſcribed, for when they evacuate little or nothing at all, they very much vex the place, where they are made. For in perſons endued with a cholerick, or hotter conſtitution, the maſſe of blood being thicker than it ought to be, and leſs diluted with Serum, becomes more bound in its conſiſtence; in theſe the ſolution of Continuity being made and kept by reaſon of the Iſſue, the blood it ſelf (for that it doth not ſufficiently diſcharge its Serum, whereby it may go away) ſticks in the paſſage, and ſo being extravaſated, cauſes a very painfull inflammation; and in the mean while, as it pours out little ichor, it remains as well unuſefull as troubleſome. The operation and uſes of Fontinels and their indications being deſigned, we ſhall ſhew in what place, in what form, and with what inſtruments they ought to be made, and after what ſort to be managed.

The places of Iſſues are deſigned, according as the ends are Evacuation General, or Secondly, Evacuation and Revulſion, or both that and derivation.

The places are appointed according to the ends or intentions of Curing by them, which chiefly are theſe three, *viz.* 1. A general Evacuation of humours from the whole body. 2. An Evacuation and alſo a revulſion from ſome particular member. 3. An Evacuation and alſo a derivation from ſome particular member. In reſpect of the firſt it is expedient that an Iſſue be made in the left arm; The ſecond Intention requires it far from the part affected, and the Third near the part.

For theſe ends, *viz.* one while for this, another while that or the other Fontinels are made in all parts of the Body, *viz.* in the Head, Breaſt, Abdomen, in the Arms and Thighs, and in moſt parts of each of theſe, either by Inciſion, or Cautery, or piercing through, and in their holes or orifices Peaſe, or wooden Peaſe, Pellets or Pledgets, are put to keep them open. We will obſerve the principal places and kinds of Iſſues by running through the members of our body.

1. *In the Coronal Suture.*

1. A Fontinel is preſcribed by ſome to be burnt by a Cautery in the Coronal Suture, and is commended for exhauſting and evacuating humours out of the brain and its outer Coverings. Although ſome uſe this in familiar practice, yet I have found by experience in ſome it doth leſs happily ſucceed, inſomuch that I have ordered many Iſſues to be ſtopt that have been made on the top of the head, being inſtructed herein from Reaſon and Experience; for that the blood transferres more feculency towards the place where it was wont to lay aſide its recrements, and depoſites them in the whole vicinage, and chiefly in the part affected, (as being the weaker and more ſuſceptible part) whence a Diſeaſe is oftner augmented than cured. For the ſame reaſon, *viz.* for the derivation of the humours from the inner head outwards, ſome form Iſſues in the fore-part of the Head over the ſagittal Suture, others in the hinder part of the Head about the beginning of the Lamboides, but the ſame exception remains againſt both as the former. And doubtleſs more rightly doth an Iſſue in the Arm anticipate the morbifick matter that is wont to be depoſited about the head, or makes revulſion in the Thigh, and raiſed a little beneath the head, derives from thence. For this reaſon in painfull diſtempers of the brain, and Meninges, we cut a deep hole in the Nape of the Neck in Children and Youths; but for thoſe grown up, and Old men, we apply Cauteries on either ſide the Spine between the Shoulders or the Homoplatas, and in the ſame places we make inciſion for two Fontinels capable of many Peaſe, often with very great ſucceſs. As to holes cut or burnt behind the Ears, or a Seton with a skane of Silk drawn through the Lobes thereof, I have ſeen them rarely with any ſucceſs, but often very troubleſome; Inaſmuch as a ſolution of Unity made in theſe places, neither diſcharges much Ichor, nor for any long ſpace; for though the hole or orifice be fill'd with a Peaſe, or Pill, it will be covered in ſpite of all endeavours to the contrary by the Cuticula, or skin growing under.

Iſſues in the fore and hinder part of the head.

Between the Shoulders.

which are profitable in many diſeaſes.

Iſſues in the back do notably help diſeaſes not only of the Head by Evacuation, and derivation of the morbifie matter, but alſo in all Gouts, Stone and Colicks, by anticipating the fuel of the Diſeaſe, and by intercepting it while it tends to its ſeats; which really is plainly proved by experiments and obſervations taken from the help of the Patients.

Fontinels between the Shoulders, alſo in the Arm or Thigh, conduce to the evacuating or anticipating, in pectoral Diſeaſes, the humours flowing to the Lungs, and to the drawing back thoſe depoſited there. How an Iſſue cut in the Cheſt between the Ribs doth ſometimes more immediately derive the conſumptive matter from the Lungs, we have elſewhere ſhewed.

The

An Iſſue in the left Hypochondrion.

The Region of the Abdomen ſeems unapt for bearing an Iſſue in any part thereof; notwithſtanding the practice of ſome, although it be more rare, is much fam'd for a large Iſſue capable of many Peaſe to be burnt with a Cautery upon the Region of the Spleen for any hypochondriac affection. I have known it of ſmall benefit to ſome, at leaſt not recompenſing the trouble and pain of ſuch a remedy.

In the Groin.

Some time ſince I ſucceſſefully cured a weakneſs in the Loyns obſtinate to all other remedies, by a Fontinel in the Groin, and in another patient an inveterate Sciatica. For ſurely the glandulous Emunctories ſettled in that place, do imbibe very many recrements of the blood and nervous Juice; which if they be throughly and continually diſcharg'd from them by a fit vent, it will much conduce to exempt the contiguous parts from any morbifick Mine.

In the Thigh.

The Thigh being a member ſoft and large in bulk, ſeems apt enough for enduring many and great Iſſues, to wit, thoſe which may purge away plentiful humours from the whole body. Yet it doth not ſucceed ſo with many patients, partly becauſe of its figure too much declining, like a Cone invers'd, the Ligature containing the Peaſe in the orifice is not eaſily kept on, and partly becauſe a ſolution of the Unity being made among the concourſe of ſo many Tendons, it frequently becomes inflamed and painfull; inſomuch that ſometimes it hath been neceſſary that it ſhould immediately be ſtopt up, to withdraw the trouble of pain and of lameneſs. Notwithſtanding it ſucceeds better in ſome Patients, for that an inflammation doth not always enſue upon the place where the inciſion was made, and that the Ligature has remained immovable to thoſe that tye their hoſe above the knee.

A fit place in the member to be choſen that it may be made far from Veſſels and Tendons.

Moreover, as concerning Iſſues, it is requiſite to chooſe a convenient place not only in the body, but alſo in the very member where inciſion is made, which chiefly calls for the judgement of an expert Phyſician or Chirurgeon; for carefull proviſion muſt be made, leſt a Cautery or inciſion be made upon, or too near the Tendons or greater Veſſels; but let the Fontinel be made not in the very body of the muſcle, but in the interſpace or diſtance between the muſcles; where the orifice, as *John Heurnius* learnedly obſerves, ought to paſs through the whole skin ſo far, untill the little membrane of the muſcle underneath be penetrated. Wherefore, this part of Chirurgery is not raſhly to be allowed to Quacks and others ignorant of Anatomy, for that from this being ill done, not only a fruſtration of the benefit, but from thence frequently great miſchief happens, and ſometimes to the hazard of life.

Symptoms accidental to Iſſues how to be cured.

It is not needfull to deſcribe the figure and uſe of the cutting Inſtrument, together with the manner of preparing and compounding Cauſticks for making Iſſues, inaſmuch as it is notorious to the common people; yet it behoves us to handle in what manner the ſymptomes which happen to theſe Emiſſaries after they are made, may be cured, and it will not be beſides the matter to diſcourſe, what do either impede or pervert their powers.

What chiefly require help.

Whereas many and ſeveral diſtempers happen to Iſſues, help is not required for them all, but only for ſuch as are of greateſt moment: Wherefore there will be need of help, 1. Whereſoever an inflammation enſues upon the part or place where it is. 2. If the Orifice vent more or leſs Ichor than it ought. 3. If the Ulcer ſhall be apt ſpontaneouſly to be dryed up, and cover'd over with a skin: or if it be prone to abound with ſpongious fleſh growing about the ſides. As to leſſer faults, as when the Ulcer ſhall break forth into frequent Hæmorrhagies, or change its place creeping into another leſs convenient, with many other ways by which it prevaricates, it will not be worth our labour to diſcourſe here.

1. Inflammation.

1. An inflammation frequently happens to an iſſue, and that ſo painfull ſometimes, that it threatens a Sphacela, yea and ſometimes cauſes one. But ſuch an affection enſues either upon the orifice new made, or happens afterwards by reaſon of the blood and humours, occaſionally agitated and ruſhing frequently and in heaps to that part.

Which happens to a new Iſſue, the Reaſon of it and Cure propoſed.

When a Fontinel is made, immediately by reaſon of ſolution of the Unity, and conſequently by reaſon of the circuit of blood ſomewhat hindred in that place, a certain inflammation and ulcerous pain happens to ſome patients; but in ſome endued with a fervent blood, and whoſe Serum is leſs diluted, this enſues much fiercer. For the blood being brought thither by the Arteries, the ends of the Veſſels being cut off and obſtructed, it can neither go out nor be returned immediately by the Veins, but ſticking there in the paſſage it is accumulated more and more, and being at length extravaſated, and filling and ſtopping all the pores of the contiguous skin and fleſh,

fleſh, it raiſes a tumour with redneſs, and heat moſt intenſe, which coming to paſs, either the blood ſo heaped up, and extravaſated, in a ſhort ſpace of time becomes immovable by reaſon of conſtipation, and for that cauſe being as it were divided from the reſt of the maſs, it is extinguiſhed, and ſuffering death produces a Sphacela upon the part: Or ſecondly, the blood ſo ſtagnating, is after a ſort agitated as to its particles, and enjoying alwayes a vital flame, and made more intenſe by the ſame, it is as it were boyled throughly, and ſo is changed into a Pus, to be evacuated by an abſceſſe: Or, thirdly, which happens more frequently, and ought always to be procured in our caſe, the blood provoking an inflammation is reduced into the Veſſels and reſtored to Circulation by other paſſages whereinto it is conſtrained.

An Inflammation hath three manner of Criſis's.

But that it may be reduced, theſe two things will be neceſſarily requiſite: Firſt, That it be much diluted with the Serum flowing thither abundantly, or rather thruſt forward into the part: Then ſecondly, that the Veſſels behind the Tumour being emptyed, may ſwallow up the blood diluted, and driven back by the Serum; for the blood being forced towards the Tumour, whenas it cannot advance forward, yet its bulk being diminiſhed, that it may be able to return back, it diſchages the Serum plentifully from it ſelf, and drives it forwards into the places obſtructed; which entring under the ſtagnating blood, dilutes it, and ſucceeding into its places, forces it back into the paſſages of the Veſſels, and in the mean while that Serum tending forward exhales by the pores; inſomuch that the blood which was extravaſated being diluted and forced back by the Serum, and the Serum it ſelf evaporated, the ſwelling with the Inflammation vaniſhes leiſurely away. But if (as in more hot temperaments it comes often to paſs) the blood being extravaſated and impacted in the pores, be not diluted by the Serum brought to it in great plenty, it will not only ſtick there pertinaciouſly, but it will irritate a fiercer Phlogoſie with a Feaver, and ſometimes other dreadful ſymptomes. So, not long agoe, when a renowned Divine, endowed with a thicker and hot blood, had an Iſſue cut in the inſide of his Leg, although the skin only was cut, an inflammation followed preſently, which within a few days ſo cruelly encreaſed, that it could hardly be impeded by any Remedies from degenerating into a Gangrene. Wherefore, when the blood being extravaſated through the ſolution of the Union, and wanting the afflux of the Serum whereby it may be diluted and brought back, proceeds into an Inflammation, Fomentations and Cataplaſms of Emollients being outwardly adminiſtred, do often-times bring help; inaſmuch as the moiſt and ſoft particles falling from theſe, go under the blood ſtagnating, and dilute it, and ſo pleaſingly moving it together, cauſe it to return the more eaſily into the Veſſels; hence it is, that the moiſt applications of this kind being adminiſtred outwardly, do ſupply the defect of the intern Serum requiſite to dilute the blood; notwithſtanding that the blood being ſo diluted and irritated into motion, might be rendered fit for its Circulation, there is alſo need that the Veſſels which ſhould receive it ſhould be enough emptyed, for which purpoſe Phlebotomy and Purgation are frequently of neceſſary uſe, beſides a ſlender Diet. And indeed according to uſual cuſtom, we purge Cacochymicks or Plethoricks a little before, or after the Iſſue is made, and frequently breathe a vein in thoſe Patients. Neither are theſe Remedies only fit in an Iſſue new made, to provide againſt or diſcharge an Inflammation, but alſo they are advantageous as often as that diſtemper enſues upon an old Orifice of the skin. For as often as the blood being very impure, and together growing feaveriſhly hot, doth enter into a ſeparating turgeſcence, it frequently happens that it diſcharges its recrements and feculencies, otherwiſe unapt to be purged out, about the Fontinel, and there being impeded in its Circuit by them accumulated together, it is extravaſated, and for that cauſe brings on a fierce Phlogoſis. Such an affection not long ſince happening in a renowned ancient perſon, and being neglected from its commencing, within a ſhort ſpace of time degenerated into a Gangrene; notwithſtanding from which by the help of appropriated remedies carefully exhibited, as well inward as outward, he eſcaped not without great danger of life. At ſome other time hereafter perhaps, when treating of Cutaneous diſeaſes, we will ſpeak more largely of the Ætiologies and Remedies of an Inflammation, and of an Abſceſſe or Impoſtumation and Spachela. At the preſent we will conſider the other Symptomes of Fontinels.

The ordinary and beſt of theſe is, that the extravaſated blood may be reduced.

How it is done.

What Remedies there is need of.

For this end oftentimes purging and bleeding are required.

An Inflammation ſometimes happens to old Iſſues.

2. Whenever an Iſſue throws out too much Ichor, which for the moſt part is thin and very ſtinking, and ſometimes diſcoloured, ſo that the ſo vaſt loſs of humour, and that ſtinking, not to be endured, do require a Remedy; in ſuch a caſe there will be

2. An Iſſue pouring out too much and ſtinking Ichor requires remedy.

two

Of which there are two Intentions.

two chief Therapeutick Intentions, *viz.* Firſt, that the mixture of blood be ſtrengthened, leſt its conſiſtence ſhould be too prone to diſſolution and ſerous efflux: Secondly, That the tone of the place ulcerated by the Fontinel be preſerved, and rendred exempt from any putredinal ferment, ſo that no taint being there lodged in ſecret, do impart any pollution on the blood paſſing through in Circulation, whereby it being infected, might preſently goe into parts, and the Serum be conſtrained there to diſcharge it ſelf more abundantly.

Firſt, that the Temperament of the blood be reſtored.

This former ſcope of Curing enjoyns ſcarce any thing but moderate purging by intermiſſion, and a regular Courſe of Diet, *viz.* that the Patient be reſtrained from all ſurfeit and exceſs, as to the plenty of Nouriſhment, the quality, and ſeaſons of receiving it; likewiſe more eſpecially from ſmall Wines, Cider and other acid liquors, whereby the blood is wont to be diſſolved into effluxes. For indeed thoſe that are ſo affected, do ſmartly pay for any error or irregularity in Diet, pain being immediately irritated about the Iſſue.

Secondly, to preſerve the tone of the part ulcerated.

For due preſervation of the tone of the place where the Iſſue is made, and exempting it from putrefaction, let ſedulous care be endeavoured, that all naſtineſs be declined, that both the ſolid things put into the orifice, as alſo the Coverings, whether Plaiſters or Leaves of Ivy, or Oyl cloaths, be changed twice every day; for in ſome perſons any of theſe will quickly contract a ſtench, and preſently cauſe the Ulcer of the Iſſue to putrifie. But if this tends to putrefaction, immediately in place of a Peaſe or wooden Pill, let a Pill of Virgins Wax be put in, incorporated with red Sanders and Verdigreaſe: Moreover, let a Fomentation withall, Morning and Evening, with the Decoction of St. *John*'s-Wort, Yarrow, Centaury, *&c.* be made uſe of.

Thirdly, a dry and troubleſome Iſſue requires help.

3. Sometimes a Fontinel like a dry Fountain pours out little or no humour; the reaſon whereof is uſually, either for that the orifice being not deep enough, doth not penetrate the whole skin, which is cured by piercing it deeper; or the Ulcer though hollow and large enough, yet remains always dry, becauſe the Serum doth not eaſily nor in plenty ſeparate from the maſs of blood, by reaſon of its conſiſtence being too much bound up; and then the only remedy is, to wear ſolid things within the Orifice, which may more provoke or twitch the mouths of the Veſſels, for which purpoſe Peaſe made of Ivy-wood, or Box, or of the roots of Gentian or Hermodactyls, are often uſed with ſucceſs.

An Iſſue ſometimes will heal up notwithſtanding all endeavours to the contrary.

4. It often happens, that the Orifice of an Iſſue being too ſhallow, and ſparingly ſweating out Ichor, is grown over with a thin skin with the Peaſe included therein, and the deep hole is healed up quite; for which fault there is ſcarce an apt remedy to be adminiſtred. Wherefore it is better to cloſe that Iſſue (rather than always in vain to fret the skin) or transfer it to ſome other place.

Sometimes it hath ſpongy fleſh growing about the lips.

5. The ſore of an Iſſue tending to healing, and being forbidden, often procures a ſpongious fleſh about the edges, and ſometimes in the hollowneſs it ſelf; the reaſon whereof is, becauſe the nutritious liquor being conveyed to the ends of the Arteries and nervous fibres, and being not immediately waſht away by the ſerous Ichor, fixes there, and beginning to be aſſimilated ſtretches out both theſe veſſels to fill the cavity with fleſh, and into theſe rudiments of fleſh both the blood and Animal ſpirits flow moſt copiouſly; and the blood in the mean time being conveyed thither, forms ſprigs of veins within that bulk for its return: Notwithſtanding this fleſh as yet rude and without ſhape, being excluded for the moſt part from the hole, grows up over the edge; and when in this manner it riſes higher than that it may poſſibly be covered and cloathed with skin and Cuticula, it remains always naked and ſpongious. This excreſcency is eaſily enough cured by ſprinkling thereon Eſcharotick powders, of burnt Alum, Colcothar, or Mercury precipitate; for remedies of this kind do eat away the fleſh ſo luxuriating by their acrimony as well as ſtipticknes, repel the nutritious humour, and lock up the mouths of the Veſſels. As often as that ſuperfluous fleſh encreaſes about the ſides of the Iſſue, it is a ſign that the nutritious humour flows thither more plentifully than the excrementitious; and for that cauſe in Patients ſo affected that vent proves not always ſo benign. Wherefore, under pretext of this reaſon many are averſe to that remedy (though ſurely it is harmleſs to moſt, although not alike uſefull and advantageous to all.) We have before conſidered the chief diſadvantages thereof, as likewiſe the ſcandals objected thereunto; yet there remains another thing according to the opinion or rather error of the Vulgar, a notable objection againſt Iſſues, which we will here diſcuſs for a Concluſion.

The reaſon thereof delivered.

With

With many in *England* a contumacious opinion is grown up (I know not whether it be ſo in other Countreys) That one or more Fontinels diſpoſe to barrenneſs. Wherefore this kind of remedy, however otherwiſe conducible to health, is ſcrupulouſly forbidden to all marryed Women that deſire Children; of which Prohibition there is no reaſon as yet made out, but only Stories related of certain Women that have been barren having Iſſues; when it were as eaſie to enumerate more barren women without Iſſues, and many others that have been fruitfull with them; and truly I uſe to retort (whenas there is no need of any other refuting) this as a chief Argument againſt that opinion. *The common error is that Iſſues diſpoſe to barrenneſs.*

SECT. III. CHAP. V.

Of the Diſeaſes of the Skin, and of their Remedies.

AFter Attractive Remedies of the *Cuticula* and Skin, namely Iſſues and bliſtering Medicines delivered before, by a certain Law of Method we are induced to handle Diſeaſes of thoſe parts, and other kinds of Remedies of divers ſorts; the true Ætiology of which will afford matter of moſt pleaſant as well as profitable ſpeculation.

As for the fabrick and uſes of thoſe parts, it needs not that I ſhould here repeat all things already accurately deſcribed, and well known in Books of Anatomy. It may ſuffice us to note concerning the *Cuticula*, that this outward skin is thin and denſe, without blood and without ſenſe, as deſtitute of Veſſels and Fibres, which cleaving to the inward skin, covers and defends it from outward injuries. This is every where full of pores, into whoſe orifices the Veſſels diſcharging ſweat do open, which *Malpighius* viewing more accurately with a Microſcope, a little before their gaping or opening, affirms to be endued with little Valves, for the retaining or free breathing forth of ſweat: but I confeſs they lye hid to me. *A Deſcription of the Cuticula.*

The *Cuticula* being taken away by Fire, or Phænigmons, the skin appears naked, and looks red, by reaſon of the ſanguiferous veſſels. But this is a thicker membrane, as to its greateſt parts, formed of filaments of Veſſels bringing blood, of Nerves, and of nervous Fibres, variouſly interwoven and complicated among themſelves, among which numerous Glandules and Lymphaducts, or Veſſels diſcharging Sweat and Vapours, are thickly interpoſed. The ſubſtance hereof is related to be double by moſt Anatomiſts, the outer is nervous, the inner fleſhy, or rather glandulous; for an example of which, the Rind of an Orange is brought. If the skin be viewed naked by a Microſcope, by the renowned *Malpighius*'s obſervations, Firſt there preſents it ſelf a body in form of a Net, in whoſe thick holes are contained not only paſſages of Sweat, but alſo very many Teats in form of a Pyramid, riſing out of the skin in parallel ranks, and paſſing into the *Cuticula*, where being ſtretcht out in length, they are divided as it were into many little Fibres; which the ſame Author hath determin'd to be the ſenſe of touching. Beſides theſe, the ſubſtance of the skin contains very many Glandules, by which means the Lympha or watery matter is carryed by the Lymphaducts or excretory Veſſels, out of the Arteries to the Pores. For indeed the moſt accurate *Stenon* hath obſerved, *that its Glandules lye under every pore*; which become either greater or leſſer, according to the uſe of ſweating: the ſweat or vapours continually ſtreaming out of theſe by the excretory veſſels, avoiding the excrements, do moiſten the nervous Teats in their paſſages, leſt perchance they ſhould grow dry. *Of the Skin. The pyramidal Papillæ the Organ of feeling. The Pores and Glandules of the Skin.*

As to the pores or paſſages of Sweat, they are diſcovered by a Microſcope to be of two kinds, *viz.* The greater, in moſt of which the roots of the hairs are implanted, and by interſpaces, on both ſides of each wrinkle of the skin, are diſpoſed in a parallel rank: Or ſecondly, they are the leſſer Pores, which being numberleſs, do fill up all the ſpaces between the former in moſt thick Punctums or pricks. For indeed the whole skin with its wrinkles, appears like a Field furrowed by a Plow, and afterwards harrowed with the ranks turned, or rather oblique; ſo that its ground *The Pores twofold, greater and leſſer.*

The wrinkles and furrows of the Skin.

being eminent above the furrows of either kind, there remain in its plain, Figures very much of a Rhomboidal or a Diamond-faſhion; and accordingly as thoſe furrows, with their banks or flattes, are either ſhorter and leſs, or deeper and greater, the texture of the skin appears either delicate and thin, or thick and courſe. This kind of Conſtitution although it be moſt owing to ones birth, and to the primogenial growing together of the humours, is however manifoldly altered by reaſon of the various accidents of the enſuing life. A more groſs Diet, difficult labour, injury of Air, and chiefly exceſs either of heat or cold, render a skin more rough: alſo contrariwiſe a nice and delicate education renders its tone more fine and ſoft.

From whence the Roughneſs or Fineneſs of the skin.

Depends much on the Humours filling the pores.

That the skin may become more neat, ſmoothe and equal, it avails much that all its pores be filled with a benign, mild and unctuous humour; for ſo, whileſt all its pores become full, and extended, the level of the whole skin appears more ſmooth: Notwithſtanding, if a vicious humour furniſh thoſe pores, or the benign humour that was in them be too much exhauſted, for that cauſe the skin will become rough and full of wrinkles. Wherefore if any endowed with a moſt ſoft and even skin, ſhall wet their hands in a Soap Lather, Lie, or Lime-water, or alſo for ſome time in warm Blood, preſently the furrows and wrinkles will grow greater and deeper, the ſaline humour being drawn out by the other Salts out of the pores; wherefore more delicate women ſcrupulouſly decline waſhing with Soap or any other things that furrow the skin.

From the ſudden ſhutting up of the pores.

Neither only the humour being too much exhauſted out of the pores, but alſo retained in the ſame either unduely or above meaſure, doth render the skin rough and unequal. The hairy pores (which though they are not the only, yet are much the paſſages of Sweat) do conſtantly ſend out more plentiful Effluvia's for the ſake of tranſpiration, wherefore they ever ſeem greater and more open; but if it ſhall happen that theſe are ſuddenly obſtructed by any outward cold, the Vapours being reſtrained within, they do every where ſwell up the skin about the places where they break out, and liſt it up into little heaps: from hence if at any time our bodies are expoſed naked to the Northern wind, or are plunged in a River, the exterior Superficies before ſmooth and ſoft, will become rough and rugged, like the skin of a a Gooſe new pull'd. Without doubt thoſe greater pores, being, according to the furrows of the skin, planted parallel and as it were in a rank after the manner of a *Quincunx* or exact Square, are made as ſo many pitts for the planting of hairs as it were trees; for ſo they appear in four-footed Beaſts, and in ſome hairy parts of men.

In the larger pores are the roots of the hairs.

Theſe things being thus briefly declared concerning the *Cuticula* and Skin, as touching their frame and uſes, there is way enough made to ſearch and unfold the Diſeaſes of the ſame parts, and the reaſons of healing them.

No Diſeaſes of the Scarf-skin.

Wherefore firſt ſcarce any Diſeaſes properly belong to the *Cuticula*, it being devoid of life and ſenſe. This ſometimes being too thick hinders Tranſpiration, and alſo ſometimes by reaſon of accidents in ſome places it grows too thick and callous: but it ſelf being clearly unſenſible it is never ſick, notwithſtanding this is a cauſe that ſome diſtempers which might be blown off by Tranſpiration, do cleave to the ſuperficies of the skin, inaſmuch as the dregs of the blood, and humours, and recrements being thruſt forward outwards, having paſſed through the whole skin, when they cannot evaporate wholly by reaſon of the thickneſs of the Scarf-skin, being faſtened in the outer skin, produce various diſcolourations, and ſtains thereof; of which ſort are thoſe ſpots called Heat-ſpots, Freckles, or Ephelides, as alſo ſcorbutical and malignant ſpots, alſo Pimples and whatſoever other ſtains without any ſwellings or roughneſs do ſeem to beſprinkle the skin or outward Scarf-skin, with marks, or ſome little disfigurings.

The cauſe of ſome.

The Cutaneous diſtempers reckoned up.

But truly as to what belongs to the diſtempers of the Skin it ſelf in general, ſince they are various and manifold, they are wont to be diſtinguiſhed under a various reſpect, and chiefly that they are either with or without a Tumour; we have but now taken notice of theſe latter ones.

Diſtempers in the skin with or without a tumour.

Diſtempers of the Skin with a Tumour, are either univerſal, diſperſed throughout the whole body; or are particular, being raiſed in theſe or thoſe members, diſperſed or as it were by chance.

The former either happen upon a Feaver, as chiefly the Small-pox, Meaſles, or other malignant wheals, whereto alſo may be added the fleeting puſhes of Infants; or happening without a feaver, as the Itch, Tetters, and leprous diſtempers.

The

The outward particular Tumours, or diſperſed ones, for the moſt part do not ſeize upon the skin only, but alſo upon the parts ſubjected, *viz.* now the carneous, another while the tendinous, or membranous or glandulous, and for that cauſe do exiſt of a ſundry diſpoſition, and of a diverſe form. To diſcourſe particularly concerning all theſe, and to aſſign the reaſons of their Cauſes, and Cure of every one, would be a matter not only of an entire Tract, but of a great Volume: Wherefore, for the preſent we will only briefly ſpeak of the Diſtempers merely or for the moſt part Cutaneous (of which ſort are all ſpots and Pimples, as alſo the Scab, or Itch, Tetters, or leprous Maladies): perhaps, an opportunity may happen, when I may treat more ſpecially of Tumours of every kind.

1. *Spots call'd Ephelides.*

Firſt then (that we may begin with Spots as Affections of leſſer moment) thoſe offer themſelves called *Ephelides*, becauſe they are chiefly cauſed from the Suns heat; for that cauſe frequent in the Spring, and increaſe moſt in Summer, again in Winter they ſoon vaniſh. Moreover, whereas they happen in the more beautifull perſons, and of a thinner skin, they break out chiefly in thoſe places where the *Cuticula* is moſt thick, and is expoſed to the Sun and Air, *viz.* the face and hands, of a colour yellowiſh or brown, in magnitude of a Flea-bite, but they exiſt unequal and irregular as to their Figure. Theſe differ little or nothing from thoſe browniſh or yellowiſh ſpots which ſome call Lentigines or Freckles, which conſiſting of the bigneſs of a Lentil, mark the parts of the face as it were with many drops.

The deſcription of the Ephelides.

The matter and cauſe thereof.

The matter of theſe ſeems to be a more thin portion of the cholerick humour, allured outwards by the force of the Sun attenuating it, and opening the pores of the skin; which beginning to be evaporated, is fixt to the inſide of the outmoſt skin or *Cuticula*, which it cannot paſs through. Surely it is a ſign theſe ſpots proceed from Choler, or other yellow ſcums of the blood, becauſe they are chiefly familiar to them whoſe hair is yellow. Moreover, the reaſon is manifeſt enough, becauſe they ariſe more often in a fair Complexion, and in thoſe parts expoſed to the Sun and Air; for their more thin skin tranſmits the humour rarified by the ſolar heat ſo far untill it is retained by the thicker Scarf-skin, near the places of iſſuing out. This affection preſages or indicates no evil, as to the ſtate of health; and although in appearance it repreſents ſomething of deformity, notwithſtanding that is made good again, inſomuch that it ſignifies them ſo ſpotted, to be endued with a more pure Conſtitution.

Lenticular Spots.

Beſides theſe ſmall freckly ſpots there are others much larger, above a hands breadth in magnitude, which deform the skin in divers places, eſpecially about the breaſt and back, one while with brown, another while with pale or blackiſh ſpots. Theſe at certain times, as I have obſerved in many, being wont to ariſe in certain parts and vaniſh again, are commonly called Liver-ſpots, and thoſe moſt markt with them are thought to have a Liver leſs ſound, or at leaſt not well ſanguifying; which notwithſtanding is not true on this account, but only inaſmuch as the cholerick humours, when they are not enough ſeparated from the maſs of blood within the Liver, being thruſt forward to the skin do ſo diſcolour it: which fault alſo is imputed to the Spleen; for truly this deformity ariſes, becauſe that the feculencies and excrements of the blood, when not enough received by the Veſſels of ſeparation, are together diluted with the Serum, with which they are conveyed to the skin, and in the ſame place being caſt off by the blood, and deſerted by the ſerous Juice while it is evaporating, they are faſtened about the outer little holes or pores, even as a moſſie down cleaving to the ſtrait places of a River.

Liver Spots falſly ſo called.

The Deſcription and cauſe of them.

Theſe ſpots chiefly appear in Summer, and moſt upon the Breaſt and Back, *viz.* at which time and in thoſe places men are moſt apt to ſweat: for that ſerous Juice which brought out thoſe dregs from the maſs of blood, into the ſtrait places of the skin, leaves them there, altogether unable to evaporate. This indiſpoſition hath nothing of evil joyned to it, nor is it a ſymptom of any preſent diſeaſe, nor doth it preſage any ſuddenly approaching; Moreover, when for the moſt part it happens to places that are covered, and brings no deformity or trouble, there ſeems little or no need of Cure: but becauſe an opinion is frequent with the Vulgar, that the Liver is eminently endangered by theſe ſpots, and neceſſarily requires Medicine, for this cauſe to ſatisfie the importunate, craving Medicines, we are wont to preſcribe, beſides extern Coſmeticks, even inward hepatical Remedies; whoſe uſe although not very neceſſary, yet becauſe from thence the depuration of blood, and opening obſtructions of the bowels are diſpatcht, they are not altogether in vain. The inward Medi-

cines profitable to this deſign, are deſcribed before among the hepatical Remedies: The Topical or outward are altogether the ſame in theſe as in any other kind of ſpots; ſome ſelect forms of which we will annex.

Peſtilential and ſcorbutick ſpots. Concerning Peſtilential, as alſo Scorbutical ſpots, of which we have purpoſely in another place ſpoken, there is no need here to repeat the ſame; eſpecially becauſe for theſe another method is required, than for thoſe but now deſcribed; inaſmuch that in one kind of ſpots, Medicines for the moſt part outward are wont to be adminiſtred, without Splanchnic or Cordial medicines, but in the other kinds only inward medicines, without any that have reference to the Skin.

The Cure of the Spots. Wherefore, as to the ſpots called Freckles, Lentigines, and thoſe commonly called Hepatical, they properly belong to the Art of Beautifying; and for the taking away theſe Deformities of the Skin, only Coſmetick Remedies are preſcribed, without any method of healing. There is every where a plentiful harveſt of theſe with curious Ladies, and others, that are ſolicitous of cleanſing their skins; yet all theſe, foraſmuch as they only reſpect two Intentions of healing, may be reduced to theſe two heads; *viz.* either by opening the pores of the skin and Scarf-skin, and ſometimes by excoriating this, they do endeavour to have the humour drawn outward, and alſo to be evaporated; or on the other ſide, and not with leſs ſucceſs, thoſe things are adminiſtred that may drive back the ſpotty matter, and force it inwards. We will annex here in order ſome uſual Forms of the Topicks of either ſort, being rationally found out, and frequently made uſe of happily enough; becauſe it is not lawful without offence of the Great Ones to detect the more ſecret myſteries of the Coſmetick Art, and to profane it among the Vulgar.

Forms of Coſmeticks.

1. which cleanſe the skin. Firſt therefore for cleanſing the skin, and drawing forth the matter of Spots:

Take of a ſmall ly of Salt of Tartar four ounces, Oyl of bitter Almonds made by expreſſion, as much as ſuffices, in ſuch a proportion let it be mingled, that the liquor turn preſently white, and ſo remain; with this mixture let the parts be anointed morning and evening, and gently chafed.

Take of Aron-roots, Bryony, Solomons-Seal, of each one ounce, Powder of Fenugreek-ſeeds one dram, of Camphir half a dram, theſe being beat together, pour on them three ounces of Oyl of Tartar per deliquium, *let it be preſſed and applyed with a rag twice a day.*

Take of quick Brimſtone in powder one ounce, black Soap two ounces, tye them in a rag, and hang them in a pinte of Vinegar for nine dayes; after let it be uſed by waſhing the part twice a day, and chafing it.

2. which repell the ſpotty matter. Secondly, For the other intention of diſcuſſing the ſpots from the skin, and repelling their matter inwards, *Lac Virginis* was a renowned Remedy among the Ancients, and is as yet commended and made uſe of by many: The Preparations are well enough known, *Viz. A Solution of Litharge made in diſtilled Vinegar, by pouring of Oyl of Tartar* per deliquium, *it is precipitated into a white liquor like milk, with which let the face and hands be waſhed twice a day, and gently chaf'd. A remedy like this or of the ſame vertue is prepared out of the ſolution of red Lead or Ceruſe made in the ſame Menſtruum, and precipitated with Alum Water, or a Solution of Sal Gem. Or,*

Lac Virginis.

Take of Camphir ſliced two drams bruiſed in a glaſs Mortar, pour thereon leiſurely the juice of one Lemmon, then adde one pint of White-wine, ſtrain it, and let the remaining Camphir tyed in a rag be hung in the Glaſs.

Take Verdigriſe four Ounces, pour thereon two pints of White-wine Vinegar, being put into a Cucurbite-glaſs, let them be diſtilled in Sand, let the Phlegme be kept for uſe, with which let the face be anointed twice a day.

For this purpoſe alſo the Phlegme of Vitriol doth notably conduce. It ſuffices ſome to uſe the diſtilled ſimple water of Bean-flowers, or of Fumitory, or the liquor of a Vine diſtilling from the Boughs cut in the Spring-time. Notwithſtanding the more nice, and thoſe who chiefly boaſt to underſtand this Art, are ſcarce content with any Remedies but Mercurial, wherefore the following water is commended and ſold by Empiricks at a great rate againſt all foulneſs of the face whatſoever.

Take

Take of Mercury ſublimate one ounce powdered, put it in a Tin Veſſel with three pints of Spring-water, let them ſtand twenty four hours ſpace, ever and anon ſtirring it with a wooden Spatula untill the whole liquor grows black, which notwithſtanding being philter'd through brown Paper, becomes clear; with a rag or a feather dipt in this, let the face be gently done over once or twice in a day. *A Mercurial Coſmetick water.*

This Remedy doth moſt notably help againſt all cutaneous Deformities, *viz.* inaſmuch as it drives away the humours within the little pores, and thoſe impacted within the little holes howſoever ſmall, diſſolves the inveterate and ſtubborn combination of Salts or Sulphurs, and reſtores the whole skin, (where it is applyed) though evilly framed as to its pores, and makes it well coloured. Wherefore it is uſefull not only to cleanſe the ſpots of the face, but alſo to take away wheals and its redneſs, as alſo the Diſeaſe of the Eriſypelas. Moreover, ſometimes it happens that many parts of the face, eſpecially the Noſe and Forehead, are markt with moſt thick Specks looking black, as if burnt by Gunpowder, which proceeds from hence, becauſe the ſudatory pores are ſometimes fill'd with a more thick black humour, another while with little worms with black heads (which little Inſects being ſqueezed out of the pores, and expoſed to the Sun, are eaſily ſeen to live, and to move themſelves) and in ſuch a malady of the skin, no Lotion or Oyntments are wont to profit, but what are Mercurial; notwithſtanding to this Hony there is a Thorn at hand more than enough malignant. For the particles of the Mercury together with its Salts (by which they are divided and ſharpened into ſmall bits) being applyed to the face, do ſhake off the peccant and uncleanly matter out of the Pores, and expell it thence, but having driven it back, they purſue it in, and readily inſinuate with the Blood and nervous Liquor, whoſe temperaments they prejudice. Yea by meeting with theſe they imprint very often on the Brain and ſometimes on the Præcordia and other parts, their virulency that can never be wiped out. From hence it is frequently obſerved, that women or men that have long uſed Mercurial Coſmeticks, are troubled with a Vertigo, and convulſive Diſtempers, or are obnoxious to paralytical, and their Teeth grow black, and ſometimes fall out. *Its Vertue.* *Its familiar uſe is not ſafe.*

SECT. III. CHAP. VI.

Of the Mange or Scab with the Itch.

After the more ſimple maladies of the skin, *viz.* thoſe which happen without any Tumour and Ulceration, and only deform it with ſpotted appearances, we will now in order treat of the more grievous Affections, and thoſe which diſſolve the Unity, and eſpecially of the Pſora or Scab, which in ſundry and frequent places of the whole Body doth much infeſt the skin with a painful Itch, and with ſmall Puſtles and breakings out, being ſometimes dry and often ſcaly, and another while moiſt and diſpoſed to ulceration; and a malady of this ſort is moſt properly the Diſeaſe of that part, conſidering it frequently begins in the very skin by reaſon of ſome outward Contagion, and often receives Cure by certain Remedies applyed to the skin only, at leaſt the reaſon of both holds ſo far, that it is ſeldom otherwiſe undertook or perfectly cured. *Pſora a diſeaſe properly cutaneous.*

The Pſora or Scab is vulgarly deſcribed to be a breaking out of Puſtules and wheals throughout the whole body, here and there, procured from a ſharp and ſalt humour heaped up in the Pores of the skin, and that it may be diſcuſſed from thence, induces a notable Itch, and a neceſſity of ſcratching. *Its deſcription.*

That we may ſearch duly into the cauſes of this Diſeaſe, and the reaſon of the ſymptoms, we will more deeply enquire concerning the matter effecting and the conjunct cauſe thereof, that it may certainly be known of what ſort that humour is which is heaped up within the skin, by what means it is either generated there, or comes from ſome other parts, afterwards in what pores or little places it is contained, and how endeavouring to break out, it doth create ſo troubleſom an Itch.

Where-

What humour its matter is of.

Wherefore about the origine of this Diſeaſe, that we may not impute the fault with the Ancients to the Liver or Spleen, the matter thereof is not any particular humour of the four commonly ſuppoſed ones, not Phlegme, nor yellow Choler, nor black, neither alſo the blood apt of it ſelf to be extravaſated; moreover neither doth it ſeem to conſiſt of two or more of theſe humours mixt together. For though ſuch humours be granted, notwithſtanding if this Diſeaſe always conſiſt of them, it would not ſo eaſily be catch'd by a meer and light contagion, or receive Cure by an Oyntment alone. Wherefore it is rather to be ſuppoſed, that the morbific matter is the humour of the Lympha conſtantly reſting in the glandules of the skin; notwithſtanding degenerating from its genuine diſpoſition, that is to ſay, its volatile ſalt, into an acid or otherwiſe offending diſpoſition. For when the continual Supplements from the blood come to this ſo depraved, and unceſſantly evaporating, theſe Juices new and old do not eaſily agree, or are united, but boyling together after the mutual cuſtom of diſſimilar Salts, they are coagulated into a recrementitious matter, which filling and diſtending the pores of the skin, every where raiſes it into Tumours; Moreover it ſomething hinders the Blood in its paſſage, and conſtrains it to be extravaſated. From hence thick Puſtules are raiſed, and becauſe that matter paſſing into an Ichor is compelled by the Serum and Blood purſuing it ſtill forward, they riſe up into little heaps; afterwards the Animal Spirits entring inordinately into the nervous Fibres, that they may promote the throwing off that ichor, do cauſe the ſenſe of that troubleſome itch.

Not any of the four common humours.

But a humour plac'd in the Glandules of the skin.

The deſcription of that Juice or Humour.

Indeed an inſpection with a Microſcope doth moſt clearly diſcover that there is a lymphous humour in the glandules of the skin which lye under all the ſweating pores, treaſured up for ſome uſes, ſo that according to the plenty and diverſe ſtay thereof, theſe Glandules exiſt more or leſs turgid. This Juice is laid aſide by the Blood, through the Arteries, in theſe Glandules, that this little burthen being caſt off, it might return more eaſily through the veins; in the mean time being repoſed there, it hath its uſes, *viz.* In the firſt place continually moiſtening the miliarie Teats, which lying under the nervous little Fibres, are the proper Senſory of Touching, it preſerves them from dryneſs, which would hinder the Senſe; alſo it imbues the aduſt effluvia's paſſing unceſſantly from the blood being kindled, in their paſſage near the skin, with a certain moiſture, and renders them fit to be voided by the pores; and whileſt part of this humour doth ſo continually evaporate with the Effluviums of the blood, thoſe expenſes are repaired by the Lympha continually freſh, being depoſited by the Arterial blood as is aboveſaid.

How it degenerates.

Notwithſtanding this œconomy of the Region of the skin is not always ſo regularly kept, but that the glandulous humour falling from its own diſpoſition and function, not only will provoke in the skin, but ſometimes in the whole body, preternatural affections of divers ſorts. This growing clammy, and cleaving more obſtinately in the little Cells obſtructs tranſpiration; and immoderate ſweating proceeds from its too plentifully flowing out, and from the ſame reſtagnating inwards, a more than uſual Diureſis. Moreover, as to what belongs to the Scab and puſtulous eruptions, that humour as it is wont to be depraved many ways, ſo chiefly theſe three, and is wont to enter into a coagulative diſpoſition with the Serum, being freſh poured out from the blood. *viz.* Firſt the Blood it ſelf being very impure, and alſo diſſolved, it leaves its corruptions and ſuperfluous droſs in the cutaneous Glandules, which in the ſame place putting on the nature of more corrupted ferment, they boyl up with other adventitious Juices, or paſſing by theſe, and are diverſly thickened, and ſo they beget not only puſtulous affections, but alſo leprous of divers kinds. From hence the daily and often eating of Shell-fiſh, and alſo of others; and of ſalted meats that have been hung in the Sun or Smoak; alſo the taking diſagreeing Drinks, and venemous Medicines, do cauſe cutaneous and frequently dreadful eruptions.

This is done three ways.

1. By reaſon of impure Blood.

2. By mere ſtagnation.

Secondly, The humour being heaped within the cutaneous Glandules, ſometimes doth not only become puſtulous by a mere ſtagnation, but alſo frequently Louſie. Wherefore, not only they that have been long in priſon, but alſo thoſe who being of a ſedentary life, are uſed to naſtineſs and ſluttiſhneſs, do live obnoxious to the above-mentioned maladies; inaſmuch as the cutaneous humour being not at all eventilated, is corrupted by mere ſtanding, after the manner of putrefying water, and ſo it puts on the diſpoſition of a corrupting ferment; to which moreover Supplements of putrefraction come from the blood in the like manner depraved.

3. By Contagion received from without.

Thirdly, If perhaps theſe Cauſes are wanting, that the glandulous humour of the skin,

skin, neither contracts any ſtain from fault of the blood, nor its own proper ſtagnation, notwithſtanding virulent ſteams communicated from without, render it no leſs prolific as to thoſe diſeaſes. This is manifeſt by common obſervation eſpecially, foraſmuch as they that have health moſt, and are endowed with the beſt Conſtitutions, ſcarce ever eſcape free from the ſame, if they lye in the ſame Bed either with a ſcabby perſon, or where he hath lately lain: and not only ſo, but moreover the Linnen of the Scabby, oftentimes waſhed with other Linnen have beſtowed the contagion upon others. Surely, the taint of no diſeaſe (the Plague only excepted) is more eaſily or certainly propagated than this of the Mange.

The reaſon of its moſt ſudden contagion is unfolded.

If the reaſon of this be enquired into, we preſently ſay that the liquour ſuſceptive of the ſcabby taint is mightily expoſed, and moſt eaſily diſpoſed unto it; and indeed much more ready to either, than the Blood or Nervous Juice. For the glandulous humour of the skin abounding in the outer ſuperficies of the body, firſt imbibes every atome let in by holes and pores every where open, and anticipates them from the blood. Moreover, that this is ſo ſoon infected with a ſcabby Contagion, both the activity of the ferment communicated cauſes it, and alſo the proneneſs of the glandulous liquor to degenerate. For indeed the effluvia's falling from the breaking out of the ſcabby skin, are aptly enough compared to the Yeſt of Ale, remaining on the top as it were its outmoſt Coat; of which if the leaſt portion be taken from thence, and mixed with other new Ale unfermented, preſently it ferments the whole maſs how great ſoever, and changes it into the diſpoſition of the liquor from whence it was taken. Certainly there is a very conſiderable energy, which the particles however ſo ſmall and little, carryed to the higheſt activity, are able to perform; but eſpecially if they fall into a liquor (of which ſort is the cutaneous) made up together of ſubtile particles of ſeveral ſorts, as well partaking of the blood, as of the nervous Juice, and for that cauſe moſt readily apt to be fermented. Whereſoever therefore theſe effluvia's of the Contagion aboveſaid hit againſt any outward part of a healthful body, firſt they will infect the cutaneous humour only planted in that place, but then the particles of this ſo corrupted, being received by the venous blood, and preſently delivered to the Arteries, are diffuſed through the entire habit of the body, and in a ſhort time defile the whole maſs of this Humour, and make it ſcabby.

The Contagion when any where received, preſently ſpreads over the whole skin.

Of the Itch.

From theſe Cauſes of a Pſora as well adjunct as procuring being unfolded, the reaſon of the firſt ſymptoms, or breaking out in Puſtules, is manifeſt enough; but as to the other, *viz.* the Itch, as it is troubleſome to Senſe, that the formal reaſon thereof may be known, we ought to conſider to what Senſory or organ of ſenſe it properly belongs, and of what ſort its paſſion or affection ſhould be.

It belongs to the Senſe of Feeling.

Concerning theſe things, firſt it is ſure it belongs to the ſenſe of touching, and that the firſt Inſtruments hereof are Teats faſhioned like a Millet, and their little Fibres diſperſed through the whole skin, as we have before declared. Moreover with this ſenſe all the nervous fibres are endowed, being diffuſed throughout the whole body. Notwithſtanding, whereas there are two ſupream paſſions of Touching, and as it were generical, *viz. Pain* and *Pleaſure*, it is deſervedly doubted to which of theſe Itching ought to be related. For the ſolution of which, we ought to ſhew by what means the Animal Spirits, being inmates to the organ of Touch, are affected in Pain, and alſo after what manner in Pleaſure; then their demeanour alſo as to the Itching being deſign'd, it will eaſily be manifeſt of what Province this Paſſion is, and in what things the nature of it, and the manner of its acting do conſiſt. Let the Reader pardon me, if I ſhould by way of digreſſion expound this more at large, and even to tediouſneſs, becauſe this Ætiology ſeems very neceſſary both to the underſtanding and curing of moſt outward diſtempers. Pain being diſtinct from Sadneſs, and belonging to the Touch, is uſed to be defined, *A troubleſome feeling proceeding from the diſſolution of Unity*. And indeed it takes its origine as often, and in as much as any ſenſible thing, diſagreeable or improportionate, being applyed to that organ of ſenſe, divides and ſeparates the fibres one from the other; and for that cauſe repelling the animal ſpirits inhabiting in them, from their wonted and quiet emanation, diſtracts them from one another, and as it were puts them to flight; then preſently foraſmuch as that outward repulſe of the ſpirits, is communicated by a continued order of other ſpirits, to the firſt organ of Senſe, it ſtirres up the Spirits dwelling there into the like confuſions, ſo a perception is cauſed of grief or pain inflicted outwardly. In truth the whole ſeries of animal ſpirits which are affected with pain, as it were ſome ſingular member of the ſenſitive Soul, conceiving trouble, as it were,

Of what ſort its Affection is.

The chief Affections of feeling are Pain and Pleaſure.

The formal reaſon of Pain.

from

from the impreſſion of the object, is forced to be wrinkled with pain, and to contract it ſelf into a leſſer dimenſion.

The Solution of the Unity always the cauſe of it.

When a diſſolution of Unity is ſaid to be the cauſe of pain, we muſt not underſtand it ſo as if this affection only were cauſed from a wound or blow inflicted upon the body, for the ſame thing is uſed to be induced from cold, heat, wind, from the extravaſating of the blood and of other humours, or their being heaped up together in ſeveral places, oftentimes the faſhioning of the member remaining as yet entire; in which caſes, although the continued parts, and chiefly the fibres and filaments, are not at all cut off, notwithſtanding they are in every Affection of grief pulled from their uſual poſition, either by the oppreſſion of the object, or by ſtrange particles forced like wedges, and are compelled into too much tenſion or diſtorſion, or divulſion; and for that cauſe the inmate ſpirits being pulled from their mutual embraces, and diſſipated, are ill at eaſe, and incur the paſſion of pain or grief.

What Pleaſure is.

Pleaſure is oppoſed to Pain, and is a manner of Feeling clearly contrary thereunto; which takes its origine, inaſmuch as a pleaſant ſtroaking being made upon the organ of Senſe, the ſpirits flock thither, and preſently being thickly gathered together, and overſpread with a certain delight, they do as it were exult and rejoyce together in the organ: afterwards, inaſmuch as the ſpirits enter into the like triumph or rejoycing within the *Corpus ſtriatum*, a perception of pleaſure is ſtirred up.

Its formal Reaſon.

It chiefly conſiſts in removing of Pain.

The greateſt pleaſure which is offered to the Touch, conſiſts in this, that the cauſe of Pain being removed, the parts formerly affected by it, may recover their wonted temper and frame; for ſo the animal ſpirits being before put to flight, and diſperſed from one another, they recollect themſelves, and ruſhing into the places from which they were baniſhed with reinforced ſtrength, they prepare themſelves to rejoyce. From hence the Peripateticks placed the formal reaſon of Pleaſure only in the removal of ſomething that was troubleſome, as when the exceſſe of cold or heat is received by an oppoſite and more agreeable ſtate. Indeed the tangible object (becauſe it is alwayes thick and dull) doth ſcarce any way elſe (excepting Venery) allure the animal ſpirits into heaps to the organ of Senſe, unleſs for that it removes their former confuſion.

What the Itch is.

From theſe things ſo deſcribed concerning thoſe paſſions, it is eaſily manifeſt, that the Itch according to the formal account thereof, is neither perfectly nor fully either Pain or Pleaſure, but imperfectly and as beginning, partakes of both. For really the ſcabby matter being heaped up within the pores of the skin, and making the ſolution of Unity in many places, enclines towards pain: yet as it is volatile, moving, and haſtens towards vent, for that cauſe the Animal ſpirits are not put to flight from the Fibres although pulled aſunder, neither are they driven back with ſenſe of pain; but the contrary, as if being ſtronger than the humour infeſting, they were able to caſt it forth, they being wrapp'd up more thick, but irregularly within the cutaneous fibres, do twitch them together variouſly, and draw them on, that they may the ſooner diſcharge the morbific matter, and expell it forth. Wherefore inaſmuch as the Animal ſpirits being neither put to flight, nor repulſed, but flowing together in crouds into the organs of Touching, they manage themſelves there tumultuouſly, and diſorderly, and as it were by tickling the ſenſible fibres do provoke them into ſmall Convulſions, no pleaſure, but a troubleſom feeling, nor alſo is it Pain, but a Paſſion clearly diverſe ariſes from it. But as ſoon as by rubbing or ſcratching, the plenty of Spirits aſſembled about the organ of Senſe, begin to be better diſpoſed, and as it were reduced into order, from thence a thorough feeling of Pleaſure is introduced. Wherefore the Itching ſeems to be a middle-ſtate between the beginning of Pain and Pleaſure, or a paſſage of the Spirits from the rudiments of that, towards the full compleating of this. But from this Phyſical diſcourſe by the by, let us return to our Pathologie or diſcourſe of the diſtemper. From what is above ſaid it is eaſie to collect the differences of this diſeaſe.

How the Spirits are moved in it.

A certain medium between Pain and Pleaſure.

The difference of the Pſora as to its origine.

In the firſt place therefore the Pſora as to its origine either is got by Contagion, or by reaſon of an ill Courſe of Diet, the fierceneſs and ſupply thereof is communicated by the Chyle and Blood being vitiated, or it is generated in the skin it ſelf, by reaſon of filth, and the defect of Tranſpiration: Whereto we may adde, that ſometimes Infants acquire this taint hereditarily contracted from their Parents.

Secondly,

Secondly, Theſe cutaneous Eruptions as to their form, vary according to the diverſe Conſtitutions of the perſons affected: for in ſome perſons of a cholerick dryer Temperament, or Melancholy, only a dry Scab is ſtirred up, and inaſmuch as it evaporates leſsby reaſon of the defect of the Serum, with an Itching not altogether ſo troubleſome; but in others of a moiſter Temperament, and of more unclean blood, very many wheals and puſtules imbued with Ichor, and moſt of all itching, do very much provoke to ſcratching, and by reaſon of the Ulcers ſtirred up therewith, the Itch is immediately altered into pain. *2. As to its form.*

As to the Prognoſticks, although this Diſeaſe is never of it ſelf mortal or very dangerous, and always eaſie of Cure: yet frequently it contains an evil event; inaſmuch as being long continued, it utterly depraves the blood and nervous Juice, and from it haſtily cured, by reaſon of the matter received within, while it is diſcuſs'd from the Pores, a pernicious taint is brought upon the Præcordia, and Brain, and other noble parts. *The Prognoſticks of it.*

The greateſt hazard from a Scab, threatens Children and Cachectick perſons; as in both of which the taint is more eaſily impreſſed from this Cutaneous humour upon the nobler parts, which afterwards when the outward malady is removed, remaining within cannot be vanquiſhed entirely, but by a very long Courſe of Phyſick, of which neither is capable nor patient; wherefore, ſuch perſons, all care and diligence being adminiſtred, ought to be preſerved from the infection of the Scab as from the Plague. *Moſt dangerous to Children and ill juiced or cachectick perſons.* *Its Cure.*

Concerning the Cure of a Scab or Pſora, two chief Indications preſent themſelves, and each of them two-fold, *viz.* The firſt intention Curatory reſpects theſe two things, Firſt, that the glandulous Humour (its corruptive ferment being wholly extinct) may be reduced to a due temper. Secondly, afterwards that the pores and paſſages of the skin being freed from thoſe Ichorous congealings, may recover their priſtine frame or good temper. *The firſt Indication curatory.*

The Second Indication Preſervatory takes care to prevent theſe two things, *viz.* Firſt, leſt the impurity of the Pſora, or corrupting Miaſma's of the skin, being diſcuſs'd from the skin (while the ferment is expugned) turn back again into the blood and nervous liquor, and bring upon them not only ill temperaments, but alſo (as frequently it uſes to doe) a more conſiderable prejudice upon the Brain or Præcordia. Secondly, alſo let it be endeavoured that the taint of the Humours, and of the noble parts contracted from the Itchy matter, may be eradicated while the faults of the skin are repaired. *The ſecond Indication preſervatory.*

All theſe intentions of Curing, by remedies internal as well as external together, being much and often uſed, ought to be joyn'd together, or at leaſt-wiſe to be interus'd, *viz.* that the morbific matter being diſcuſſed from its receſſes, may not depart into and lye hid in any lurking-places any where elſe, but from every part, inwardly and outwardly, by remedies taken, may be wholly removed away; wherefore Purgatories ought alwayes to begin and end this method of Curing. Although *Helmont* with great pomp overthrows this Cathartick method of Phyſick, and as it were leads it in Triumph, becauſe it doth not cure the Scab by it ſelf, yet we may affirm this Diſeaſe without that remedy can ſcarce ever eaſily be cured, but never ſafely. Moreover Phlebotomy, unleſs ſomething contradict it, is preſently to be celebrated in the beginning; upon theſe, Alteratives that cleanſe the blood and ſtrengthen the bowels, and defend againſt the aſſaults of the morbific matter, challenge their turns; and in the mean time Liniments, or Baths, or topical remedies of another kind, and properly Cutaneous, are adminiſtred: As without which not only Purging and Bleeding, but alſo Diaphoreticks, Diureticks, yea whatſoever remedyes evacuating blood or humours, or altering them, become uſeleſs. We will annex ſome more ſelect ſhort forms of Medicaments, of every one of theſe Kinds but now recited. And firſt for the due undertaking of the Purging part, let there be adminiſtred in the beginning a purging Medicine or a Vomit; alſo after Phlebotomy being uſed (if need require) an Apozeme or purging Ale may be adminiſtred for ſeven or eight dayes. *Both inward and outward Medicines are to be taken together.* *Purges, Bleeding and Alteratives, and afterwards Topicks are required.*

Take of Electuary Diacarthamus three drams, Spec. Diaturbith with Rhubarb one dram, Cream of Tartar, Salt of Wormwood an. half a ſcruple, ſyrup of purging Apples what ſuffices, make a Bolus to be taken with Government. Or, *Forms of Purgers.*

Take Sulphur of Antimony ſeven grains, Scammony ſulphurated eight grains, Cream of Tartar half a ſcruple, make a powder.

Take roots of Polypody of the Oak, ſharp-pointed Docks prepared, an. one ounce, leaves of Senna ten drams, Turbith, Agarick, Epithymum, an. one ounce, Carthamus-ſeeds half an ounce, Citrine Sanders two drams, Anniſe, Carue ſeeds, of each two drams, being ſliced, bruiſed, &c. digeſt them warm in four pound of White wine twenty four hours, pour it clear off without ſtraining: the Doſe ſix ounces by it ſelf, or with a ſpoonful of ſyrup of Epithymum.

Apozems. *Or take the foreſaid Ingredients and boyl them in ſix pound of Spring-water to half, then adde one pound of White-wine, and preſently ſtrain it for an Apozeme to be taken as the former.*

Medicated Ale. *Take roots of Polypody of the Oak, ſharp-pointed Docks an. three ounces, Senna four ounces, Epithymum, Turbith, Mechoacan, of each two ounces, of yellow Sanders one ounce, Coriander-ſeeds ſix drams, prepare them according to art, make a bag for four gallons of Ale; draw it after five or ſix dayes, take twelve ounces more or leſs every morning, for eight or ten dayes.*

For ordinary Drink let a little four-gallon Veſſel be filled with ſmall Ale, wherein may be put the following Bag.

Take the tops of Tamaris, dryed Fumitory an. four handfuls, roots of ſharp-pointed Docks dryed ſix ounces, the rinde of woody Night-ſhade two ounces, ſlice and bruiſe them and mingle them. Or let them take a Bochet of the Decoction of Sarſaperilla, Saunders, with ſhavings of Ivory, Harts-horn, and Liquoriſh.

Altering Remedies. II. As to what belongs to altering Remedies, beſide the Phyſick-Ale for ordinary Drink, there ſeems not need of many others, but only, that a due government of Diet be obſerved, by declining Salt and ſpiced Food, Shell-fiſh, and others ſeaſoned with pickle; alſo abſtinence from Wine, Strong-waters, ſtronger Ale, and from all Liquors apt too much to ſtir and ferment the blood. In a contumacious Pſora, and ſeizing upon a Cachectick body, it will be expedient to adminiſter the following Electuary with a diſtilled water twice a day.

Electuary. *Take of Conſerve of Fumitory, roots of ſharp-pointed Docks, of each three ounces, Troches of Rhubarb, Species of Diatrion Santalon, of each one dram and a half, Salt of Wormwood one dram, Vitriolum Martis four ſcruples, with a ſufficient quantity of ſyrup of Cichory with Rhubarb, make an Electuary, the doſe from one dram to two, twice in a day, drinking upon it three ounces of the following water.*

A diſtilled water. *Take of the tops of Fir-tree, ſix handfuls, of leaves of Fumitory, Agrimony, Fluellin, Liverwort, Brooklime, of each four handfuls, roots of ſharp-pointed Docks two pound, Bark of Elder two handfuls, the outward Rinds of ſix Oranges, cut them and bruiſe them, and then pour upon them eight pints of Poſſet-drink turn'd with middle beer, diſtill them in a Roſe-Still; let the whole Liquor be mingled together.*

Oyntments whereof the Baſis is chiefly Sulphur. III. Oyntments for to anoynt the Skin, are wont commonly and efficaciouſly to be preſcribed for the curing of the Scab; notwithſtanding thoſe which are adminiſtred to many other Tumours or Ulcers, do not help here at all; but Brimſtone and Preparations thereof ſeem to have a ſpecific vertue in this Diſeaſe, ſo that for the moſt part they are put into all Liniments for the Itch, and are the baſis of the whole Compoſition. The Receipt chiefly uſed by the Vulgar is this.

Forms of them. *Take Powder or flower of Brimſtone half an ounce, unſalted Butter four ounces, powder of Ginger half a dram, make an Oyntment.*

A little more neat, though not much more efficacious is preſcribed thus.

Take Oyntment of Roſes four ounces, powder of Quick Brimſtone half an ounce, Oyl of Tartar per deliquium *what ſuffices, make an Oyntment: for ſcent ſake adde one ſcruple of Oyl of Rhodium.*

Other ſtronger Medicines. When the force of the Brimſtone is to be drawn forth or ſtrengthened by other things added,

Take Oyntment of Enula-campane without Mercury four ounces, powder of Sulphur half an ounce, Oyl of Tartar per deliquium *what ſuffices. For the ſame purpoſe the Oyntment*

ment of the roots of ſharp pointed Docks boyled in Butter, or Oyl, with White-wine, to the conſumption of the Wine, and made up with Sulphur and Oyl of Tartar. Alſo thoſe Oyntments are uſed with ſucceſs by themſelves, the more curious abhorring the ſmell of Sulphur.

3. The third kind of Liniment againſt the Itch, is made of Mercury, wanting no guards of Sulphur, or any other Vegetables. But of it ſelf it is too powerfull to be applyed all over the body, but only to the Joynts of the Arms and Thighs, or worn about the Loyns, made up in a Girdle, for ſo it ſeldom fails in curing the Itch. Notwithſtanding there is danger leſt this practice (as it often happens) produce evil and pernicious ſymptomes; for from the Mercurial Oyntment, frequently a ſalivation, alſo ſometimes dimneſs of the eyes, or drowſie or convulſive Affections do proceed: Alſo ſometimes the Poyſon of the medicine within the Præcordia or Bowels produces the dreadful Affections of ſhort breathing, Swouning, or bloody Fluxes. *The moſt powerfull made of Mercury.* *But dangerous.*

The vulgar form of a Mercurial Oyntment, and chiefly in uſe for the Itch, is this. *The Form of it.*

Take of Quick-ſilver reduced into ſmall particles with an acid, or (as they ſay) kill'd, an ounce and a half, freſh Hogs Lard ſix ounces, incorporate them well, ſtirring them long in a Stone or Glaſs mortar.

Neither only under the form of an Oyntment, but alſo after many other wayes the aforeſaid Medicines are wont to be often uſed. For the fume of Cinabar (which is prepared of Mercury with Sulphur) caſt upon Coals and taken in at the mouth, or ſtriking the ſuperficies of the Body, cures the Pſora. The Mercurial Coſmetick before deſcribed, being weaker by two degrees, if it be applyed upon the Skin, chiefly on the ulcerated places, it kills the Scab. Notwithſtanding the uſe of theſe is not always ſo ſecure as to be adminiſtred every where to all perſons. *A Mercurial Water for the Itch.*

Baths are prepared of Sulphur and Vegetables, either apart or together, being boyled in water, which heal this Diſeaſe not as a common Bath, by only waſhing off the filthineſs of the Skin, but alſo by deſtroying the ferment thereof. Moreover, beſide theſe there is another more eaſie and neater manner of healing the Itch, *viz.* Let a Shirt boyled with Powder of Brimſtone in Spring-water, and dryed by the Sun or Fire, be worn next the body for four or five dayes; for ſo that diſeaſe is wont to be cured without bathing, or naſtineſs of anoynting, or evil ſmell. *Baths.* *A Sulphurous Shirt.*

If the Ætiologie of theſe be enquired into, and firſt why Brimſtone is ſuch a ſpecifick Antidote againſt the Itch, that poor and ordinary men (who have not wherewithall to uſe any other Medicine) do take againſt this Diſtemper inwardly only powder of Brimſtone with Milk, and adminiſter it outwardly with Butter, I have already in part given an account, where we have unfolded the balſamick vertue of Brimſtone towards the Lungs. Namely, it is a good expedient in either caſe, inaſmuch as it deſtroyes the acidities of the Blood and Humours, and all the exotick and corrupting roughneſſes, and reſtores a benign diſpoſition to every Juice, *viz.* a mild and an unctuous: and ſo the Particles of Brimſtone any way outwardly applyed, do eaſily enter into the pores of the skin, and being admitted inward, do forthwith work upon the ulcerous Ichor there abounding, kill the Salts there predominating, and procure a balſamick nature to the cutaneous Juice, that it may aftewards agree with the Blood and Serum continually flowing to it. *Why Sulphur is the Antidote of the Pſora.* *The Reaſon of it.*

As to Mercury, it is no wonder if Medicines prepared hereof do throughly heal the places of the skin affected with the Pſora wherever applyed, for by the application hereof, wheals and puſhes, and all malignant ulcers, *viz.* Venereal and Scorbutick, are wont to be tamed. Neither is it a thing to be admired, that theſe Remedies adminiſtred in any private places, as long as they provoke ſalivation, are a Cure of an Univerſal Itch; but really that without ſpitting they can produce ſuch an effect, as that a Girdle wherein Quick-ſilver is ſowed and worn about the Loyns, ſhould aboliſh the Scab of the whole body, and that ſometimes without any ſenſible evacuation or harm cauſed thereby, I ſay the reaſon hereof is not ſo eaſily apparent. *How Mercury cures this Diſeaſe.*

Yet for the ſolution hereof, we muſt ſay that the Particles of Mercury being able to extinguiſh the ſcabbineſs of every Itchy ferment, when they are applyed to any private part, do preſently take away the Scab of that place; and beſides being caught by the venous blood, and diffuſed through the whole maſſe thereof, and a little after they are not only carryed back by the arterious blood to the ſame *The reaſon of its vertue.*

place where taken in, but being brought outward every where, they are depoſited in the skin of the whole body, and in the ſame place deſtroy every Miaſma of the Scab: If it then ſhall happen that theſe Mercurial particles, after they have finiſhed the Cure, ſhould be all evaporated again out of the skin, no ſalivation afterwards, or other prejudice will follow.

SECT. III. CHAP. VII.

Of the Impetigo *or* Lepra *of the* Greeks.

Several names of the Impetigo.

After the Scab with the Itch, it follows that we treat of another Diſtemper, a little a-kin to this by reaſon of the breakings out of little puſtules, which is commonly call'd *Impetigo*, by ſome a Tetter and Morphew, and by others the Leproſie of the *Greeks*. And as it gains ſeveral names, ſo they are variouſly applyed by Authors, and by theſe they deſign one kind of Diſeaſe, and by thoſe another kind. Wherefore, as the names of this Diſtemper are variouſly confounded, and perhaps that as to its nature and formal appearance it has been various in divers Regions, neither may it be altogether the ſame in our generation as in former times, for this cauſe my buſineſs here ſhall not be to deſcribe this diſeaſe according to Books, but from the proper obſervation of the Patients themſelves.

It is deſcribed according to its appearances.

The Impetigo is wont to ariſe and affect after this manner; to wit, little wheals or red puſtules, ſometimes ſingle, and ſometimes many together, are raiſed in divers parts of the body, but chiefly in the Arms or Thighs; to each of which, new ones every where are adjoyned, (the Diſeaſe augmenting) and in a ſhort ſpace of time there become many heaps of riſings of that kind, like cluſters. For the little pimples breaking out daily near to their ſtemme, and ſpreading ſtill larger, diffuſe themſelves into a Circle, and ſo cauſe every heap of Eruptions to be enlarged. The rough ſuperficies of each appears ſomething white and ſcaly, ſo that upon ſcratching the ſcales fall off, and often a thin Ichor ſweats out, which being preſently dryed up again, hardens into a ſhelly ſcale.

Theſe Cluſters of little Pimples being firſt ſmall and fewer, appear perhaps three or four in the Arm or Thigh, or other particular member, about the bigneſs of a Penny or half a dram: but afterwards, if the diſeaſe be ſuffered to augment, they break out every where more frequent, which being leiſurely encreaſed in their ground, afterwards appear to equal or exceed the bigneſs of a Silver Crown, but not always round or of a regular Figure, but diverſly formed. Moreover there is no ſtop in this condition, but the diſtemper, unleſs it be reſtrained with Medicine, breaking out ſtill in more places, and creeping on every where in broadneſs, at length not only covers over the whole member but alſo the whole body with a leprous dry ſcurf; and this kind of Impetigo the Ancients call'd by reaſon of its outrage *Ἀγριον*, and for the moſt part accounted it incurable.

The differences of this diſeaſe.

From hence the chief differences of this diſeaſe are made known; and in the firſt place as it is leſs or more malignant according to the faſhion thereof, it is diſtinguſhed, as it comes nearer the nature of the Scab, or Leproſie, or as it is in a middle condition between both. We are alſo to note, this diſtemper ſometimes infeſts ſome particular members, as the Arms or Thighs, the reſt of the body being untoucht; but ſometimes it begins together in all parts, and every where excites ſcatteringly little Pimples or Cluſters thereof. Alſo eruptions of this kind are in ſome for a ſeaſon, or periodical, and for the moſt part infeſt theſe perſons during Winter only, vaniſhing away about Summer; likewiſe on the contrary, in others they abhorre Winter, and are wont to obſerve the ſeaſon of the Swallow going and coming: but in moſt others the Diſeaſe being continual grants no truce, yea it hath neither remiſſion nor mediocrity.

How it differs from the Pſora and Leproſie.

Moreover, we muſt diſtinguiſh an Impetigo from other Diſeaſes a-kin to it, and firſt from the Scab, and the Leproſie. It differs from the former as to the form of the Puſtules; for every where in the Pſora they are ſingle and remote from one another, although by ſmall ſpaces; here moſt of them break out in Cluſters, concurrently,

currently, and as it were disjoyned by branches with great interspaces. But between these distempers a notable difference yet arises, in that the Scab is wont easily or scarce otherwise to be propagated or arise, but by Contagion; but the infection of an Impetigo is so seldom or never, that the Miasma from the Husband doth not pass to the wife, or from her to him, though they lye together.

Also this Disease differs from the Leprosie, as well in respect of the form of its eruption, as of its contagion, which is likewise active in this, as in the Psora; and the breaking out is much larger and more horrid, *viz.* it is every where shelly and scaly, without intermission, and diffused through the whole body.

The material cause not a humour of the skin.

From hence it is manifest, that the material cause of an Impetigo, is not merely a cutaneous humour, by reason of effluvia's or a taint received from without, or depraved by reason of other accidents, and degenerated from its temperament; because it is not easily communicated to others by Contagion, as in the Psora, neither is it immediately dispersed throughout the whole body. But indeed little Pustules breaking out first about the initiations of the Disease seem therefore to proceed, for that certain acid salt Concretions happen to be in the mass of Blood (like Tartar in Wine) which when they can neither be concocted or again dissolved, are here thrust out into the skin, as there into the sides of the Vessel. As long as these Concretions are small and few, they are conveyed into the skin in this or that member, and by one or two branches of an Artery; then as Nature is wont to continue the same manner of excretion as it began, the matter being carryed every where by the same vessels, to the same nests, near the first wheals it causes heaps of others round about them; but afterwards when the dyscrasie of the blood is daily augmented, and that Tartarous matter is generated more plentifully in the mass thereof, more portions are conveyed by other Arteries, and still by more to the outward places: and for that cause also more pimples break out both in the same, and in other members, which a new matter coming continually by the same Arteries, and being placed close to the former, enlarges them every day, and every where dilates them by the addition of other pustules; and at length if this sort of Tartar of the blood augment hugely, being carryed out by more or all the Arteries together, it is fastened in the skin, and in process of time covers over all the superficies thereof with a scaly or downright leprous shell: And then that cutaneous humour being wholly corrupted, promotes the disease it self; for it causes the stock of the morbific matter to be encreased, by polluting more, or rather poysoning the blood and humours, whilest they pass in Circulation; moreover dismissing the corruptive steams from it self, it renders the Contagion of the same disease unto others.

But tartarous Concretions begot in the blood.

The next cause of it.

Wherefore, both the procuring and conjunct causes of this Disease consist in this, for that without any fault of the skin, it happens that the blood is filled with salt Particles of a various disposition and condition; (into the preceding cause of which disposition we will anon inquire) and where those fixt and acid Salts are especially predominant (as the manner is) they mutually embrace one another, and so grow together into Tartarous Concretions; which being thrust forth into the blood, cause eruptions of wheals, as it were nests of the Disease; then they being daily and leisurely encreased both in number and largeness, according to the supply of matter, they produce the beginning, augmentation, and state of this disease.

The evident Causes.

As to what relates to the antecedent and evident causes, there are two chief kinds of occasions from which this distemper for the most part derives its origine; to wit, an evil manner of Diet, or a taint of the Scurvy, or Pox, or other Diseases left in the body, being ill, or not at all cured. We will weigh a little the reasons of each of these.

Irregularities in Diet.

As to the former, besides the common irregularities in Diet, wherein some being too much addicted to eating of flesh salted and afterwards dryed in the Sun or Smoak, and the drinking of acid Wines, do easily contract this malady; Also it is a vulgar observation, that very many are disposed thereunto by the too frequent or daily feeding on Pork, and Fish, and especially Shell-fish. There is a notable instance of the former, which is, that that food was chiefly forbidden the *Jews* for prevention of this disease. Also there is an example of the other, that in time past the Inhabitants of *Cornwal* for the most part dwelling on the Sea-coast, inasmuch as the poorer sort were fed with Fish, became very obnoxious to Leprous Distempers; insomuch that for their relief many Hospitals were erected in that Countrey. That I may hint in a few words the reason hereof, I am apt to think whether that food is rancid,

The daily eating of Pork or Fish.

The reason thereof inquired into.

or

or otherwiſe improportionate, that it conveys particles not rightly mixed, nor eaſily to be ſubdued to our blood, which being ſo heterogeneous and largely heapt up by a long uſe of ſuch Diet, the ſaline particles of which kinde do eaſily aſſociate themſelves, and ſo do conſtitute Tartarous Coagulations to be exterminated in the skin, and the ſeeds of the Leproſie or of the Impetiginous Evil.

It often follows the Pox and Scurvy.

But yet a plentiful Crop is begot from the taint of the Scurvy and Pox left in the body, and afterwards by the combination of Salts and Sulphur exalted to extremity. We have elſewhere diſcovered the reaſons of the former diſeaſe, and eſpecially of the foreſaid ſymptome coming after it, which being accommodated to our preſent Hypotheſis do make it more clear. And it ſo often happens, that puſtulous eruptions of this ſort do follow an inveterate Pox, although it ſeem to be cured, that none diſtempered almoſt with theſe, wants the ſuſpicion of that ſhamefull Diſeaſe; ſo that the firſt Queſtion of a Phyſician in ſuch a caſe being conſulted, is, Whether the Patient have not at ſome time formerly contracted that Diſtemper? For ſurely the Corruptions of the blood, after they are by a long ſtay become altogether heterogeneous and indomitable, at length acquire to themſelves ſalt Particles, wherewith growing into ſuch like Tartarous Concretes, and being thruſt forth into the skin, produce thoſe Impetiginous Puſtules.

Its Prognoſticks.

As to the Prognoſtick part of this Diſeaſe, although it ſeldom threatens death or imminent danger, yet after it hath taken deep root, the Cure is very difficult, if at all: The Impetigo firſt beginning, and exciting a few Puſtules, and knots of them, perhaps in one or two members, ſometimes admits of Cure, but hardly without a moſt efficacious remedy. But if the Diſeaſe proceed ſo far, that the frequent and broad cluſters of wheals appear diſpers'd throughout the body, then ſmall remedies effect nothing, and the great ones howſoever diligently obſerved, will not eaſily perform a Cure. But if the Diſeaſe, maugre all remedies advance daily, and encreaſe at length into a Leproſie, *Celſus* judges it impoſſible to be cured, and therefore we muſt wholly abſtain from it.

The Cure.

Two chief Indications.

There are two chief Indications concerning the Cure of an Impetigo, *viz.* Preſervatory, which reſpects the cauſe of the Diſeaſe, and the Curatory, which relates to the ſymptomes, *viz.* the puſtulous Eruptions. The vital Indication hath ſeldom place here, unleſs in a deſperate condition, where ſleep and ſtrength fail. The Method of Curing ought to begin with the Preſervatory Indication, which takes away the Cauſes of the Diſeaſe by inward remedies, for otherwiſe external (as in the Pſora) are never adminiſtred with ſucceſs; but the roots of the diſeaſe in the blood being cut off, the cutaneous ſproutings quickly conſume away: for the taking them away, we muſt proceed in one manner when the Impetigo begins by it ſelf, and in ſomewhat a different manner when it follows an inveterate Scurvy or Pox, being ill or not at all cured. We will conſider each caſe throughly by it ſelf, and diſtinctly.

How to be cured, the Diſeaſe beginning of it ſelf.

The evident cauſes to be firſt removed.

Therefore whenſoever this Diſeaſe is ſimple, and primarie, and being yet New, let the evident and extern Cauſes be removed; let the manner of Diet, and unwholſomneſs of Air be corrected; therefore thoſe that have been lately too much accuſtomed to ſalt Diet, and the fleſh of Pork and Fiſh, let them change to Diet of good Juice and eaſie of digeſtion. They that inhabit the Sea-coaſt, or Fenny places, let them remove to a dry and clear Air; in the mean while let no leſs care be had to their Drink, by declining thick and foggy Ale, and ſmall and acid Wines too much abounding with Tartar: at length let care be taken leſt their Drink or Food be dreſſed with any mineral waters that are apt to petrifie.

The conjunct Cauſes how taken away.

The chief Remedies made known.

Secondly, In reſpect of the conjunct and procuring Cauſe, there are two chief Intentions of Cure, *viz.* that the impurities of the bowels and humours be quickly purged out; alſo that the acid ſaline diſtemperatures of the blood and nervous Juice be altered (whereby the Tartarous matter may be the leſs engendred in them;) for theſe purpoſes Medicines both evacuating and altering are preſcribed of ſeveral kinds. Notwithſtanding, becauſe not all, but the greateſt remedies are here convenient, thoſe which are moſt chiefly of uſe and available, are Catharticks, Phlebotomy, Whey, Chalybeate Waters, Juicy expreſſions of Herbs, Decoctions of Woods, ſteel'd Medicines and Salivation. Some certain Models of each of theſe, and the manner of uſing them, we will annex.

1. *A Purge.*

Wherefore in the firſt place, univerſal purging and bleeding being celebrated (as in the Cure of the Pſora) we appoint the following Tincture or purging Infuſion, whoſe doſe is from ſix to eight ounces, to be repeated in ſix or ſeven days.

Take

Take of the roots of ſharp-pointed Docks dryed, Polypodie of the Oak, of each half an ounce, Senna ten drams, Epithymum ſix drams, Rhubarb, Mechoacan of each half an ounce, yellow Sanders two drams, Celtick Nard half a dram, Salt of Tartar one dram and a half, put them in a glaſs with three pints of White-wine, water of Elder-flowers one pound, let them ſtand ſtopt in a cold place three dayes, pour off daily as much of the clear liquor as is ſufficient. A purging Infuſion.

Secondly, For ſweetning of the Blood, and waſhing of the Salts thereof, let ſimple Whey, two or three pints, or with the infuſion of Fumitory, Chicory, and ſharp-pointed Docks, be drunk every morning, for twenty or thirty dayes, if the Stomach will bear it, and likewiſe evening and early in the morning, let a doſe of the enſuing Electuary be ſwallowed. 2. *Whey.*

Take Conſerve of the roots of ſharp-pointed Docks ſix ounces, Crabs-eyes, Coral prepared, of each two drams, Ivory one dram, Powder of Lignum Aloes, yellow Sanders, of each a dram and a half, Sal Prunella two drams, Vitriol of Mars a dram and a half, Syrup of juice of Wood-ſorrel what ſuffices to make an Electuary, the doſe two drams. An Electuary.

Thirdly, For the ſame reaſon that Whey, your Iron Mineral waters are preſcribed for this Diſeaſe, and do oft notably help: for when all the other remedies have been in vain, I have with thoſe alone cured a painfull and almoſt leprous Impetigo. Moreover, for more efficacy ſake, let the uſe of Sal Prunella or Vitriol of *Mars*, or of the Electuary but now mentioned, be dexterouſly adjoyned. 3. *Steel'd Waters.*

Fourthly, In ſome endued with too much Serum, and a watery Conſtitution, where the drinking Whey or Mineral waters are leſs requiſite, it is ſometimes expedient that a Decoction of the Woods be aſſumed at phyſical hours, and alſo conſtantly inſtead of ordinary drink. 4. *Decoctions of Woods.*

Take the Shavings of Willow half a pound, of Sarſaperilla eight ounces, white Sanders, Lignum Lentiſcinum, of each two ounces, Shavings of Ivory and Harts-horn, of each ſix drams, Filings of Tin, crude Antimony, of each four ounces tyed in a rag, of Liquoriſh one ounce, infuſe them in ſixteen pound of Spring-water, and boyl them to half, keep it ſtrained for uſe.

Fifthly, Medicines of *Steel*, in that they are every where accounted among the more excellent Remedies, are wont ſeldom to be omitted in this Diſeaſe, although not frequently given with ſucceſs: for moſt Preparations of Steel, wherein the Sulphureous Particles predominate, inaſmuch as they ferment the blood, and irritate it into Critical Effervescences, do cauſe theſe impetiginous eruptions to augment rather than diminiſh; notwithſtanding the Salt, Syrup, Tinctures, and infuſions of Vitriol, inaſmuch as they fix the Blood, and ſomething reſtrain the raging of the Salts, do fitly enough agree with the intention of Cure now propoſed; but being weak in efficacy, they do not prevail againſt ſo Herculean a Diſeaſe. 5. *Medicines of Steel.*

Wherefore Sixthly, theſe and many other Remedies nothing availing, many commend *Salivation*, as the ſtouteſt Wreſtler and only match for ſuch an Enemy. Yet the event doth not always anſwer this great expectation; for I have experimented this remedy without ſucceſs in four Patients labouring under a painful Impetigo, which had reſiſted other Medicines. Some of theſe were provok'd to abundant Spitting by Unction with Quick-ſilver, others by doſes of Solar Precipitate; which they have endured for the ſpace of twenty dayes; which time being elapſed, all the ſcaly eruptions and cluſters of wheals have vaniſhed; notwithſtanding, to confirm the Cure, a Diet-drink of the Decoction of Sarſa was appointed, and frequent ſweating under a Cradle, and due purgation between, was continued for a month: Notwithſtanding, this Courſe being finiſhed, when no footſteps of the diſtemper ſeemed to be left, within another month a new ſtock of the ſame Diſeaſe beginning to break out, it encreaſed quickly to its uſual maturity. Moreover, when one of them would repeat this courſe, and another after two relapſes would experiment it the third time, both of them at length after great ſufferings of Pain deſpaired of Cure: Whence it is manifeſt that the Venereal Diſtemper, although highly malignant, and raiſing moſt filthy Ulcers conſuming the fleſh and bones, is more eaſily and certainly cured than the Impetigo. 6. *Salivation.* *Salivation does not always cure this Diſeaſe.*

The

Why the Impetigo is more difficult of Cure than the Pox.

The reaſon whereof if we enquire, may plainly be conceived, for that the cauſe of the latter Diſeaſe conſiſts in a malignant and altogether heterogeneous pollution, infecting and poyſoning the blood and nervous Liquor for a certain time, but not altogether overthrowing, or for ever depraving its temperament; wherefore the Cure is performed by Salivation, or a ſudorifick Diet, eradicating all that venom, and then the natural diſpoſition of the blood and humours remains entire: But in a more difficult Impetigo, the Elemental particles and firſt Conſtitutives of the blood are corrupted, inſomuch that unleſs the natural diſpoſition and conſtitution of theſe are reſtored, all Evacuations and Expurgations of any venemous, malignant and heterogeneous matter, however plentiful and eradicative, do little or nothing prevail. Wherefore, many famous Phyſicians not undeſervedly judg'd this Diſeaſe being confirmed and raiſed to the borders of a Leproſie, to be hardly or never cured.

Impetigo ſucceeding a Scurvy, how to be cured.

Secondly, No better event attends this malady enſuing upon an inveterate Scurvy; perhaps hence the intentions of healing are a little more certain when this Diſtemper is placed as the Baſis or root of that; to wit, that the chief curing Indication being taken from thence, we muſt chiefly inſiſt upon Antiſcorbutical remedies; but the more ſharp and hot of this kind, as the Garden Scurvy-graſs, Water-creſſes, the Horſe-rhadiſh, Pepperwort, and others too much irritating the blood, inaſmuch as they diſſolve the temperament thereof more, and drive out more plentifully the Tartarous Coagulum to the skin, are always diſcovered to be more prejudicial than advantagious; and for this reaſon the uſe of Baths, or bathing in hot waters, which namely evacuate the humours of the whole body by an abundant Evaporation, and cleanſe the pores of the skin, and ſeem very available in this malady, often-times are ſo far from helping, that thoſe Eruptions are wont to be exaſperated from thence and very much encreaſed: for I have known many not extreamly Impetiginous, to have gone to our Baths, to bathe in the hot waters, that have returned altogether Leprous. Wherefore, when the Symptoms of this diſtemper ariſe from a ſcorbutick evil, all elaſtick things are to be avoided, and only the more temperate, endued with a Nitrous, Vitriolic or volatile Salt, are to be adminiſtred. We will lay down ſome Models of each ſort; As firſt Cryſtal Mineral, Juices of ſome Herbs and Decoctions, Salt and Mineral purging Waters, are moſt predominant with a Nitrous Salt.

Hot antiſcorbuticks do not agree.

Nor Baths.

But only the more temperate Remedies endued with a nitrous, vitriolick or volatile Salt.

Forms of Nitrous Medicines.

Take of Cryſtal Mineral, or Nitre purified one ounce, Flowers of Sal Armoniack one dram, bruiſe them in a glaſs Mortar, give one dram three or four times in twenty four hours.

Take of the leaves of Houſleek the greater two handfuls, bruiſe it and boyl it in two pound and a half of new Milk till it turn to Curds and Whey, ſtrain it, and take a pint of the clear liquor twice in a day.

Water of Sowthiſtles.

Take of the leaves of Dandelyon ſix handfuls, bruiſe them, and put them into a glazed earthen pot with a cover, which put in an Oven after the bread is drawn out, let it ſtand ſix or ſeven hours, then pour it through a Strainer, the doſe is four ounces to ſix of the clear liquor, thrice or oftner in a day.

Cucumbers.

Cucumbers being endowed with a Nitrous quality are advantagious by experience againſt this diſeaſe, wherefore in lieu of a Sallad let them be plentifully and often eaten; moreover three or four of them cut into ſlices, let them be infuſed, and ſtopt cloſe, in three pints of Spring-water all night; to the clear liquor poured out, adde Sal Prunella two or three drams, the doſe is half a pint thrice or oftener in a day. For the ſame purpoſe Decoctions of the leaves in running water together with the fruit do profit.

Purging Mineral Waters.

1. Certain mineral purging waters, of which ſort are chiefly thoſe of *North-hall*, an Analyſis being made by Evaporation, manifeſtly ſhew a Nitrous Salt with which they are imbued, and I have ſometimes found the daily drinking about four pintes for many dayes, to help againſt a gentle Impetigo.

Vitriolick acidule waters.

2. But as I have before hinted, thoſe Mineral waters endued with a vitriolic Salt, of which kind are the *SPAW*, and *Tunbridge*, and *Aſtrope* Wells, do far excell thoſe Nitrous, and all other Remedies, and do more prevail in the Cure of an Impetigo. To thoſe Patients that have not the opportunity of uſing theſe waters, I uſed to give with good ſucceſs againſt this diſeaſe common water impregnated with our Steel, and

and ſo rendring moſt exactly the guſt of thoſe Mineral waters. By reaſon of the Mineral Salts, or at leaſt the Mercurial Particles in them, Tin and Antimony are oft in uſe in the Cure of the Impetigo, and are uſually preſcribed with other remedies. Let the Filings of Tin, and Powder of crude Antimony, be infuſed in Ale for ordinary Drink: alſo Decoctions of *Sarſa* made with the woods, are found beneficial againſt this Diſtemper. *Medicines of Tin and Antimony.*

3. The uſe of a Viper, and the Preparations thereof, doth enough commend the wonderful vertue of volatile Salts in a grievous Impetigo, and alſo in curing the Leproſie it ſelf. This Antidote of that Diſeaſe is reported to be found out firſt by a caſual experiment, inaſmuch (as *Galen* reports) that drink being pour'd out of a Bottle wherein a Viper was put to poyſon one labouring with an Elephantiaſis, and ſo given him to free him from his miſery, prov'd his remedy, and what was deſtined for his murder, diſpatched an incurable Diſeaſe. Hither relates the Analogy, taken from the nature of this Animal, whence they collect that it helps in this Diſeaſe: becauſe the Viper yearly ſhakes off his ſcaly Coat, therefore ſome think its particles prevalent to throw off the leprous skin of a diſeaſed man; but though we do not attribute much to theſe things, yet it is manifeſt by frequent obſervation, that remedies of a Viper do profit in the Impetigo and Leproſie; the true reaſon whereof ought to be aſcribed much to the volatile Salt wherewith this Animal is endued. For the particles hereof deſtroy the fixt and acid Salts predominating in the blood of the diſeaſed, and diſſolve their combinations; notwithſtanding, the Salt, Spirit, and Oyl chymically extracted out of Vipers, by reaſon of their elaſtick particles, contracting an Empyreuma from the fire, profit not in this diſeaſe; as alſo neither *Spirit* nor volatile Salt of *Harts-horn*, *Soot*, *Blood*, and other the like *Armoniacks*; becauſe by violently ſtirring the Blood and Humours they rather diſſolve their temperament, and thruſt forth the Corruptions more plentifully into the skin. Wherefore the more ſimple Preparations of Vipers, as broths from their fleſh boil'd in water, and Drinks impregnated by Infuſions, and Decoctions, and powders being made of them dryed and beaten, are preſcribed more ſucceſſefully againſt this Diſeaſe. Moreover not only the boyl'd fleſh of Vipers, but of any other kinde of Oviparous Snakes being taken in lieu of ordinary food do oft afford notable relief.

3. Medicines endued with a volatile Salt.

Chiefly prepared of Vipers.

But not chymically.

Broths and infuſions of Vipers.

4. The Impetigo or ſcaly eruption of Pimples, and formed as it were into cluſters, is ſo frequent and familiar a ſymptome of an inveterate Venereal diſtemper, that we firſt ask the Patient whether ſomething of that malignity be not concealed of which they are conſcious; and if we perceive the matter ſuch, all Specificks againſt this Diſeaſe, and Antiſcorbuticks being omitted, we muſt come to the Decoctions of Woods, and thoſe little or nothing helping, we muſt deſcend to the uſe of Quick-ſilver. And truly by this method I have cured many that were accounted Impetiginous and Leprous, (who have been handled long in vain, and wretchedly vexed with other Remedies appropriate to theſe diſeaſes:) But we referre this ſort of Impetigo to the Pathology of the Venereal diſtemper, whereto it is an Appendix. *4. How the Impetigo following the Pox is to be cured.*

II. The ſecond Indication curatory relating to the Diſeaſe it ſelf, and the primary ſymptom, to wit, the ſcaly eruptions and cluſters of Puſtules, preſcribes Topical Remedies to be applyed to the outer skin for the removing theſe effects; for which purpoſe in the firſt place Baths and Liniments are convenient: which yet rarely or never help of themſelves, unleſs the procuring cauſe, that is, the Tartarous diſpoſition of Blood be firſt purged out. *The ſecond Indication Curatory.*

There is a vaſt medley of Topicks of this ſort vulgarly vented, as well by Phyſicians as by Empiricks and Quacks; among all which notwithſtanding, Baths or Liniments compounded of Tarre do far excell all other Remedies of either kind, inſomuch that we ſhould only uſe theſe but for their ill ſavour; wherefore we will annex ſome models of Compoſitions both with and without Tarre. *Topicks of Tarre are the beſt.*

Wherefore, for Baths it is common to take water out of Tubs wherein Tarre hath long ſtood, and impregnated with the infuſion thereof: Or,

Take of Tarre two pound, and with white Aſhes ſifted incorporate it into a groſs maſs, which boyl in a ſufficient quantity of Spring-water, adding leaves of Ground-Ivy, Fumitory, white Horehound, the roots of ſharp-pointed Dock, Enula-campane, of each four handfuls, make a Bath to be uſed with government; Or let ſuch a Decoction be prepared without Tarre for Patients abhorring the ſmell.

Baths. *Sulphureous Baths* as well Natural as Artificial are found by experience leſs appropriate, yea for the moſt part the former do prejudice; Moreover, every bathing ought cautiouſly to be adminiſtred: for becauſe this adminiſtration exagitates the blood, and puts it into an Effervеſence, its Temperament is endangered (as has been ſaid) rather to be diſſolved, and the corruption to be ſpread more plentifully over the skin.

Liniments. 2. *Liniments* whoſe uſe is more ſafe, and convenient, are of a Triple kind or degree, *viz.* Gentle, Indifferent, and moſt Strong; of each of theſe we will propound one or two patterns.

1. Mild Liniments. 1. Firſt therefore in a ſlighter Impetigo, when the Eruptions and Cluſters are ſmall, Faſting Spittle is commended; likewiſe the weeping of green Wood in the Fire, alſo mere rubbing them with roots of ſharp-pointed Docks bruiſed and macerated in Vinegar: Or,

Take Oyl of Tartar per deliquium, *Oyl of Nuts or Almonds by expreſſion of each equal parts, make a Liniment to be uſed to the parts affected twice in a day.*

2. Stronger, of Tarre. 2. Liniments of the Second kinde have Tarre for an Ingredient, which is eſteemed above all.

Take of Oyntment of Roſes ſix ounces, of Tarre two ounces, melt them together: Or,
Take a fat piece of Weather-mutton, which ſtick with the roots of ſharp-pointed Docks, ſpit it and roaſt it, and in the mean while baſte it with Tarre dropt leiſurely upon it; the Dripping being received in a Veſſel under it, keep it for an Oyntment moſt excellent for an Impetigo.

3. The ſtrongeſt of Mercury. 3. The moſt prevalent Liniments are Mercurial, *viz.* thoſe made with Quick-ſilver or Præcipitate. Let the model of the former be that preſcribed already againſt the Scab; for the other,

Take of white Præcipitate three drams, Oyntment of Roſes three ounces, mix them, for to anoynt the parts chiefly affected.

The uſe of theſe ought chiefly to be ſuſpected in this Malady; for if ſpitting be raiſed, that great glutt of matter impacted in the pores of the skin will be moved, which if the whole together ruſhing too much towards the *Ductus Salivales*, gather about the parts of the Throat, will endanger ſuffocation.

A notable Relation. Some years ſince a Virgin of a Noble Family, being of a hot Temperament, and endowed naturally with a ſharp and ſalt blood, after being a long time obnoxious to an Impetigo, almoſt from her Cradle, about her riper years began to be afflicted more grievouſly; for the cluſters of ſcaly Puſtules covered not only her Arms and Thighs every where, and the other covered parts of her body, but alſo her Hands and Face were ſo defiled, that ſhe was aſhamed to appear abroad or converſe with others of her rank. Leſſer remedies almoſt innumerable were exhibited without ſucceſs; by uſing Baths ſhe at firſt appeared relieved, but at length grew worſe thereby. *Aſtrope* Wells which have cured ſome, afforded her little or no relief. Wherefore, when all ordinary means would not effect any thing, I propounded Salivation, as a remedy more prevalent than all the reſt and (as it is accounted) the laſt. When the Parents and Patient readily conſented to this advice, preparing her body duely by Purgation and Phlebotomy, I gave her (after our manner) Pills of Solar Præcipitate two dayes, and after the interval of one day, the remedy being repeated the next, an abundant and laudable ſpitting began, and continued for a month without any ill ſymptome; to keep which in its due tenour, I applyed a Mercurial Oyntment to the bending of the Joynts and the places moſt affected one while to one, another while to another. Before the finiſhing of this courſe, all the Eruptions vaniſhed; notwithſtanding to confirm the Cure, as alſo for the extirpation of the Mercury, ſhe remained another month in Purging, Sweating, and Diet of the Decoction of *Sarſa*, *China*, &c. in which time ſeeming perfectly cured, ſhe ſo remained for about forty dayes. But afterwards though ſhe obſerved an exact courſe of Diet, the ſame diſeaſe began to bud forth again, and leiſurely encreaſing, at length it advanced into its former ſtate. I being confounded with this event, perſwaded her to hope an alteration for the better after her Menſtrual Flux, which was ſuddenly expected. Notwithſtanding,

Salivation cures for a time the Impetigo, but with a relapſe.

withstanding, after long delay that Crisis at length happening, and managing her self regularly after it, brought no Cure or ease of that Disease, but rather a fresh assault. Whereupon recourse was had again to Physick, and divers Remedies assay'd, all which when they became frustrate, her friends importuned that she might salivate again, to wit, allured by this hope, that that method which cured her for a short space, being administer'd again, would cure her either for a longer space or altogether. Wherefore according to their wishes, the same course of spitting and sweating repeated for two months space, and thereupon the Pustules every where going off, the Noble Virgin seem'd again wholly to recover her health. But within a fortnight after the course finished, the Pustules and their Clusters again appeared, and leisurely encreasing daily in number and bulk at length grew fouler than before, insomuch that like an *Hydra*, after the loss of one head this disease received sevenfold.

That remedy repeated, did not thoroughly cure the Disease.

I knew another strong man endowed with a lusty habit of Body, who after he had laboured with an Impetigo many years, the malady still encreasing, and being advanc'd to the highest, he was covered all over with a white Scurf, as it were leprous, that every night the Scales fell off like Bran in great plenty in his bed, and might be gathered up in heaps. This man for Cures sake first tryed the ordinary Remedies of every kinde, notwithstanding without succes; and afterwards trying a lighter Salivation, found himself nothing better: but afterwards the same method being repeated, by a long and painful Spitting, he seemed to be restored to health; but within three months the same disease budding out, in a short space arrived to its former outragiousnes; Moreover, when he had undergone the third time that most painful Remedy, that affect, which seemed expulsed for a certain time, returned again; and afterwards maugre this and all methods, it exercis'd its Tyranny during the Patients life. It will not be requisite here to discourse any thing of the *Lepra*, which being only a more intense degree of the former Malady, for the most part admits of no Cure. As to what relates to other Tumours, and their manifold kinds, and the Ætiologies or Reasons of each, I confes I am scarce able to contain my self, but that I should enter upon that pleasant Field of Speculation. But this seems as irrational and unusual, as for one wearyed with a long Course, and breathless at the end, running beyond his Post, presently to begin a new Race.

FINIS.

FINIS.

A TRACT OF THE SCURVY.

CHAP. I.

The Contents.

A Deſcription of the Scurvy. The Internal and neareſt Cauſe of it is chiefly in the Blood, and alſo in ſome part radicated in the nervous Liquor.

THere is ſo rare Mention, and ſo ſlender Deſcription in the ancient Medicine of this Diſeaſe, which we call the Scurvy, that ſome have doubted, whether there were in the times of old any ſuch Sickneſs, though now epidemical in many places, and almoſt every where ordinary, and with which every one is trouble, or at leaſt thinks himſelf troubled with it; and which like the Pox and the Rickets, is derived a great way down to the Children: but certainly it is plain by the teſtimonies of *Hippocrates*, *Areteus*, *Pliny*, and others, that this Affection though known by other Names, was taken notice of by the Ancients, and that its cure hath been treated of though after a ſlender manner.

Being not very ſolicitous concerning the appellations of this Diſeaſe, we will preſently proceed to the knowledge and application of its Nature: which as it is ſo diffuſe and extends its ſelf into ſo various and manifold Symptoms, that it can neither be comprehended by one definition, or ſcarce by a ſingular deſcription, it will ſeem beſt firſt of all to recite all the *Phænomena* of this Diſeaſe, or to relate the Hiſtory of the more notable accidents of it, and thence to accommodate a certain *Hypotheſis* for the right ſolving its appearances.

A recital of the chief Symptoms of the Scurvy.

As to the first, there are reckoned up a great company of Symptoms in the Scurvy, and manifold Affections and of diverse kinds; and which sometimes are of an opposite or contrary nature to it: yea if any unusual accident, never before heard of in an humane Body happen, when it cannot be referred to any other kind of Disease certainly, we presently without doubting pronounce it the Scurvy: so that this Disease, like one condemned, and of an evil Name, suffers for others faults: In the mean time it is wont to excite symptoms very many from its own power, which appear almost in every part of the Body, a recital of which will be best performed by a distribution of the parts of the Body. Therefore that we may thorowly handle the marks of the Scurvy, from the beginning to the end,

In the Head.

we will begin first from the fountain of it in the Head: and to this belong great and habitual Headaches, and those either by certain fits, or at certain times, sometimes a numness or stupidness of Spirits, sometimes pertinacious Wakings, frequent Giddinesses, and Swimmings in the head, Convulsions, Palsies, plentiful Spittings, Ulcers in the Gums, a looseness of Teeth, a stinking in the Mouth. Secondly, sometimes in the region of the Breast, pains in divers parts of its membranes, and chiefly about the *Sternum*,

In the Breast.

which being often sharp and piercing, do miserably torment those labouring with this Disease night and day, a frequent *Asthma*, difficult and unequal breathing, a straitness of the Breast, a striving with an empty Cough and inordinate Pulse, a trembling of the Heart, frequent Swoonings, and often faintness of Spirits, or a fear of it almost continual. Thirdly, this Disease,

In the lower Belly.

as it were fixing its chief seat in the lower belly, produces an Iliad of Diseases: for often they have Nauseousness, Vomitings, Belchings, gnawing at the Heart, Inflammations, and grumbling of the *Hypochondria*, often Colicks, and troublesome Griefs running up and down here and there, almost a continual *Diarrhœa* or Looseness, sometimes a Dysentery or Flux, or a desire of going to stool, a wasting away of the Flesh, and sometimes an *Ascitis*.

The Urine, for the most part red and lixivial, with a crustiness swimming in it, or else sticking to the urinal: sometimes also by fits it is pale and waterish and in abundance. Fourthly, besides these Affects of the Belly, there are wandring

In the outward Parts.

pains and those not seldome highly painful, and troubling chiefly at night in the external Members, yea thorow the whole habit of the Body they feel a heaviness and spontaneous weariness, a wasting of the Flesh, an ach about the Loyns, and a debility and enervation of other Members; in the Skin spots of several colours, Tumours, Pimples. and often venomous Ulcers shew themselves about the Muscles: a Numness, Stifness and pricking, and as it were the ascension of a cold air, Also Contractions, and leapings of the Tendons: Besides, to scorbutical Persons happen inordinations of the Blood, uncertain Effervescencies, wandring Intemperaments, erratick Fevers and great Hæmorrhagies. Besides these more common and accustomed symptoms of the Scurvy, of which some have more some less, and which infest them now after one manner, and now after another manner, and in another kind, oftentimes there happen other unaccustomed and prodigious accidents to this Disease.

The evident causes of the Scurvy.

For the more full knowledge of this Disease, it seems good that we here observe as it were lightly, what concerns the original, beginning or first invasion of it. For we are to inform you, that the Scurvy may be produced by reason of several Causes and occasions: for although an ill course of Diet, a sedentary life, the inordination of the Spleen, and the Crudities heaped up in the first passages are very much accused; yet there is wont to be a further cause, as the unwholsomness of the Air, and the evil *Crasis* of the Blood, vitiated by former Diseases: wherefore the Scurvy or Scorbute is often venacular or peculiar to marish places, and to the Sea Coasts: and frequently falls on those who much use the Sea, and feed much upon salt and smoak-dry'd Meats, and who are forced to drink putrefied Water: and often succeeds to continual Fevers, and to other chronical Diseases ill cured; also to great Hæmorrhagies and other evacuations; and to usual excretions, as the Piles and monthly courses being suppressed: Moreover this Disease, without any great forerunning cause, is excited not seldome by contagion, and sometimes is also hereditary.

The cause of the Disease diffused thorow the body sticks either.

It manifestly appears, from what we have observed concerning this scorbutick Affection, that the material cause of this Disease is not contained in any private place or singular mine, but is diffused thorow the whole body and every part of it, both within and without: from whence we gather that the scorbutick Miasm or

Contagion

Contagion, is poured forth, either in the Blood or in the Nervous Juice or in both: And indeed, the eruptions of Spots, and little whelks, the redneſs, and as it were lixivate urine, or like lie, plainly teſtifie the Contagion to be placed in the effervency and inordinatneſs of the Blood; to which another like prognoſtick may be added, the divers production of this diſeaſe, which for the moſt part ſucceeds the depravation of the maſs of Blood: no leſs do the troubleſome dolors, both within in the Membranes, and without in the Muſcles, the debility of the Members or reſolutious, the *Vertigo*, Cramps, and frequent faintings of the Spirits declare the fault or vice to be in the nervous Juice. Therefore, when both the general Humours are in fault, we will ſee which is firſt and chiefly vitiated, and from whence it draws its Contagion, and by what means it communicates its harm to another humour, and to any other parts, that are wont to be affected. *To the Blood or to the nervous Juice or to both*

As to the Blood (in whoſe maſs the Scurvy ſeems moſt of all to be rooted) we have elſwhere ſhown, that its diſpoſition is even almoſt of the ſame temper, and of ſuch like particles compoſed, as Wine: for that we have hinted, the Blood, even as Wine, to be ſick, chiefly from two cauſes, to wit, either, becauſe that there is ſomething extraneous, and not to be truely mingled with it, poured into one or the other, or elſe becauſe the diſpoſition of the Liquor, or its temperament is perverted, that is, for as much as ſome things that are to be in Subjection, either to one Element or to another, and which ought to be ſubjugated, are exalted. *The Dyſcraſie of Blood and Wine Compared.*

As to the firſt we have obſerv'd of ſome, that when the *faeces*, are firſt ſecreted, and thruſt up from the bottom, they are by being moved, lifted up; or if any exotick thing be caſt into the Pipe, as Sewet or Sulphur, preſently a notable perturbation is ſtird up; by which, unleſs it be ſoon quieted, the whole *Craſis* of the Wine will be in danger to be ſubverted. In like manner there are many things not miſcible, which diſturb the Motion and Circulation of the Blood, by being poured into it, and hinder it, that it cannot perform its due œconomy, the nutritious Juice being full of the feculences, does inordinatly ferment the Blood, and as we have formerly ſhown, that Liquor becoming degenerate, ſtirs up the paroxyſms of intermitting fevours, the vaporous Recrements of the Blood, the ſerous, bilous, and melancholy being retained in the boſom of it, bring forth Catarrhs, Dropſies, Jaundice, Melancholy, and many other Diſeaſes: but if that extraneous thing be removed in time, it ſoon, even as Wine freed from its extraneous mixture, recovers its priſtine Condition. But either Liquor, being for a long time infected with thoſe heterogeneous contents, ſo that the due *Craſis* is at length degenerate, it is not then eaſily to be reſtored. *As to things not miſcible poured into either.*

2. Beſides, both Wine, and Blood, by reaſon of many other cauſes, depart from their right Temperament. As to Wine there are many ways and reaſons whereby its Liquor is perverted from its legitimate diſpoſition: which may alſo be parallel'd, by as many, if not more, in the dyſcraſie of the Blood. (For this is often wont to be ſuddenly empoyſon'd and broken, which does not eaſily happen to Wine) 1. Therefore, we may obſerve of Wines, that they do not ſometimes attain to maturity, but for want of Spirit they remain crude, for as much as the Spirits, and the other active principles of Sulphur and Salt being overwhelmed with more thick and groſs parts, cannot extricate themſelves; wherefore they become without Spirit, but having a thick conſiſtence, and ungrateful taſte, degenerate into a taſtleſs Wine: and almoſt after the ſame way it is, when the Blood, the Spirit, and Sulphur depreſſed, becomes crude and watry, and without vigor, and unable to be inkindled afreſh in the Heart. And this kind of diſpoſition of the Blood *Horſtius* affirms to be the cauſe of the ſcorbutick affection, but this ſame diſpoſition, ſeems rather to infer the *Pica*, or ſtrange longings of women with child, as alſo the Dropſical diſpoſition, than the Scurvy, as we ſhall ſhew more at large anon. 2. The ſulphureous parts of Wine being exalted above the reſt, cauſe an immoderate effervescency or ebullition in the Liquor, and is called in our idiom or proper Speech, *Fretting of Wine*: In like manner, the ſulphureous parts of the Blood being too much provoked or carried forth, cauſes a feveriſh intemperance, and is apt to be inflamed in the Heart, and indeed is the cauſe of very many fevers together. 3. Not ſeldom the Spirit in Wines growing weak *As to the temper of either variouſly altered.*

and the Sulphur being bound up, the ſaline part being carried into a flux overcomes the reſt; wherefore the Liquor becomes ſour. The famous *Sennertus* thinks the Blood in the Scurvy to be altered as Wine degenerated into Vinegar, which we ſhall ſhew by and by, to be otherways. And we have formerly ſhewed, the dyſcraſie of the Blood, being grown ſour, cauſes Melancholy. 4. There yet remains another ill diſpoſition of Wines, to which we may very aptly compare the ſcorbutick Diſpoſition of the Blood, to wit, when the Spirit being depreſſed, the ſulphureous and the ſaline Particles being combined together, are exalted, and as this comes to paſs in Wines, after a two fold manner, ſo alſo by the like affection of the Blood we may deduce from thence a two fold Kind of Scurvy, as we ſhall ſhew more clearly anon. It is then a common obſervation in Wines, that beſides their degenerating into a taſtleſs Liquor, and into ſour Vineger, they do ſometimes, the Spirit being depreſſed, and the Sulphur and Salt being together exalted, become rancid, or ropy, or mucilaginous; in proper terms, *Wines that are fretted, or ropy*. In either mutation, the Spirit being ſubjugated, the ſulphureous and the ſaline Particles being aſſociated together, exceed the reſt of the Elements, and cauſe the diſpoſition of the Liquor, to become of their Nature. But yet the buſineſs is not performed, altogether after the ſame manner, in both: for that in the former dyſcraſie of the Wine the Sulphur is ſomething more potent, than the Salt, but in the latter the Salt exceeds the Sulphur: ſo that either of them being the ſtronger, their Lord, the Spirit, being caſt off; they agree one with the other, and ſurmount the due tenour. The reaſon of either, may ſeem to be unfolded after this manner.

The Scorbutick Dycraſie of the Blood like wines when they become.

Fretted or Ropy

When generous Wines have grown hot for a long while, the particles being much agitated and ſtriking one againſt another, the Spirit partly evaporates, and partly overwhelmed in the more thick Elements, is ſuppreſſed: In the mean time, the Sulphur (of which there is the greater plenty) being more carried forth by the agitation, and ſo caſting off the yoak of the Spirit, adheres to the Salt, and lifting that up, alters the mixture of the Liquor, which by reaſon of the riſing up of the Sulphur combined with the Salt, becomes rancid, or fretted: In like manner, when thin Wines have been kept long, the Salt is carried forth, and diſpreſſes the Spirit, overcome by its *fluor*, and ſo ſubjected by its watriſhneſs, the Liquor becomes ſour, or ſharp; after that the Salt growing eminent, the Sulphur (of which there is a leſs quantity) cleaving to it, and intimately uniting, converts the Conſiſtency of the Liquor from thin to thick, and as it were of an oily ſubſtance; and from an acid, ſour taſt to a very ingratefull, and as it were muſty.

It is probable that after the ſame manner the Blood is altered in the affection of the Scurvy, as Wines, as often as they become too hot, degenerate into fretted and ropy; for it is an argument, that this diſeaſe does not depend ſo much on the feculencies mixed with the Blood (though ſuch ſhould be there, they might be at laſt driven forth, and their ſupplies cut off,) but on the habitual dyſcraſie of the Blood; becauſe the Scurvy being radicated, is ſo difficult and ſometimes not at all, to be cured. Moreover we may affirm, the dyſcraſie of the Blood which cauſes the Scurvy, to be two fold, as of the Wine, to wit, a ſulphureous-ſaline and a ſaline-ſulphureous diſpoſition. For as there are very great variety of affections, which are ſtirred up by the Scurvy; yet all of them may be aptly enough reduced to two principal Heads, or as it were two Fountains of evill, to wit firſt, that the blood being touched with the ſcorbutick Miaſm or Contagion, becomes either very fervid or hot, in which the Sulphur having dominion, aſſociates it ſelf powerfully with the Salt: wherefore it being made more rancid or fretting, grows inordinately hot in the veſſels, and perpetually ſends forth from it ſelf aduſt recrements, to wit, concretions of Sulphur and Salt, and diſperſes them here and there, which ſpreading outwardly, produce ſpots, pimples, whelks, or ulcers: but being inwardly layd up, bring forth a diſpoſition to Vomit, pains about the heart, Looſneſs, Fluxes and grievous pains. In this kind of Scorbutick rancidity or frettedneſs of the Blood, temperate Remedies only are convenient, and often Blood-letting, Scurvigraſs, Horſe-radiſh, or other things endued with a ſharpneſs and incitation: even by the like means as fretted Wines are cur'd, by diſcharging them from their *faeces*, and by pouring into them, Milk, Flower, or Starch, Glew, or other Demulſions or Sweetnings this is helped. Or in the ſecond place, in blood nouriſhing

nouriſhing the Scurvy, Salt has the chief dominion, and aſſociates Sulphur to it ſelf: wherefore it is not ſo fervid, but like ropy Wine becomes thick and mucilaginous, and is ſlowly circulated in the Veſſels, and is apt to ſtuff the *Viſcera* in its paſſage, and to affix there its feculencies as it were mud. Thoſe affected after this manner, for the moſt part without any puſtulaes or eruptions of the skin, become ſluggiſh, breathleſs and feeble. and labour with ſpontaneous weakneſs and ſtraitneſs of the Breaſt; and are found to be obnoxious to the paſſions of the Heart, the *Vertigo*, and Convulſions: In the ſcorbutick diſpoſition of this kind, more hot Remedies, and ſuch as are indued with a volatile Salt, yea Chalybeates or ſteel Medicines, which may fuſe and agitate thorowly the Blood, are wont to be moſt uſed, and are to be handled even after the ſame way, as ropy Wines, to wit, to be ſoundly ſhaken and agitated; and alſo to them are put Lime, burnt Allum, *Gypſum* or Plaſtering, Sea ſalt calcined, and the like indued with an high acritude or ſharpneſs. So much for the beginnings of the Scurvy radicated in the Maſs of Blood: There yet remains to be unfolded, for what cauſes the Blood degenerating from its proper nature, conceives this or that morbifick diſpoſition, bringing forth the Scurvy. But it firſt behoves us to ſhew by what means the ſeeds of this Diſeaſe lye hid in the nervous juice, the other general humour.

By what means the ſcorbutick Contagion is impreſſed on the nervous Juice.

We have elſewhere declared that from the Blood driven to the confines of the Brain, there doth diſtil a ſubtle Liquor, both for the matter and for the vehicle of the animal Spirits, and that it doth diſperſe it ſelf every where thorow the *Encephalon* and the nervous Stock: This *Latex*, ſo long as it is right and good, conſiſts chiefly of Spirit and Salt combined or volatiliſed in it, and with theſe and the *modicum* of Water, wherewith they are waſhed, there ſeems to be little need of Sulphur and Earth: but yet this concretion of Spirit and volatile Salt doth indeed conſtitute the moſt precious humour which penetrates, paſſes thorow, actuates, and irradiates all things, concerning which the Chymiſts have dreamt of their *Alchaeſt*. At the beginning of the Scurvy, whilſt the *Craſis* of the Blood and the tone of the Brain are not thorowly vitiated, this watring liquor of the Brain and Nerves, being as yet ſpirituous, ſweet, and not very unfit, performs performs all the functions to which it is deſtinated: but afterwards out of the bloody Maſs made poor and very much weakned, a much thinner *Latex* and inclining towards Vinegar drops forth: and further, from the fœculented Blood and as it were rancid or fretted or ropy heterogeneous Particles and very much infeſted are carried to the animal Regiment, and that being made weak within the brain, they are admitted without repulſe, and thence poured forth with the moiſtning Juice on its *Appendix*, both medullar and nervous: and from hence in ſeveral Regions of the flowing animal Spirits, ſometimes faintings and wanting of ſtrength, ſometimes painful and ſpaſmodick, or cramplike diſtractions, and exploſions do follow. Wherefore a *Paralyſis* or Palſy, Convulſions, *Vertigo* or turning round or giddineſs in the head, , tremblings, and other preternatural Affections of the Brain and nervous Stock, are wont to fall on thoſe who have the Scurvy deeply rooted: concerning which we will hereafter ſpeak more particularly. In the mean time we will take notice in general, that the ſcorbutick Contagion affixed in the nervous Juice, conſiſts in one of theſe three or in all of them together, *viz.* that the moiſtning of the Brain and Nerves becomes much thinner or poorer; or that it degenerates from its ſaline diſpoſition into ſourneſs; or that it is ſtuft with heterogeneous Particles.

Hitherto we have ſhown after what manner the firſt ſeeds as it were of the ſcorbutick Affection are ſown in the Blood, and from thence in the nervous Juice. Before we will conſider of the fruits or ſymptoms of the Diſeaſe, excited by reaſon of the evil diſpoſition of either of the humours and the reaſons of them, and their manner of becoming ſo; we muſt inquire into the more remote cauſes and differences of the Diſeaſe it ſelf: to wit, that it may appear from what cauſes or occaſions, and by what proviſion the ſcorbutick diſpoſition is impreſſed on the aforeſaid humours.

CHAP. I.

Chap. II.

Of the more Remote Cauſes of the Scurvy, by which its Contagion is affixed on the Maſs of blood, and conſequently on the nervous Juice.

HAving ſhown in the former Chapter, what is the conjunct and neareſt cauſe of the Scurvy, *viz.* the evil diſpoſition impreſſed on the Blood and nervous Juice, it now remains, that we inquire into the more remote Cauſes, by which the Contagion of either humour, and chiefly of that which is chiefly and firſt in fault, is carried into the Blood: for the depravation of this being detected, it will eaſily appear, how the morbifick Miaſm or Contagion is derived to the other Juice. Therefore as we have determined, that the ſcorbutick Affection is chiefly founded in the vitiated Blood, and that the evil of it conſiſts, whilſt the Spirit is depreſſed, in that the Salt and Sulphur, as in Wines becoming fretting and ropy, is unduly exalted; we will ſeriouſly conſider, how this or that diſpoſition is impreſſed in the maſs of Blood.

The opinions of others concerning the original of the Scurvy recited.

But we ought not to paſs over what other Authors, diligently ſearching after the nature of the Scurvy, have determined concerning its Cauſes and Subject. As there are many opinions of this thing, almoſt all agree in this reſpect, that the fountain and origine of this Diſeaſe is derived from the fault of the *Viſcera*, and the ſeat of its product is placed in the bloody Maſs, to wit, that this being almoſt only infected with their vitiouſneſs, contracts the ſcorbutick Contagion. The more Ancient did impute the chief cauſe of this Diſeaſe to the Spleen, not rightly performing its office: but as the office of the Spleen was conceived this thing by ſome, another thing by others, and a different thing by theſe; they ſhewed the production of this Diſeaſe after a ſeveral manner. *Wierius*, *Echtius*, *Albertus*, *Ronſſeus*, *Eugalenus* with many others, ſuppoſing that the Spleen was the receptacle of the excrementitious melancholick Juice ſeparated from the Blood, have determined the internal and next cauſe of the Scurvy, to be a plenty of lutulent or muddy humour, and of melancholy only, or alſo of that mixed with others, framing a peculiar form of corruption, which abounds about the Spleen and Liver, and in the Veins themſelves, This opinion might deſervedly challenge our aſſent, if it had pronounced the ſecretion of the melancholick Juice from the Spleen being neglected or hindred, to be ſometimes and in part the cauſe of the Scurvy; but that this Diſeaſe is held to ariſe always and altogether from the default of the *Viſcera*, is very highly improbable; as will hereafter be made plain, when we ſhall declare the far more potent cauſes of the Scurvy. Other Authors attributing the office of ſanguification to the Spleen, ſay that the Scurvy is produced, for that the Spleen does not turn that part of the Chyle deſtinated to its ſelf, into laudable Blood. But again others as *Reuſnerus*, *&c.* have thought the more humid and watry parts of the Chyle to be prepared in the Spleen, and to be converted into Blood. Therefore they judged the next and internal cauſe of the Scurvy to be the watry and ſerous humours, which not being received by the Spleen, were poured on the Blood, and ſo produced the original of the Scurvy. In the mean time others, as *Platerus*, *Bauhinus*, *&c.* ſayd that the thicker part of the Chyle being drawn by the Spleen, was the cauſe of ſanguification, and by it to be prepared for it ſelf, and other parts convenient Blood. From this ſuppoſition *Gregory Horſtius* ſaid the cauſe of the Scurvy to be the crude and ichorous Blood in the whole Body, but yet chiefly in the *Hypochondria*, offending not only in quantity but with a kind of ſpecifick corruption, proceeding from the imbecillity of the Spleen, *viz.* becauſe thorow the preternatural Affection of the Spleen, the more crude parts of the Chyle, are not averted from the ſanguification of the Liver, from whence the blood in the veins of the Liver and Spleen is firſt depra-

ved,

depraved, and then by the Commixtion of ſtrange matter the Sanguification of the Liver is hindred, by reaſon of the object not righly diſpoſed, for as much as the chyle, by reaſon of the hurt of the Spleen, was not depurated in its juſt meaſure. *Horſ. appen. ad. lib. 2 part. 2 Sect. 1 de Scorbuto.* This opinion eaſily falls to the Ground, becauſe he aſſerts, contrary to the Laws of Sanguification, the Spleen to ſanguifie and to draw the more crude parts of the chyle to it ſelf; when tis well known, there is no paſſage for the Chyle to the Spleen. Alſo this miſtake is refelled by the opinion of *Reuſnerus* and others, which affirm the next and internal cauſe of the Scurvy to be the ſerous and watry humours which the Spleen ought to draw, and by its peculiar office of Sanguification, to convert into Blood.

The moſt learned *Sennertus*, although with the former he artributes alſo the office of Sanguification to the Spleen, *Inſtitut lib. 1. cap. 9* yet he derives the cauſe of the Scurvy otherways than from the fault of this *Viſcus*. For he affirms, that by reaſon of the evil Concoction of the Chyle in the firſt paſſages, and being deſtitute of Spirit, ſalt and tartareous Feculencies to be heaped up, about the Meſentery and Cawl, and theſe being continually augmented by the approach of new matter, and moiſtened by the *Serum*, to be at laſt transferred into the Spleen and Liver, and from thence into the Stock of the veins, and ſo in them to infect the whole bloody Maſs, and to render it crude and ſalt. He calls this firſt Mine of the Scurvy, gathered together in the firſt paſſages, a melancholy Humour; which beſides he ſays to be ſerous, ſtopped up with pituitous humours, and by reaſon of its ſtay in thoſe parts, corrupted afrer a peculiar manner: Then he adds, that this humour is generated by the fixion of the Spirit and volatile Salt, after the ſame manner, when as Wine changes into Vinegar.

The Scurvy does not always ariſe by the fault of the Spleen or the firſt paſſages.

Several Reaſons of no ſmall moment do convince me, that I cannot in all things aſſent to this opinion; however probable it ſeems. For beſides that this Doctrine does not exactly quadrate with the Circulation of the Blood, ſince by its Law the humours in the meſaraic veſſels are ſcarcely gathered together apart from the other kind of Veſſels, at leaſt there is not any paſſage for them from thence into the Spleen, moreover it is not rightly determined, that the Scurvy begins only in the firſt paſſages; for ſometimes it is contracted by mere Contagion. Neither alſo do we think that this Diſeaſe proceeds from the fixedneſs of the Salt, or from the Crudity of the Blood and humours; for oftentimes it ſucceeds to long continued Fevers, and that rather ſeems to proceed from aduſtion and too great deflagration of the Blood, than from any advention of the Chyle and other humours in the firſt paſſages: moreover ſometimes a ſea and mariſh air induces this Diſeaſe, though no Crudities are begotten about the *Viſcera*: and the ſick do not complain from the beginning, of their Appetite and Digeſtion. Indeed wee grant, as to what belongs to the Crudity and the fixity of the Salt, in the Chyme (or ſecond digeſtion) or the Blood, and defect of Spirit, that from theſe cauſes a ſickly Diſpoſition is oftentimes produced, but not therefore preſently the Scurvy, but rather the *Malacia* of longing women, *Pica* of Virgins, the phlegmatick Dropſie, or ſome other dropſical diſpoſition ſucceed. Therefore ſince the Scorbutick Ætiology hath been deliverd by Authors, to whom the Circulation of the Blood was not known, and agrees leſs with the Truth, we will open the whole matter will that Key, and to the beſt of our Skill more accurately unfold the cauſes, both procatartick and evident, of this Diſeaſe, according to the Law of Sanguification.

We have already hinted that there are many occaſions and procatartick means from which the Scurvy ſeems to deduce its original. 1. In ſome places it becomes national or peculiar, ſo that the morbifick Contagion is drawn in together with the vital Spirit, by reaſon of the evil Influence of the Air, and of the vapours, wherewith it is ſtuffed 2. Very often this Diſeaſe follows upon long continued fevers, and other Chronical Diſeaſes and is very deſervedly accounted the affects or products of them 3. Sometimes it is hereditary, and is propagated by traduction from Scorbutick Parents 4. Sometimes again it is taken by mere Contagion 5. An evil manner of living, inordinations as to the things non-natural, an innate or acquired Dyſcraſie of the *Viſcera* ſometimes induce a Scorbutick affection, more often contribute to its birth, or nouriſh the inkindling. We will conſider the reaſons of every one of theſe effects.

1. There

1. There is none of the ordinary ſort of People, but confeſſes that the Scurvy is very often contracted by the fault of the Air, and it is almoſt in every bodies mouth, that places neer the ſea ſide, mariſh lakes, and moiſt places, render the dwellers obnoxious to intermitting Fevers, or the Scurvy: wherefore the ſickly, or ſuch who have any regard to their health, do chooſe their habitations far from ſuch kind of places. Indeed ſuch an humid Air, continually diffuſing filthy exhalations and infection, becomes unwholſome in a double reſpect, and often brings forth the Scurvy, *viz.* by reaſon of Tranſpiration being hindred: and becauſe of the ſuſception of an incongruous Ferment. For in the firſt place, people dwelling in a thick and not purified Air have the paſſages and Pores of their skin much cloſer, or ſhut up: wherefore when the *Effluvia* of the Blood are not duly exhaled, but the ſame retained within, ferments the reſt of the bloody Maſs, and diſpoſes its active particles to various inordinations. Then in the ſecond place, for as much as at the ſame time filthy vapours, ſtinking, incongruous Salt and Sulphurs are ſucked in, by reaſon that the Spirits of the Blood are greatly depreſſed, and in the mean time its ſulphurous and ſaline particles are carried forth to the extremity, and from thence the *Craſis* of the ſanguineous Maſs being by degrees changed, it degenerates into an evil diſpoſition. And indeed, the ſulphureous part of which being exalted by it ſelf induces a notable rancour to the Blood; and there is wont to be excited, ſometimes continual, but often intermitting fevers ſo familiar, by the unwholſome air, for the reaſons elſewhere ſhewed. If from ſuch an occaſion (as it very often happens) the ſaline principle is carried forth together with the Sulphur, ſuch a ſcorbutick diſpoſition as we have above deſcribed, like to fretted or ropy Wine is impreſſed on the Blood. Not only a great tract of humid and vapourous Air, is unwholſome after this manner, but alſo to dwell in houſes ſcituate neer any mariſh, or encompaſſed about with a pond or moat, or in houſes new plaſtered with lime, renders perſons obnoxious to this Diſeaſe.

By what means unhealthfull Air breeds the Scurvy.

2. A Fever of long continuance, very often induces the Scurvy: the reaſon of which manifeſtly appears from our *hypotheſis*; for from the often, and too much deflagration, of the Blood the Spirits are very much waſted, and like liquor that becomes poor and liveleſs; by its burning, a great plenty of the more pure Sulphur evaporates, and in the mean time what is left of it, aſſociating to it ſelf the Salt, carrying it up, is wont to cauſe the *Craſis* of the Blood to become planely morbid and ſcorbutick. It is to be obſerved, after a long Fever, by reaſon of the Spirit and Sulphurs to much exhaling and very much of the Salt being for a long time concocted with the remaining Sulphurs, that the Blood becomes very ſalt, and as it were lixivial, ſo indeed that from thence, it is ſcarcely enough inkindled in the heart to perform the circulation: ſuch a diſpoſition of the Blood is not to be reſtored, but by a long time, and is very difficultly hindred from running into the Scurvy. Not only after fevers, but alſo after other chronical diſeaſes, evilly cured, the Scurvy is induced, and that for a double reaſon or means of affecting, to wit, either becauſe the Blood is changed by the preſent diſeaſe towards a ſcorbutick diſpoſition, or becauſe the diſeaſe hinders the ſick for a great while, from any exerciſe, or motion, and from thence they are inclined, by a long Idleneſs and ſitting ſtill, to the Scurvy. The firſt is diſcerned in Melancholy, when by the depreſſion of the Spirit, and the Salt being carried out into a *fluor*, the Blood turns to a Sourneſs. This kind of *Craſis*, the Sulphur afterwards aſſociating with the Salt, and both of them being carried forth, eaſily paſſes into the Scurvy. The Hypochondriack Affection is ſo much of kin to the Scurvy, that it very often takes it for a Companion: for the melancholy feculencies, which only after the nature of that affect pollutes the Blood, afterwards perverts its *Craſis*, and renders it ſcorbutick: in like manner the Jaundice and Dropſie which at firſt only infects the Blood by an impure and incongruous Mixture, after a long ſtay, quite changes its Temperament. 2. Many other Diſeaſes accidentally induce the Scurvy for as much as the ſick are hindred from any kind of Labour or Exerciſe; ſo that their blood is very little eventilated, but retained, like Wine a long time upon its lees, looſes its *Craſis* or Temperament, and is liable to the inordinations of the Salt, and Sulphur. After this manner the Palſie, *Lumbago*, or feebleneſs of the Loins, the fracture of Bones, Ulcers, Wounds long time in curing, render Men obnoxious to the Scurvy.

2. Why it follows upon long fevers.

3. The

3. The Scurvy is ſometimes contracted by ſucceſſion, ſo as the contagion of the Diſeaſe being derived to Children from their Parents, without any other external or internal cauſes, produces infected fruits exactly like the nature of the ſcorbutick Affection: So have I known Children ſprung from ſickly Parents, to have been affected with wandring pains in their Limbs, an eruption of Spots, an eroſion and rotteneſs of the Gums and Teeth. Beſides it is obſerved, the Children of Parents touched with the venereal Diſeaſe, to be obnoxious to moſt grievous ſymptoms, like to the ſcorbutick Affection. The reaſon of theſe ſorts of affections ſeems to conſiſt in this, for that the filthy taint being impreſſed on the genital humour, becomes like empoyſoned ferment, which although it for a long time lies hid, being involved with other Particles, at laſt exerts its power and raiſes up the ſymbolick Elements of Sulphur and Salt in the Blood or nervous Juice, and by carrying them above the reſt of the Particles, inclines to the ſcorbutick taint. *3. How it is contracted by Succeſſion.*

4. By the ſame reaſon and means of affecting, the Scurvy is propagated by contagion, *viz.* the Effluvia's proceeding from an infected Body, and entring into the Pores of one that is near or inſpired by the Breath, ferment either the Blood or the nervous Juice, or both of them together: and ſo by carrying up the ſpirituous-ſaline, and ſulphureous Particles, pervert the Temperament or *Craſis* of the Liquor, according to their nature. *How by Contagion.*

5. The cauſes of the Scurvy hitherto cited, reſpect more immediately the bloody Maſs, and ſhew the diſeaſe to begin from its *latex*, without any great fault in the firſt paſſages. But leſt we ſhould think this Region, to which ſome attribute all the fault, to be wholly free; it ſeems to be determined according to the judgment of others, that the rudiments of the Scurvy is alſo ſometimes conceived within the *Viſcera* of Concoction, and from thence traduced into the Blood: For when it happens from the Chyle, being for a long time vitiated, that the nutricious Juice becomes incongruous, and is ſtuffed with Particles of enormous Salts and Sulphurs, which it carries to the bloody Maſs; there is a neceſſity that its *Craſis* will at length be changed, and perverted according to the nature of the matter, by which it is conſtantly and daily ſupplied. Wherefore it is obſerved, that thoſe who eat much of ſalt or ſmoke-dryed Meats, and drink much Wine and ſtrong Waters, by which means Salt and ſulphureous Particles are violently carried into the Blood, are found to be very much obnoxious to the Scurvy: Beſides thoſe who feed much on Swines fleſh or Fiſh, although freſh, but eſpecially on Shell-fiſh, for that theſe Aliments have in them plenty of rank Sulphur and Salt (as may be gathered by the extreme ſtink of their putrefaction) are very apt to fall into the Scurvy, and which is more, ſometimes into the Leproſie. On the contrary, they are not ſo incident to this Diſeaſe, who eat milk meats, raw and unripe fruits, freſh Cheeſe and other abſurd things, which heap up in the Ventricle a great quantity of Phlegm; neither is the Juice nouriſhing the Scurvy, produced from depraved or ill digeſted meats; but ſometimes Aliments fit or convenient enough turn into a morbifick matter by the fault of the *Viſcera*; which indeed happens not always by the fault of the Liver or Spleen, as ſome have thought, for theſe have no buſineſs with the Chyle, but the Stomach it ſelf being endued with an extraneous ferment, perverts every thing that is put into it, and changes it ſometimes into a ſour, ſometimes into a Salt or vitriolick pulp, and it is very likely alſo that the incongruous Juice from the Pancrace, or the cholldical paſſage, may be mixed with the Chyle, and imbue it with an heterogeneous tincture. We do not deny but that the Spleen and the Liver do not ſeldom contribute to the production of the Scurvy, but yet not the Chyle but more immediately the Blood ſuffers for their faults when the Liver is obſtructed; ſo that the aduſt recrements of the Blood are but little or ſmally ſeparated, by reaſon that its Maſs being more feculent, becomes too luxuriant with the particles of Salt and Sulphur concocted together. As to what relates to the Spleen, it is not altogether undeſervedly, that ſo many complaints are exhibited againſt it, as to the production of the Scurvy: For as the office of this Bowel (as we have before ſhewn) conſiſts in this, that it doth receive and ſeparate both the atrabilary or melancholy feculencies of the Blood, which conſiſt in a fixed Salt and Earth, and alſo that it digeſts the ſame by a further concoction into a ferment, to be mingled again with the Blood: If then at any time the Spleen does not rightly perform theſe its Offices, the maſs of Blood is wont to be infected in a double reſpect: to wit, either becauſe the atrabilary or melancholy faculencies are not wholly received by the Spleen being *How the Viſcera and the firſt ways are in fault.*

obſtructed or debilitated; or becauſe being received, the ſame are perverted into an unfitting and corruptive ferment of the Blood: After this manner and ſome times after that, the ſanguinious Maſs becomes evilly diſpoſed, and not rarely by this only occaſion, or by the acceſſion of other cauſes, degenerates into a ſcorbutick diſpoſition: And indeed from ſuch a foregoing cauſe, we have formerly declared the hypocondriack affection to ariſe, to which truly the Scurvy (as even now we hinted) is ſo near a kin, that it moſt often is a companion with it, or follows hard after it. But it plainly appears by the obſervation before cited, that the Scurvy does not always and only ariſe from the fault of the Spleen: For ſome time paſt there was a noble Gentleman, who for many years had laboured under a ſcorbutick affection, accompanied with very many and grievouſly horrid Symptoms; The Phyſicians whilſt they had this Gentleman in cure, concluded his ſickneſs to be contracted by the fault of the Spleen; and all thoſe heavy evils to come upon him for the ſake of that Bowel: At laſt after being afflicted almoſt with continual pains, for the ſpace of ten years, and alſo with the *Paralyſis* and miſerable Convulſions, waſting away, he died with a Conſumption. The Corps being opened it appeared to the ſenſe, that the Spleen ſo evilly defamed was free from all fault; for this inward was very laudable in figure, magnitude, ſubſtance, and colour, and without any tumor or obſtruction: Beſides the ſanguiferous Veſſels being opened and freed from their ſtuffings, the nervous Fibres appear'd firm enough, and the Blood contained within the pores of the Spleen, free from corruption.

Wherefore ſadneſs and immoderate Studies beget the Scurvy.

Among the cauſes of the Scurvy, that are wont to be derived from the inordination of the *non*-naturals, we may here deſervedly place ſadneſs, for it is every where obſerved, that men through ſome occaſion ſtruck with ſorrow, and ſo remaining for a long time ſad, do become ſcorbutick. The reaſon of which ſeems to be this, great ſadneſs immediately affecting the inferior or bodily Soul, compells inwardly both its parts, to wit, the ſenſitive and the vital, ſtraitens their *Syſtaſes* or conſtitutions, inhibiting their wonted expanſions, and draws them into a leſſer ſpace. Hence the Animal Spirits being hindred from their due expanſion, remit their Oeconomy, wherefore the Blood repeating its Circuits in a leſſer compaſs, is apt to be heaped up about the boſom of the heart, and there to ſtagnate for this reaſon, when the Spirits of either Government, *viz.* either animal or vital are depreſſed, and the Blood and nervous Juice begin to be altered in their complections, either of them by degrees loſing their vigor, turns from a generous Liquor to one ſour and liveleſs: Beſides the *Viſcera* of Concoction being denyed the wonted influx of Spirits, perform very untowardly their Offices. Hence from the Chyle not rightly concocted, or being depraved in its coction, the nutritious Juice being ſtuffed with feculencies, becomes vitious; and is poured on the bloody Maſs, whereby it more perverts its *Craſis*, and cauſes it eaſily to paſs into a ſcorbutick diſpoſition. Moreover for this reaſon, immoderate and too ſerious ſtudies, and the continual intention of the mind, for as much as from hence the Spirits being depreſſed, and the offices of the *Viſcera* ſubverted, the chief *Craſis* of the humours altered for the worſe, they often acquire a ſcorbutick taint: To which we may add, that both ſad and ſtudious perſons, for the moſt part lead a ſolitary life; for which cauſe, both the Blood and nervous Juice, as water wanting motion contracts mud, is wont to be vitiated and ready to fall into a ſcorbutick corruption.

The ſcorbutick taint is derived from the Blood to the Brain and nervous ſtock.

Theſe are, if not all the procatartick or more remote cauſes of the Scurvy, yet at leaſt the chief of them which affix its taint on the Blood; there will not need any other Ætiology, to ſhew how it is derived from the hurtful Blood into the nervous Juice, for the Blood by its accuſtomed rite and law of circulation, diſtils a portion of its ſpirituous Liquor into the Brain: But as we have before ſhewn, from the Blood depauperated a thin *latex*, and from that a ſharp liquor and ſalt withal, is drawn off after the manner of ſalts when they are diſtilled: Alſo beſides from the feculent Blood, and as it were, muddy heterogeneous Particles, infeſting the animal Kingdom, are brought forth; which notwithſtanding are not eaſily admitted into a firm and ſound Brain. Wherefore as ſuch Particles being received within the *Encephalon*, do induce thereupon paralytick affections or Cramps; ſome cauſes precede, by which the conſtitution of the Brain is debilitated, of which ſort they uſe to be, 1. Its evil hereditary Diſpoſition. 2. Frequent Surfeits or eating too much, immoderate drinking of Wine, noon Sleeps, great Hæmorrhagies, and other occaſions, whereby either the animal Spirits are too much conſumed, or the

pores

pores and paſſages of the Brain, relaxed, and too much opened, that they admit of every thing brought from without.

CHAP. III.

Of the differences of the Scurvy, alſo of the Signs, Symptoms, and Cauſes of this Diſeaſe, and chiefly of thoſe which ariſe by reaſon of the taint being impreſſed on the Blood.

The differences of the Scurvy.

FRom the cauſes of the Scurvy hitherto deſcribed, it will be eaſie to aſſign the differences of this Diſeaſe: For in the firſt place, this affection may be diſtinguiſhed according to the twofold Region of the conjunct Cauſe, *viz.* the Blood and the nervous Liquor, for that it is either of this or that Kingdom chiefly, and is more deeply rooted now in the Blood, now in the nervous Juice. Secondly, according to the double taint of the Blood affected, to wit, as that ſhall be either ſulphureous-ſaline, or ſaline-ſulphureous, it ſhall alſo ſignifie the Scurvy by divers Names, or it ſhall be called according to the vulgar appellations, either bilous or hotter, ſhewing it ſelf in ſpots or whelks, and other more apparent ſymptoms; or Melancholy, whoſe poyſon lying hid, as it were covered with aſhes; is known rather by the intrinſick hurt of the faculties, than by outward eruptions. Thirdly, according to the Original and manner of invaſion of the Diſeaſe, to wit, for as much as it is received either by contagion, or that it ariſes through an internal *procatarxis* or remote cauſe; alſo according to its various ſtate, it is many ways diſtinguiſhed, and is either beginning, more perfect, or deſperate, and requires divers manner of Indications as to the Cure, of which we ſhall treat more largely hereafter. In the mean time, it is our buſineſs to recite the ſigns and ſymptoms of the Scurvy, and to add the cauſes of them, and after what manner they happen.

Signs and Symptoms.

The Signs by which Prognoſticks or *Indicia* of the Scurvy are taken, are either extrinſick, to wit, certain accidents and circumſtances, which till the more certain notes of the Diſeaſe appear, give a ſuſpicion of it: So we may deſervedly think, any one having a very ſickly diſpoſition, to have contracted ſome taint of the Scurvy, if he be ſprung from ſcorbutick Parents, or if he have long converſed with a Wife, or Companions affected with it; or if he live near the Sea Coaſt or marſhy or otherways unwholeſom places, or if he ſhould have had before a long Fever or other Chronical Diſeaſes, or if he ſhall be ſenſible of help by anti-ſcorbutick Remedies, and that ſuch ill diſpoſition be without a Fever, or certain ſigns of any other Diſeaſe. Or Secondly, the ſigns of this Diſeaſe are preſent affects and ſymptoms, to wit, inherent to the ſick body; which ſort as they are manifold, are wont to be variouſly diſtributed, and reduced into certain Claſſes; that is to ſay, for as much as they are proper to the Scurvy, or common to it with other diſeaſes, alſo for that they are excited, either about the beginning or in the increaſe of the Diſeaſe, or in its worſt ſtate or condition. Further, they are diſtinguiſhed according as they ſhall be excited in the various parts of the Body internal or external, alſo for as much as they may happen either in the Head, Breaſt, the *Abdomen*, or about the Members or habit of the Body: By this way we have already recounted the ſcorbutical ſymptoms. But they may be aptly enough diſtributed according as they ariſe, either by reaſon of their taint, being fixed chiefly in the Blood, or by reaſon of the faults of the nervous Juice, or by reaſon of the congreſſion, or as it were conjunct influences of either humour becoming enormous. We ſhall as much as we can, inſiſt on this method, in reciting and unfolding the ſigns and ſymptoms of the Scurvy, although in the mean time, very many affections which ſeem to proceed from the ſingular fault of this or that humour, procure ſome fault of the other humour, to be alſo a part of the cauſe: As to what relates to the præternatural affections of the

firſt paſſages, and the *Viſcera* in the Scurvy, although they ſometimes proceed from errors in living, yet moſt often the ſickneſſes of theſe parts becoming indeed permanent ariſe by reaſon of the Blood or nervous Juice, as ſhall be declared hereafter in its proper place. In the mean time, we will ſhew at once how the chief ſymptoms of the Scurvy proceed from the fault of this or that humour, or conjunctly from both.

1. What kind of Affections ariſe by reaſon of the ſcorbutick Dyſcraſie of the Blood.

1. When as the Blood is very much infected with a ſcorbutick taint, evil ſymptoms follow for three chief Reaſons, *viz.* 1. Becauſe its Liquor being depauperated, wants its wonted vigor; ſo that it can neither be inkindled in the heart freely, nor be circulated lively and equally: For which Reaſon, a dejection, and as it were a falling down of the whole Soul, Sadneſs, Anxiety, difficultneſs of Breathing, a ſtraitneſs of the Breaſt, intermitting Pulſe, frequent Swoonings, and inordinate ſuffuſions of Heat and Cold follow. 2. The Blood abounding with feculencies, pours all about its Recrements on the parts which it waſhes: Wherefore Spots outwardly, Pimples, Whelks, Puſtles, and Ulcers are excited. Hence alſo, Catarrhs, the Dropſie, a ſwelling of the Members, Ulcers of the Gums, Vomitings, Lasks, Fluxes, great Spitting, Sweats, a lixivial Urine, or filled with Contents, as alſo tumors of the *Viſcera*, or obſtructions do not ſeldom follow. 3. A poor and feculent Blood ſupplies the Brain and nervous ſtock with but a vicious Liquor; and ſo by the means of thoſe Parts it communicates its faults: Beſides, a depraved Blood does not afford preſently a *Copula* or joynting to the Spirits, every where abounding within the Fibres, convenient enough exploſive for the acts of the locomotive faculty, from whence a ſpontaneous laſſitude, or wearineſs, and impotency to the moving of the parts proceed.

2. How impreſſed on the Brain and nervous Juice by reaſon of the taint.

2. In the Scurvy, the moiſtning juice of the Brain and nervous ſtock, after it is infected with the filthy taint, offends in a treble reſpect. 1. For as much as it declines from a noble and ſpirituous, into a poor and thin Juice, from whence a languor and enervation of the whole Body, and in ſome part alſo an Atrophy proceeds. 2. For as much as this Liquor is changed from a ſpirituous-ſaline, into a ſour, acetous Juice, from whence melancholy and fear, a failing of Spirits, and a ſuppreſſion from their wonted vigor, and alſo almoſt continual griefs and irritations of the nervous parts, and a crackling of the Bones are induced. 3. For that this Liquor is ſtuffed with heterogeneous Particles, and infeſting the animal Regimin, Convulſions, Spaſms, or Cramps, Palſies, Vertigo's, ſoporiferous Affections, or pertinacious Watchings, at laſt Fooliſhneſs, or Moping, or Madneſs ariſe.

3. How by reaſon of the Conjunct evils of either humour.

3. In a more heavy and inveterate Scurvy, the recrements of the Blood and nervous juice, being depoſited together in divers parts, for as much as they are endued with ſaline Particles, which are of a divers nature, they encounter one with another; and by a mutual ſtriving and effervescency, produce moſt horrible Symptoms. From hence ariſe intollerable dolors, chiefly at night, wandring pains in the Joynts, Rheumatiſms, and other affections of this kind. After this manner, from the double fountain of the ſcorbutick taint, very many Rivulets of evil affections running every where in all parts of the whole Body, create griefs.

4. That yet a more full knowledge may appear, it will not be from the matter, to recount each of the aforeſaid Symptoms, and the reaſons of every one of them, and how they come to paſs particularly to deliver.

The cauſe of the Symptoms unfolded.

1. The firſt ſign of the Scurvy, by which oftentimes a ſuſpicion of the beginning of this Diſeaſe is given, is a ſpontaneous wearineſs, to which are added impotencies as to motion, alſo a debility of the Thighs, and as it were a ſenſe of weight or heavineſs. Theſe Symptoms are wont to ariſe about the beginning of this Diſeaſe, and are derived rather from the fault of the Blood, than of the nervous Liquor, which is as yet ſcarcely infected: But this may be done in a double reſpect, *viz.* in the firſt place, for as much as the Blood being made impure, flings out ſerous feculencies in its circulation, and inſinuates them into the pores and paſſages of the Muſcles, wherewith they are ſtuffed and loaden, ſo that the Spirits being hindred and intercepted, they perform not freely enough nor lively their locomotive exploſions: Beſides, the parts being loaded as it were with a certain Burthen, they are not eaſily and readily moved as formerly. 2. From a vicious Blood, the exploſive *Copula* of the animal Spirit becomes degenerate and weak, wherefore they neither readily accompliſh, or nimbly perform the local motions: We believe in an inveterate Scurvy the impotency as to motion to ariſe alſo from depravation of the nervous juice, and from the want of Spirits.

Spontaneous wearineſs.

2. Difficult

2. Difficult breathing and a ſhortneſs of breath upon any motion, is a familiar ſymptom of the Scurvy, of which as there are wont to be two cauſes, it depends now upon one now upon the other, and ſometimes on both together. The ſcorbutick *Dyſpnœa* or ſhortneſs of breath, if it be very frequent and almoſt conſtant, comes from the very poor, and as it were, liveleſs ſtate of the Blood, whereby it is indeed apt to ſtagnate, and not to be eaſily inkindled in the Heart: wherefore from any motion, as the Muſcles urge the ſanguiferous Veſſels, by compreſſing every where their contained liquor, the Blood ruſhes ſomewhat more plentifully into the boſom of the heart, which when it is not there preſently inkindled, and carried forth of doors, it lies heavy at the heart, and threatens a decay of the vital function: Therefore the Lungs that they may bring help, are moved more ſwiftly, that the Blood may be drawn forth quickly, and ſo for this end, to wit, the circulation of the liveleſs Blood, and of it ſelf almoſt immoveable, the often and ſhort breathing is cauſed. In this caſe, with laborious breathing there is alſo a quick and ſmall Pulſe. 2. Sometimes the ſcorbutick *Diſpnœa* or ſhort breathing proceeds from the fault of the nervous ſtock, for after the morbid or filthy taint has occupied the Brain and its appendices, the heterogeneous Particles ſent from the *Encephalon*, as they are of kin to other nerves; ſo alſo to other Spirits, to wit, thoſe ſerving to the motion of the *Diaphragma* and the Muſcles of the Breaſt, come to the Brain; and ſo according as thoſe Nerves are either inhibited or perverted from performing rightly their offices, a difficult reſpiration is produced of a various kind, and is for the moſt part either Paralytick or Convulſive: For the morbifick Particles entring into the nervous ſtock, and about their foldings or extremities being more plentifully heaped up; are fixed with plenty of Spirits. Hence it ſometimes happens from ſuch a cohæſion of Particles, (if perhaps they be Narcotick) that the Spirits inhabiting thoſe Nerves, are every where bound and hindred from their deſigned actions: Whence reſpiration being hindred, other Spirits the gueſts of Nerves yet free, that they may perform the common task by their own ſtrength, are very much ſtirred up, and ſo as much as they may, they cauſe a more frequent and laborious reſpiration. But whenever the Spirits flowing within certain Nerves, for the office of reſpiration, are affected with an heterogeneous, exploſive, or ſpaſmodick *Copula* or joynting of the ends of the Muſcles, for the ſake of whoſe preſſing out, when they are excited through plenitude or for other occaſions, they run into convulſive motions: And from thence the Lungs are detained with laborious and often repeated turns, now of *Syſtoles* now of *Diaſtoles*, like to aſthmatick Paroxyſms. In theſe caſes, ſometimes the Nerves of the *Diaphragma*, ſometimes the Pneumonick, and thoſe abſolving the motion of the Breaſt, alſo ſometimes perhaps thoſe embracing the *Bronchia*, ſometimes theſe, ſometimes thoſe apart from the reſt, are ſtupefied or obnoxious to cramplike affections, and for that reaſon the various differences and ways of the anomal or unequal reſpiration occur: Some kinds and examples of which we may add hereafter. I know ſome aſcribe the cauſes of the aforeſaid Symptoms to the Vapours elevated from the Ventricle and its Neighbourhood, whoſe opinion in another place we have deſervedly rejected, with reaſons ſhewn to the contraay. *Eugalenus*, *Horſtius*, and *Sennertus*, whom others follow, deduce the cauſe of the ſcorbutick *Dyſpnœa* or purſineſs, from the *Viſcera* of the lower belly, being inflated or tumefied, and by that means preſſing the Cawl, as it uſes to come to paſs in Hydropicks, and women big with Child. But I cannot aſſent to this opinion, becauſe this ſymptom does not ſeldom happen to thoſe, whoſe Belly and *Hypocondria* are ſoft enough, and who have the ſinking below the Ribs, and the ſpace for the motion of the *Diaphragma*, free enough, as I have often found upon examination. But, that difficult reſpiration falls upon Hypochondriacks, and ſometimes alſo upon Scorbuticks, upon the perturbation of the Spleen, the reaſon is, becauſe the ſplenick Nerves communicate with the pneumonick: Therefore indeed when either of them are beſet with the morbid, *viz.* the ſpaſmodick matter, and the ſame being moved in either of them, ſtirring up Cramps; it draws the others into a conſent of affection, as I have already manifeſtly declared, diſcourſing of the hypochondriack paſſions: In all difficult reſpiration excited by reaſon of the fault of the nervous ſtock, the Pulſe though for the moſt part ſtrong enough, yet becomes quicker than it ought to be, and ſometimes intermitting.

Difficult Breathing.

A ſtraitneſs of the Breaſt heavily infeſts ſome ſcorbutick perſons, which kind of ſymptom hath joyned with it a difficult reſpiration, and commonly is aſcribed to the

A ſtraitneſs of the Breaſt.

the ſame Cauſe, to wit, from the compreſſion of the Caul by the elevated *Viſcera*: But yet though the Breaſt be ſometimes by that means ſtraitned, that thoſe purſily affected can hardly draw their breath, but that the taking in of the breath terminates in the midſt of the *Thorax*, yet ſometimes on the contrary, they draw in the Breath too deeply, ſo that they breath it out again hardly and difficultly; which certainly by no means ought to be attributed to the inequalities of the inferior *Viſcera* in the *Diaphragma*; but either to the undue accenſion of the Blood in the Heart, or rather to the preternatural affection of the Nerves, ſerving for reſpiration: By the like reaſon alſo the cauſe of more difficult inſpiration or taking in the Breath, is deduced from the ſame fountain, *viz.* in either caſe the Nerves ſerving for the drawing in and thruſting out the Breath, for that they are poſſeſſed with a morbifick matter, and that either Narcotick or Spaſmodick, they perform in the executing their proper Offices either more or leſs than they need to do. But ſometimes ſcorbutick Perſons are troubled with a ſtraitneſs of Breaſt, without the breathing much hindred; ſo that they feel the compaſs of the *Thorax* to be more ſtrictly drawn together, and to be contracted into a narrower ſpace: In the mean time, thoſe ſo affected complain rather of the anxiety of the heart, than of any hindrance of the motion of the Lungs: The cauſe of this ſeems to be, that the Membranes inveſting the *Præcordia*, for as much as being too much irrigated with a ſerous humour, together with the nervous, become more contracted like wet Leather: So that their Fibres being irritated, wrinkle themſelves too much into ſhort Convulſions or Spaſms, and from thence they force the containing parts to be ſtraitned: Beſides, this kind of ſtraitning of the *Præcordia* follows in ſome part the motion of the Heart it ſelf: For whilſt the Blood is made poorer, it does not leap forth ſtrongly enough from the boſom of the Heart, nor flames out openly into the Lungs. Wherefore theſe need the leſs to be dilated or expanded, but rather that they may anſwer to the circulation of the Blood, performed in a leſſer compaſs, and exactly quadrate to the inveſting Membranes, and to the nervous Fibres deſtinated to their motion, they are regulated according to the weak limits of expanſions: Wherefore this conſtriction of the *Præcordia*, as I have obſerved in very many, is wont to be ſuddenly remitted and intended, by reaſon of the occaſious of Joy and Sadneſs, even as the Blood leaps out more plentifully or more ſparingly from the boſom of the Heart, the greater or the leſſer ſpace is proportionated to its Circulation.

Inordinate Pulſe. 4. An unequal and an intermitting Pulſe, alſo frequent ſwoonings and fear of the ſame, very often happen in the more grievous Scurvy, the ſame reaſon of which as of unequal breathing, is aſcribed deſervedly, now to the undue accenſion of the blood in the Heart, and now to the inordination of the nervous ſtock. The Blood being made more ſaltiſh, and beſides much ſtuffed with ſcorbutick feculencies, is but unequally and brokenly inkindled, like the oyl of a Lamp imbued with Salt and muddy filths: Wherefore from hence an irregular Pulſe, with a waſting of the vital ſpirits in the Brain is ſtirred up. Moreover, when the cardiack Nerves are alſo beſet round with a morbifick matter, ſo that the influx of the animal Spirits, by which the motion of the heart is continued, is not performed in a juſt dimenſion and equal manner, by that means it happens that the motion of the heart is ſomewhat hindred, and its reciprocations variouſly diſturbed; an inequal or intermitting Pulſe, and a ſmall and weak ſeems to proceed from the dyſcraſie of the Blood, but if it be great and ſtrong enough, from the fault of the animal function.

The paſſions of the Heart. 5. The trembling palpitation and great leapings of the heart often happen to thoſe ſcorbutically affected; theſe ſort of paſſions are merely convulſive, and altogether depend on the cardiack Nerves, to wit, belonging to the heart it ſelf or *Pericardium*, beſet with a ſpaſmodick and exploſive matter: For the animal Spirits, the inmates of the Nerves themſelves and of the Fibres, and their appendices being inordinately exploſive, compel the whole joynting of the heart to be cruelly ſhaken and moved. In the mean time, whilſt the whole bulk of the heart is agitated by that means, it does often rightly perform the proper motions of *Syſtole* and *Diaſtole*, as I have obſerved in many, who with ſuch a ſhaking of the heart have had an ordinary and laudable Pulſe.

Wandring Fevers. 6. Erratick Fevers, alſo ſudden ſuffuſions of heat and cold in ſeveral parts of the Body, uſe to come upon an inveterate Scurvy: The reaſon of the former is, becauſe the extraneous matter being often carried to the Blood with the nutritious Juice, for that alſo the alible Juice it ſelf is made degenerous, becauſe it is not rightly mixed

mixed with the Blood, they ſtir up its extemporany effervescencies. In the mean time, a Fever obſerving a regular type, for that cauſe excited rarely happens to Scorbuticks, becauſe the ſalſuginous Blood, although it be taken with a feveriſh burning, does not burn long nor much, at leaſt not equally: As to the ſudden ſuffuſions of heat and cold, they indeed ſeem to be inferred ſomewhat by reaſon of the affection of the nervous ſtock; for that the Nerves and Branches and nervous ſuccours, do diverſly embrace and compaſs about the ſanguiferous Veſſels in moſt parts of the Body, perhaps for that uſe, that the courſe of the Blood might be urged and reſtrained, as it were with Goads and Bridles, according to the force of the paſſions, and other exigencies of Nature, it is very likely that when the œconomy of the animal Kingdom is perverted by the ſcorbutick taint, that moſt of the Nerves and Fibres and their Appendices, being ſtretched out here and there; do every where run into ſpaſms or convulſive motions, and alſo by reaſon of their hurt, the irregularity of the Arteries and Veins are contracted: So that the Blood is compelled into theſe parts more than it ought, and is too much eſtranged from them, from whence theſe kind of inordinations of heat and cold proceed.

7. Plentiful Sweats chiefly at night, are wont to be very troubleſome to ſome ſcorbuticks, the reaſon of which is, that as the nutritious Juice being daily brought into the maſs of Blood, by reaſon of the dyſcraſie or evil diſpoſition of this, and the impurity and filth of that is not aſſimulated; but being rejected of the Blood is ſent away under the form of Sweat. But that the nutritious Juice in the time of its aſſimilating, becoming degenerate; does not produce an intermitting Fever after its manner, the cauſe is the ſalſuginous intemperature of the Blood, which therefore becomes leſs able for periodick deflagrations: this ſort of immoderate ſweating happens chiefly in the Scurvy, following upon a long Fever or other Chronical Dyſcraſies, where the nutritious Liquor is perverted, rather by the default of the aſſimilating Blood, than of the concocting *Viſcera*. *Nightly Sweats.*

8. In a more certain Scurvy, as in other Diſeaſes, we conſult the Urinal: For if the Urine appears intenſly red, and as it were lixivial without a Fever or the Jaundiſe, we undoubtedly pronounce this a ſign of that Diſeaſe: For whilſt the ſerous *Latex* is circulated for ſome time with the ſoluted Salt and Sulphur, the ſaline and ſulphureous Particles being inconcocted in the ſame, beſtow on it a very deep and as it were lixivial tincture: Alſo that ſuch Urine abounds very much with contents, which, the ſtale being cold, precipitate to the bottom, it altogether owes it to the Particles of the degenerate nutritious Juice, ſnatched away with the *Serum*. But yet the Urines of the ſcorbutick perſons often vary, for ſometimes they appear of a Citron colour, with a Cream ſwimming in it or fixed to the ſides of the Glaſs, from whence an *indicium* is taken, that the Blood doth abound with ſaline rather than ſulphureous Particles: Indeed if ſuch an Urine be exhaled at the fire, the ſaline reſidence will remain in almoſt the double quantity of the Liquor. Moreover, ſometimes the Urines of the Sick are changed from this or that ſtate to the contrary, ſo that what was to day red or of a Citron colour; to morrow is made limpid, clear, and thin, and in abundance: Which kind of Piſs, as it appears, was not circulated long with the Blood (becauſe it hath received no tincture from it) we judge to come to paſs from the watry recrements of the Blood and nervous juice, contained partly within the Lymphæducts, and partly depoſited within the Pores and paſſages of the ſolid parts, which when they are gathered together to a fulneſs, every where run forth of their Receptacles with the riſing flood, and ruſhing into the bloody Maſs, are from thence ſent away preſently by the Reins. *Lixivial Urine.*

9. There follows upon this Diſeaſe being grown very grievous, a plentiful ſpitting, and for the moſt part a bloodineſs of the Gums, and then a looſeneſs of them and at length a putrefaction, which is wont to be accompanied with an Eroſion, Looſeneſs, or falling out of the Teeth, and with a ſtinking Breath: That the reaſon of which may the better appear, in the firſt place, you are to be advertiſed, that there are ordained about the peculiar parts of the mouth, certain Pipes or paſſages, to wit, ſalival, by which the ſerous humours are plentifully ſent forth: Theſe ariſing from various Glandula's, to wit, the *Parotides* being in the Weſand or Throat, the Maxillar for thoſe belonging to the Jaws, and thoſe under the Tongue for the moſt part terminate about the Gums or near them: The conſtant and ordinary Office of theſe, is to lay up the Spittle for ſome neceſſary uſes in the Cavity of the mouth. Beſides, it is obſerved, that the ſuperfluous humours, yea the more *A plentiful ſpitting and ulcerous Affections of the Mouth.*

more thick and vicious, are perhaps ſent away forth adoors by this way, rather than ſeparated from the Blood as by Urine, Sweat, and otherways. Quickſilver prepared with Salts and taken inwardly, or the Body anointed with it, is minutely diſſolved by the ſaline Particles of our Body, and being with them involved, mixes it ſelf moſt deeply: Theſe kind of Concretions of Salts and Mercury, being diffuſed thorow all the humours, and into all the parts of the whole Body, as Nature endeavours to expel the trouble they afford; the beſt and indeed moſt eaſily performs their execution, by theſe emunctories of the Mouth: For the Blood, and perhaps in ſome part the nervous Liquor being burthened with thoſe mercurial-ſaline Recrements, endeavour by every way to ſhake them off; which however, when they are more thick and fixed, than that they can be exhaled or diſtilled forth by ſweat, or ſent away, being precipitated by the ferment of the Reins through the Urine; they are ſometimes breaking thorow the little mouths of the Arteries, inſerted in the Inteſtines, in ſome part excluded by the Belly: But yet the particles of this Medicine being involved with the *Serum*, and moſt readily depoſited in the aforeſaid Glandula's, and in others belonging to the Mouth and Throat, flow out by ſalivation more plentifully excited; by which effluxion it happens that the Gums and other parts of the Mouth are ulcerated, and the Teeth are looſened with a ſtinking of the Mouth. But this kind of ſalivation ſometimes ſucceeds of its own accord, inſtead of a *Criſis* without *Mercury*, in the declination of ill judged Fevers, and the humour to be excerned, ſweating forth not only from the more open holes of the ſalival paſſages, but alſo from the little mouths of the Arteries every where thick planted, daub over the Cavity of the Mouth with a whitiſh ſcurf. The like reaſon as of theſe accidents, may be rendred of theſe ſort of Symptoms in the Scurvy: For indeed when in a depraved Blood, more and thicker recrements of the enormous Salt and Sulphur are gathered together than can be excerned by evaporation or by Urine or Seige, they are carried to the emunctories of the Mouth; by which the more ſalt purgaments of the Blood are wont to go forth; theſe ſalt things being diluted with the *Serum*, ſweating not only from the ſalival Veſſels, create great ſpitting; but alſo being carried thorow the Arteries, enter into the ſoft and ſpungy fleſh of the Gums, which firſt of all, their pores being filled with an ichorous Blood, ſwell up; but afterwards the ſalt Ichor going forth from the Blood, and being continually excreted, the fleſh of the Gums, by reaſon of the defect of laudable nutriment, grows flaggy, leaving the Teeth almoſt naked. Further, by a long afflux of matter plainly corroſive, the fleſh of the Gums is eaten away; ſo that the Teeth can hardly ſtand, but grow looſe or fall out of the corrupted Stalls: And by reaſon of the ſaline-ſulphureous Particles, partly of the excreted humour and partly of the putrefying Gums, being continually breathed forth, the filthy ſtinking ſmell of the mouth is excited.

Various Spots and Whelks.

10. Spots breaking forth in the Thighs and in other parts of the Body, are accounted a pathognomick ſign of the Scurvy: Theſe are ſometimes about the bigneſs of a Penny, and often as big as a Shilling; ſometimes the Skin ſeems to be marked or ſpotted an hands breadth or more in ſome part: Beſides theſe Spots are of divers colours, to wit, now Citron Colour, now Dark, now Purple, and ſometimes appear livid, blewiſh or black: Beſides ſome have whelks variouſly ſwelling, *viz.* now lightly, now with a hard, and as it were a cruſty skin, or they break out with ſcales here and there in all the members of the Body: Among the ſpots and breakings forth whether tumid, or equal, or rough, this difference is noted in general, *viz.* that theſe contain a matter not congruous with the Blood, wherefore being ſecreted from its Maſs in its circuit, they are fixed in the Skin; neither are they altogether forſaken by the Blood, but that the Blood paſſing by adds to them others and new Particles, whereby it comes to paſs that the extravaſated matter, by the continual approach of the Blood, is either at length ſupp'd back again, or being ſubtiliſed is breathed forth, (and ſometimes it is effected partly one way and partly the other) or laſtly that matter being ripened, runs into an Ulcer or Sore. Moreover, Whelks almoſt of every kind do generally happen not only in the Scurvy, but in many other Diſeaſes, yea if at any time the Blood does immoderately boyl up through any occaſions. But ſpots are portions ſecreted from the Blood and every where forſaken by it; ſo that there is nothing of commerce between them and the circulated Blood, wherefore they increaſe not in bulk, nor ſuppurate, nor eaſily evaporate. The Citron or darkiſh Spots ſeem to be ſome portions of Choler or Melancholy,

melancholy poured forth from the Blood into the Skin: But as to the black or Purple marks, it is to be known, that they are not excited in any other diſeaſes, beſides peſtilential Fevers, the venereal diſeaſe, and the Scurvy: In the Plague and malignant Fevers they ſeem to be certain rejected parts of the blaſted and deadly affected Blood, to which always a malignity and Contagion are joyned, as we have elſe where ſhown more at large: In the Pox and Scurvy, though there is not ſo much malignity found, that the Spirits of the Blood are greatly mortified, or that its liquor becomes ſo greatly blaſted, yet we may well ſuſpect, that in either diſeaſe, growing grievous, the Blood being apt to be in ſome meaſure broken and coagulated, it grows together into leſſer Clotters; which ſort of Concretions of the Blood being extruded at the mouths of the Arteries, are fixed in the Skin, and according as theſe portions are greater or leſſer, and participate more or leſs, of the corrupted Blood, the Spots alſo, as to their bigneſs, and colour, are fixed in the Skin.

The Flux of the Belly.

11. A Flux and looſneſs of the Belly happens frequent enough in the Scurvy, ſo that the *Fæces* of the Belly, which are ſometimes liquid and ſometimes compacted, and of divers Colours, ſeem to exceed in quantity the aliment that is taken in, which ſort of Flux, although it appear immoderate if it be ſtayed by the uſe of Medicines, preſently the Sick are wont to find a ſwelling of the Ventricle and *Hypochondria*, a hardneſs of Breath, or a waſting of the Spirits. The cauſe of the ſcorbutick *Diarrhœa*, is partly, that the Chyle is not rightly cook'd, neither is it ſoon enough, or ſufficiently born through the milky Veſſels; hence ſtagnating in the Inteſtines and becoming degenerous, is caſt forth a doors, but this chiefly happens, for that the impurities admitted within, from the bloody Maſs, drop out from the little mouths of the Arteries, wherefore the things excreted are more copious ſometimes than thoſe put in.

Vomiting, nauſeouſneſs, &c.

12. By the like reaſon, Scorbutick and Hypocondriack perſons are found obnoxious to frequent Vomiting, nauſeous Belching, and heart pains: which Symptoms indeed do frequently happen in this Diſeaſe, partly, becauſe the Tone of the Stomach is looſned, and its Ferment vitiated, whereby it comes to paſs, that the reliques of the Chyle evilly concocted, is turned into auſtere Salt, Vitriolick, or otherwyas degenerate pulp, and beſides, though the Stomach be ill, becauſe the recrements of the Blood reſtagnating within, are poured into its Boſome.

Dyſenterie and Hæmorrhagies.

13. Sometimes a dyſenterick Affection, alſo frequent hæmorrhages or flowings of Blood at the Noſe, the Fundament, Reins, *Thorax*, Gums and other places, follow thoſe ſick of an inveterate Scurvy: The cauſe of which Symptomes is, for that the Blood being made more ſalt, and therefore more apt to grow hot, eaſily breaks forth at the mouths of the Veſſels; but chiefly, becauſe when the tone of the ſolid parts is weakned, and that the Fibres are made very lax, the mouths of the Veſſels become broader and diſcontinued, ſo that it does not rightly lead the paſſages from the extremities of the Arteries into the little mouths of the Veins, but that the Blood being intercepted between the openings of the Veſſels, and being there apt to ſtagnate and flow out, by what it can, it eaſily breaks forth, and ſlides it ſelf forth a doors.

Theſe are the chief Symptoms, which are wont to be inferred by the Scurvy, by reaſon of its taint; being impreſſed on the maſs of Blood, and from thence tranſlated immediately into other parts, ſome of which alſo happen to be cauſed, partly by the depravation of the nervous Liquor. Now we will next conſider of the Effects and Accidents of this Diſeaſe, which are wont to be excited, almoſt only or chiefly by the fault of the nervous Juice.

CHAP. IV.

The Symptoms and Accidents which are wont to ariſe in the Scurvy, by reaſon of the Taint impreſſed on the Brain, and nervous Stock.

Fearfulneſs and languor of the whole Body.

1. WE have already intimated, that in the more grievous Scurvy, the moiſtning Liquor of the Brain and nervous appendix is wont to become thinner and poorer, whereby it comes to paſs that moſt of the animal Functions are performed untowardly and ſlowly, hence the locomotive power flaggs very much, ſo that the ſick loving Idleneſs and eaſe, ſhun exerciſes and labors of the Body, go about unwillingly any Task, and preſently being weary give it off. I have known in ſome the whole ſenſitive Soul to ſeem leſſned, and as it were made unequal for the Body, ſo that the ſick, believing themſelves not able to walk, nor ſtand, have refuſed altogether to be raiſed, or to riſe from their Beds; when as yet no evident cauſe did hinder, but that they were ſtrong enough to do what was required: Beſides ſuch, however ingenious they were before, abhorred the Studies, and labours of the Mind, and plainly affected to wear out their Life by doing nothing.

Melancholy.

2. In an inveterate Scurvy the nervous Juice declines from a ſpirituous-ſaline diſpoſition towards a ſour one; hence, as we have elſewhere ſhown, Melancholy, a fluctuation of the mind, an often mutation, and inconſtancy of purpoſes, proceed: moreover, as the nervous Fibres are perpetually watered by the influx of ſuch an humor, from hence, in ſome part, come the more light Spaſms or Twiches, cramp-like contractures, and wandring Pains. But indeed, the cheifeſt vice of the nervous liquor, is wont to be, that being ſtuffed with filths and fæculencies, it contains heterogeneous particles, and divers ways hurtful to the animal regiment: wherefore happen very often to Scorbuticks horrid and grievous Affections, of which ſort, are the following Symptoms.

Scorbutick Palſie.

3. Paralytick Affections, *viz.* Impotency, or the reſolution of one or more of the Members, alſo ſtupor, or lack of feeling, and a ſenſe of tingling, or pricking, often follow upon a deep and heavy Scurvy: which ſort of Symptoms are not however, for the moſt part, very much fixed and permanent, but ſometimes they ceaſe or remit, and anon are repeated or increaſed. The ſcorbutick Palſie is wont to be excited chiefly from three ſorts of cauſes, which now conjunctly now diviſively produce this Diſeaſe. 1. For the Debility, or reſolution of the Members happens, becauſe of the nervous Juice being departed, there wants a ſufficient plenty, or ſtock, of the animal Spirits, whereby all the members ſhould be actuated: Hence, the ſick have the locomotive faculty flagging, or weak, as if infeebled by old age, about the thighs, and feet, and ſometimes in other extream parts, to which the influx of the Spirits doth not plentifully reach: perhaps afterwards, as greater afflux of the Spirits is carried to the affected Member, and is in the mean time elſe where deficient, the diſeaſe ceaſes, or is transferred to another place. 2. Sometimes the animal Spirits, although they are plentifully and ſufficient enough in the parts, yet they are infected with Heterogeneous, and as it were narcotick particles, brought along with the nervous Juice, ſo that being as it were bound, and almoſt overwhelmed, they are not able ſufficiently and nimbly enough, to perform their exploſive endeavours, or labors: hence ariſe not only the impotency of the motive faculty, but alſo a certain depravation of the ſenſitive, *viz.* a benummedneſs, and a ſence of ſtinging, tingling or pricking: for that, whilſt the animal Spirits are loaded with an incongruous *Copula*, their irradiation, like the beams of the Sun, paſſing thorow a cloudy air, is performed, but refractedly, and diſturbedly. 3. Although the animal Spirits are diſpenſed in a ſufficient plenty, and are free and clear of any narcotick quality, yet oftentimes their paſſages are obſtructed, ſo that the Commerce between the inflowing Spirits and thoſe implanted within ſome members, cannot

From 3. ſorts of Cauſes.

cannot be performed conveniently; for it ſometimes happens, that the more thick and earthy Particles do enter into the bodies of the Nerves with the moiſtning Juice, which ſo ſtuff the paſſages, about the enfoldings of the Nerves and other nervous windings, with their full burthen, that the irradiation of the Spirits in this or that member is wholly hindred. So I have known ſome, who have had a hand or foot wholly enfeebled or reſolved, whilſt the arm, or thigh, with the reſt of the Body was well.

Pains, of which there are ſeveral Species.

4. From the like cauſe, *viz.* ſcorbutick Fæculencies, fallen upon the Bodies of the Nerves, Griefs or Pains alſo, which are eſteemed the moſt frequent Symptomes of this Diſeaſe, do in ſome ſort proceed; But as they are of a divers kind, they alſo ariſe ſometimes from other Cauſes. For indeed, the ſcorbutick Pains are either more light, uncertain, and quickly paſſing away, which depend ſometimes upon a *Flatus*, or Wind diſtending the Membranes, and ſometimes on a ſharp or Salt matter, poured forth, now from the Blood, now from the nervous Juice, upon the nervous parts; which kind of matter, for that it is improportionate to the nervous Fibres, pulls or hawls them, and irritates them into corrugations or wrinklings and becomes painful: but, for as much as the ſame is quickly waſhed off by the flowing of the *Serum*, or diſſipated by heat, the troubleſom ſenſe brought in from ſuch a cauſe is more eaſily removed. Or in the ſecond place, the ſcorbutick Dolors, are more grievous, very acute, and hard to be moved, which ſort alſo, are either fixed, or determinated to ſome particular place, or wandring transfer the Pain, and that moſt grievous, from one place to another, as may be perceived in a wandring and Scorbutick Gout, and Rheumatiſm, concerning which we ſhall diſcourſe hereafter: In the mean time, fixed Pains and a long time remaining, are wont to be excited in divers parts, but chiefly in the Belly, Loyns Thighs, *Sternum* or Cheſt, and in the Head: It will be worth our labour, briefly to deſcribe the Pathologie belonging to every one of theſe places.

1. An almoſt continual Pain of the Belly.

1. The pain of the belly is ſo familiar to the Scurvy, that according to the German *Idiom*, it ſhould take from thence its name. This Symptom, though in a lighter degree, almoſt continually afflicts ſome ſick perſons, to which is joyned now a looſneſs, and now a high binding up of the Belly: the reaſon of which ſeems to be, for that, when both the Blood and nervous Juice abound with impurities, both the Arteries and Nerves carry the plenty of excrementious matter towards the ſink of the Belly, which being fixed about the Coats of the Meſentery, or the Inteſtines, ſtir up conſtant Pains, by a perpetual pulling the nervous Fibres. But beſides there happen to ſome ſcorbutical perſons, Paroxyſms or fits of very acute Pains, as it were Colical Affections, which being protracted for many days, yea ſometimes weeks, miſerably torment the ſick: ſo that they think their Bowels to be pulled, and torn to pieces with the grievouſneſs of the Pain: theſe pains are wont hardly to be allaied with any remedies, unleſs with the more generous Opiates; and as ſoon as the virtue of the Hypnoticks is conſumed, they are repeated with their wonted Cruelty, but continuing with a longer fit, very often torments in the Loins and Back are propagated and at length are diffuſed on the members of the whole Body: to this ſort of affection a Palſie does not ſeldom ſucceed. But then in reſpect of the Cauſe of the Scorbutick Colick, it is not probable that it ſhould ariſe from a ſharp matter, depoſited within the Cavities of the Inteſtines, neither from any ſimple humor, however miſchievous it be impacted in their Coats: for this is quickly ſhaken off, or goes into an Ulcer, beſides that is eaſily exterminated by the uſe of Clyſters, or Purges: but indeed, theſe cruell torments of the Belly can come from no other cauſe, than the mutual ſtrivings and efferveſcencies of the Salts (which are of a divers Nature) fighting or ſtrugling together, whereby truly the Nervous Fibres are pulled, and as it were torn aſunder. For we may ſuppoſe, that certain ſour recrements of the nervous Juice, like to vitriolick *Stagmas*, being gathered together about the foldings of the Meſenterie, or other nervous parts of that region, to which comes a ſerous *Colluvies* from the arterious Blood growing hot, abundantly ſtuffed with the particles of a fixed, and as it were a lixivial Salt, and with thoſe ſwellings up produces as it were piercing Pains. From hence it may be argued that the mine of the former morbid Stock deſcends from the Head, by the paſſage of the Nerves, into the lower Belly, for that great headaches, alſo the Vertigo and Swimming, or turning round in the Head often præceed, and not rarely ſucceed this kind of Colick.

2. Pains as it were of the Colick.

The cauſe of them.

Beſides, it appears that from the Bloody Maſs there is a large ſupply ſent of particles of fixed Salt, paſſing as it were by *Deliquium*, or a ſtraining thorow; becauſe the fitt of this Diſeaſe being very urgent, the Urine of the ſick appears of a deep colour, and is very much ſtuffed with Salt, and is as it were lixivial, and oftentimes its ſuperficies is variegated with divers Colours, like the train of a Peacock: But ſo ſoon as the Diſeaſe begins to decline, the Urine is better, and from hence they are wont to aſſume hope and ſigns of growing well. But that this affection of the Belly is often propagated into the Loins, the reaſon is becauſe the nerves of the Loyns and the meſentery intimately communicate, and in very many places are mutually inoculated: wherefore when the dolorifick matter ſuperabounds in the paſſages of theſe, it eaſily paſſes into the neighbour proceſſes of thoſe: But then that the Diſeaſe increaſing, the pains being diffuſed thorow the whole Body, almoſt every Joynt and Member are afflicted, the reaſon is, becauſe when a more plentiful proviſion of the morbid ſeed is begotten in the head, than can be derived to the whole ſtock of the firſt affected Nerves, *viz.* the moving and intercoſtal pair; part of it entering into the Bodies of the other Nerves, and alſo ſpinal Marrow, ſpreads abroad this morbifick mine, participating of acetous Salt into very many parts of the whole Body, which every where by the acceſſion of the fixed Salt, from the bloody Maſs becomes dolorifick: and laſtly, after that the plenty of Spirits is profligated by the incongruous matter, the reſidue after the mutual effervescencies of the Humours, being in very many of the Nerves together beſet, and mightily filled or ſtopped up, the waies of Emanation are obſtructed, and their mutual commerce is broken off, ſo that 'tis no wonder if thoſe long Pains end at laſt in a Palſie,

Pains in ſeveral parts of the Abdomen. not only in the middle of the Belly, where the morbifick cauſe ſeems to ſubſiſt, about the foldings of the Meſenterie, but in other places round about, Pains not inferior to the Colick, are wont to ariſe. I know a noble Maid that was obnoxious to moſt cruel Torments, near the *os Pubis*, during about the ſpace of a Month, and were wont to be repeated upon any occaſion, given without any ſuſpition of the Stone, or Ulcer in the urinary Paſſages: which kind of affection I judge to depend upon a morbid matter impacted in the nervous foldings, planted in the *Hypogaſtrium*. Further, it is familiar to ſcorbutical Perſons, to find fits of very cruel Pains, ſometimes in the right, ſometimes in the left *Hypochondria*, and ſometimes about the Region of the Ventricle: the cauſes of which we think to ly hid in the nervous foldings belonging to the *Viſcera*, planted in that place.

In the Loins and Back. 2. Scorbutick Pains, are wont ſometimes to infeſt the Loins, and alſo the Region of the Back, now above, now below, without any prævious Affection of the *Abdomen*, or of the Reins. I have known ſeveral keeping their Beds with ſuch a Diſtemper, perpetually crying out Day and Night, by reaſon of the intollerable torment: The cauſe of this kind of Paſſion may be aſcribed to the acetous Recrements of the nervous Juice poured on the Membranes, and Tendons of thoſe parts, and ſo ſtirred up into effervescency, by the acceſſion of the Sanguinious ſaltiſhneſs.

In the Breaſt and Pleura. 3. By reaſon of the ſame conjoyning of Salts, affixed on the Membranes, Cloathing the *Præcordia*, very troubleſom Pains about the region of the Breaſt, and not eaſily to be removed, are often induced; hence the Baſtard pleuriſie is ſo frequent a ſymptom of the Scurvy. I have known many ſcorbutical perſons very much troubled for a long while, with a moſt grievous Pain under the *Sternum*, ſo that in ſeveral ſo affected, I could not but think there was ſome Ulcer, or abſceſs lying hid in the *Mediaſtinum*; when in truth this ſymptom did depend only upon the heterogeneous matter, brought thither, partly by the Nerves, and partly by the arteries, and there growing hot, being affixed to the Membranes; as the event often proved: for that the ſick were freed, by the long uſe of antiſcorbutick Remedies.

In the Head. 4. Hitherto we have recouoted the chief kinds of Pains, infeſting the middle parts of the Body. But in the Scurvy there is felt thoſe no leſs troubleſom, in the extream parts, *viz.* the Head, Thighs and Leggs. As to the firſt, Headach is ſo rarely wanting to this Diſeaſe, that many by this effect are ſatisfied chiefly that it is the ſcorbutick Venom; by which they become obnoxious to moſt grievous fits of this evil, and handled for a long time, and oftentimes repeated. The cauſe of this is obvious to every one, that it may be aſcribed to the humours poured on the *Meninx* or Films inwrapping the Brain, which alſo Anatomie hath proved.

For

For the Skulls of ſome of the dead being opened, I perceived both the membranes grown together, and every where ſet thick with little Whelks, and ſcirrhous tumors, which kind of tumors and concretions, ſeem to have riſen from the mutual coagulations of the two-fold painful humour, after many efferveſcences.

5. Nor indeed is it any otherwiſe to be determined, as to the Pains moſt grievouſly afflicting the Thighs and Leggs of the ſick, chiefly in the night time: for many labouring with an inveterate Scurvy as ſoon as ever they are warm in their beds, are wont to endure intollerable torments, about the calves of the Leggs, Shins and Thighs, and ſometimes about other parts, ſo that they cry out their fleſh is gnawn, or torn in pieces like the biting of Dogs: Theſe tortures if they leave their Bed, do ſomewhat abate; otherwiſe the afflicted are moſt miſerably tormented all Night long: In this caſe there can nothing be more aptly conceived, than the acetous recrements of the nervous Juice, to fall down on the Leggs, as into a place having a great declivity and to be copiouſly affixed to their Membranes, to which whilſt the rejected Salts do come from the Blood notably rarefied and agitated, thorough the heat of the Bed, and do ferment with theſe after the manner of Salts, therefore indeed from the mutual ſtriving and efferveſcency of the Particles of divers kinds, the nervous Fibres being pulled and hawled beyond meaſure, run into painful Corrugations, neither do indeed theſe dolorifick Pains ceaſe or remit, till the particles then gathered together, either evaporate or by their mutual wreſtling being brought under are worn out, are quiet from their efferveſcencie; but then within a little ſpace, freſh proviſion of either matter diſpoſes to a new paroxyſm, by reaſon of the mutual efferveſcencie and coalition. Of theſe kind of Salts of a diverſe kind, proceeding from a twofold humour, the wandring Gout, the Rheumatiſm and certain other affections are produced, which we deſervedly impute to the conjunct dyſcraſies, and as it were evil confæderations of the Blood and nervous Juice. Moreover in the ſame Claſs certain ſpecies of ſcorbutick Pains but now handled, ought to be placed; but becauſe they are of kin to other Pain, ariſing from the Sole Vice of the nervous Juice, or of the Blood, therefore we have here joyned together the divers Theories of the dolorifick Affections. *In the Thighs.*

As there is a conflux of Symptoms of a divers kind in the Scurvy, ſo there is begotten a manifold morbifick matter, and of a divers nature: *viz.* Heterogeneos particles coming into the Brain and nervous ſtock, with the moiſtning Juice, are ſometimes narcotick, bringing forth the Palſie and ſometimes ſaline, cauſing Pains, (as we have ſaid) alſo ſometimes they are nitro-ſulphureous and exploſive, from which the ſpaſmodie or cramp-like affections ariſe: but by reaſon of particles of this ſort go together in the Brain, there happen to ſcorbutical perſons, Vertigos, ſwimmings in the head and outragious aſſaults, like the falling ſickneſs: From the like cauſe, poſſeſſing the nervous Stock, proceed convulſive motions, tremblings, ſhakings, and very often horrid contractions in the *Viſcera* and in the Members. We have already ſpoken largely enough of the nature, differences and cauſes of Convulſions. Beſides we have fully deſcribed certain admirable caſes of this affection, ariſing from the ſcorbutick infection, ſo that it ſeems needleſs to diſcourſe any more of this matter, for it may be eaſily accommodated by the hypotheſis before delivered, to all the ſpaſmodick ſymptoms of the Scurvy whatſoever.

6. Thoſe labouring with an inveterate Scurvy are very obnoxious to a Vertigo: Concerning this affection, and alſo of many other Cephalical, we have made ſpeal diſquiſitions, which may perhaps be ſometimes be made publick. In the mean time we will in one word ſignifie that this Symptom ariſes, for that the animal ſpirits are in ſome meaſure perverted from the wonted ways of their expanſions, to wit, being either hindred on otherways driven from their ſeries, ſtate, and orders are compelled to break off: this happens to come to paſs as in other caſes, ſo chiefly in the Scurvie eſpecially for two cauſes, either for the one, or the other, or for both together; *viz.* either becauſe the commerce of the Spirits is obſtructed ſomewhere, in ſome paſſages and Pores of the brain, being poſſeſſed by ſome extraneous gueſt, or ſecondly, ſome companies of the Spirits, being burthened with an heterogeneous *Copula*, or joynting are compelled to ſtay behind the reſt, or to go out of their tracts: In this Diſeaſe the liquor indeed inſtilled to the brain from a very impure blood, brings with it very many Fæculencies, by which it can be no otherways, but that the heterogeneous particles ſhould every where ſtuff up *The Vertigo.*

the

the Pores of the Brains and growing to the animal Spirits, oppoſe them or force them into exploſions.

Sleepineſs. 7. Almoſt for the like cauſe, ſleepineſs and torpor, or heavineſs frequently happens to Scorbutick perſons, *viz.* for as much as the animal Spirits being burthened with watery or narcotick Particles, and very much oppreſſed, cannot perform readily their expeditious and quick motions within the Brain very much alſo abſtructed, neither continue long the acts and exerciſes of their functions, but love to ly down and to indulge themſelves with idleneſs and reſt. Moreover, this ſort of affection ſometimes is ſtirred up by the defect and want of the animal Spirits; for from the Blood very much vitiated and as it were dead, the Brain and nervous Stock is ſupplied but with a thin Liquor, and almoſt lacking of all *Vigor*: From ſuch a *Prophaſis* or occaſion, I have known a Lethargie excited in thoſe about to dy; by which the affected though they ſeemed to indulge themſelves with a continual ſleep, yet being called are wont to know thoſe ſtanding about them, and to anſwer thoſe who ſpeak to them; but the ſtore of the animal Spirits growing weary, they were neither able to wake long nor to attend to diſcourſe. When I have opened ſuch who were overwhelmed with perpetual ſleep, I have found the Brain dry enough and altogether free from a Dropſie, or ſerous *Colluvies*, with which lethargick perſons are wont for the moſt part to be affected.

And waking. But ſometimes on the contrary, ſome ſcorbutick perſons are moleſted with almoſt continual waking. Which kind of Symptom proceeds ſometimes from the affections of the mind, Grief, convulſive Paſſions, fear of Swooning, paſſions of the Heart, and alſo from the perturbations of the Stomach and of other *Viſcera*; for as much as the Spirits being vehemently moved in every part of the ſenſitive Soul, their whole Hypoſtaſis is detained from entering into reſt, or a tranquil condition. For I have known ſome touched with a ſcorbutical Taint, who though they were free from Pains or Spaſms, and alſo clear from any immoderate affection of the mind, have been induced to watchings day and night for many weeks, and oftentimes could get no ſleep, though they had taken ſtrong opiates: In the mean time they continued lively enough and ready to the performance of Labours, without any heavineſs of the Head, and without any torpor or ſluggiſhneſs of the mind or ſenſes, as if they had wanted no ſleep. The reaſon of this ſeems to be, that ſometimes together with the nervous Juice, certain nitro-ſaline Particles of a fierce and unquiet nature, (of which ſort are the effluvias falling from *Aqua fortis*, or the ſpirit of nitre) growing to the Spirits, compell them to be perpetually agitated and to be continually in motion: for even as Vapors breathing forth from ſtygian Waters, are never altogether fixed or at reſt, ſo the heterogeneous Particles which are of that ſort of Nature, adhering to the Spirits inhabiting the Brain, ſuffer them ſcarce ever to be idle or to indulge ſleep. Theſe are the chief ſymptoms that are wont to be ſtirred up in the animal regimen, by reaſon of the ſcorbutick taint being impreſſed on the moiſtning liquor of the Brain and Nerves; which with thoſe before mentioned happen by fault of the Blood, degenerating from its right *Craſis*. But as to thoſe great and Herculian Diſeaſes, to wit, the aſſaults of the Apoplexie and the Epilepſie, which ſometimes happen to ſcorbutical Perſons: In theſe caſes the former affection, being as it were married to another more worthy looſes it name, and paſſes into the Pathology of that, as it were into its Progeny, laſtly we will inquire what are the ſymptoms of the Scurvy by reaſon of the conjunct Dyſcraſies of the Blood and nervous Juice, as it were joyning their alliances in Evil.

CHAP. V.

CHAP. V.

Of the ſymptoms of the Scurvy which ariſe by reaſon of the Conjunct Dyſcraſies of the Blood and nervous Juice.

IN this rank, in the firſt place is ſet the ſcorbutick Atrophy or conſumption of the Fleſh: for who labour long with this Diſeaſe often fall into a *Maraſmus* without any ſignal fault of the Lungs, or ſuſpition of a Conſumption or *Phthiſis*, ſo that the Fleſh wholly falls away, and the Skin becoming very flaggy, ſcarce ſticks on the Bones. The cauſe of which ought not only to be attributed to the fault of the Blood degenerating from its right *Craſis* or diſpoſition; for this however depraved it be, for the moſt part aſſimilates ſome portion of the nutricious Juice, and beſtows it on the parts to be nouriſhed: but indeed when as the nervous Juice is alſo bad, the nutritive faculty is altogether inhibited; for that by the defect or fault of this, the nutriment elaborated by the Blood becomes altogether unprofitable and unfruitful: By what means, as to nutrition, either Liquor, to wit, the Sanguinious and nervous diſcharge themſelves, we have elſe where ſhewn. From that hypotheſis, which ſeems to be built upon ſufficiently probable reaſons, it eaſily follows that the Atrophie familiar to the Scurvy depends from the conjunct irregularities of either nutritive faculty. For as much as the Blood gives only vicious aliment, and that the nervous Liquor fails in the actuating and aſſimilating it, there is a neceſſity for the ſolid parts, being continually defrauded of their food, to wither away. *The Scorbutick Atrophy.*

2. The ſcorbutick Gout, which is very much wandring, and affects now this Part now that ſucceſſively, now more parts together, and leaps about from one place to another, or from theſe places to thoſe, ſeems to depend upon a double Stock, even as the Colick above deſcribed, but the manner altogether inverted. For indeed it is to be ſuppoſed in this Diſeaſe, that very many heaps of the fixed Salt, from the bloody Maſs are diſpoſed here and there about the Members and Joynts as ſo many Neſts: which indeed being hid within ſo many diſtinct Cells, remain as the Eggs of Fiſhes, or as the feminine Seed, to which afterwards the acetous four-recrements of the nervous Liquor come as the maſculine Seed, and renders them fertil, to wit, in as much as the Salts of a divers nature, being commixed, they greatly ferment or grow hot; and ſo by the mutual wreſtling and agitation of the particles, the Membranes and nervous Fibres being notably hauled, they are carried into dolorifick Corrugations. In truth, it from hence appears that the firſt mine of this diſeaſe as alſo of the common Gout, is to be placed in the bloody Maſs, and to be actuated by the Recrements of the nervous Juice, becauſe when the aſſaults of the Pains ariſe in various parts together, or ſucceſſively, the Blood ſeems not to grow hot above the meaſure, nor its ſalſaments paſſing by *Deliquium* at that time flow out more plentifully; for that neither the Pulſe becomes quicker nor the Urine lixivial. But in an urgent fit, very often a foregoing Headach, an heavineſs of the Head or Vertigo, inquietude of the Members and often a leaping of the Tendons, which ſort of Symptoms often præcede or accompany the aſſaults of pains, argue the four recrements of the nervous Juice to ſuffer a flux. To this appertains that the acid liquors being drunk up, provoke the gouty Paroxyſms. In the Scurvy indeed either Mine is more plentifully begotten, the neſts of the Gout are longer publiſhed, and the pains in theſe do ſpring ſooner by far: beſides from a very impure Blood, a ſaline or tartarous matter is heaped up not only in the Joynts of the Feet or Thighs, but almoſt every where about the membranes and the interſpaces of the Muſcles, to which alſo an acetous *Copula* or joynting being poured out in many places from the nervous Juice, it becomes fruitful of Pains; then for as much as either Mine conſiſts in a matter leſs thick, and is gathered together in open places, it is either waſhed away in a little time by the *Serum* flowing to it, or it is diſſipated by heat, or elſe being ſucked again by the Blood, it is transferred to ſome other place. *The wandring ſcorbutick Gout.*

3. The

3. *The Rheumatism.*

3. The Rheumatism, as it is described by modern Authors, often comes upon an inveterate Scurvy. Which sort of affection, exciting Pains almost in all parts of the Body, one after another, although it appears like to the wandring Gout, but now described, yet it differs from it both in respect of the pains, which in a Rheumatism quicklier pass over, and oftner change their seat, and that with them are very often joyned a small Fever, and a tumour of the affected parts, and a *phlegesis* or Inflammation; as also by reason of the conjunct Cause, which indeed being of Kin to that which brings forth the scorbutick Colick, is clean contrary to the cause of the wandring Gout: For it seems that in the first preparation of this Disease, an acetous Mine is deposited in very many places from the nervous Juice, as it were the female Seed; to which sort of Symbols left in divers places here and there, whilst that the blood growing hot, pours forth its plentifully rejected saline reliques, presently upon the wrestling and Congression of dissimilar Particles. Pains are caused moreover, because the recrements of the Blood being exposed in the middle of its Course, they something hinder its motion, therefore a tumour and Inflammation is brought upon the part affected then, because the Blood at last licks up again the Matter, but now rejected by it self, and transferrs it to some other place, those often shiftings and mutations of Pains happen. This Affection deserves a peculiar consideration: but this may suffice to have said these few things of it in general, to wit, as it is a symptom of the Scurvy.

Hitherto we have unfolded the Symptoms of the Scurvy, arising from a threefold kind of Cause, the Pathologie of which contains in it self other manifold Affections, and very different in themselves: of which it is worthy to be observed, that as many Diseases, belonging to the Brain and nervous Stock, which exist very often alone and of themselves, come also upon the Scurvy; yet as to their formal reasons and as to the method, to be observed in the curing of these or those, a very great difference occurs. But when a Palsie, Vertigo, Convulsion, Lethargy, and other Diseases of that kind happen of themselves, they always depend upon a more fixed cause, and very much on some notable fault of the Head and nervous Appendix; and as Cephalick remedies and appropiate to those Diseases only, are convenient, yet the success does not easily nor alwais answer to their Wishes. In the mean time either little care is taken for the Emendation of the Blood, or if it be, for the most part it is in vain: But when these affections are brought in by the Scurvy, there is less danger, and although they have oftner fits, yet they more easily pass away; but the cure of the Disease is performed more happily by Antiscorbutick Remedies than by Specificks and by reduction of the Blood to a due *Crasis* or Complexion, rather than by administring any thing to the evils of the Brain and nervous Stock. The same observation is to be had in Tumors, Ulcers, the Dropsie and many other Distempers brought in by the Scorbutick infection, which otherways when excited by themselves, are healed only with antiscorbutick Remedies. The reason of which is, that in the Scurvy, the conjunct cause of the Symptoms and of very many Affections, consists for the most part only in the humors, to wit, in the Blood and nervous Juice, and not in the solid parts, *viz.* the *Viscera*, *Præcordia* and Brain, wherefore when their Dyscrasies or evil dispositions may be more easily mended, then the evil formations of the other Diseases of this kind, are more certainly and easilier or with less trouble cured, when excited by reason of the Scurvy than when they come to themselves. But when the Disease is more deeply rooted, and that the principle solid parts are hurt, (as it many times happens) *viz.* when the recrements of the Blood and nervous Juice, being impacted for a long time in them hurt their Tone, stuff their Pores and Passages, and bring forth in them Scirrhous Tumours, very often, or Ulcers; the aforesaid Symptoms, although imputed only to the Scorbutick Taint, seldom or never admit of a Cure, and by reason of this invincible Cause, at last the Scurvy it self becomes desperate and deplorable.

How the Diseases differ being excited by themselves, and brought on by the Scurvy.

CHAP. VI.

CHAP. VI.

The Prognoſticks of the Scurvy.

The Prognoſis in the Scurvy ought not to be without conſideration.

WHen in the ſcorbutick affection very many and ſometimes very cruel and horrid ſymptoms together are wont to oppreſs, there is expected a *prognoſis* from the Phyſician: Yea he himſelf, that he may the better inſtitute the method of Curing, carefully weighs what may be the future event of the Diſeaſe: Notwithſtanding Judgments in this caſe ought to be cautious, a long while ſuſpended and not too raſh, for very many (as have fallen under our obſervation) eſteemed deſperate, have grown well. I have knows ſome whom a a frequent and horrid *Aſthma* had already ſeemed to have choaked, others continually dying with frequent ſwooning, and alſo others troubled either with the Palſie, or convulſive Paroxyſms, or with a moſt grievous Colick, to be wholly freed in a ſhort ſpace by the help of Medicines. I have again known ſome ſcorbuticks ſwelled with the Dropſie through their whole Body, others reduced by an Atrophy to an extreme leanneſs, at laſt reſtored to perfect health. Therefore although thoſe labouring with this Diſeaſe, are ſometimes urged with affections highly dangerous, yet if the *Viſcera* be ſtill indifferently whole or at leaſt not much vitiated, we ought not to deſpair of thoſe evils; excited through the mere taint of the Scurvy. But on the contrary, when ſymptoms leſs terrible appear, if the Contents of the *Hypochondria* and *Abdomen* become hard and as it were ſchirrous, or if the Lungs begin to be corrupted; there is no great matter or benefit to be promiſed as to the cure of the Diſeaſe: But in caſes not deſperate, where a hope of recovering health is left, or at leaſt the fear of ſudden death is far off, if perchance the queſtion be asked how ſoon or how long, how eaſily or difficultly the Cure may ſucceed, let the anſwer depend on theſe ſorts of judgments.

1. The Scurvy as it does not ſtrait kill thoſe affected with it, or precipitate them into an incurable ſtate, ſo neither is it ſoon or eaſily cured: For the chief cauſe of the Diſeaſe conſiſting in the dyſcraſie of the Blood, is not eaſier to be taken away, than Wines to be reſtored to their due complexion when they are made fretted or ropy: Wherefore thoſe corrupted with this taint, endure its hurt for many months, and ſometimes years, yea ſometimes through their whole life.

2. This Sickneſs depending on the ſulphureous-ſaline intemperateneſs of the Blood, or like to the mere hot fretted Wine, is more hardly cured; than if the ſame proceeded from the ſaline-ſulphureous dyſcraſie, or leſs aduſt like to ropy wine: For this evil conſtitution of the Blood or Wine, may be after a ſort brought again to the condition from whence it fell, but that is wont not eaſily to be reduced into the ſtate which it departed from.

3. The Scurvy coming upon long Fevers and other Chronical Diſeaſes, is cured, or coming upon an originally, or for ſome other occaſions, ſickly conſtitution, is eſteemed of a more difficult cure, becauſe indeed in theſe caſes both the *Craſis* of the Blood is more vitiated, and not ſeldom alſo ſome hurt is affixed to the *Viſcera*. Next to theſe they are hardly cured, who by reaſon of an evil manner of living, and chiefly by the aſſiduous drinking of the more generous Liquors, have contracted this taint with hurting the tone of the Ventricle and other *Viſcera*: But thoſe who are become ſcorbuticks by reaſon of Contagion, the unhealthfulneſs of the Air, going to Sea, or a ſedentary Life, are more often and with leſs trouble reſtored to health.

4. This Diſeaſe being yet freſh, ſo long as the taint being included only in the bloody Maſs, is not yet impreſſed on the Brain and nervous ſtock, nor hath excited durable ſymptoms in the ſolid parts, often admits of a perfect Cure: But if the affection being more deeply rooted, is propagated into the animal Kingdom, and there produces ſpaſmodick and dolorifick paſſions, and that its poyſon hath ſpread it ſelf more largely by the eruption of ſpots and breakings forth, and by the eroſion or eating away of the Gums and Teeth, and by other pathognomick ſigns, it is

ſcarce ever wholly extirpated; but the chief buſineſs of Medicine is employed in giving help to the Symptoms moſt grievouſly urging, and in ſuppreſſing their encreaſe and extremities.

5. Thoſe who labour with an inveterate Scurvy, refuſe to live moderately, but indulge their ſickly appetite, readily deſiring what is nought: And beſides they are very moroſe and difficult to take Remedies, ſo that they very often delude the labour of the Phyſician, that in truth it is better to leave them to their evil *genius*, than to defame profitable Medicines preſcribed in this caſe altogether in vain.

6. Becauſe this affection growing grievous, the morbifick matter is manifold and of divers ſorts, ſo that the cauſe of the Symptoms of a various kind and nature, is engendred; therefore Remedies not only of one kind are adminiſtred, but when a certain method of Medicine, though preſcribed with the beſt judgment, profits little or nothing in the Cure, the ſick are not preſently to be left off, but other medicaments and then others are to be tryed: For indeed the ſame things are not convenient to all, nor always to the ſame perſon. In the ſick Body the powers and combinations of Salts and Sulphurs every where vary, ſo alſo Medicines not helping ſhould be as often changed, till ſomething congruous and helpful be light upon.

7. If that notwithſtanding or by the uſe of Remedies not rightly adminiſtred, the Scurvy by degrees growing grievous, is carried daily into a worſe condition, at length it induces a Dropſie or Conſumption, the next paſſage then is to Death, either from this or that Diſeaſe: For after that the Blood is very much depraved, it pours forth its recrements, being more plentifully heaped up either on the Lungs, or in the *Viſcera* of the lower Belly; and ſo cauſes an affection of this or that kind equally mortal.

CHAP. VII.

Of the Cure of the Scurvy.

AS to what reſpects the Cure of the Scurvy, for that it is not one ſimple preternatural affection, but a whole Legion that is to be put to flight; therefore the method of Curing ought to comprehend manifold indications, and thoſe variouſly complicated and ſubordinate, which after the ordinary mode may be referred to theſe three heads: to wit, that they be preſervatory which reſpect and take away the cauſe of the Diſeaſe, and curatory which reſpect and take away the Diſeaſe it ſelf and its ſymptoms, and laſtly vital, which may defend or reſtore the power and ſtrength of the Patient.

The Indication three-fold.

1 *Preſervative.* At the very beginning of the Cure we ought to aim at the cauſe of the Diſeaſe, for this like the Root being cut off or pulled away, preſently the Trunk, Branches, and Fruit wither: Therefore as we have ſhown the cauſe of the Scurvy to be found ed in the dyſcraſie of the Blood, *viz.* being either ſulphureouſly-ſalt or ſaltiſhly-ſulphureous; the firſt work muſt be that it may be mended and made better, both of this or of that ſort or nature. To this end in the firſt place impediments are to be taken away, then the primary intention it ſelf is to be performed; for either ſcope or purpoſe Remedies are required, from Diet, Chirurgery, and Medicine: As to Diet, there ſhall be ſhewn hereafter a ſpecial method of living, in the mean time we will proceed to the reſt.

The Reduction of the Blood to its due *Craſis* by appropriate Remedies, is chiefly hindred by theſe two ways, *viz.* In the firſt place, becauſe a proviſion of vitious nutritious Juice is continually inferred by it: Then Secondly, becauſe the Recrements brought into its boſom are not ſufficiently ſent away through convenient ſinks: Therefore care muſt be taken that the buſineſs of the Chyle may be rightly performed in the firſt paſſages, both that the vaporous Recrements may be ſufficiently purg-

ed

ed forth by Sweat, the ſerous by the Reins and Lymphæducts, the bilous by the galliſh *Cyſtis*, the melancholy by the Spleen, and all the others of every kind by their proper emunctories; then theſe offices being rightly inſtituted we muſt endeavour to reduce by ſpecifick Medicines, and chiefly thoſe endued with a volatile Salt, the dyſcraſie of the Blood: Remedies reſpecting every one of theſe intentions, ought to be uſed and adminiſtred together, but by what means and by what manner of adminiſtrations, ſhall be yet more particularly deſigned.

The Therapeutick Intentions.

1. That the Chyle may be perfectly concocted in the firſt paſſages, care muſt be taken that the load of excrementitious matter heaped up in them may be exterminated, that the ferment being loſt or depraved may be reſtored, that the paſſages and pores any ways ſtuft and obſtructed may be opened: To theſe ends, Cathartick, Digeſtive, and opening Medicines are deſtinated.

2. The Excrements gathered together in the bloody Maſs, when they are not ſufficiently ſent away by their proper emunctories, may be drawn forth by other convenient ways: For this purpoſe alſo Catharticks or Purgers, and beſides Diaphoreticks and Diureticks, or Medicines that evacuate by Sweat and Urine, are convenient.

3. The ſcorbutick dyſcraſie of the Blood ſhould be mended by Phlebotomy and ſpecifick Remedies: Wherefore that the whole buſineſs of the preſervatory indication may be reduced to one point, the Remedies which perform its chief intentions are Catharticks, Blood-letting, Digeſtives, opening Medicines, Diaphoreticks, Diureticks, and Anti-ſcorbuticks or Specificks. Then, for that indeed Digeſtive and opening Medicines are imbued, either of them with acid, biting, or ſaline Particles, they more often overcome; beſides, for that Medicines of this ſort move conveniently enough by Sweat or by Urine, therefore the Curatory proviſion requiſite to the aforeſaid intentions, may be yet reduced to ſtraiter limits; to wit, that it may almoſt only conſiſt in Cathartick, Digeſtive, and Anti-ſcorbutick Medicines, to which Phlebotomy may be added as occaſion ſerves: It now is my part to deſign ſome forms and preſcripts of them, and alſo the manner of uſing them.

Purging.

Purging.

1. The method preſcribed for the Curing almoſt of all ſcorbutical perſons, begins with Purging Medicines; for unleſs the firſt paſſages are made clean, Medicines deſigned for any other uſe are infected by their filths: Wherefore Vomiting ſometimes is no leſs convenient than Purging.

By Vomit.

If the Ventricle (as it is often wont to be) is grieved with a viſcid, ſouring, and unſavory matter, and endeavours to caſt out the impure Load, by a nauſeating and ſtriving to vomit, and if the Patient is wont to bear ſuch an evacuation ſtrongly enough and with eaſe, there is no hindrance, ſo that their ſtrength be not too much decayed, but that an emetick Medicine may be adminiſtred: For the more ſtrong, let them take an infuſion of *Crocus Metallorum* or *Mercurius Vitæ*, or the *tartarous Emetick* of *Mynſichtus*, or *Glauber's Sulphur* of *Antimony*: Thoſe who are of a more thin and weak Conſtitution, let them take *Wine* of *Squills*, or the *Gilla* of *Theophraſtus*: Let thoſe who take but a ſmall doſe, drink after it good ſtore of Poſſet drink, till the Ventricle being full to nauſeouſneſs, Vomiting may be the more eaſily provoked, by ones Finger or a Feather thruſt down the Throat, which may be reiterated as often as they pleaſe. By this way of Vomiting the mere Contents of the Stomach being wiped from its foldings are ſent forth; neither are there ſtirred up in any other of the *Viſcera* about it, or in the Membranes (as it is wont to happen from Stybiates or Antimonial Emeticks) painful haulings or Convulſive, with ſwooning or fainting away. To thoſe whoſe Ventricle, by reaſon of evil digeſtion, eaſily gathers together a load of Phlegm or other degenerous matter, I have preſcribed (and often with good ſucceſs) ſuch a Vomiting once a Month, which they have found ſafe and wholeſome.

By Stool.

Where there is no need of Vomiting begin by a Purge, at leaſt let there be ſome days between this and the other evacuation if this follows. I judge what in times paſt has been inculcated by Authors, concerning the preparation of the humours, to be either needleſs, or the circulation of the Blood not underſtood, to be altogether

gether erroneous: But in the place of that intention are ſubſtituted things reſtoring the Ferment of the *Viſcera*, and things altering the *Craſis* of the Blood: In the mean time, that the filth of the firſt Paſſages and the recrementitious ſuperfluities both of the Blood and alſo of the nervous Liquor may be ſent forth; in the firſt place a light and gentle Purge is ordered and afterwards once a week it may be either oftner or ſeldomer repeated according to the ſtrength of the Patient, and the ſtrength of the Medicine may be proportionated according to the ſucceſs of the firſt Doſe. To this end Pills, Potions, Apozems, Electuaries, Pouders, and many other forms of Medicines are wont to be preſcribed.

Remedies made known in a more hot Scurvy. If the Conſtitution of the ſick be more hot, and that the Scurvy ſeems to be founded in an aduſt Dyſcraſie of the Blood, *viz.* a Sulphureous-Saline, all Aloetick, and Diagrydiat Purges are to be ſhunned, and only the more temperate made out of Senna, Rhubarb, and others which do not too much agitate the Blood and Humors, are to be adminiſtred.

Pills. Take of the leaves of Senna ℥j, of Rhubarb ʒvj, of Epithymum ʒiij, Roots of Polypodium of the Oak, of Engliſh or Monks Rhubarb dryed, of each ℥ß, of yellow Sanders ʒij, of Celtick Spike ʒß, of the Salt of Wormwood ʒij, being cut and bruiſed, let them be digeſted in a Glaſs, in hot Sand, with white Wine and Fumitory Water, of each a Pint (or a Quart of our Magiſterial antiſcorbutick Water) for two days, the Colature being clear, let it be evaporated in the gentle heat of a Bath, to the conſiſtence of Hony, then add to it of the Pouder of the leaves of Senna, and of Rhubarb, of each ʒj, of the Cream of Tartar ʒiß, make a Maſs for Pills. The Doſe from ʒß to ʒj.

Syrup. Or prepare the ſame infuſion, which being evaporated by a gentle heat, to the conſiſtency of a Syrup, by adding at the end, of clenſed Manna and white Sugar, of each ℥ij, make a Syrup. The Doſe from j to ij ſpoonfuls in a convenient Vehicle.

Tincture. Or of the Tincture of the ſame may be given ℥iiij or vj for a Doſe, by adding of the Cream of Tartar ʒß, and if there be need of Sweating, of the Syrup of Pippins ʒiij.

Of Raiſins. Or put to the præſcribed Tincture of Corinthian Grapes cleanſed ℥vj, let them be digeſted hot till the Grapes Swell, which being taken forth, evaporate the Liquor to the Conſiſtencie of a Syrup, adding to it of Sugar and cleanſed manna, of each ʒiß, then the Grapes being laſtly put into it, let the Medicine be kept in a glaſs Veſſel, cloſe ſtopped. The Doſe from one ſpoonful to two.

Electuary. Or add to the aforeſaid Tincture, being evaporated to the half part, of freſh Caſſia, and of the Pulp of Tamarinds, extracted with antiſcorbutick Water, of each ℥iij, of the Conſerves of Violets, of Damask Roſes each ℥ij, of the Pouder of Senna, of the greater Compoſition ʒj, of the Pouder of Rhubarb ℥ß, of Cream of Tartar, of the Species of Diatrion Santalon, each ʒij, let them be bruſed together in a Stone Morter, till they are reduced to the form of an Electuary. The Doſe about the bigneſs of a Walnut more or leſs, according to the ſucceſs of the Operation.

Pouder. For thoſe whoſe Stomachs being full of loathing and will not admit of the Medicines, but in a ſmall quantity and elegant form: Take of the Reſine of Scammony *gr.* iiij to viij, of the Cream of Tartar ℈ß, of Celtick Spike *gr.* vj, mingle them and make a Pouder, let it be given in a ſpoonful of Gruel, or in the form of Pills.

Purges in a more cold Scurvy. Thoſe who labour with the ſcorbutick Indiſpoſition, and are of a more frigid and cold conſtitution, and where the Diſeaſe ſeems to be founded in a Nitro-Sulphureous diſpoſition of the Blood, like to ropy Wine, are to have adminiſtred to them more ſharp Catharticks endued with more hot Particles.

Pills. Take of Stomach Pills with the Gumms ʒij of the Reſine of Jalap *gr.* 20, Vitriolat Tartar *gr.* 16, Oyl of Juniper ℈ß, with as much as will ſuffice of Ammoniacum, ſoluted in the Water of Earth-worms, make Pills 16, take 4 at a time once in 7 days.

Take of Pilulæ Tartar of *Bontius* ʒiß, of the reſine of Jalap *gr.* 12, of the ſalt of Tartar ℈ß, with what will ſuffice of Auguſtan Syrup, make Pills. 12.

Extract and Syrup. Take of the Extract of Pil. Ruffi ʒj, of the Extract of black Hellebore ℈j, of the Salt of Tartar ʒß, with what will ſuffice of Ammoniack ſolute, make 9 Pills to be taken, 3 for a doſe.

Take

Take of the Leaves of Senna ℥j, of Rhubarb ʒvj, of Mechoachan, Turbith: with Gums, of each ℥ß, of the Strings of Hellebore black ʒiij, of the Salt of Tartar ℥ij, of yellow Sanders ʒiß, of Winteran Bark ʒij, being ſliced and bruſed let them be digeſted in a Quart of Whitewine for two days, let it be ſtrained without preſſing it, and take of it by it ſelf, from ℥v to ℥vi, either in the extract or reduced to a Syrup, or electuary as the Tincture above deſcribed, but adding of as much as will ſuffice of the Pouder of Arthritice, or of Diaſena.

Or, there is prepared a Tincture of t[illegible]ſort, which may be given to ſtrong men, from half a Spoonful to a Spoonful. Take of Salt of Tartar ℥j, of the ſmaller Spirits of Wine ℔iß, let them digeſt till it becomes Yellow: to this being poured off from its Fæces, put of the Leaves of black Hellebore macerated in Vinegar ℥j, of yellow Sanders ʒj, the yellow part of Orange ʒiß, let them digeſt being cloſe ſhut up and warm for 3 days. The matter being Strained clear, let it be diſtilled in Balneo to the half part, the remaining Liquor keep for Uſe. *Tinctura.*

Take of ſharp-pointed Docks, of Polypodium of the Oak, ſtinking Nettles, and of Chervil, of each ʒvj, of the Leaves of Eupatorium and Betony, each j handful, of White Sanders and of Yellow, each ʒjß, wild or baſtard Safforn ℥j, of the Tartar of White-Wine ℥ß, boyl them in three Pints of Spring Water, or ℔ijß, till half is conſumed, add to it of Rheniſh-Wine ℔j, and preſently let it be ſtrained, to which put of the beſt Senna ℥ß, the Yellow Rind of the Orange ʒij Rhubarb ʒvj, of the Leaves of Black Hellebore ℥ß, infuſe them being warm and cloſe ſhut for 12 Hours, being ſtrained, let it be kept in a Glaſs cloſe ſtopped. The Doſe is ʒv to vj. *Apozim.*

We might here add many other forms of Purges, but there is no great need of variety in theſe: of the aforeſaid, either theſe or thoſe which ſhall be thought moſt convenient, let them be adminiſtred, and every 5 or 6 days as occaſion ſhall require iterated. Too often and violent purging, deſtroys the ſtrength and very much waſts the force of the *Viſcera*, and in the mean time takes not away the Diſeaſe.

After a Purge or two, if there be any need of taking away Blood, let it be done either by Phlebotomy in the Arms, or by Leeches in the Veins of the Fundament. It is not much matter whith Vein is Cut: nor is there ſo much benefit in the opening the Salvatella, as hath been commonly thought. The great do among Authors, who were ignorant of the Circulation of the Blood, about opening the Cephalick, or the Liver Vein, or any other chiefly in the Scurvy comes to nothing. Phlebotomie is indicated by the plentifulneſs and Vitiouſneſs of the Blood, which rather ought to be performed by taking away a ſmall quantity often, than a great deal all at once: For when the bloody Liquor becomes very impure, it is not more certainly mended by any kind of Remedies, than by letting it forth often and ſparingly. For as often as the old corrupted Blood is let forth, freſh, better and more pure ſucceeds. In the mean time there is neeed of Caution, leſt too great quantity be taken away at once, for its ſtock being diminiſhed together, Sanguification grows weak, and for that reaſon a Dropſy, or a Cachexia, or evil diſpoſition of the whole Body follows. *Phlebotomy.*

After Purging, and (if need be) Phlebotomy, many other kinds of Remedies, no leſs neceſſary, are required in the Scurvie: In the præſcribing of which in order, we ought preſently to conſider whether the Indications being only Præſervatory they may have place here, or ought not to be deferred to thoſe which are contrary, to wit, thoſe which reſpect the more grievous Symptoms: But if you endeavour the whole buſineſs of the Cure againſt the cauſe of this Diſeaſe, proceed according to the following method: It ſhall be ſhown hereafter what ſort of Cure is to be adminiſtred, (if perchance occaſion requires) to the Symptoms.

Therefore if the buſineſs of Medicine be chiefly deſigned againſt the cauſe of the Scurvy, and that it may be firſt eradicated by it ſelf for this end, as we ſhewed but now, there are moreover to be made uſe of at all times except on the days of purgation, Digeſtive and Specifick, or antiſcorbutick Remedies: to which ſometimes if need be, may be added Diaphoreticks, or Diureticks, or Medicines operating by Sweat or Urine. The forms of Medicines, for the performing theſe kind of Intentions, and manifold Præſcriptions, and of various kinds, are every where extant among Authors. It pleaſes me however, to place here ſome of the more

more ſelect, which I think good to diſtinguiſh into two Claſſes, according to the twofold nature of the Scurvy, to wit, the ſulphureous Saline, and Saline Sulphureous. And in the firſt place we will deliver what is convenient in the latter Diſtemper, to wit, where there is need of Medicines, indued with a certain Incitation, and very much filled with a volatile Salt.

Digeſtives. Digeſtive Remedies, which reſtore the Ferment of the Ventricle, and help its Function, and alſo of the other *Viſcera* ſerving to the Chyle; and Antiſcorbutick or Specifick, which take away the Dyſcraſie of the Blood, are either joyned in the ſame Compoſition, or at leaſt they are to be taken ſucceſſively the ſame day.

Among the Digeſtive Medicines, are deſervedly ranked, Creme of Tartar, Cryſtal Salt, and Tincture of Cryſtal, Vitriolate and Chalybeate Tartar, Elixir *Proprietatis*, ſimple Mixture: The uſe of every one of theſe given twice a day, does oftentimes prove beneficial.

Beſides you may eaſily make with the two following *Menſtruums* magiſterial Tinctures and Elixirs of divers kinds and digeſtives, appropriate to the Scurvy.

Take of the Spirit of Vitriol rectified ℥vj, of the Spirit of Wine Alcholiſated ℥xvj, mix them and diſtil them in a Glaſs Retort, with three Cohobations: Keep it for uſe in a Glaſs very well ſtopped. The Elixir *Proprietatis*, is better and more eaſily prepared with this compounded *Menſtruum*, than the ordinary way.

Take of Winteran Bark, of *Lignum* Aloes, of the Roots of the leſſer Galangal, each ℥ij, of Cinamon, Cloves, Cubebs each ℥j, *Ameos* or Biſhops Weed and Naſturtium Seeds, each ℥ß, being bruiſed, pour on them the aforeſaid *Menſtruum* till it be 3 Fingers breadth above them, let them digeſt in a Veſſel, in a Sand Furnace for 6 days. Strain it and keep in a Glaſs cloſe ſtopped. The doſe 20 drops, more or leſs in a ſpoonful of Canary Wine or proper Water. Let it be given twice a day.

Take of the whiteſt Amber, of Gumm, Hedera, Caranna, Tacamahaca, each ℥j, of Saffron ℥ß, of Cloves, Nutmeggs, each ℈ij, bruiſe them and pour on them the aforeſaid *Menſtruum*, and as before draw forth a Tincture. The doſe 20 drops as before.

Take of the Salt of blew Tartar ℥iiij, let them digeſt with ℔j of the Spirit of Alcholiſate Wine to the Extraction of the Tincture. This is the other *Menſtruum*, whereby you may prepare Elixirs out of Gumms, Spices, *&c.* after the ſame manner as with the former *Menſtruum*.

Specifick's or Antiſcorbuticks. Whilſt theſe ſorts of Remedies are adminiſtred in a ſmall doſe morning and evening, or firſt and laſt at Medicinal Hours, to wit, before eight in the morning, and four in the after-noon: other kind of antiſcorbutick Medicines are to be taken, which for the moſt part we are wont to præſcribe in a double form, to wit, ſolid and liquid to be taken together, ſo that the ſolid being firſt taken the other may be drunk after it: Of either there are very many Species and ways of Compoſition extant: *viz.* in the ſolid form, Electuaries, Confections, Pouders, Pills, Tablets or Lozenges: In the liquid are Decoctions, Infuſions, Expreſſions, diſtilled Waters, and medicated Wines and Ale. Of every one of theſe kinds we will propoſe ſome more ſelect Medicines.

Electuaries.

Take of the Conſerves of the Leaves of Scurvy-graſs, of Roman Wormwood, of Fumitory, of each ℥ij, of the Pouder of Winteran Bark, of the Roots of Angelica, Aron, each ℥ij, of the Species of Diatrion Santalon ℥jß, of the Pouder of Crabs Eyes ℥j, of the Salt of Wormwood ℥ij, with what will ſuffice of the Syrup of Citron Peels, make an Electuary.

Take of the Leaves of Scurvy-graſs, Conſerve of Brook-lime, made with an equal part of Sugar, of each ℥iij, of the Troches of Capers and of Rhubarb, each ℥ij, of the Salt of Wormwood and of Scurvy-graſs, of each ℥j, of the Pouder of Ivory and Coral calcined, of each ℥j, make it up into an Electuary with as much of the Syrup of the Juice of Scurvy-graſs as will ſuffice.

I was wont to præſcribe Conſerves of the exterior Bark of Limons and Oranges, alſo of the Purple Flowers of the Aſh-tre, of the Leaves and Flowers of Cardamine, of the Roots of Sharp pointed Docks, and Engliſh Rhubarb prepared with an

an equal part of Sugar, which of themſelves or mixed with other Conſerves and *ſpecies* of the ſame kind are made into an Electuary.

Take of the Conſerves of the yellow part of Oranges and Limons, of the flowers of the Aſh Tree, of each ℥ij, of the powder of the Roots of *Contrayerva* ʒj, of the leſſer Galangal ʒß, of the Roots of Aron ʒij, of the *Species Aromatic. roſat.* ʒj, of the ſalt of Wormwood ʒij, with as much of the Syrup of Candied Nutmegs, as will ſuffice to make it up into an Electuary. The doſe of theſe kind of Medicines is the quantity of a Nutmeg, drinking after it ſome proper Liquor.

For Country people and the poorer ſort, for whom leſs dear and more eaſily to be prepared Medicines are required, I preſcribe after this manner. Take of the leaves of Scurvygraſs and Brooklime, of each ℥iiij, of the whiteſt Sugar ℥viij, let them be well beaten in a Mortar together, adding of Winteran Bark powder ℥ß, of Tartar calcined with Nitre ʒiij, with as much Spaniſh Wine as will ſuffice, let it be made up into an Electuary. The doſe about the quantity of a Walnut twice in a day, drinking an appropriate Liquor after it.

Take of the leaves of Scurvygraſs ℔j, of Raiſins of the Sun ſtoned, of white Sugar, each ℔ß, the boylings of wild Radiſhes ℥ij: Let them be beaten together in a Mortar, and reduced to the form of an Electuary. The doſe is about the quantity of a Walnut twice or thrice in a day.

Confections.

Take of Aron compound ℥j, of the pouder of Winteran Bark ℥ß, of the *Species* of *Diatrion Santalon*, of the Troches of Capers, each ʒij, of the ſalt of Wormwood and of Scurvygraſs, each ʒjß, of the rinds of Candied Oranges ℥iij: Let them be bruiſed in a Mortar together, then add of white Sugar diſſolved, in as much as will ſuffice of the water of Earth Worms ℥iij, and ſo make it up into a Confection.

Take of the Roots of *Eryngo* and *Scorzonere* candied, of each ʒij, of Walnuts and *Myrobalans* candied, each *N°.* ij, of electuary of *Saſſaphras* ʒvj, of the pouder of Cubebs and Cardamums each ʒij, of the pouder of the Roots of Zedoary, and of Angelica, each ʒjß, of the ſalt of Wormwood ʒij, with as much Syrup of candied Walnuts as will ſuffice: Make a Confection.

Take of the pouder of *China* Roots, of Saſſaphras wood, each ℥ß, of yellow and white Saunders each ʒij, of the ſeeds of Rocket, Cubebs, *Naſturtium*, grains of Paradiſe, of each ʒiß, of the *Species Dialacca*, Cinnamon, Orris, the leſſer Galangal, each ʒj, of the ſalt of Wormwood ʒij, of the Conſerves of the yellow of Oranges, and of Sugar *antboſat.* ℥iij, diſſolved in as much water of Snails as will ſuffice, and as before make a Confection: The doſe as much as a Nutmeg twice a day, drinking after it ſome appropriate Liquor.

In ſome caſes of the Scurvy, where there is need of the uſe of Steel, or of Steel prepared with Sulphur, add of it ℥iij, or of Vitriol of Steel ʒij, to any of the preſcriptions of the Confections or Electuaries, and after the taking of the Medicine once or twice a day, exerciſe the Body according to its ſtrength. *Chalybeat Medicines.*

Pouders.

Take of the pouder of Aron compounded ℥jß, of Winteran Bark ℥ß, of Cubebs, the grains of Paradiſe and of Cardamums, each ʒij, of the ſalt of Wormwood ʒiij, of the Orange Tablets ʒiij, make a Pouder: The doſe ʒj in a proper Liquor.

To the aforeſaid Pouder add of the Nuts of the Indian Fruit *Cacao* ℔ß, let it be brought into a Maſs or Paſte in a warm Mortar, the doſe ʒij: Let it be taken after the ſame manner as Chocolate, *viz.* boyled in Spring water with either Roſemary flowers or Betony, or with the Roots of *Scorzonere*, or alſo with the ſhavings of Ivory or Hartſhorn.

Pills.

Pills.

For those who had rather have the Medicine in a lesser dose, and form of Pills; take of the Roots of Virginian Snakeweed, *Contrayerva*, each ʒij, of Winteran bark, seeds of Rocket and of Cubebs, each ʒiij, of the salt of Wormwood and of Scurvygrass each ʒjß, of the extract or the rob of Juniper ʒß, and with a sufficient quantity of the Syrup of preserved Nutmegs, make a Mass: Dose 4 Pills a day, drinking after them some proper Liquor.

Tablets or Lozenges.

For the more delicate Tablets or Troches are prescribed after this manner: Take of the pouder of Winteran Bark, of the eyes of Crabs, each ʒiß, of the pouder of Pearls ʒß, of the finest Sugar ℥vj, dissolved in as much water of Earthworms as will suffice, and boyled up to the height of Tablets: Add of the Spirits of Scurvygrass ʒij, of which make Lozenges or Tablets, each weighing ʒß, take about ʒj twice a day, drinking an appropriate Liquor after it.

The Orange Tablets sold in the Apothecaries Shops in Oxford.

TAke of the Rinds of Oranges, Limons, and Citrons preserved, of each ℥j, of preserved *Eringo* Root ʒß, of Pine Nuts and Pistaches each 20, of sweet Almonds blanched number 10, of the pouder of Anniseeds ʒß, candied Ginger ʒij, *Species* of *Aromatic. Rosat.* and of Nutmeg each ʒj, of the Roots of Galanga ʒj, ten Cloves, of Amber grise *gr.* iiij, of Musk and Civet of each ij grains, of the whitest Sugar ℔iß dissolved in Rose water, and boyled up to a Tablet: Of which make Troches or Lozenges as before.

Liquid Medicines.

So much for Medicines in a solid form or more thick substance, that are wont to be given to scorbutical persons: That the virtue of which might be the better and with the greater benefit, carried into the mass of Blood, for the most part liquids are prescribed to be drunk after them: Although great variety of them and divers ways of compounding them are extant, yet the chiefest and most usual are those we mentioned above, and shall now subjoyn the forms of each of them.

1. *Decoctions.*

Although Decoctions are the most familiar kind of liquid Medicines, yet more rarely made use of in the Scurvy, because the simples which are chiefly beneficial to this Disease, as Scurvygrass, Brooklime, *&c.* lose their virtues received from the volatile Salt by boyling; yet because Remedies by this means are easily and suddenly prepared, they ought to be admitted sometimes, for that it has been found by experience, that they have some efficacy. For Country and poor People, an easie Medicine by this preparation is commended by many Authors. Take of the leaves of *Nasturtium Aquaticum* or water Cresses iij handfuls, of the lesser Sorrel *m* ij, being bruised let them be macerated or steeped in six pints of Milk, and then boyled till the third part be consumed: Take of it from 6 to 8 ounces twice a day. A Decoction of Wormwood is praised hy *Eugalenus* and others, the following Remedy I have often tryed with good success. Take of the tops of Broom *m* iij, cut small and boyled in 3 pints of strong Ale till half be consumed; let it be taken from ij to iij ounces twice in a day.

2. *Infusions*

2. *Infusions.*

An Infusion being added to the Decoction, makes a most profitable Medicine. Take of the Roots of *Scorzonere*, of Chervil, each ℥j, of the leaves of *Eupatorium* and *Chamepitys*, each *m* ß, of burnt Hartshorn ʒij, of Raisins *m* ß, boyl them in in 3 pints of Spring water till the third part be consumed, add then of Rhenish Wine half a pint, and presently strain it into a glass vessel, to which put of the leaves of Scurvygrass and Brooklime each half a handful, of the rinds of Oranges steeped and cut small ℥ß, make an Infusion warm and close stopped for six hours, strain it and let it be kept in a close Vessel: The dose ℥vj twice in a day after a solid Medicine.

Take of Whey made with Whitewine or Cider ℔ß, boyl in this of the Roots of Burr docks and *Eringoes* steeped, of each ʒvj, of preserved Juniper Berries ℥ß, the liquor being boyled away to the third part, let it be strained into a Jugg, to which let there be put of the leaves of Scurvygrass and of Brooklime each *m* j, make an infusion warm and close stopped for 6 hours: The dose half a pint twice in a day, after a solid Medicine.

Sometimes Infusions made by themselves are of notable use. Take of the leaves of Scurvygrass *m* j, the slices of Horse-radish Roots *m* ß, Winteran Bark bruised ʒij, let them be put in a glass Vessel with Whitewine or Cider, and Scurvygrass water, each ℔j, let an Infusion be made in a Cellar for 2 or 3 days: The dose ℥vj to viij twice in a day as before.

3. *Juices and Expressions.*

'Tis also a very commendable use to take twice or thrice a day, of the Juice of antiscorbutick herbs or fruits or their expressions, by themselves or with their appropriate Liquors, for so it is presumed, the virtue of the Remedy is exhibited whole and undiminished.

Take of the leaves of Scurvygrass, of water Cresses and of Brooklime each *m* iij, being bruised let the Juice be wrung out hard, and kept in a close Vessel: The dose ℥iß to ℥iij twice in a day, in a draught of Ale, Wine, or distilled Water.

Take of the leaves of Scurvygrass *m* iiij, of Wood-sorrel *m* ij, being bruised let the Juice be pressed forth, which being put into a Glass close stopped will quickly grow clear; for the sharpness of the Wood-sorrel precipitates the thicker parts of the Scurvygrass: The same also happens if the Juice of Oranges is mingled with the Juice of Scurvygrass, the dose ℥ij or ℥iij twice in a day.

Take of the leaves of Scurvygrass *m* iiij, of Brooklime and of water Cresses each *m* ij, of long pepper ʒiij, of the shavings of Horse-radish ℥ij, all being bruised together let them be put into a glazed Vessel, with Rhenish or Spanish Wine which is best liked ℔ij, the mouth being very close shut, let it stand in a cold Cellar for two days, then let it be pressed forth strongly: The dose is ℥iij twice in a day, after a solid Medicine.

Take of the leaves of Scurvygrass *m* iij, of Brooklime and water Cresses and of Wood-sorrel, of each *m* j, being bruised pour on them of the water of Snails and of Earthworms each ℥vj, make an Expression strongly, which keep in a Glass close stopped: The dose ℥ij twice a day.

4. *Syrups.*

For the same reason as Decoctions so also Syrups are but little used in the Scurvy; for as much as the virtue of the simples chiefly efficacious, evaporates in the boyling; yet because there is need sometimes for sweetning of appropriate Liquors with such a Medicine for some; we will propose here our preparation, the strength of the ingredients being preserved as much as may be.

Therefore take of the leaves of Garden Scurvygrass *m* vj, of the rinds of 4 Oranges and two Limons cut very thin, of the slices of Horse-radish *m* ß, of long pepper poudered ʒiij, all being bruised together let the Juice be pressed forth, which being

preſently put into a cloſe ſtopped Glaſs, place in a cold Cellar till it ſettles and grows clear, then the Liquor being clear pour it off ſoftly into another glaſs, and being faſt ſhut let it be kept warm in *Balneo Mariæ:* In the mean time for every ounce, take of Sugar ℥iſs. and let all the quantity be diſſolved in as much of the water of Earthworms, and boyled up to a thickneſs, to which let the aforeſaid Liquor be poured by degrees, warm and ſtirred together with a *Spatula:* As ſoon as it is incorporated let it be taken from the fire, and being cold let it be put into a glaſs, and in this hang tyed up in a little Rag; of Cinnamon bruiſed ℥iſs, of the ſeeds of water Creſſes, and of Rocket poudered and mingled together, of each ℥j.

5. *Diſtilled Waters.*

Diſtilled Waters becauſe they are a neat and pleaſant Remedy, fill almoſt every Page among the anti-ſcorbutick preſcripts: Some diſpenſations of theſe eſteemed very profitable and fit, are in our *Pharmacopœa*; as the compound water of Radiſhes, and the magiſterial of Earthworms and of Snails. Beſides, there are extant very famous preſcriptions of theſe ſorts of Waters, delivered by *Quercetan*, *Dorncrellius*, *Sennertus*, *Doringius*, and other Authors. Moreover every Phyſician is ready to preſcribe as occaſion ſerves, ſuch like appropriate to the condition of every ſick Body; for the anti-ſcorbutick Ingredients and others added, which may reſpect particular Diſtempers being received, and being cut, ſliced, and bruiſed, are put into ſome convenient Liquor, to wit, Whitewine, Cyder, or the Whey of Milk made by either of them; then let the whole mixture be diſtilled in a Cucurbit or in a Roſe Still: We will here ſubjoyn one or two forms uſed by us.

Take of the leaves of both the Scurvygraſſes, of Brooklime, of water Creſſes, and the tops of Broom of each *m* iiij, of the leaves of Germander and *Chamepitys* or ground Pine each *m* ij, of the Roots of Horſe-radiſh ℔ß, of Aron, Angelica, *Imperatoria* or Maſter-wort each ℥iiij, the outer peels of 4 Oranges and of as many Limons, of the Roots of *Calamus aromaticus* ℥j, of Cinnamon, Cloves, each ℥ß, being bruiſed and cut pour to them of the beſt Cyder ℔viij, let them digeſt for two days in a glazed pot cloſe ſhut, then let them be diſtilled in a common Still, the firſt and laſt water being drawn off let them be mixed together.

In Winter time when green herbs are not to be had, we preſcribe after this manner: Take of the leaves of Scurvygraſs *m* iiij, the tops of Broom, Pinetree, and Juniper, of each *m* ij, the middle bark of the Elder Tree and of the Aſh Tree each ℥iii, of the Roots of Horſe-radiſh and of *polypody* of the Oak, each ℥iij, the rinds of 4 Oranges and of as many Limons, of Winteran Bark ℥iiii, being cut and bruiſed put them into 8 pints of Whitewine or Cyder, or the Whey made of either of them, and let them be diſtilled.

The ſimple water of the leaves of Aron being diſtilled in the Spring time, is an efficacious Remedy againſt the Scurvy, if it be taken to the quantity of 3 or 4 ounces twice a day with ſome other Medicine.

The ſimple water of Scurvygraſs being poured upon freſh leaves bruiſed and diſtilled, and ſo often reiterated with new cohobations, becomes an effectual Remedy: Moreover, the ſtrong Spirit of Scurvygraſs is prepared after this manner. Take of the leaves of Scurvygraſs as much as will ſuffice, being bruiſed let them be made up into Balls ſuch as thoſe of Woad which the Dyers uſe, then pour upon thoſe Balls being put into a well glazed Pot, either as much of the water of Scurvygraſs or of Wine of the ſame herb, as will cover them at leaſt 4 fingers, and let them be kept exactly ſhut for 3 or 4 days in ſome cool place, then let the whole matter, being put into an Alembeck be diſtilled: Let the diſtilled water, being put into a Cucurbit, be rectified, at firſt there goes forth the ſtrong Spirit, of which may be taken in a fit Vehicle from 15 to 20 drops.

6. *Anti-ſcorbutick Wine and Ale.*

I was wont to prepare ſimple anti-ſcorbutick Wine of excellent uſe, after this manner in the Spring or Summer time. Take of the leaves of Scurvygraſs gathered in a clear day as much as you pleaſe, being bruiſed and the Juice preſſed forth, fill a Veſſel

Veſſel of 3 or 4 Gallons with it, and putting thereto 1 or 2 ſpoonfuls of Yeaſt, let it ſtand to ferment for two days; then the Veſſel being cloſe ſhut let it be put into a Wine Cellar for 6 months, then the Liquor being clear and of colour like Spaniſh Wine, draw it forth into Bottles and keep it for uſe: It may be kept good and incorrupt for many years, the doſe ʒiij or iiij twice in a day.

Medicated Wines, of which may be taken 4, 3, or 2 ounces at medical hours daily, as alſo at Meals, are prepared after this manner: Take of Scurvygraſs leaves *m* iiij, ſhavings of wild Radiſhes ʒiiij, of Winteran Bark ʒß, of the outer rind of 4 Oranges and of as many Limons, and let them be put into a glaſs with 12 pints of Whitewine, Rheniſh, or thinner Spaniſh Wine: The Veſſel being cloſe ſhut up let it be kept in a cold place, and as often as you need, draw the Wine off clear.

It is a uſual thing to preſcribe for ſcorbutical perſons, medicated Ale or Beer to be drunk conſtantly for their ordinary drink: Let Ale or Beer be prepared as much as will fill a 4 Gallon Veſſel, and inſtead of Hops boyl therein of the tops of the Pine or the Firr-tree *m* iij, and after it hath fermented in the Veſſel, let there be put to it of the leaves of Scurvygraſs *m* ij, of the roots of ſharp pointed Docks prepared ʒiiij, the rinds of 4 Oranges, and after it hath ſtood 7 days drink of it.

Theſe ſort of medicated Ales may be prepared with other ingredients, according to the affection or temperament of the Patient, by which kind of Remedy the medicinal Particles altering the dyſcraſie of the Blood, being continually carried into its Maſs together with the Aliments, many have found much benefit in taking away the cauſe of the Scurvy. But for as much as we have ſhewn the cauſe of this, even as the *ſpecies* of the Diſeaſe to be two fold, and that hitherto the Medicines propoſed, reſpect only the ſaline-ſulphureous intemperature of the Blood: In the next place it behoves us to add ſcorbutick Medicines, which are convenient in the other, *viz.* in the ſulphureous-ſaline dyſcraſie of the Blood.

CHAP. VIII.

Of Medicines of every one of the aforeſaid Forms reſpecting the Scurvy, being excited in a more hot Conſtitution, and ſulphureous-ſaline Dyſcraſie of the Blood.

IN ſome ſcorbutical perſons, the uſing much of the aforeſaid ſharp things, as Scurvygraſs, Horſe-radiſh, Winteran Bark, and others endued very much with a volatile ſalt, hath been found hurtful: Wherefore in ſuch like caſes where the morbifick cauſe conſiſts in a more hot dyſcraſie of the Blood, like to ropy wine, temperate Medicines leſs agitating the particles of the humors, apt to grow hot of themſelves are preſcribed: Wherefore we will here add the forms in the ſame order as the former, and firſt we will begin with the ſolid Remedies.

Electuaries.

Take of Conſerves of Brooklime, Cardamines, made with an equal part of Sugar, of each ʒiij, of the *ſpecies* of *Diatrion ſantalon*, and of *Diorrodon Abbatis* each ʒj, of the pouder of Ivory ʒj, of Pearls ʒß, of the ſalt of Wormwood and of Tamariſk each ʒj, and as much as will ſuffice of the Syrup of Coral, make an Electuary.

Take of the Conſerves of wood Sorrel, and of Cynorrhodon or of Hyps each ʒiij, (or of the Conſerves of ſharp pointed Docks, and of the roots of Succory each ʒiij) of the troches of Rhubarb ʒij, of the *ſpecies* of *Diamargarit. frigid.* ʒiß, of Tamariſk Bark ʒj, of *Sal Prunellæ* ʒiß, preſerv'd *myrobalans* 2, and with what will ſuffice of the Syrup of preſerv'd *Myrobalans*, make an Electuary.

For the Poor I was wont to prescribe this more ready Medicine. Take of the Leaves of Brook-lime ℥vj, of wood Sorrel ℥ij, of white Sugar ℥viij, let them be bruised and beaten together, by adding to it of the Flower of sweet Fenil Seeds ℥ß, of the Pouder of Ivory ʒij, of *Sal Prunellæ* ʒjß, with what will suffice of the Syrup of the Juice of Brooklime, make an Electuary.

Confections.

Take of the Pouder of China Root, and of the Male Pæony, each ʒj, of white and yellow Sanders, each ʒiij, of Ivory ʒjß, of Pearls ʒß. of Crabs Eyes ʒj, of Coral being steeped in the Juice of Orenges, and ground on a Marble ʒij, of the whitest Tartar ʒjß, of white Sugar ℥vj, dissolved in as much water of *Scordium* compound as will suffice. Make a Confection.

Take of the candied Eryngo Roots, and of Scorzonere, each ℥ij, of the Pouder of Aron Compound ℥ß, of the Species of *Diatrion Santal.* ʒij, of *Sal Prunellæ* ʒj, with what will suffice of the Syrup of Cloves. Make a Confection.

Pouders.

Take of the Pouder of the Leaves of *Chamæpitys*, and of Aron Compounded, each ℥jß, of Ivory Pouder, of red Coral prepared with the Juice of Orenges, each ʒij, of the Orange Tablets ʒij, mingle them and make a Pouder, dose 1 Spoonful twice in a day.

Pills.

Take of the Species of *Diatrion Santal.* of *Diamargarit. Frigid.* each ʒij, of the Seeds of Citron and of *Carduus* bruised, each ʒjß, of the Roots of Cretian Ditany, and of the male Pæony, each ʒjß, of the Salt of Tamarisk ʒij, with what will suffice, of the Gelly of Harts Horn or Snakes Skins, make a Mass.

Tablets.

Take of *Species Diatrion Santalon*, of *Diamargarit. Frigid.* of each ʒjß, of Perls poudered, of red Coral prepared, of Pouder of Ivory, each ʒj, of Sugar ℥vj, dissolved in Water of *Scordium*, and boyled up to a Consistence, make Tablets as before.

If that with these sort of temperate Antiscorbuticks, there shall be any need of the use of Steel, let there be added to the Electuary or the Confection, or also to the Mass of Pills, of the Magisterium of Steel of *Mynsychus*, or of the extract of Steel of our preparation ʒij. In some cases of *Crocus Martis* about ʒijß or ʒiij may be added to the like Composition: But it seems better to give the Chalybeates in the Liquors to be drunk after the solid Medicines, than to put them into the aforesaid Compositions. It remains now that we prescribe the forms of the Liquors.

Decoctions.

In the Scurvy excited after a long continued Fever, these sort of Decoctions are given with benefit, which may purify the Blood and plentifully move Urine.

Take of the Roots of Chervil, Scorzonera, Sorrel, Parsely, of each ℥j, of the Leaves of Agrimony, and Harts Tongue, each mj, of Harts Horn burnt ʒij, of the Rinds of 3 Apples, of Corinthian Grapes ℥ij, of Liquoris ʒiij, let them be boyled in 4 Pints of Spring Water till the third part be consumed, add to it of *Sal Prunellæ* ʒij, or ʒiij. The dose ℥vj, twice or thrice a day.

Take of preserved Eringo Roots ℥vj, of Grass Roots ʒij, of the Leaves of Goose-

grass

graſs or Cleavers, *mij*, of Agrimony and of Liver-wort, each *mj*, of Raiſins of the Sun ℥ij, of white Sanders ʒj, of Liquoriſh ʒij, let them be boyled in 4 Pints of Spring Water, to the Conſumption of the third part. The doſe ʒvj, after a ſolid Medicine.

For Country, and the poorer ſort of People, that they might not fall into the Scurvy after a Fever, I was wont to præſcribe that they ſhould take twice a day this following draught, *viz.* Take of the Roots and Leaves of Dandelyon *mjſs*, let them be boyled in a Pint and half of Poſſet Drink till the third part be conſumed: let it be ſtrained and ſerve for two doſes.

Or Take of the Roots of Dandilyon *mſs*, of Citron, and *Carduus* Seeds, each ʒj, let them be boyled in a Pint and a half of Poſſet Drink made of Apples or Cyder, till the third part be conſumed.

Infuſions.

The Apozems but now preſcribed become more powerful againſt the Scurvy, if being prepared without Liquoris, they be ſtrained into a Jugg, into which let there be put of the Leaves of Brook-lime and of water Creſſes or Cardamines, each *mj*, then make an Infuſion warm, and cloſe ſhut for 6 Hours. The Liquor at laſt being ſtrained, let it be kept in cloſe Veſſels. The doſe ʒvj twice or thrice in a day. Alſo make an Infuſion of Whey boyled with the Roots of Dandelyon, or the Leaves of Fumitory ſtrained into a Veſſel with one handful of the Leaves of Brook-lime, and as much of Celandine the leſſer.

Chalybeate Infuſions are wont to be of frequent Uſe, to wit, of the Salt of Steel, or of the Magiſtery or Extract put into ſome Decoction or diſtilled Water; but as the natural Water or Spaws, ſo alſo the Artificial, of our preparation of Steel diſſolved in Spring Water, and impregnated with the Infuſion of Antiſcorbuticks, hath been drunk with very notable Benefit.

Juices and Expreſſions.

Take of the Leaves of Brook-lime, of water Creſſes, each *miiij*, of wood Sorrel *mij*, being bruiſed let the Juice be wrung forth, and let it purify in a Glaſs cloſe ſhut, which it will ſoon do. The doſe is ʒjſs, to 7 Ounces in a convenient Vehicle.

Take of the Leaves of Brooklime *miiij*, of the Branches or ſtrings of Engliſh Rhubarb *mij*, being bruiſed let the Juice be preſſed forth.

Take of the Leaves of Brooklime, of Creſſes, of Cardamines, of the leſſer Celandine, of wood Sorrel, each *mij*, being bruiſed let the Juice be preſſed forth, add to it a fourth part of the Juice of Oranges: Let it be kept in a Glaſs.

Syrups.

As often as there is any need of Syrup for any other Compoſition, we make uſe of either the Compound Syrup of the Juice of wood Sorrel, or of Fumitory, or of Coral; or alſo a Magiſtral of the Juice of Brooklime may be prepared after the ſame manner, as we before preſcribed concerning the Juice of Scurvy-graſs.

Diſtilled Waters.

Diſtilled Waters more temperate are prepared, either by changing the ingredients, or the *Meſtruum*, or both.

As to the firſt, proceed after this manner. Take of the Leaves of Brooklime, Garden Creſſes, Fumitory, Harts Tongue, Liverwort, Baum, the tops of Tamariſk and Cyprus, of each ℥ſs, of the Roots of ſharp pointed Docks, of the Polypody of the Oak, each ℥ij, of the outward Bark of four Oranges, of cleanſed

Snails

Snails ℔ij, being cut and bruiſed pour on them of Whey made of Syder ℔vj, let them be diſtilled in a common Diſtillatory.

2. As the *Menſtruum* is more weak, let the Ingredients be moderately hot.

Take of the Leaves of Scurvygraſs, of Brooklime, of Water and Garden Creſſes, each *m*iij, the Rinds of 4 Orenges, a pint of Snails, being all cut ſmall, pour to them of the common Whey of Milk, or freſh Milk ℔vj. Let them be diſtilled in the ordinary way.

3. In the Scorbutick Atrophie and Tabid Diſpoſition, where no hot thing agitating the Blood, Spirits and Humours ought to be admitted; both the Ingredients and the *Menſtruum* ought to be temperate, and ſweetning the Blood.

Take of the Leaves of Brooklime, of Cardamines, Harts Tongue, Maiden Hair, Liverwort, Betony, Agrimony, of each *m*ij, of Snails cleanſed ℔jß, (or the ſoft fleſh of a Capon, or the Heart of a Sheep cut to pieces) being all ſcalded and cut, let them be bruiſed together, and then pour to them ſix Pints of freſh Milk (or Fumitory Water) and let it be diſtilled after the ordinary way.

Medicated Wines and Ale.

Although the uſe of Wines ſeems to be leſs agreeable in the Scurvy, excited by reaſon of heat, or the Sulphureous-Saline Dyſcraſie of the Blood, yet when either the Stomach is more weak, or that by long cuſtom, they at leaſt require drink of Wine mixed with a little Water; the ſame ſort of Liquor ought to be prepared, both more temperate and alſo medicated. And firſt of all may be granted them ſmall Wines diluted with Water, and impregnated with the Infuſion of Baum, Borage, or of Pimpinell or Burnet, or others.

Moreover Wines are prepared of the Juice of Currans, Raſps, Cherries, and of other garden Fruit, which being ripened by fermentation become very grateful to the Stomach, and purify the Blood; Then Cyder, the familiar and almoſt genuine Wine of our Country, ſo it be clear, ſweet, ſoft, and without any ſharpneſs, helps very much in the Scurvy. Beſides to this Liquor, being freed from its Fæces, and put up into little Veſſels, may be put ingredients of various natures or kinds; *viz.* of which ſort are the tops of Pine or Fir-tree, the Flowers of Tamarisk, alſo the ſhavings of Harts-Horn, or Ivory, which will ſweeten the Liquor and preſerve it from groowing ſour; for as much as the Particles of the fluid Salt abounding in tht Cyder, being apt to cauſe it to grow ſour of it ſelf, are hindered by diſſolving the foreſaid Ingredients.

The more temperate medicated Ale or Beer, is preſcribed after this manner. *viz.* let there be Ale prepared to fill a ſmall Veſſel, holding 5 or 6 Gallons, in which inſtead of Hops, let there be boyled the tops of Pine or Firr Tree, or of Tamarisk, or the ſhavings of any of their Woods, then after it hath worked, put into the Veſſel the Roots of ſharp-poynted Docks dryed, (than which certainly there is not a more helpful remedy in the Scurvy) to theſe ſometimes may be added the Leaves of Brooklime, Watercreſſes, Barberries, and alſo Orenges and Limons ſliced may be put into the Veſſel.

The Leaves of Harts Tongue, put into the Veſſel of ſmall Ale, after fermentation, gives it a moſt grateful taſt and ſmell.

CHAP. IX.

Of the Curatory Indication of the Scurvy, by which help is afforded to the Diſeaſe it ſelf, and to the Symptoms chiefly afflicting.

WE have hitherto treated concerning the Cure of the Scurvy, and ſhewed what belongs to the preſervatory indication, to wit, the taking away of the morbifick cauſe, *viz.* both the intentions of healing and manifeſt Remedies. Which kind of method being timely entred upon and rightly inſtituted, oftentimes performs the whole buſineſs, for that the cauſe of the ſickneſs or the Root being cut off, the diſtempers depending upon it wither away of their own accord. But yet we may not always follow this courſe directly, but ſometimes ſtepping of one ſide, go another way to work, becauſe ſometimes more grievous accidents and ſymptoms happen, which require peculiar and as it were extraordinary help of Medicine, which ought to be attended upon immediately, and the general Cure often interrupted: As to this it is to be obſerved, that when the diſtempers which follow upon the Scurvy, require proper Remedies according to the nature of every one of them, and the diſpoſition of the Patient, yet there ought always to be mixed with theſe Anti-ſcorbuticks. There will be no need to inſtitute a curatory method, againſt all the diſeaſes and diſtempers with which the Scurvy is wont to environ one, for ſo I might tranſcribe the whole practice of Medicine, but we ſhall have regard only to the ſymptoms chiefly afflicting, by which either the life of the Patient is endangered, or the principal Cure is hindred: By what means and with what Medicines ſuch may be cured, we ſhall now ſhew.

Of the Curing difficult Reſpiration and Aſthmatical Paroxyſms.

Difficult breathing with ſtraitneſs of the Breaſt and aſthmatical fits, ought to be taken away by appropriate Remedies, and to be preſcribed beſides the general method, otherwiſe the ſick may be ſoon brought into danger of life. As theſe kinds of evils ariſe for the moſt part in ſcorbutical perſons, by the vice of the Blood ſtagnating in the heart, or by reaſon of the pneumonick Nerves, being hindred in their function, ſo they are to be cured with Cardiacks or anti-ſpaſmodick Medicines, *viz.* of Hartshorn, Soot, Blood, of mens Skulls, alſo the tincture of *Caſtor*, Antimony, or of Sulphur, the flowers of *Sal Armoniac*, the flowers of Benjamin, alſo *Elixir Proprietatis*, in theſe caſes are of excellent uſe: Which kind of Remedies may be given at every turn, with a doſe of ſome anti-ſcorbutick Liquor, proper alſo againſt the aforeſaid diſtemper. For the ſudden allaying of difficult breathing, merely ſpaſmodical when it afflicts very ſore, I never found a more ready Remedy than 10 or 12 drops of our tincture of opiate *Laudanum*, being given in ſome convenient Liquor, for that ſleep creeping on the Spirits remit their inordinations, and being in the interim refreſhed, they reſume afterwards their priſtine task after a due manner. The more ſharp Clyſters which very much cleanſe the Belly, alſo ſudorifick Decoctions and Diureticks often give help.

Take of the Roots of Bur Docks, of Butter Bur, Chervil, each ℥j, of the leaves of Maiden hair and *Germander* each *m* i, of bur Dock and baſtard Saffron ſeeds each ʒiii, of Raiſins ℥ii, being cut and bruiſed let them be boyled in Spring water ℔iii, to the conſumption of the third part, add of Whitewine ʒiiij, let it be ſtrained into a Jug, to which put of the leaves of Scurvygraſs cut *m* j, of the roots of candied *Enula Campane*, and cut ſmall ℥ß, let them infuſe hot and cloſe ſhut for three hours: The doſe ʒvj twice or thrice a day.

Of

Of the Diſtempers of the Ventricle, that are wont to follow upon the Scurvy.

Sometimes ſcorbutical People are wont to be cruelly tormented with great pain and fulneſs of the Ventricle, alſo with a nauſeouſneſs and belchings, and ſometimes alſo with cruel and frequent vomiting. Which kind of vices ariſe ſometimes from the Chyle, being there degenerated into a putrefying humour, but more often from the morbifick matter being carried away, either by the paſſage of the Blood or the nervous Juice, and depoſited either in the cavity of the Stomach, or fixed in the nervous folds and membranes. In theſe caſes if a viſcid or ropy ſtinking matter, or otherways hurtful be caſt out by vomiting, and that it be ſuſpected that the cauſe remains within the cavity of the Ventricle, a gentle Vomit of wine of Squills, or of vitriol Salt, will be convenient to be taken: Or if the peccant humour diſturbs the Belly, either an extract of Rhubarb or an infuſion of it, the Salt or Cream of Tartar being added. But if the matter ſticks cloſely within the Membranes or nervous foldings, Diaphoreticks, or things reſtraining the effervencies of the Salts rather help: *Elixir Proprietatis*, or the flowers of *Sal Armoniac*, or the Spirits of Soot may be taken by turns, with the water of Radiſhes compound, or of Snails, or any other anti-ſcorbutick Liquor. In the mean time, once or twice in a day there may be applied to the region of the Stomach, a fomentation of Wormwood, Centaury, Camomil Flowers, the Roots of Gentian and others, boyled in Whitewine, with woollen Stuphs dipt in it and wrung out very hot. The uſe of Clyſters is convenient, and not ſeldom Opiates yield great help.

Of the Pain of the Belly and Scorbutick Colick.

There is almoſt no Diſtemper requires the ſpeedy help of Medicine more than the Colick and torments of the Belly, which frequently happen in the Scurvy. Againſt theſe evils, Clyſters of ſeveral ſorts, Fomentations, Liniments, and Cataplaſms are adminiſtred. Here the uſe of Opiates are thought to be very neceſſary, certainly in this caſe that preſcript of *Riverius*, that purging Pills ſhould be adminiſtred with ſome *Laudanum* mixed with them, may take place; for by ſleep being moved, and a plentiful ſolution of the Belly being cauſed, very often the fits are taken away: But the pouders of Shell-fiſh, by which the acetoſous Salts are imbibed or fixed, conduce very much to the profligating or driving away the morbifick cauſe. As for example, take of the pouder of Crabs eyes, and of Egg ſhells each ʒiſs, of Pearls ʒi, make a pouder, let it be divided into 12 doſes, let one of which be taken every ſixth hour, with ſcorbutick water or with the decoction of the Seeds and Roots of Burdocks, as is above deſcribed, or elſe with poſſet drink, in which is boyled the Roots and ſeeds of Burdocks, the leaves of ſweet Marjoram, and Saxifrage, and the leaves of Scurvygraſs infuſed. In the ſcorbutick Colick, alſo in the diſtempers of the Ventricle, but now deſcribed the uſe of *Epſom* and *Barnet* purging waters or the like, affords oftentimes very great benefit.

Of the Lask and Dyſenterical Diſtempers.

An inveterate *Diarrhœa* ſuch as often happens to ſcorbutical perſons, ought in no wiſe to be ſtopped with aſtringent Medicines, nor is it eaſily cured by alteratives or every Anti-ſcorbutick: Purging waters impregnated with iron or vitriol are the beſt Medicines for this diſtemper: Next to theſe are the artificial ſpaws or chalybeate medicines, which are wont to give notable help. *Crocus Martis* rightly prepared is to be preferred to all others., I have uſed the following method with good ſucceſs: Firſt a Purge of the pouder or the infuſion of Rhubarb is to be inſtituted, with aſtringent Spices added, and often to be repeated every three or four days. In the other days, let a doſe of the following Electuary of the bigneſs of a Nutmeg be taken in the morning, and at 4 a Clock after noon. Take of the Conſerves of common Wormwood made with an equal part of Sugar ℥vj, (in a more hot conſtitution, inſtead of this let Conſerves of red Roſes be taken) *ſpecies Diarrhodon Abbatis*

ʒij,

℥ij, of the pouder of white and red Sanders each ʒi, of *Crocus Martis* the beſt ʒß; with what will ſuffice of the Syrup of Steel, make an Electuary.

In dyſenterical diſtempers or a *Tenaſmus* or deſire of going to Stool, you muſt proceed after the like method; if it may be had, let the uſe of purging waters be inſtituted, beſides let often Clyſters prepared of vulnerary decoctions be uſed. Lately I cured one greatly labouring with a tedious dyſentery, who had for a long while voided by Stool many ounces of Blood, by this Medicine. Take of the beſt Rhubarb in pouder ʒi, of the pouder of red Sanders ʒii, of Cinnamon ʒi, of *Crocus Martis* ʒiij, of *Lucatella*'s Balſom what will ſuffice to make a pilulary Maſs, he took 4 Pills ſometimes every day and ſometimes every other day for a Week, and was perfectly cured. I alſo preſcribed him to drink medicated Ale conſtantly, with the roots of ſharp pointed Docks, and the leaves of Brooklime infuſed in it.

Of the Vertigo *and fainting of the Spirits and other Diſtempers, that are wont to be joyned to the ſame ſcorbutical Affection.*

The *Vertigo* often comes upon an inveterate Scurvy, to which is wont to be added a fainting or frequent ſinking of the Spirits, and almoſt a continual fear or dread of it, alſo a *ſtupor* or ſtiffneſs in the members, and a ſenſe of tingling or pricking here and there running about them, which kind of diſtempers proceed from the failure of the animal Spirits in the fountain it ſelf, and ſometimes of thoſe within the Nerves, both the Cardiack and thoſe ſerving for the motion of the Members; and when they depend on the Brain and nervous ſtock, being beſet very much with the ſcorbutick Salt, they are not eaſily cured. Cephalick Remedies, ſuch as are convenient in the *Vertigo* and paralytick Diſeaſes excited by themſelves, are to be adminiſtred with anti-ſcorbuticks mixed therewith: Therefore firſt of all a proviſion of the whole being made by fit Catharticks, and ſuch as are convenient in the Scurvy, you may proceed with appropriate Remedies againſt the ſaid Diſeaſe after this manner.

About the beginning of the Cure, let there Blood be taken from the veins of the Fundament by Leeches, and unleſs any thing may contradict, let it be at ſeveral times repeated.

Take of the pouder of the male Peony root ʒß, of red Coral prepared ʒij, of an humane Skull and of Elks Claws each ʒi.

Take of the beſt Sugar diſſolved in the compound Peony water, or in the water of wild Radiſh, and boyled up to a conſiſtence ʒviii, of the beſt oyl of Amber rectified ʒß, make thereof Tablets, and take of them from ʒiß to ʒii morning and evening, drinking after it a draught of the following diſtilled Water.

Take of the leaves of Scurvygraſs, of Brooklime, of Creſſes of the Garden, of the Lillies of the Valley, of Sage, Roſemary, and Betony, each *m* iii, of green Walnuts ℔vi, of the rinds of 6 Oranges and of 4 Limons, of the freſh roots of the male Peony ℔ß, being bruiſed and cut, let there be put to them of the phlegm of Vitriol ℔j, of Whey made with Cyder ℔v, let them be diſtilled after the ordinary way, and let the whole water be mixed together: The doſe ʒiij to ʒiiij.

Of Hæmorrhagies or Fluxes of Blood.

Great fluxes of Blood very often threaten great danger in the ſcorbutick diſtemper, in ſo much as the ſick are given over, for that reaſon to ſudden death, whilſt the Blood breaks forth now from the Noſe, now by the menſtrual Flux or at the hæmorrhoidal veins, even to the fainting away of the Spirits or ſwooning: Beſides that ſometimes being caſt out from the Lungs or Ventricle, gives a ſuſpition of an Ulcer lying hid, or at leaſt a great debility in the affected part: Wherefore if theſe bloody excretions are immoderate, or happen in an inconvenient place, they ought for the preſent to be ſtopped, and prevented for the time to come.

For the ſtaying of the Blood when it breaks forth immoderately, the method is commonly known, and there is nothing more to be done or particular in this diſtemper by reaſon of the Scurvy, than when excited upon other occaſions: But as to the preventing Hæmorrhagies, Remedies, which take away the acrimony of the

Blood, and bind up the mouths of the Veſſels being too looſe and gaping, are to be adminiſtred, either intention is beſt performed by Chalybeate Medicines. The uſe of vitriolick Spaws is very fit in this buſineſs, beſides the infuſions of Steel, Extracts, Salt, and ſuch kind of preparations which chiefly contain the ſaline or vitriolick nature of the Iron, are always moſt profitable againſt Hæmorrhagies: by what means Iron and its preparations, produce theſe effects and ſeveral others in the humane body, we have ſhown already.

Take of the Conſerves of red Roſes, of Cynorrhodon or of Hipps each ʒiij, of the *ſpecies Diarrhodon Abbatis*, and *Diatrion Santalon* each ʒjſs, of the ſalt of Steel ʒj, of the beſt *Crocus martis* prepared ʒij, of red Coral prepared ʒiſs, with what will ſuffice of the Syrup of Steel, make an Electuary: Let the quantity of a Nutmeg be taken thrice a day, drinking after it a draught of ſome proper Liquor.

For poor people I am wont to preſcribe after this manner, Take of the tops of Cypreſs, of ſtinging Nettles each ʒiiij, of Brooklime ʒij, let them be pounded in a Mortar with ʒx of white Sugar, then add the thin ſhalings of Iron finely poudered ʒi, of the pouder of white and red Sanders each ʒij, with what will ſuffice of the Syrup of Nettle juice, make an Electuary: The doſe the quantity of a Walnut twice a day.

Take of diſtilled water, or of a temperate anti-ſcorbutick Decoction ℔ij, of our Steel prepared ʒij, mingle it in a glaſs: The doſe from 3 to 4 Ounces.

Take of the tops of ſtinging Nettles, of Brooklime each *m* iiij, being bruiſed let the juice be preſſed forth and kept in a Glaſs, the doſe ʒij or ʒij twice a day, with diſtilled anti-ſcorbutick Water.

Of the Vices of the Mouth coming of the Scurvy.

As ſoon as the ſcorbutick Taint ſeiſes on the parts of the Mouth, ſo that the Gums begin to ſwell, and their fleſh to become ſpungy, preſently Remedies which may drive away putrefaction from them, are carefully to be adminiſtred: Among theſe, things to waſh the mouth and liniments are of chief uſe, whilſt the Diſeaſe is beginning about theſe parts, or growing grievous therein, which yet have reſpect to various intentions, and ſo are ſeverally to be prepared, *viz.* the fleſh of the Gums at firſt ſwelling up, are to be freed and dryed from the incurſions of the Corrupt and ſalt Blood or *Serum*: Afterwards their fleſh growing flaggy and falling from the Teeth, is to be defended from rottenneſs, and alſo that it may more ſtrictly embrace the Teeth, it is to be conſtrained or bound cloſer, for theſe and perhaps other intentions, Gargariſms or waters to waſh the mouth of ſeveral kinds are inſtituted: The chief Ingredients of which for the moſt part are boyled vegetables and infuſed Minerals. The Herbs or Roots which are boyled in ſome fit liquor, *viz.* Water or Wine are moſt commonly either ſharp, bitter, or ſtyptick or binding, and ſo theſe ſort of Decoctions are impregnated, either with a Volatile, Lixivial, Vitriolated, or Chalybeated, or aluminous Salt, we will here ſhew you ſome forms of every kind of them.

1. When therefore the fleſh of the Gums begins firſt to ſwell up, and to become ſpungy by reaſon of the influx of a corrupt and ſalt Blood and *Serum*; take the middle bark of the Elder Tree and of the Elm each *m* ß, of the leaves of Savory, Sage, Hedg-muſtard, garden Creſſes, each *m* j, of the roots of Pellitory ʒij, being bruiſed and cut let them be boyled in ℔iij of Lime water, to the conſumption of the third part: If a ſweetning be required, add of honey of Roſes ʒii, make a Gargal. Or take of Camphorated Vitriol ʒi, (commonly called by our Countrymen by the name of Captain *Green*'s Pouder) a quart of Spring water, mingle them in a glaſs and ſhake them well together, and then the Liquor ſettling and growing clear, may be made uſe of. Or let there be prepared a Lye of the aſhes of Broom, or Roſemary, or of Nitre, or Tartar calcined, boyl in 3 pints of this, of the leaves of Savory, Thyme, Sage, Roſemary, each *m* j, when it is ſtrained put into it two handfuls of Scurvy-graſs leaves, make an infuſion cloſe and warm for three hours, then let it be ſtrained again, and kept to waſh the mouth often in a day.

For the ſame intention alſo, Liniments may between whiles, and eſpecially at night be applied, that their virtues may be communicated to thoſe that are ſick, or while they are ſleeping. There is a preſcript very celebrious among Authors, and

by

by long uſe confirmed. Take of the Leaves of Columbine, of curled Mint, Sage, Nutmeg, Mirrh (which ſometimes may be omitted) of each ʒij, of burnt Allum ʒß, of Virgin Hony ʒiiij, or what will ſuffice, make a Liniment according to Art.

2. When the Fleſh of the Gums growing flaggy, forſakes the Roots of the Teeth, ſometimes a light Scarification may be adminiſtred, beſides let the mouth be waſhed with this Decoction. Take of the tops of the Bryar, Cypreſs and Ladyſmock Leaves, each *mj*, let them be boyled in three Pints of Water, in which Iron hath been quenched, to the Conſumption of the third part, to the ſtraining add of Hony roſat. ʒij, mingle them.

This kind of Liniment may be applyed. Take of the Pouder of the *Florentine Oris*, of the Leaves of Sage and of St. *John's* Wort, each ʒij, of bole Armenic, of *Sal Prunellæ*, each ʒj, of freſh Virgins Hony, as much as will ſuffice, let them be well incorporated, by working them together.

2. When the Gums begin to putrefy and corrupt, and alſo the Teeth, and the fleſh about them grow looſe and yeild a noyſom Savour, more ſtrong Medicines and great reſiſters of Putrefaction are adminiſtred, here an infuſion of Vitriol Camphorated, alſo of the Medicinal Stone, have the chief place.

Or take of the Roots of Gentian, and of round Birthwort being cut, each ʒß, of the Leaves of the leſſer Centaury, pontick Wormwood, Savory, Columbine, each *mj*, let them be boyled in Lime water, or a Lie made of either Iron or Alum ℔iiij, to the conſumption of the third part. Add to the Colature of raw Hony ʒij or iij, mingle them.

4. If the falling out of the Teeth be chiefly feared, take of the Bark of the Roots of the Sloe Tree ʒj, of Tormentil and Biſtort whole, each *mj*, of the outer Rinds of Pomegranats, and the Flowers of the ſame, each ʒß, let them be boyled in three Pints of Spring Water. Add to it when ſtrained, of Alum 2 or iij drams, of the beſt Hony ʒij, mingle them. Take of Vitriol Camphorate, of burnt Harts-horn, each ʒj, of Nutmeggs ʒß, of the beſt Hony what will ſuffice, make a Liniment. Or take of the Pouder of the Root of Biſtort, of the Rinds of Pomegranats, of bole Armenick, of burnt Allum, each ʒj, of Hony of Roſes what will ſuffice, add of the Spirit of Vitriol ℈j; make a Liniment.

5. If at any time (as ſometimes it is wont) that deep and putrid Ulcers eat into the Gums or other parts of the Mouth, the aforeſaid more ſtrong Remedies are often to be uſed. Beſides, let little raggs be often applyed to the affected place, ſteeped in Egyptian Oyntment diſſolved in the Spirit of Wine, or in an Infuſion of Sublimate, or of the medicinal Stone. In theſe caſes the Cure is to be left to a skilful Chirurgion.

Of the Pains that are wont to Infeſt the Leggs, and ſometimes other Limbs, Chiefly in the Night.

Againſt theſe Pains, for that indeed they are ſometimes very bitter; beſides the general method of curing the Scurvy, Specifick Remedies, and things helping this Symptom are ordered. Therefore in ſuch a caſe, the means of Purgation being inſtituted, and Phlebotomy alſo (if there be need) celebrated, it is convenient to ſet upon the Diſeaſe with inward Phyſick, and outward Topicks.

As to the firſt, thoſe which move by Sweat and alſo by Urine, does often avail, for that they carry another way, the lixivial and ſour recrements of the Blood and nervous Juice, that are wont to be gathered together in the affected part: But chiefly thoſe things are to be adminiſterd, which may defend either Humour from its depraved nature, *viz.* both Saline and Sour: ſhelly Pouders, Crabs Eys, Jaws of Pikes, alſo Spirits, and Flowers of *Sal Armoniack*, Spirits of Blood, Tincture of Antimony and of Coral: Decoctions of the Roots and Seeds of Burdocks, *Chamepitys*, Germander, very much help. Which kind of Remedies are to be taken twice or thrice a day with Antiſcorbutick diſtilled Waters. Water diſtilled out of Horſedung, to which is added Scurvygraſs, Brooklime, Gout Ivy, and ſuch like, is ſometimes very profitable. In the mean time Liniments, Fomentations, Cataplaſms and ſuch kind of Applications which allay Pains, are outwardly to be applyed.

Of the wandring Scorbutick Gout.

Eugalenus, *Wierus*, the *Campen* Phyſitian, and *Gregorius Horſtius*, have wrot particularly of this diſtemper, ſaid to be very frequent in the Northern Countries of *Belgia*. A certain Sign of which is manifeſted by putting a live Worm to the grieved place, for he is preſently wont to leap off, twine himſelf about, bend himſelf round, to ſlide along, and to dye: which I have alſo often experimented on our Country men. The reaſon of which Experiment (as it ſeems) is this: we have determined the cauſe of the Pain and Tumour ſtirred up in the affected part, to be for that the ſaline or Lixivial Fæculencies from the Blood, and the ſour, from the nervous Juice, being depoſited in the ſame place, do mutually ferment or grow hot, even as Spirits of Vitriol and Salt of Tartar, mingled by deliquium or melting: further from ſuch a ſtriving and agitation of diſſimilar particles, as the Pain and Tumour are cauſed, ſo indeed very ſharp, and as it were Corroſive *Efluvia's* plentifully evaporate, which kill the worm layd upon the grieved place, even as if he ſhould be held over thoſe Liquors boyling: Becauſe of the effect of this Experiment, the cure of this Diſeaſe has been ordained by Worms, to wit, Remedies prepared of them; but I know not whether being taken inwardly, they ſo certainly deſtroy the Diſeaſe, as they being applyed outwardly, are deſtroyed by the Diſeaſe. Even as Worms, ſo alſo Snails, Hoglice, or Sows, and other bloodleſs little animals, for that they abound in a volatile Salt, do often enough become an efficacious remedy.

Henry Petræus relates two remedies uſed againſt this Diſeaſe, in *Weſtphalia*. Take 9 Worms bruiſed together, with two ſpoonfuls of Wine in a Morter, and wrung out hard through a woollen Cloth, to theſe add half a meaſure of Wine, and let it be taken 3 ſpoonfuls morning, noon and night, for ſeveral days. 2. Take two or three ſpriggs of Savin, two ſpoonfuls of Virgins Hony, let them be boyled in a meaſure of Wine, till two fingers breadth be waſted: let it be ſtrained, and take of it 4 or 5 ſpoonfuls thrice in a day. A certain Vulgar Potion, akin to the former Medicine, is cited by *Horſtius*, and called the Monaſterie Potion: Take of Sage Betony, Rue, of each 5 Leaves, of earth Worms, every one with red rings about their Necks, number 5, a little Savin, of Devils bit Roots 2, let them be bruſed with Water of Elder Flowers, and the Juice being preſſed forth, let it be given to move Sweat. Alſo the like preſcript is propoſed by the *Campen* Phyſitian in *Foreſtus*.

Certainly in this diſtemper the Magiſterial Water of Earthworms, preſcribed in the London Diſpenſatory, is extreamly convenient. I have often given alſo with good ſucceſs, the Spirits and Salts of Harts horn, the Spirit of Blood, and the Flowers of *Sal Armoniack*. Beſides the ſhelly Pouders, as of Crabs Eyes, Corals, Perls, and Vegetables, which have in them Antidotes for the Gout, as the Roots of Birthwort, the Leaves of Groundpine, Germander, and the like joyned with Antiſcorbuticks, conduce to the cure of this Diſeaſe. Outwardly, for the allaying of the Pains, beſides Anodynes, things under the form of a Liniment, Fomentation, or Cataplaſm, are made uſe of: The Oyl of Earth-worms, Froggs, and Toads, are often very profitable. I was told by a very ſignal Perſon much obnoxious to this Diſeaſe, that the Water of the Contents, taken from the Ventricle of an Ox newly killed, and drawn off clear by diſtillation, and with Raggs dipt in it warm, and applyed for a Fomentation, brings certain help.

Of the Convulſive and Paralytick Diſtempers that are wont to come upon the Scurvy.

When at any time the ſcorbutick Taint breaking in upon the Brain and Nervous Stock, doth greatly infect the moiſtning Liquor of either Province, for that reaſon indeed, ſeveral Diſeaſes, and chiefly the paralytick and Spaſmodick, or cramplike diſtempers (as we have already ſhown) are wont to ariſe: even according as the morbifick matter, being carried to the Animal Kingdom, ſhall be either narcotick or exploſive. Although theſe kinds of Diſtempers ſhall be accounted in this

this caſe Symptomatical, yet they being very grievous, do challenge for themſelves both the name and the greater part of the Cure, before their parent the Scurvy; ſo that the Sick is ſaid rather to labour with the Palſy, or the Convulſion, then with the Scurvy, and alſo Medicines proper for thoſe diſtempers, are at the ſame time propoſed, with the others requiſite to other Intentions.

For the curing thoſe Diſtempers coming upon the Scurvy, that chiefly muſt be performed, that the Remedies appropiate to them be rightly or conveniently applyed with Antiſcorbuticks. As to the Convulſive Diſeaſes, what I have made known in a former tract, may be eaſily trasferred hither. But as to the Palſy, Lethargy, and many other diſtempers of the Brain, and nervous Stock we intend ſhortly to make publique ſome ſpecial Diſquiſitions thereupon: In the mean time it is not fit, that we ſhould in this place foreſtal the therapeutick Method, which belongs to thoſe diſcourſes, but rather we will propoſe what may ſeem neceſſary at the end of this Work, the Caſes and Cures of ſome ſcorbutick Perſons, lying ſick alſo of thoſe Diſeaſes.

Of the Atrophy or waſting of the Fleſh: alſo of the Scorbutick Fever; which oftentimes is either the Cauſe of it, or the accident, or effect of it.

There are three kinds of Cauſes, hanging by a certain Series, from one of which or more the ſcorbutick Atrophy without the Conſumption of the Lungs is wont to be produced, *viz.* either the Chyle is perverted by the default of the firſt paſſages, by which means it does not carry ſufficient or laudable proviſion to the Blood. Secondly, or being brought to it, yet by the fault of the Blood, it is not rightly changed into Blood and nutricious Juice. Or thirdly and laſtly, the nutricious Juice being prepared in the bloody Maſs, by reaſon of the fault of the nervous Liquor, is not rightly aſſimilated in the ſolid parts.

The Remedies appropriate to this Symptome reſpect either the emendation of the firſt paſſages, or of the aforeſaid Humors. As to the firſt, ſometimes it happens by reaſon of the Tone of the Stomach being broken, or its Ferment vitiated, ſo that it comes to paſs that the aliments put therein are not rightly dreſſed, but turn into an unprofitable Rottenneſs. To theſe ſort of evils, gentle Catharticks, digeſtives and ſtrengthners are to be adminiſterd. But more often the work of Chylification or of making the Chyle, is hindered by reaſon of a Schirrous Tumour, being excited now in the Ventricle, now in the Meſentery or in the circumjacent part. In this caſe opening and diſſolving things are convenient; and the uſe of Spaws or Purging Waters has bore away the Bell from all other remedies: Beſides Fomentations, Liniments, or Plaſters, ought to be outwardly applyed.

Further, it ſometimes happens that without any Tumor ſtirred up in the *Viſcera*, the milkie Veſſels being impacted by ſome thick and viſcous Matter, to be ſo much obſtructed, that the Proviſion of Chyle, though laudable enough and plentifully made, is not ſufficiently carried into the Blood. In this diſtemper, for the moſt part the Belly voides copiouſly white excrements like curdled Milk, and not like others dyed or ſtinking with Choler. The reaſon of which is, for that the impoveriſhed Blood more ſparingly begets the yellow bile, from which being poured into the Inteſtines, the colour and ſtink of the Excrements proceed. In this caſe the purging Spaws are convenient, and alſo with things opening, taken inwardly, Liniments, Fomentations, and Baths are uſed outwardly.

Againſt the *Maraſmus* or waſting of the Fleſh, ariſing from the fault of the Blood, degenerating from its Complexion, Aſſes or Cows Milk diluted with Water, or other proper Water diſtilled, often brings help. The broth of Snails or milk Meats, with them boyled in them; beſides diſtilled waters of Milk or Whey, with Snails and temperate antiſcorbutick Herbs mixed, help very much in this Caſe: alſo to this end, decoctions with Vulnerary and antiſcorbutick Herbs infuſed therein are taken with good ſucceſs: In the mean time Frictions to the external parts, with woollen coathes made warm and dipped in reſumptive Oyntment, or the freſh Oyl of Walnuts, may be dayly adminiſtred.

When the Atrophy ariſes from the Vice of the diſtempered Blood, perverting by

by that means the nutritious Juice, it hath moſt commonly joyned with it, an erratick Fever with nightly ſweats, for that the ſanguinious Maſs is compelled to inequal and uncertain effervencies by that degenerate Juice; and that the ſo troubleſome matter is caſt out by the nightly Sweat. In this caſe a ſlender Diet being ordered, let them often take Decoctions and diſtilled waters, which fuſe and purifie the Blood, with anti-ſcorbuticks mixed therewith.

Take of the ſhavings of Ivory and of Hartshorn each ʒijß, of *Eringo* Roots preſerved ʒvj, of the Roots of Chervil, Dandelyon, each ʒß, of the leaves of Harts Tongue and Liverwort each *m* j, one Apple cut, of Raiſins of the Sun *m* j, let them be boyled in Spring water ℔iiij, to the conſumption of the third part: Being ſtrained, put into it of the leaves of Brooklime bruiſed *m* ij, of *Sal Prunellæ* ʒiß, or of fixed Nitre ʒj, make an infuſion warm and cloſe for 3 hours: Take of it iiij or ʒvj thrice in a day.

Take of the leaves of Brooklime ℔iiij, of Sorrel and Dandelyon whole each *m* ij, of Snails cleanſed ℔iß, the rinds of two Oranges: Being ſliced, cut, and beaten, pour to them of ſweet Milk or Whey made with Cyder, or of the Juice of freſh Apples ℔vj, let them be diſtilled after the ordinary way, take of it ʒiij twice or thrice in a day.

Of a Rheumatiſm.

This Diſtemper we have determined to proceed from the congreſſion and mutual effervencies of the Salts which are of a divers nature and generation, to wit, of the fixed coming from the Blood, and the acetous coming from the nervous Juice. The ſubjects of either Salts are the ſuperfluous feculencies depoſited, and by the aforeſaid humours acted into certain turgeſcencies or riſings up, being ſpread abroad into the parts, now into theſe now into thoſe: Wherefore that the Diſeaſe may be cured, and the turgeſcencies of the humors allayed, both their ſuperfluous feculencies are to be purged forth, and alſo both the degenerate Salts of either order, are to be reduced and made volatile.

For the two former intentions, a light Purge and Phlebotomy are chiefly required, and ought to be often repeated according to the ſtrength of the Patient; alſo Diureticks and Diaphoreticks which may convey forth ſome way the ſalt Seroſities, are next to be given: That theſe ſort of Evacuations may the better ſucceed leiſurely, with a good habit and nature aſſiſting, Opiates are often made uſe of: For the other ſcope on which the chief hinge of the cure doth turn, alteratives, and chiefly thoſe which are indued with a volatile Salt, do greatly help: Wherefore in this caſe it is a common, but not to be contemned Medicine, to drink twice or thrice a day 4 or 6 ounces of an Infuſion made of Stone-horſe dung, in ſmall Wine or Ale or in proper diſtilled water. But a Medicine a little more grateful, though not more efficacious may be prepared, if a water be diſtilled out of that Dung with anti ſcorbutick Ingredients, infuſed in Whitewine or Cyder; which may be taken twice in a day from ʒiij to ʒiiij, I have often preſcribed in this caſe Spirit of Hartshorn, and of Blood, with very ſignal benefit to the ſick.

Of the Dropſie.

As we have determined that the Dropſie that is wont to ſucceed upon the Scurvy, is two fold, *viz.* habitual and occaſional, we ſhould utterly loſe our labour to ſpeak of the cure of the former, for in truth no Remedies can be able to reſtore the Liver and the Lungs, and the other *Viſcera* ſometimes vitiated, and the complexion of the Blood wholly overthrown. In ſuch a caſe if any thing be thought fit to be done, the bounds of Medicine will be but narrow, for neither for Catharticks nor Diaphoreticks, nor for any other more ſtrong ſort of Evacuation, is there any place left: Therefore chiefly and indeed only Cordials and Diureticks muſt be inſiſted on. To theſe ends, *Elixirs*, Tinctures, Electuaries, Powders, Infuſions, Decoctions, diſtilled Waters, *&c.* which are partly againſt the Dropſie and partly againſt the Scurvy, are to be adminiſtred; but becauſe they ſignifie little we ſhall omit preſcribing their forms.

The

The ſcorbutical Dropſie ſuddenly excited from an evident or certain occaſion, as hath been ſhown, very often admits of a Cure, which that it might more eaſily ſucceed, firſt of all the tumults of Nature are to be quieted, and its inordinations to be ſuppreſſed: Wherefore if awaking do very much infeſt, Sleep muſt be allured by the uſe of Opiates, and then it muſt be provoked as often as there is great need. As ſoon, as by reaſon of ſtrength, it may be lawful to purge, let the following Pouder be taken, and a due ſpace being between let it be repeated, and in the interim let the Belly be kept ſoluble by frequent Clyſters. Take of *Mercurius Dulcis* ℈j, of the reſine of Jalap *gr.* v to 10, of Cloves ℈ß, mingle it, and let it be given in a ſpoonful of Watergrewel; at other times Diureticks, and ſometimes Diaphoreticks are carefully to be taken. Take of the tincture of the ſalt of Tartar, impregnated with an infuſion of *Millepedes* or Hog lice as much as you will, let there be taken of it ℈j to ℈ij twice in a day, with an appropriate Liquor.

Take of the Spirit of *Sal Armoniac* what you will, the doſe ℈ß to 15 drops, after the ſame manner. Take of *Millepedes* prepared ʒiij, of the Salt of Tartar ʒij, of Nutmegs ʒj., mingle them and make a Pouder: The doſe ʒß twice in a day with a proper Liquor. Or take of Bees dryed and poudered ʒij, of the pouder of Ameos Seeds ʒi, of the oyl of Juniper ℈j, of Turpentine what will ſuffice, make a Maſs of Pills: The doſe ℈j to ʒß twice a day, drinking after it a ſpecifick Liquor.

Take of the leaves of either Scurvygraſs, of water Creſſes, Pepper wort, Arſeſmart, each *m* iij, of the Roots of Aron, Briony, of the Florentine Oris each ʒiiij, of the middle Bark of the Elder Tree *m* ij, of Winteran's Bark ʒij, the outward rinds of 4 Oranges and of 3 Limons, of new Juniper Berries ʒiiij, being cut and bruiſed, put to it of Rheniſh Wine 3 pints, of Wine of the Juice of Elder Berries ℔ij, let them be diſtilled after the ordinary way, and let all the water be mixed together. Doſe ʒiij to ʒiiij twice in a day, after a doſe of any of the Medicines preſcribed before.

Let there be prepared Decoctions and medicated Ale, ſuch as hath been before deſcribed, adding thereto anti-dropical Ingredients.

Of the Crackling of the Bones.

There yet remains a ſymptom ſometimes, though rarely coming upon the Scurvy, *viz.* a crackling of the Bones, the cure and reaſon of which being omitted in the former Pathology, it will not be amiſs to ſpeak of it here. I have known ſome, but not above three or four, who whilſt they laboured with the Scurvy were troubled with its evil, not only in the humours and fleſhy parts, but at laſt alſo in the Bones themſelves, for as often as they bended any of their Members any way, the heads of the Bones as if they were naked, rubbing againſt one another made a great noiſe: Further, as they lay in bed and turned themſelves from one ſide to the other, a great noiſe from the colliſion of the *Vertebræ*, as if it were the ſhaking of a skeleton, was plainly heard, even affrighting thoſe ſo affected.

The Conjunct Cauſe of this perhaps may ſeem to be, that the ſoft *interſtitium* of the Bones, *viz.* the Fat, Membranes, and Ligaments, being greatly waſted, their junctures even as milſtones, being altogether emptied by reaſon of their mutual rubbing together, make a noiſe: But the matter is quite otherwiſe, becauſe thoſe that are greatly waſted away have not this crackling noiſe of the Bones, nor do thoſe who labour with this Diſtemper always waſte off their fleſh: Wherefore we rather ſay that the immediate cauſe of this ſymptom, is the dryneſs of the Bones or a defect of the *medulla* or marrow ſo properly called, which ought to be contained within the cavities of the Bones, and chiefly within their heads: For as certain Bones do include marrow or an unctuous humour every where ſhaken out, either from the great cavities or pores, and the ſmall paſſages, we have determined the uſe of this to be, that both the Bones being thus moiſtned, may become leſs brittle, and moreover, that this humour moiſtning the knobs of the Bones, may make ſlippery all the joyntings, even as Greaſe or Oyl the hinges of a Machine, and by that means facilitates their motion: Wherefore the heads of the Bones being deſtitute of this marrow, make a noiſe like to the wheel of a Cart that is ſeldom greas'd.

But if the proctaartick or more remote cauſe be inquired into, *viz.* wherefore that

that unctuous liniment of the Joynts becomes defective; this indeed is to be imputed either to the vice of the Blood, as if it did not ſupply the Bones with aliment, participating equally with Sulphur and Salt, which truly ſeems unlikely, becauſe the bloudy Maſs alſo in ſcorbutical perſons, contains Particles of either of the aforeſaid kinds, and for that theſe labouring with the crackling of the Bones, have their Skin and Muſcles ſufficiently moiſtned with fatneſs: Or ſecondly and more likely, this unctuous humor by which the Joyntings are made ſlippery is wanting, through the fault of the Bones themſelves, *viz.* becauſe their pores and paſſages being ſo much obſtructed by ſome extraneous, and perhaps muddy matter, or tartareous carried thither by the Blood, that for that reaſon they cannot receive ſufficiently the Balſom deſtinated for them, nor ſend it forth for the moiſtning their Joyntings: It will not be eaſie (for that the matter lies ſo abſtruſe) to inveſtigate the particular reaſons of this Diſtemper, nor to conjecture further in this Ætiology.

We are no leſs at a loſs, how to proceed in the cure of this Diſeaſe: For although the primaay indication, *viz.* the humectation of the Bones or Joyntings is obvious enough, yet by what means and by what Remedies that ſhould be performed, does not ſo plainly appear. For I have known in this caſe very many kinds of Medicines, and ſeveral ways of Adminiſtrations tryed altogether in vain. A certain ingenious man, labouring for many years with this Diſeaſe, had taken the advice of many, and of the moſt famous Phyſicians, and beſides the uſual Remedies againſt the Scurvy, (together with often letting Blood and purgations, from which he received no help) he tryed various and long courſes of Phyſick without any ſucceſs: for after he had underwent a method preſcribed by one Phyſicion for ſome months in vain, he applyed himſelf to another and ſo again to more. In the mean time, from each of them was preſcribed always a new way of curing, uneſſayed by the former: Fomentations, Liniments, and Frictions are daily applyed to the Joynts, and ſometimes the Baths at Bath were uſed, and then ſeveral ſorts of purging waters, ſometimes one ſometimes another were drunk; all which nothing helping out, a chalybeate courſe was taken, and another time a decoction of the more temperate woods, ſometime a Milk Diet, and again at another time Electuaries, diſtilled waters, *Apozems*, and other Remedies prepared againſt the Scurvy. After this manner when he had lived almoſt conſtantly medically and miſerably above three years, and nothing profited as to the Cure of the aforeſaid Diſeaſe, but in the mean time he was indifferently well as to his ſtrength and Stomach, he married, and as to the reſt of the common Symptoms of the Scurvy became better: Hence it appears too pertinacious a Diſeaſe, yielding almoſt to no Remedies, the crackling of the Bones is, which I have alſo proved in others, labouring with the ſame Diſtemper altogether mocking and eluding the skill and pains of the Phyſician.

CHAP. X.

Of the Vital Indication, in which are included Cardiack Medicines, Opiates, and Diet, or the manner of living as to Eating or Drinking, requiſite in the Scurvy.

WE have hitherto largely unfolded the Indications both Preſervatory and Curatory, which belong to the Cure of the Scurvy, it yet remains that we ſpeak of the vital Indication, to wit, that we may declare by what method and by what Remedies, the ſtrength of the ſick being too apt to languiſh, may be ſuſtained, or being loſt and caſt down may be reſtored. For theſe ends, Cordials and Opiates are preſcribed to be taken, according to the exigencies of the ſick, and beſides a right way of living as to Diet, and if need be an analeptick or reſtorative, and always anti-ſcorbutick is preſcribed.

As

As to Cardiack Medicines, to wit, which thorowly agitate the Blood, ſtagnating in the heart, reſuſcitate or raiſe up its half ſpent flame, reſtore the animal Spirits oppreſſed or diſtracted to a free and due irradiation, it is obvious that very many Remedies which properly are called Anti-ſcorbuticks, do perform theſe intentions, of which ſort are the compound water of Radiſhes, the magiſterial of Snails and Earthworms, the Spirits of Hartshorn and Soot, the ſhelly Pouders with many others, which are not only taken with benefit at certain hours, according to a method ordained in a certain order, but alſo as occaſion ſhall ſerve when ever a *ſyncope* or fainting of the Spirits ſhall happen.

But beſides thoſe who are found very obnoxious to paſſions of the Heart, frequent Swoonings, Nauſeouſneſs, Vomiting, Tremblings, *Vertigo's*, and other horrid Symptoms, have alſo ready other ſorts of Medicines, more properly Cordials, by which they give relief immediately to their fainting Spirits. To this end is very convenient the *Elixir Vitæ* of the greater compoſition, in the diſtillation of the ſame *Elixir*, the ſecond water may be given to a ſpoonful ſweetned, alſo the Bezoartick Water, *Aqua mirabilis*, *Gilbert*'s temperate water, Treacle and Cinnamon water, to each of which compounded or of themſelves, may be added *Confectio Alchermes*, *Confectio de Hyacintho*, pouder of Pearls or the magiſtery of Coral, Syrup of Clove Gillyflowers, of Coral, of Citron peels, or of Cinnamon: Of theſe and others of this Rank, divers forms of Medicines are wont to be preſcribed, as for Example.

Take of Treacle water and *Aqua mirabilis* each ℥iij, of Balm water ℥iiij, of the Syrup of Clovegillyflowers ℥iß, of the Confection of *Alchermes* ʒj, mingle them: The doſe 3 or 4 Spoonfuls.

Or take of *Aqua mirabilis* ℥vj, of Snails and of Walnuts each ℥ij, of the Pouder of Pearls ℈j, Confection *de Hyacinth.* ʒj, of the Syrup of Clovegillyflowers ℥j, mingle them.

When ſcorbutical Women are wont to be troubled with hyſterical Diſtempers, or Men with Convulſive; take of Balm and Pennyroyal water each ℥iij, the compound water of Briony ℥iiij, of the tincture of *Caſtor* ℥ß, of the tincture of Saffron ʒj, of the Syrup of Clovegillyflowers ʒiß, of *Caſtor* tyed in a rag and hung in the glaſs ʒj, the doſe is 3 or 4 ſpoonfuls.

For thoſe who had rather have Cordials in a ſolid form, Electuaries or Tablets are preſcribed.

Take of the Conſerves of Clovegillyflowers ℥iij, of the Confection of *Alchermes* ℥ß, of the pouder of Pearl ʒ, with as much as will ſuffice of the Syrup of Coral, make an Electuary.

Take of the *ſpecies* of *Diamargarit. frigid.* of *Diarrhodon Abbatis* each ʒiß, of Pearls poudered, of the beſt Sugar diſſolved in Treacle water, and boyled up to Tablets ℥iiij, of the oyl of Cinnamon 6 drops, make Tablets according to Art.

As to what relates to Opiates and anodyne Medicines, in ſome diſtempers of Scorbuticks, I had rather want the uſe of any other kind of Medicines beſides than of theſe, for indeed I have found by often experience, that there is no better Remedy, not only againſt pertinacious pains and wakings, but in aſthmatical paroxyſms, in Vomiting, Fluxes, and alſo in the *Vertigo*, and in the Convulſive Diſtempers, as often as nature being irritated or provoked above meaſure, hath fallen into moſt cruel inordinations, than that Sleep might be allured by ſome ſafe Narcotick being given: In the mean time there is need of caution, that they be not taken when there is any thing in the conſtitution of the Sick, or in the condition or time of the Diſeaſe, that may forbid the exhibition of ſuch a Medicine.

Beſides the hypnoticks uſual in the Apothecaries Shops, *viz.* Opiate, *Laudanum*, *Nepenthe*, *Philonium*, *Diacodium*, and Syrup of wild Poppies, I know two preparations of *Opium*, which I am wont to give in the form of a Tincture or more liquid extract, with any other appropriate Liquor from 10 to 20 drops.

Diet or the manner of living, to be obſerved by Scorbuticks in the curatory method, is not of the leaſt moment, which being neglected or ill inſtituted, the other preſcripts of Medicine profit very little or nothing towards health: As the diætetick Rule extends it ſelf to various things, yet chiefly it is imployed about the Air, the ſoyl of the habitation, Meat and Drink, and the motion and reſt of the Body.

As to the firſt, what kind of places and manſions in reſpect of the Heaven and Soil, do breed the Scurvy, and therefore ought to be avoided, appears ſufficiently

by what we have above declared. Thoſe who ſtudie to prevent or to cure this Diſeaſe, let them endeavour to choſe an Aire moderately hot and dry, and which ſhall be alſo thin and pure and ſufficiently eventilated or winnowed.

Meats only for good Juice and well cooked are convenient; heavy, ſlimy, putrefied, fennewed and meats dryed in the Smoak, alſo unfermented aliments, or greatly compounded, Pulſe, Milkmeats, and unripe Fruits are to be ſhunned, Sweatmeats or things candied, or very much imbued with Sugar, I ſo much blame, that I am apt to think the Invention and immoderate uſe of them, to have contributed very much to the cruel increaſe of the Scurvy in this Age. For indeed that Concreet is made up of a Salt ſufficiently ſharp and Corroſive, though mitigated with Sulphur, as may plainly appear by a Spagyrical *Analyſis* made of it. For Sugar (as we intimated before) being diſtilled by it ſelf, yields a liquor, little inferior to the Stygian Water: for if you ſhall diſtil it, being poured to a good deal of ſpring Water in a Bladder, although the fixed Salt does not ſo aſcend, yet it produces a Liquor like to the ſharpeſt *Aqua vitæ*, burning and highly pricking: Therefore as Sugar being commixed almoſt with every aliment, is ſo plentifully taken in by uſe, it is very likely that from its daily uſe, the Blood and the Humours are rendered ſalt and ſharp, and from thence Scorbutick. A very famous Author hath attributed the cauſe of the Engliſh Phthiſick, or Conſumption, to the immoderate uſe of Sugar among our country men, and I know no reaſon, but that I may rather think the increaſe of the Scurvy derives it ſelf from this enkindling.

Let the Drink be midling Beer, mild and clear, and altered with antiſcorbutick Ingredients, but without any ingrateful taſte; let it not be thick nor ſweet, nor too ſalt and ſour, and let it be taken in a moderate quantity, and almoſt only at the ſet times of Dinner and Supper: That which with many is thought a good Cuſtom, to wit, that as ſoon as they are out of their beds, to indulge themſelves with (as they uſually ſay) a large mornings draught, ſeems to be very pernicious. For by this means, for that the ſanguiferous Veſſels are too much filled with the proviſion of freſh Chyle, almoſt perpetually poured in, both Crudities and morbifick Fæculencies are begotten in the Blood, and the office of Sanguification greatly weakned. It is better indeed for moſt men (unleſs ſuch, who whilſt they are empty and uſed to have their Ventricle grievouſly wrinkled and drawn together) to remain faſting till dinner, nor is it a leſs adverſary to health, according to the uſual cuſtom, to fill themſelves with drinking full Cups preſently after Dinner. Wines or Cyder ſo they be mild, right and not adulterated, and moderately taken, do not hurt; but there is nothing more hurtful and injurious to our health, than thoſe adulterated, ropie, ſharp and growing ſour.

Exerciſe and Labour is ſo very profitable, both for the curing and the preventing of the Scurvy, that many by this remedy only have recovered their Health, or preſerved it intire: For in thoſe leading an idle and ſedentary Life, the Blood and nervous Liquor like ſtanding Water contract a ſlimyneſs and muddy ſetlement: But by much and aſſiduous motion of the Body, the Humours and the Spirits grow clear and vigorous, the excrementitious and heterogeneous Particles evaporate, the ſtuffings of the *Viſcera* are diſcharged and their tone ſtrengthned.

CHAP. XI.

Some Hiſtories and rare Caſes of Scorbuticks.

Obſervation. WHat we have thus delivered, concerning the Theory and the Cure of the Scurvy, ſhall be yet illuſtrated more clearly by examples of ſickneſs, or by Hiſtories brought to light and explained according to the aforeſaid *Hypotheſis*. As there are manifold and divers caſes extant of thoſe labouring with this Diſeaſe, we ſhall here propoſe ſome more rare, excited by reaſon of the Taint being affixed in the Brain and nervous Stock, no leſs than in the Blood.

A Gentlewoman, tall and handſome, about 25 years of age, had contracted the ſcorbutick Taint by reaſon of various errors in living, or manner of life, the ſigns of which were a ſpontaneous wearineſs, difficult breathing, pains and ſpots in her Legs, beſides her Gums ſwollen and bloody; in the ſpring time after miſcarriage falling into a tertian Feavour, ſuddenly ſhe became languiſhing and weak, from which diſeaſe, however ſhe had been quickly recovered, being at firſt methodically cured, but that greedy of fleſh and other incongruous things, ſhe ſoon fell into a Relapſe. But then growing weary of Medicine, ſhe took only empirical Remedies, by which ſometimes her Ague fits were driven away, then ſoon after they returned: In the mean time ſhe remained pale, weak as to motion, breathing ſhort and ſwollen, and blown up near the Ventricle and *Hypochondria*. About the third month of her ſickneſs ſhe began to feel cruel Pains and Torments in her Belly; which afflicted her almoſt continually night and day, running about, now at her Back, now in her Stomach; Beſides ſhe was affected ſometimes with hyſterical Fits, and with a frequent Vertigo, alſo being troubled with often Vomiting, ſhe dayly caſt forth a clammy and frothy Flegme. Within a months ſpace this Diſeaſe diſplaying its ends, ſtirred up Pains in the Back, Loyns and then in every part of the Body. But at this time ſhe complained of a great ſtraitneſs of her Breaſt, and a great contraction of the *Viſcera*. In the mean time the habit of her Body became very lean, that the Bones being deſtitute of fleſh, the Skin could hardly ſtick on them. Her Urine was little and red, on whoſe Superficies was a little Skin coloured like the tail of a Peacock. A little time after this, ſhe felt a ſtupor or numneſs and a ſenſe of pricking, ſometimes in her Belly, and ſometimes in her Limbs, and then the Pains and Torments began to be remitted, but in their place a Palſie ſucceeded, which within the ſpace of a week ſo invaded the Members of her whole Body, that ſhe could neither bend her hand or foot or any other part, nor move one jot from the place.

As to the Ætiology or the reaſon of the aforeſaid caſe, this is plain that theſe more grievous Symptoms did wholly ſpring from a ſcorbutick Root; for by reaſon of the Taint being fixed chiefly in the Blood, the ſpontaneous wearineſs, the difficult breathing, and alſo the intermitting Fever wavering and often returning, and other previous and as it were more light Skirmiſhes of Symptoms were induced: further, the lixivial Urine and of variety of Colours, plainly indicated or ſhewed, a Blood corrupted with a ſulphureous Saline dyſcraſie or evil complexion: which kind of Piſs by that means well known, I have taken notice of in ſeveral others affected with the like Diſeaſe. But when the morbid Seed in this ſick Gentlewoman, being plentifully increaſed, and flowing thorow the Maſs of Blood, did ſpread into the confines of the Brain and nervous Stock, the more grievous diſtempers did then ariſe; to wit, the morbifick Matter, conſiſting of heterogeneous and irritative Particles, being depoſited within the Brain, brought in the *Vertigo* and Swimming, or turning round, and the ſpaſmodick or cramplike Diſpoſition; then a Portion of it falling upon the Nerves of the intercoſtal and moving Pair, and being by their paſſages caſt upon the meſenterick Foldings, ſtirred up the ſcorbutick Colick; and when the ſame matter being hugely increaſed, had come to many other Nerves, the painful Diſtempers were propagated almoſt into every part of the Body; for that the acid Recrements like to vitriolick *Stagmas*, being depoſited every where from the nervous Liquor, did incounter with the lixivial Salts, every where alſo poured forth from the Blood: Then laſtly when all the Nerves being by degrees filled and ſtuffed with the morbifick Matter, were ſo much obſtructed that the irradiation of the Spirits and their commerce were hindred, the Palſie followed upon the whole Body. *The Reaſons.*

This Gentlewoman living far from hence, had taken Medicines by the advice of a neighbour Phyſician, uſual againſt the diſtemper of the Colick; notwithſtanding which, when the Diſeaſe grew grievous, the Patient being brought to *Oxford*, made tryal of very many Remedies, both Antiſcorbutick and Antiparalytick almoſt of every kind and form, but without any benefit. Therefore after that every ordinary method of Curing, ſeemed not ſufficient for this Diſeaſe, it was thought good to proceed to great Remedies, and indeed not altogether free from danger: wherefore we adminiſterd to her, as ſick, weak and lean as ſhe was, a mercurial Medicine for ſalivation. The effect of which ſucceeded to wiſh, for the Flux at the mouth being riſen within two *The Cure.*

days, and perſiſting gently for many days without any evil Symptom, brought great eaſe to this Gentlewoman. For the Pains being mitigated, ſhe began to move a little her Members, and to deſire and to digeſt better her Food, and alſo to enjoy quiet Sleep. The Salivation being finiſhed, ſhe took a Decoction of Sarſa and China with Antiparalytick ingredients for a few days; then being carried to the Bath, ſhe there uſed for ſome time the more gentle and temperate Baths, and preſently recovered an indifferent ſtate of Health. All the Winter, ſhe conſtantly took Medicines againſt the Scurvy and the Palſy, and when the following year, ſhe repeated the uſe of the Baths, ſhe grew perfectly well, and afterwards became the joyful Mother of ſeveral Children.

Obſervation. A Man about 40, of a Melancholy temper, labouring for many years with the Scurvy, was wont to be ſenſible of divers and manifold Symptoms of it, at ſeveral times of the year. There appeared about his Thighs Spots and black large marks as if coming of ſtrokes; pains of the Belly, with a Looſeneſs often troubled him; his Urine for the moſt part appeared like Lye, and he almoſt conſtantly had a ſpontaneous wearineſs, a failure of his ſtrength, and a want of Appetite: Beſides theſe ordinary evils, and as it were cuſtomary, he lived obnoxious to moſt cruel Fits of Sickneſs, and thoſe of various kinds. Two years before when I firſt ſaw him, he complained moſt grievouſly of a difficulty in Breathing, as if he were in danger to be choaked, with a trembling of the Heart, with a fainting of the Spirits, and of a conſtant fear of Swooning: Beſides if any of theſe diſtempers in the *Præcordia* ceaſed a little, for the moſt part an heavy giddineſs in the head, and *Vertigo* aſſaulted him. After that he had taken for ſome time Antiſpaſmodick and Antiſcorbutick Remedies mixed together, he ſeemed to be perfectly well; but then within a few weeks he was affected with a nauſeouſneſs and pain about the Heart, with an inflation of the *Hypochondria*; his Urine was little and very lixivial, and ſhortly after the *Abdomen* ſwelled up, and then his Feet and Legs with a great wateriſh ſwelling, ſhewed the ſigns of a growing Dropſy: afterwards the ſame Tumour invaded the fleſh of his Thighs, Arms, and Back alſo: which Diſtemper however though it ſeemed deſperate, was eaſily cured with antiſcorbutick Remedies, with the addition of Catharticks and Diureticks. But yet this remarkable perſon, although he was reſtored to health, did not continue ſo long: for two quarters of the year were ſcarcely paſt but he began to complain of a grievous Head-ach, with a *Vertigo* and a pertinacious waking, and then without any evident cauſe, he was taken with moſt horrid Vomiting: a little while after, his aſthmatical fits, with the trembling of his Heart and ſinking down of his Spirits, returned. Alſo at this time, when he almoſt ſeemed deſperate, he again grew well in a little while, with the uſe of antiſcorbutick Medicines. It plainly appears by this caſe, how many evils the ſcorbutick infection, like to Ferment lying hid both in the Blood and nervous Juice, and as occaſion ſerves, ſpreading abroad its Poyſon, can cauſe; which kind of diſtempers, how horrid and terrible ſoever they ſeem, whilſt they depend only of the Humors vitiated in their Complexion, and that the *Viſcera* are not at all hurt in their Tone or Conformation, are wont to be cured moſt commonly very eaſily, or without much trouble, *viz.* with an antiſcorbutick Method aptly deſigned, both according to the condition of the Patient, and of the Diſeaſe.

Obſervation. A Lady about 25 years of Age, of a ſanguine Complexion, of a ſlender make of Body, of a fair skin and beautiful, had laboured for ſome time with the ſcorbutick diſtemper; for beſides broad ſpots and red ſwellings breaking forth in divers parts of her body, ſhe was wont to be troubled of a long time with cruel pains and torments, chiefly vexing her at nights, ſometimes in her Legs and ſometimes in her Arms: She had often begun to take Phyſick for the Cure, but being with Child was forced to give it over. After her laſt Child, for that ſhe had great fluxes, ſhe remained for many days languiſhing and weak, with difficulty of breathing, and upon any motion breathleſs. Being riſen up after lying in her month, and endeavouring to walk ſhe fell into a moſt grievous *dyſpnœa* or ſhortneſs of breath, with the trembling of the heart and a frequent fainting or ſinking of the Spirits: Being preſently put to Bed, yet trembling and with quick palpitations, ſhe continued ſo for almoſt a whole day; beſides her lower Members as if they had been dead, were altogether ſtiff and cold, and could not be made warm with the applications of warm cloaths or by rubbing: At length the night being almoſt paſt, ſhe found her ſelf better about her *Præcordia*, ſtrong Cordials having been often adminiſtred to her, but there ſucceeded

ed

ed a very acute pain on the top of her Thigh nigh to her left Groin, reaching even down to the Calf of her Leg, and within a few hours a hard tumor reſiſting the touch, poſſeſſed all that ſpace. Being ſent for at this time whilſt the ſick was gaping for breath, a Clyſter being preſcribed and taken, I gave her 12 drops of the Spirit of Hartshorn, in a ſpoonful of the following Julap, ℥ij of the ſame being drunk afterwards. Take of the water of Snails ℥vj, of hyſterical water ℥iiij, of Walnuts ſimple and of Pennyroyal each ℥iij, of Sugar ℥j, of *Caſtor* tyed in a Rag and hung in the Glaſs ℥j. Theſe Medicines were repeated every ſixth hour. I took care to have a large Veſicatory to be applyed to the inward part of her Thigh, then in the evening for that ſhe had continued all this fit without any ſleep, I gave her j grain of *Laudanum*, of the pouder of Pearls vj *gr.* of the Confection of *Alchermes* without Musk ℥ß: She ſlept quietly, and in the morning was very much refreſhed, the pain and tumour of her Thigh were ſomewhat abated, alſo while ſhe lay quiet in her bed ſhe was well at her *Præcordia*, but if ſhe ſat up or turned of one ſide, ſhe preſently ſeemed as if ſhe would expire with the *dyſpnœa* or want of breath. She continued to repeat the uſe of the Hartſhorn and Julap every ſixth hour for ſome days; but becauſe ſhe was oppreſſed with a troubleſome thirſt, and that her Urine was little and the Contents red and high coloured, ſhe took a doſe to ℥vj twice a day of the following *Apozem.* Take of Graſs Roots, Chervil, *Eringo*'s preſerv'd, each ℥vj, of the ſhavings of Ivory and of Hartshorn each ℥ij, of Hartshorn burnt ℥jß, of Raiſins of the Sun ℥ij, 1 cut Apple, of Liquoriſh ℥ijß, being cut and bruiſed let them be boyled in 3 pints of Spring water, to the conſumption of the third part; then add of Whitewine ℥iiij, let it be ſtrained into a Jugg, to which put of the leaves of Scurvygraſs and of Brooklime each *m.* j, of the Salt of Wormwood ℥ij, make an Infuſion cloſe ſhut and warm for 3 hours, being ſtrained let it be kept in cloſe Veſſels: Sometimes every day, ſometimes every other day they gave her Clyſters. By the daily uſe of theſe ſhe ſeemed to be better, ſo that within the ſpace of a Week ſhe was able, being raiſed from her bed, to ſit up in a Chair by the fire ſide for 2 or 3 hours: But if ſhe ſat up a little too long, or did but endeavour to ſtir, ſhe preſently fell into an aſthmatical fit or *dyſpnœa*; ſo that one day having ſtayed ſomewhat longer out of her Bed, having ſuffered a moſt heavy aſſault of the Diſeaſe, ſhe was afflicted with a difficulty of Reſpiration, with a trembling of her whole Body, and continual ſinking of her Spirits: By reaſon of this Relapſe of the ſick Lady, at laſt I being ſent for, gave her 20 drops of the Spirit of Hartshorn with the above preſcribed Julap, and at night a doſe of our *Laudanum*; but when ſhe began to be better about her *Præcordia*, the pains and tumors ſucceeded in her right Thigh and Leg as had happened before in her left: I alſo ordered a Veſicatory to be applyed to that Thigh, and beſides the Remedies hitherto cited, ſhe took twice a day of our Wine of the Juice of Scurvygraſs ℥iiij, with ℥ij of the magiſterial antiſcorbutick water. Beſides I ordered a Purge of our ſolutive Syrup above preſcribed, which ſucceeded ſo well, that I repeated it again within 3 or 4 days. With theſe Remedies ſhe grew well within a Month.

As to the Reaſons of the Symptoms obſerved in the aforeſaid caſe, firſt it is obvious from the ſpots and pains of the Limbs, that the Blood and nervous Juice had been for a good while touched with the ſcorbutick taint, which notwithſtanding lay hid within the aforeſaid humours, as it were ſubjugated and without any ſignal evil, ſo long as they were ſtrong in the vital and Animal Spirits: But after the great hæmorrhage or flux of Blood, when the Blood and nervous Liquor grew weak in their *Craſis* or Complexion, the particles of the morbid ſeed like to ferment, being moved, ſtirred up thoſe terrible diſtempers: That grievous *Dyſpnœa* or want of breath, ſeemed to ariſe from a double cauſe, or a concourſe of a double evil, to wit, becauſe certain pneumonick Nerves being beſet with the ſcorbutick matter, were hindred as to their office of Reſpiration: For from hence there was a neceſſity that the Lungs ſhould be ſwiftly moved, that they might draw the Blood from the heart, and the act of Reſpiration being more weak by reaſon of the Nerves being hindred, it became therefore more ſhort and very laborious: A fit of the *Dyſpnœa* urging, when as the Blood about the *Præcordia* was very much agitated, the extreme parts (which were then almoſt wholly wanting) by reaſon of its abſence grew ſtiff and cold; afterwards when as the Spaſms or Convulſions of the Lungs abated, and that the Blood being greatly imbued with the morbifick matter, which it had there ſupped up, looſned from its ſtagnation, was returned to Circulation, that ruſhing impetuouſly into her Thighs, firſt into her left, then into her right, the other being deſerted and

The Reaſon.

ſo

ſo overflowing its Channels, being extravaſated with the ſerous filth, cauſed that ſudden tumor with the red ſwelling. But by reaſon of the ſhifting of the morbifick matter into the more ignoble parts to and again, the Diſeaſe though it ſeem'd very dangerous, eaſily gave way to Remedies, altering the dyſcraſies or evil diſpoſitions of the humors, and gently carrying away the Reliques of the morbifick Mine.

Obſervation. A Noble Gentleman about 33 years of Age, of a ſanguine Complexion as he ſeemed to be, tall and ſlender, of a very ſharp wit and great underſtanding, although he had exerciſed himſelf very much for a long time in immoderate and unſeaſonable ſtudies, together with an inordinate way of living, yet to that time being freſh and full of vigor, he ſeemed to enjoy a whole mind in a ſound body; a little more than two years before, when he had very much tyred himſelf in dancing a whole night among his Gueſts, in the morning going into a cold Bed in a Chamber ſomewhat moiſt, deſirous of a little Sleep he began to be Sick; for being awaked he fell into great perturbations about the *Præcordia*, with great fainting of the Spirits: After having taken a draught of Wine and ſome Cardiack Remedies, he was ſomewhat better; but by and by he relapſed, ſo that both himſelf and his friends feared all that day a mortal ſwooning or an imminent Apoplexy. But after this Aſſault of the Diſeaſe had paſſed over, he lived after that ſtill obnoxious to daily paſſions of the Heart, and upon any more great error in living, he was wont again to be troubled with moſt grievous fits. Notwithſtanding the uſe of Remedies, the Diſeaſe increaſing upon him within a few Months, it not only infeſted the *Præcordia*, but in the whole habit of his Body, Suffuſions ſometimes of cold, ſometimes of heat, and beſides a *ſtupor* or numneſs, or ſenſe of tingling or pricking, or light and ſudden Convulſions or Contractions in his Limbs were excited: And of late beſides theſe Symptoms ſpoken of already, which although they were very grievous to this Noble Gentleman, yet he was further troubled after a terrible manner with a frequent *Vertigo*, and with diſtractions and decay of the Spirits, that inhabit the forepart of the Brain, inſomuch that he was forced to abſtain from Studies and Political Affairs (to which he was always addicted) yea and from every more ſerious intention of the Mind; for otherways he felt thoſe ſort of perturbations both in the Head and in the Nervous Stock, that made him fear an Aſſault of the aſtoniſhing Diſeaſe, or moſt horrid convulſive Affections: Whilſt he had the more grievous Fits of this Diſeaſe, his Ventricle alſo was diſturbed for the moſt part, but he often received eaſe by Vomit, either by the free aſſiſtance of Nature, or by the help of an emetick Medicine. Hence ſome thought the cauſe of the Diſeaſe, to ſubſiſt altogether about the Stomach or the *Hypochondria*, but Catharticks, Emeticks, Digeſtive, Cephalick, Anti-ſcorbutick, Chalybeate, and other Medicines almoſt of every kind, preſcribed him for two years by the moſt famous Phyſicians, and alſo by Empiricks and Quacks, profited little towards the Cure of the Diſeaſe. Of late having tryed *Aſtrop* waters, he found himſelf worſe for the uſe of them, preſently deſiſting, he was next adviſed to be carried to the ſulphureous waters at *Knaſborough* in *Yorkſhire*, but with what ſucceſs I have not as yet learned.

This caſe becauſe by reaſon of the Concourſe of various Symptoms, it can belong to no other kind of Diſeaſe beſides, is not undeſervedly referred to the Scurvy; for it may be ſuſpected that the procatarctick or Remote Cauſe of this Sickneſs, lay in the evil diſpoſition of the Blood, to wit, that its Liquor was degenerated from a Balſamick and a ſpirituous, into a ſharp and ſulphureous-ſaline, by reaſon of theſe Elements being carried up above meaſure, which indeed ſeems to have happened partly from Errors in living, for that this Noble Perſon being often kept by buſineſs or more ſerious Studies even till Midnight, was wont to ſup at that time, and preſently to go to bed to ſleep: Further, this Diſeaſe did partly ariſe from a ſickly diſpoſition of the Spleen, and perhaps of the other *Viſcera*, ſupplying the Blood with a morbid ferment, neither is it altogether without reaſon, that we judge the Spleen ſhould be accuſed.

The Reaſon. The Blood labouring with the aforeſaid Dyſcraſie, and from thence gathering together heterogeneous Recrements, eaſily poured the ſame on the head, being helped by the evident cauſe: Wherefore when the Brain by reaſon of immoderate and untimely ſtudies, being ſomething debilitated became leſs ſtrong to reſiſt the evils, and when for that occaſion before cited, the bloody Maſs being carried up into a greater ebullition, the pores of the whole Body being by and by ſhut up, it could not be ſo well eventilated, its great ſuffuſion or ſpreading into the head brought

brought on the first manifest sickness, to wit, from the Blood too much heaped up about the Region of the Head, first the swelling up and *Phlogosis* or inflammation of the Face came: Further, from the same at that time impetuously rushing on the borders of the Brain, and there stagnating the heterogene Particles, partly Narcotick, partly explosive, fell down into the Origin of the Nerves, which being so beset with incongruous matter, those perturbations stirred up about the *Præcordia*, (for the Reasons shown in the spasmodick Pathology) did succeed. Further, for as much as the same matter being dilated towards the hinder part of the head, coming upon the Nerves, arising from the spinal marrow, it invaded the extreme passages and processes of them all, and stirred up through the whole Body, a *stupor*, pricking, and the lighter Cramps or Convulsions. Moreover, because the Nerves and their branches compassing about the sanguiferous Vessels, being affected with Convulsions were variously contracted, those sudden diffusions or spreadings of heat and cold, by reason of the Bloods being as it were sometimes restrained with a Bridle, and sometimes agitated forward with a Spur, did arise through the whole Body.

About the beginning of the Disease, because the morbifick matter being suggested from the Mass of Blood, breaking forth first either on the Region of the Cerebel, or if admitted into the Brain, being from thence presently sent forth, it fixed chiefly about the original of the Nerves, therefore the chief taint appeared in the nervous Appendix, and about its exterior processes without any *Vertigo* or previous swimming or Scotomy, or any notable hurt in the chief powers of the Soul: But afterwards by reason of the dyscrasie of the Blood being daily increased, and the constitution of the Brain or *Encephalon* being more weakned, the heterogeneous Particles also breaking through into the anterior Brain, or the regal Palace of the Soul, they brought on both the distractions and meltings or sinking down of the Spirits inhabiting there: So that this Disease after that its Roots being once planted somewhere within the *Encephalon*, did daily shew its intentions, notwithstanding the use of Medicines, as that at first only the original of the nervous wandring pair, and the intercostal were infected, and then afterwards the morbifick matter entred into the processes and interior passages of the other Nerves of the whole Body, which being filled full, at length that being carried by the as yet impure Blood into the Brain it self, it possessed its more noble Cells, which kind of Cephalick Distempers, I have observed to have made the like progress in many, so that it plainly appears these Symptoms excited by such a *Series*, arise by reason of the aforesaid Causes, and not from Vapours supposed to be elevated from the *Viscera* or inwards.

But that a fit urging oftentimes the Ventricle was disturbed, also that it was wont to be suddenly eased by Vomit, it will not be difficult to shew the reasons without prejudice to this *Hypothesis*. As to the first, there is nothing more plain than that the Ventricle is subverted, and that a nauseousness or Vomiting doth succeed, by reason of some grief inflicted on the Origin of the Nerves, as we have at large already declared, then there is more reason for that Vomiting should bring present help: For in the first place, as the Nerves of the wandring pair and the Intercostal are very much shaken, (as it is the manner of the Nervous Parts) they presently remit their inordinations excited from an internal cause, as an itching or pained member is freed from grief if it be scratched or rubbed. But the aforesaid Nerves being greatly shaken together and contracted in Vomiting, they easily shake off the morbifick Matter, fixed to their ends or extremities; by which it comes to pass, that oftentimes a sharp or acid Matter, or otherwise infestous, being heaped up within the first Passages, and there either infecting the Blood, with its hurtful Ferment, or irritating the nervous Bodies into Convulsions, is brought away by Vomit, and so the Fountain or Provocative of the Disease is carried forth.

As to the therapeutick or curatory Method, to be used in this case, and others like it, there are two intentions which are chiefly to be insisted on, *viz.* In the first place to make pure the Mass of Blood, and to bring away the noxious Ferment administred from the Ventricle, Spleen, and other *Viscera*. Secondly, that the Brain and nervous Stock be strengthned, lest they admit of extraneous Particles: and that the nervous Juice watering those parts, degenerating from a right into acetous or otherwise morbid *Crasis*, may be rectified and restored. The first of these are to be performed by Catharticks, Emeticks, Phlebotomy, and cheifly by specifick Medicins, correcting the scorbutick Taint of the Blood, or carrying it quite away: But as to this Iron or Vitriolick Spring, celebrated for the purging the

Blood,

Blood, that they were rather hurtful than helpful to this Gentleman, the cauſe ſeems to be, both for that the Brain being made weak by reaſon of thoſe Cephallick Diſtempers, hardly excluded the filth of the Water ſent from the Blood, but was in danger to be overflown, by its falling more furiouſly upon its Confines; and alſo becauſe when the nervous Liquor degenerating from its *Craſis*, turns ſour, it is wont to be more perverted by the fluid Salt of thoſe purging Waters. Wherefore we have ſtill obſerved, that the drinking thoſe Waters, in a Rheumatiſm and the Gout, hath increaſed the morbid Diſpoſition. The ſecond intention is beſt inſtituted by cephalick Remedies, and chiefly thoſe indued with a volatile Salt, of which ſort are Spirits, and Salt of Blood, Soot, and Harts-horn, of the Roots and Seeds of Peony, the leaves of Miſletoe, *&c.* With which Antiſcorbuticks may be mixed.

FINIS.

How Cured. 41
Viſcera *how in fault breeding the Scurvy.* 9
Vomiting a ſymptom of the Scurvy. 17
Urine red and lixivial a ſymptom of the Scurvy. 2,15

W.

Waking much a ſymptom of the Scurvy. 22
Waters diſtilled good for the ſcurvy. 34,37
Weakneſs ſpontaneous a ſymptom of the Scurvy. 2,12
Whelks breaking out, ſigns of the Scurvy. 16
Wine and Blood compared. 3
What is meant by fretted and ropy Wines. 4
Antiſcorbutick Wine. 34,38

FINIS.

Since nothing could ſo well expreſs the meaning and intention of the Author, as the very *Latin* and *Greek* words uſed in theſe Tracts, we have continued them expreſly, and though in many places I have given their meaning by *Synonymas*, yet for the benefit of the meer *Engliſh* Readers, we have here compoſed a Table Alphabetically of all the hard *Greek* and *Latin* words, uſed in the whole Volume; as alſo of all Terms of Art, and many other words derived from the *Latin* and *Greek*, though uſual among Scholars, yet not frequently known to the vulgar, and therefore we have fully explained them and rendred them intelligible to the meaneſt Capacity in the following Table.

A TABLE of all the hard words derived from the *Greek* and *Latin*, of all Terms of Art and other words not vulgarly received, with the explanation of them.

A

page

ABdomen, *The lower part of the Belly from the Navel downwards.*
Ablution, *A waſhing away.*
Accenſion, *An Inkindling.*
Acceſſion, *A coming to or approach.*
Acme, *The height or top of a thing.*
Acid, *Sharp.*
Acidity, *Sharpneſs.*
Acidulæ, *Medicinal waters running forth from Veins of Iron, Copper, and ſuch like, called* Spaws *from that famous place for Mineral-waters, the* Spaw *in* Germany.
Acrimony, *Sharpneſs or ſourneſs rather.*
Actionoboliſm, *An Irradiation of Beams, or ſhooting forth of the ſpirits like beams of the Sun.*
Aconite, *A venomous poiſonous Herb put for* Libbards *bane.*
Acute, *Sharp, or exceſſive painful, or that is quick and dangerous.*
Aculeated, *Made ſharp and prickly like a Needles point.*
Adhæſion, *A ſticking to.*
Adjuted, *Helped.*
Adventitious, *Coming by accident, or by the by.*
Aduſt, *Burnt or parch'd.*
Aduſtion, *A burning or parching.*
Æquilibrium, *An equal or even poiſe when the Balance ſtands bending neither to the one ſide or the other.*
Æquinox, *When the Sun is in the Equinoctial Line and divides the Day and Night into an equal length, which is about the* 12. *of* March *and about the* 12. *of* September.
Ætherial, *Heavenly or belonging to the Air or Skie.*
Ætiologie, *The rendring of the Cauſe or Reaſon of a thing.*
Affection, *Taken for the natural Condition, and often ſignifies ſickneſs or diſeaſe.*
Affected, *Diſtempered or diſeaſed. Sometimes natural diſturbance.*

page

Affuſion, *A pouring forth of any thing.*
Agaric, *A Drug that purges Phlegm.*
Aggeſtion, *A heaping together of any thing.*
Agitated, *A violent ſhaking or jogging together.*
Alembic, *An Arabic word for a Still uſed by Chymiſts.*
Alexipharmaca, *Medicines againſt Poiſons and Venom.*
Alexiterion, *The ſame, being an Antidote againſt poiſon.*
Alchaliſat, *A ſalt made of the herb* Kali. *Alſo taken and applyed to ſalts made of Herbs and ſhells of Fiſhes.*
Alible, *Nouriſhable, or that nouriſhes.*
Aliment, *Food.*
Alliſion, *A ſtriking or knocking together.*
Aloes, *A juice made out of a bitter herb uſed in purging Medicines, alſo a ſweet wood.*
Amalgama, *A Chymical term for the ſetling and mixture of ſeveral Minerals or Metals, or other things whereby a ſeparation and extraction may be made.*
Ambages, *A compaſſing or going about.*
Ambient, *That invirons or compaſſes one about as the Air.*
Amulets, Pomanders *or* Bracelets *made againſt Witchcraft and Infection and Poiſon.*
Analogy, *Proportion, agreement or likeneſs.*
Analyſis, *The laying open or unfolding of the matter.*
Anatomy, *A diſſecting the Body to ſee the ſeveral parts.*
Anaſarca, *The watry Dropſy ſwelling up the whole fleſh.*
Analeſia, *A ſtupifying diſeaſe that takes away the ſenſe from all parts of the Head.*
Angle, *A Mathematical Term, being the nook or ſpace at the cutting of two lines, and is of ſeveral ſorts. A Corner or nook.*

Anhelous, *Short-winded, or that puffeth for want of breath, that breatheth difficultly.*

Annularie, Annular, } *Ringy, or like Rings.*

Anodynes, *Medicines procuring eaſe from pains by ſleep or other means.*

Anomal, *Irregular, out of order.*

Antaſthmaticks, *Things good againſt the Cough or* Aſthma.

Anterior, *The former.*

Antidote, *A Medicine againſt Poyſon or any other diſeaſe.*

Anticipate, *To go before.*

Antihypnotics, *Medicines given againſt too much ſleeping.*

Antipyreuticon, *A Medicine againſt a Feavour, or a Feaver-Curer.*

Antipyreticks, *Medicines againſt burning Feavers.*

Antiſpaſmodicks, *Medicines againſt Convulſions.*

Anus, *The Fundament or Arſe-hole.*

Aorta, *The great Artery the mother of all the reſt, proceeding from the heart, one branch aſcending, another deſcending.*

Apoplectic, *One ſubject to the Apoplexy.*

Apoplexy, *A Diſeaſe that ſtupifies and takes away ſenſe and motion.*

Apozems, *Decoctions or drinking Medicines made with herbs.*

Appendixes, *Things belonging or depending on another, as the parts about the heart.*

Aquoſity, *Wateriſhneſs.*

Area, *The void ſpace in a figure, as a Triangle or Quadrangle: the plat or floor of any thing.*

Armoniac, *Salt extracted out of ſtones.*

Arteries, *The Veſſels that carry the blood to the heart.*

Arthritick, *Gouty, or belonging to the Gout.*

Arſnick, *Or Orpiment, a poyſonous drug.*

Archeus, *A chief Officer, Workman, or Operator.*

Articulation, *A ſhooting of ſtriggs from the joynts.*

Aſcites, *A kind of Dropſie which ſwells between the skin and the fleſh.*

Aſper, *Sharp, Aſper artery, the wind-pipe.*

Aſſimilation, *A growing or making like.*

Aſſimilate, *To grow or make like.*

Aſthma, *A troubleſom diſeaſe, when the lungs being ſtopped, one cannot take breath.*

Aſthmatical, *Belonging to that diſeaſe, or troubled with it.*

Aſtringent, *Binding.*

Ataxias, *Diſorders, irregularities.*

Atoms, *Small little Bodies, ſuch as Motes in the Sun-ſhine,*

Atrabilous, Atrabilary, } *Belonging to the black Bile or melancholy, or to the melancholic humour.*

Atrophie, *A Diſeaſe cauſing a pining away, or a waſting, or Conſumption of the fleſh.*

Attrition, *A knocking, or bruiſing, or rubbing together.*

Auditory, *An Aſſembly, or thoſe who hear.*

Aurum fulminans, *Or Thundering Gold, a metal prepared by Chymical Art, that being heated goes off like a Gun with a Thundring noiſe.*

Auſtere, *Biting, harſh.*

Axillarie, { Vein *is a branch of the* Vena Cava *coming thorow the arm-hole from the channel bone deſcends into the in ſide of the arm.* Artery *ſprings from the left ſide of the* Aorta *above the heart, and aſcending obliquely thorow the arm-holes, and thence ſending branches into the upper ribs, ſhoulder & chanel bone, it deſcends down to the bowing of the Elbow.*

Azygos vein, *is a branch of the upper Trunk of the* Vena Cava, *ariſing on the right ſide.*

B

Balneum Mariæ, *Is a way of diſtilling with a Glaſs-belly, holding the Ingredients put into a Veſſel of water, and ſo fire being made under it, it diſtils with the heat of the water.*

Balſamic, *Balſamie, or belonging to Balſam.*

Baſilick Vein, *A large Vein into which the* Axillarie *Vein is carried, called alſo the* Liver vein. Back vide: Tabe dorſali —

Baſis, *The foundation or foot of a thing.*

Bechicks, *Medicines againſt the Cough.*

Belly, { *Upper, the head ſo called.* *Middle, the region of the ſtomach.* *Lower, The parts below the Midriff, containing the Inteſtines.*

Bezoartick, *Belonging or made of the pretious ſtone* Bezoar.

Bezoar, *A pretious ſtone brought out of the* Indies *very Cordial.*

Bile, *Choler.*

Bilary, *Belonging to Bile or Choler, ſometimes applyed to the Veſſel containing the Choler.*

Bipartite, *Divided into two parts.*

Bolus, *Is a Medicine made up into a thick ſubſtance to be ſwallow'd not liquid, but taken on a Knives point.*

Botanick, *Pertaining to herbs or herbie.*

Brachial, *Belonging to the Arm.*

Bronchia, *The griſtly parts about the Wind-pipe.*

Bubos, *Filthy ſwellings about the groin.*

C

Cachexia, *An evil diſpoſition of the Body when all the nutriment turns into evil humors.*

Cachectical, *To ſuch evil ſtate or diſpoſition belonging, or one troubled with ſuch evil diſpoſition.*

Cacochymical, *Full of evil and bad juyce in the body, or of very ill digeſtion.*

Callous, *Hard, fleſhy and brawny.*

Calx, *Aſhes, Lime, ſometimes taken for the remaining*

maining parts of things Chymically drawn off.

Capillaments, *Small hairy threds of the Nerves.*

Caput mortuum, *The dead head, being the laſt thing remaining after ſeveral Chymical extraction and good for nothing but to be flung away, all vertue being extracted.*

Carbuncle, *A red fiery ſore; a Plague-ſore.*

Cardiack, *Cordial, or belonging to the Heart.*

Carotides, *Two Arteries which ariſing out of the Axillary Artery, are carried thorow the ſide of the Neck upwards into the Skull.*

Carthamums, *A little ſeed uſed in Medicines.*

Caruncles, *Little pieces of fleſh.*

Cartilage, *Is a griſtle or tendril, a ſubſtance ſomewhat ſofter than a bone, and harder than a Ligament.*

Cartilaginous, *Griſtly or belonging to, or full of ſuch griſtles.*

Caſſia, *A ſweet ſhrub like Cinamon, alſo a drug that purgeth.*

Cataplaſm, *A Poultis or aſſwaging Plaiſter.*

Catarrh, *A great Rheum falling from the head into the mouth.*

Cathartic, *A purging Medicine.*

Cava vena, *The great Liver-vein going thorow the Body.*

Cavity, *Hollowneſs.*

Cauſtic, } *A Compoſition made to burn a hole in*
Cautery } *the skin and fleſh to make Iſſues.*

Celiac veſſels. *Veſſels belonging to the Belly.*

Celebrated, *Performed or done.*

Cephalalge, *The Head-ach.*

Cephalic, *Belonging to the head, a medicine proper for the head.*

Cephalic vein, *Which ſpringing out of the Axillary vein, paſſes between the firſt and ſecond muſcle of the ſhoulder, and ſo paſſes evidently into the Arm.*

Cephalic arterie, *Conſiſts of two branches which ſpringing out of the great Artery, aſcend up into the head.*

Cerebel, *The hinder part of the Brain from whence the Nerves proceed that ſerve to the vital function.*

Cervical, *Belonging to the Neck.*

Chalybeat, *A medicine made of prepared Steel, or belonging to Steel.*

Characteriſtical, *The notes, ſigns or figures belonging to a Character.*

Chlorotis, *The Green-ſickneſs, or the Virgins diſeaſe.*

Choleduc veſſels, *The veſſels that hold and ſend forth the Gall.*

Chorodeidal, *Belonging to the Net, like to the infoldings about the Brain.*

Chyle, *Is the juyce or ſubſtance of the meat digeſted.*

Chylification, *The making of Chyle.*

Chyme, *Is the juyce of the meat further digeſted.*

Chronical, *Long and tedious diſeaſes.*

Circumpulſion, *A driving about.*

Claſſes, *Forms or Orders.*

Coalition, *Nouriſhment.*

Coagulation, *A curdling like milk, a turning into a Curd, or a ſeparation of the parts like Curds and Whey.*

Coagulum, *Any thing that cauſeth ſuch a curdling as Rennet.*

Coagulated, *Curdled.*

Coction, *Boyling or ſeething, alſo digeſtion.*

Cohobation, *A dreyning or pouring off from a ſettlement.*

Coindications, *Things to be conſidered with the diſeaſe, alſo ſigns beſides the diſeaſe it ſelf.*

Colcothar, *Droſs of mettals.*

Colical, *Belonging to the diſeaſe called the Colick.*

Colliquation, *A melting together.*

Collation, *A comparing or coupling together.*

Collated, *Compared or coupled together.*

Colliſion, *A ſtriking or knocking together.*

Colocynthida, *Or Coloquintida, a bitter purging Gourd or Apple.*

Colon, *The fifth Gut, or that great Gut in which is ſeated the diſeaſe, called the Colick.*

Colluvies, *A filthy heap of any thing.*

Commiſſures, *The joyning or joyning together of things, as of the skull bones.*

Complication, *A folding together.*

Conarium, *A Kernel ſticking to the outſide of the Brain in the form of a Pine-apple.*

Concatenation, *A chaining or joyning together.*

Concatenated, *Joyned, tyed, or faſtned together.*

Conflagration, *A burning out, or being in a flame, as in great Feavers.*

Conformation, *The framing, faſhioning, or diſpoſition of a thing.*

Congelation, *A freezing or gathering together into an hard ſubſtance, as Ice of Water.*

Congeled, *Frozen, ſtifned.*

Congeſtion, *An heaping or gathering together.*

Conjugation, *A yoking together, a derivation of things of one kind.*

Conſiſtency, *Thickneſs or ſubſtance, as a Jelly.*

Convolutions, *Roulings about, or together, a twiſting together.*

Contexture, *A weaving together, or a framing or compoſition.*

Copula, *A joyning or faſtning together, fettering.*

Corollary, *Addition, vantage, or overplus.*

Corroſive, *Knawing, eating corroding.*

Corrugations, *Wrinkling together.*

Cortex, *The bark, ſhell, or piel, or rind.*

Cortical, *Belonging to the bark, or rind, or piel of a thing.*

Craſis, *The diſpoſition, complexion, temperature or mixture of natural humors.*

Craſs, *Thick.*

Craſſament, *A thickneſs or thick ſetling, as of dregs.*

Pharmaceutices Sect: 1. Cap. VI.

Cough or Could. 38 Tincture—

Cribrous, *Sivelike, or that hath holes like a Sive.*
Crude, *Raw, undigeſted.*
Crudities, *Raw and undigeſted humors, or rawneſs, or indigeſtion of any thing.*
Criſis, *Is the time of the turn of the diſeaſe when it either increaſes or diminiſhes, always obſerved by the Phyſitians.*
Critical, *To the Criſis, or ſuch time belonging.*
Cremaſteral, *Muſcles belonging to the Teſticles.*
Crural, *Belonging to the Leg.*
Crucible, *An earthen Veſſel uſed to melt Metals with.*
Cucurbite, *A Glaſs-body with a great Belly, uſed in diſtillations.*
Cuneform, *Wedg-like or in form of a Wedg: a bone ſo ſhap'd.*
Cutaneous, *Belonging to the skin, or skinny.*
Culinarie, *Belonging to the Kitchin.*
Cuticula, *The little thin skin under the Cutis or the upper skin.*
Cutis, *The upper or outward skin of the Body.*

D

Dead head, *The ſame with* Caput mortuum.
Decapulation, *A pouring off.*
Defection, *A failing, weakneſs or infirmity.*
Decoction, *A boyling or ſeething.*
Defecated, *Made free from dregs.*
Deflagration, *A flaming or burning forth.*
Deliquium, *As of the ſalt of* Tartar, *a clear draining, alſo a ſwooning away, or a failing of the ſenſes.*
Delirium, *A raving madneſs, as in Feavers.*
Deltoides, *A muſcle in the top of the Arm, having the figure of a* Delta, *the* Greek *D.*
Demerſed, *Drowned.*
Depauperated, *Made poor or waſted.*
Depraved, *Corrupted or marred.*
Depurated, *Cleanſed from dregs.*
Depuration, *A cleanſing or making pure.*
Deſultory, *Leaping, wavering or inconſtant.*
Diabetes, *The Piſſing evil, a diſeaſe that cauſeth the party troubled therewith almoſt continually to piſs, and in a great quantity a clear and ſweetiſh water.*
Diacodium, *A Syrup to procure ſleep, made of the tops of* Poppy.
Diagnoſis, *Dilucidation, or Knowledg.*
Diagridium, *See* Scammony.
Diaphoreſis, *Evaporation, as by ſweating.*
Diaphoretic, *That cauſeth Evaporation, or ſweating forth of humors.*
Diaphanous, *Clear and ſplendid.*
Diaphragma, *The Midriff that ſeparateth the Heart and Lights from the ſtomach.*
Diapneon, } *A breathing forth.*
Diapnoe, }
Diarrhœa, *A looſneſs of the Belly, without inflammation, a Lask.*
Diaſcordium, *A Cordial medicine made of* Scordium *and other Ingredients.*
Diaſtole, *The riſing up of the Heart or Artery, the contrary motion of Syſtole.*
Diatheſis, *The affection or diſpoſition,*
Diluted, *Rinſed or waſhed.*
Dilucidation, *An explaning or clearing.*
Dioptric, *Belonging to the Perſpective, or a Mathematical Inſtrument, thorow which they look to take the height of a thing.*
Divarications, *A varying or ſevering into parts running up and down, as the Veins and Nerves.*
Diverſory, *A diverting place, or a place to turn of one ſide out of the way.*
Diureſis, *Evacuation by Urin.*
Diuretick, *A Medicine that cauſeth evacuation by Urin.*
Dogmatic, *Stiff in Opinion.*
Duodenum, *The firſt Gut or Inteſtine of twelve fingers long.*
Dura mater, *The hard membrane or tunicle that encompaſſeth the Brain next the skull.*
Dyſcraſie, *Intemperature, as ſome humor or quality abounding in the Body.*
Dyſentery, *A flux of the Belly that corrodes the Bowels and often cauſes blood, called then the* Bloudy flux.
Dyſpathy, *A contrariety of affection.*
Dyſpnœa, *A purſineſs or ſhortneſs of breathing, and a ſtopping of the Conduits of the Lights.*

E

Ebullition, *A boiling up.*
Eccentric, *Without Centre.*
Eccathartic, *Not purging.*
Eccritic, *Not critical*
Edulcorated, *Made ſweet.*
Effervency, } *A being very hot or inflamed.*
Efferveſcency, }
Effluvia, *Things that flow out of the Body, as ſteam and breath thorow the pores of the skin.*
Egeſtion, *A caſting forth as ordure from the Body, or any excrementitious humor.*
Egritude, *Sickneſs or not being well.*
Elaſtick, *That goeth off with a force like Gunpowder, or ſpreads forcibly forth with a jerk.*
Elaterium, *A violent ſtrong purging Medicine.*
Elixation, *A boyling.*
Elixir, *An* Arabian *word for Quinteſſence, high Cordials ſo called.*
Elogie, *A report in praiſe or diſpraiſe of a thing.*
Emanations, *Things that flow or proceed from the Body or its parts; flowing forth.*
Embryo, *The Child before it hath perfect ſhape in the Mothers womb.*
Emiſſaries, *Places that ſends forth any thing as the ſinks of the Body.*
Empirical, *Belonging to an Empirick or of knowledg in Phyſick, got by practice only.*
Empiric, *Such a Phyſitian who hath no judgment, but has all his skill from practice, or by experiments.*

Empyema,

Empyema, *An Impoſthume or collection of corrupt matter with inflammation between the breaſt and the Lungs,*

Empyreuma, *A ſmatch or taſte of the fire, as burnt too, or as in moſt waters newly drawn off by diſtillation.*

Emulgent, Emulging, *Veſſels or Arteries, or Veins: two large Arteries ſo called ſpringing out of the great Artery, which being carried near to the back bone are inſerted into the Reins. Alſo two large Veins which ſpringing out of the* Vena Cava, *under the Ventricle, are carried into the Kidneys.*

Emunctories, *Sinks or cleanſing places for the Body.*

Encephalon, *The head and all its parts.*

Enema, *A Cliſter.*

Energy, *The force, or operation, or virtue of a thing.*

Enervation, *Unnerving, or a looſing of the ſtrength, a weakning or making feeble.*

Enthymiama, Enthymeta, *Medicines uſed to expreſs the flowing of the Blood or other humors to any place.*

Ephemera, *Things of a days laſting: a ſhort Feaver of a day.*

Epidemical, *General, univerſal, publick.*

Ephidroſis, *A ſudden ſweat beginning about the head and breaſt paſſing over the Body, unprofitable and of ſmall uſe for that Evacuation of the diſeaſe: ſometimes taken for ſweating.*

Epigaſtric, *Belonging to the* Epigaſtrium.

Epigaſtrium, *The ſame with* Abdomen, *or the outward part of the Belly, from the Navil to the privy members.*

Epilepſie, *The Diſeaſe called the* Falling-ſickneſs.

Epiphyſis, *Is an addition of ſome bone of a different deſcription to the true bone to which it is annexed: an addition or augmentation.*

Epiſpaſticks, *Certain Medicines uſed for the drawing forth of ulcerous matter.*

Epithema, *Moiſt Medicines uſed to bathe or foment the parts affected.*

Epithymum, Dodder of Time, *uſed to purge Melancholy.*

Equinox, *When the day and night are of an equal length, about the twelfth of* March, *and the twelfth of* September.

Eradicated, *Rooted out.*

Erratic, *Creeping, wandring, or ſtraying.*

Eſcharotic, *A Plaiſter or Salve to heal up a wound, and to bring it to a Cruſt.*

Etymologie, *The true Expoſition or interpretation of a thing.*

Evident, *Plain, clear, manifeſt.*

Eventilated, *Fannowed, or that receives wind.*

Euphorbium, *The Gum of a certain Tree ſo called.*

Excandeſcency, *A growing very hot and burning.*

Excern, *Thruſt out, to purge, or ſift forth.*

Excrementitious, *Belonging to Excrements: filthy, polluted.*

Excretion, *Avoiding the Excrements, or ſuperfluities of the Body.*

Excretory, *To ſuch a thing belonging, that puts forth the excrements of the Body.*

Excreſcences, *Things that grow forth out of the Body, or any other thing beſides the Body, or thing, as Warts or pieces of fleſh.*

Exert, *To ſhew or put forth.*

Exitition, *A ſparkling, boiling, bubling, or leaping up, or forth.*

Exonerate, *To disburden, or diſcharge, to purge forth.*

Expanſion, *A ſtretching forth, ſpreading abroad, or inlarging.*

Expanſed, *Spread out at large, or ſtretched forth.*

Expatiated, *A running forth or about, enlarged.*

Exploſion, *A driving forth with violence.*

Exploded, *Thruſt forth, or driven out.*

Extravaſated, *Put, or let forth of the Veſſels as Blood out of the Veins.*

Extraneous, *Strange, or of another kind.*

Extirpated, *Rooted out, or plucked up by the Roots.*

Extricated, *Delivered, or unintangled.*

Exuberances, *Swellings forth, or riſings up, in the fleſh or other parts.*

F

Fœces, *Dregs.*

Fœculencies, *Dregs or ſettlements.*

Farciments, *Stuffings or fillings of any thing.*

Fermentation, *A fermenting or working, like leaven.*

Fibrils, *Little ſmall ſtrings of Fibres, or of the Nerves or Veins.*

Fibres, *The hairy ſtrings of the Nerves and Veins.*

Fibrated, *That has ſmall and hairy ſtrings.*

Filaments, *Little, thin, ſlender Rags like threds, ſuch as appear in Urin.*

Filter, *To ſtrain: A Strainer.*

Fiſſures, *Clefts, chaps, or diviſions.*

Fiſtulous, *Belonging to a Fiſtula, or ſore running Boil.*

Flatulent, Flatuous, *Windy or full of wind.*

Fluor, *A Flux.*

Fluid, *Flowing or running.*

Fluidity, *Apt to flow, flowing or wetneſs.*

Fornix, *An hollow place in the Brain, bending like an Arch.*

Forum, *A place in* Rome *where Judgments were given, and Cauſes decided.*

Friable, *That may be rub'd to pouder between the Fingers.*

Frictions, *Rubbings.*

Fuliginous, *Sooty, or belonging to Soot.*

Functions, *The Exerciſes or diſcharging of ſome Offices.*
Fuſe, *To melt as Metals.*
Fuſed, *Melted or running, as Metals made liquid.*
Fuſion, *A pouring forth, alſo a melting of Metals or other things.*

G

Ganglia, *Things like the heads of* Muſhrumps *in the Body.*
Ganglioform, *Of the ſhape of* Ganglias, *or the heads of* Muſhrumps.
Galen, *An ancient learned Phyſitian.*
Gargariſms, *Medicines to cleanſe the mouth and throat, and to waſh them from filth.*
Geneſis, *Beginning, Nativity, or Generation.*
Genuine, *True or natural.*
Germination, *A ſpringing or budding, or ſprouting forth, as of Trees in the Spring.*
Geſticulation, *A wanton moving up and down of the Legs and Arms or other parts of the Body, like a Tumbler or Mimick.*
Glandulas, *Are little round Kirnels every where up and down in the fleſh and other parts.*
Glutæi, *Muſcles of the Thigh.*
Gonorrhea, *The running of the Reins, a flux of ſeed or matter at the privy parts of man or woman.*
Grumous, *Clottery like blood when congealed.*

H

Hæmorrage, *An exceſſive flux of Blood at the noſe or elſewhere.*
Halos, *A Circle about the moon or ſtars.*
Hellebore, *The root of an herb uſed in Phyſick, two ſorts, white and black.*
Hepatic, *Belonging to the Liver, and a Medicine proper to cure the diſeaſes of the Liver.*
Hermodactils, *Or Mercuries finger, white and red, uſed in Medicines.*
Heterogeneous, *Of an other kind or Genus, ſtrange, not agreeing.*
Homogeneous, *Of the ſame kind or Genus, agreeable, and ſorting.*
Horizon, *The Circle of the Firmament, terminating our ſight.*
Humid, *Moiſt, wet.*
Hydropic, *That hath the Dropſy, or belonging to the Dropſy.*
Hydrotic, *A Medicine evacuating watery humors.*
Hydragogues, *Medicines that will draw forth the watery humor of thoſe who have the Dropſy.*
Hyoeides, *A forked bone like the letter* Y, *ſo called of the* Anatomiſts, *conſiſting of divers ſmall bones which are the ground or foundation of the muſcles of the* Larynx, *and the Tongue and helps to breathing, and ſwallowing down meat and drink.*
Hypercatharſis, *Over-purging, or in extream.*
Hypochondria, *The* Præcordia: *the forepart of the Belly and ſides about the ſhort Ribs and above the Navel, under which lieth the Liver and the ſpleen.*
Hypochondriac, *A windy melancholy bred in the* Hypochondria, *from whence a black phlegm ariſes that infects and troubles the mind, one troubled with ſuch melancholy.*
Hypnotic, *A medicine that cauſes ſleep.*
Hypogaſtrium, *The lower part of the Belly, which reaches from the Navel downwards to the privy parts.*
Hippocrates, *A learned ancient Phyſitian, and the firſt methodizer of Phyſick, and made it Artificial.*
Hippocrates ſleeve, *A long woollen, ſtraining-bag ſharp at the bottom, ſo called, being almoſt in faſhion of a ſleeve or Dublet.*
Hypotheſis, *An argument or matter about which one may diſpute.*
Hypoſtaſis, *A ſubſtance or ſettlement, ſuch as is in the bottom of an Urin.*
Hyſterical, *Belonging to the womb or mother, or troubled with the diſeaſe called the* Mother.

I

Jalap, *A purging Drug.*
Ichor, *The matter or corruption running forth of a ſore, or Ulcer.*
Idiocraſie, *The proper diſpoſition or temperament of a thing or Body.*
Idioſyncraſie, *The property of the temperament of Bodies.*
Idiopathic, *Belonging to the proper paſſion of a diſeaſe, thing or body.*
Idiopathy, *The proper paſſion of a diſeaſe.*
Idea, *The form and figure of a thing conceived in the Imagination.*
Ilion, *The third Gut from the Ventricle, wherein the digeſted food or Chyle waxing thicker begins to reſt; the thin Gut or ſmall Gut.*
Iliack, *Belonging to the Colick: the Colick in extremity. Iliack paſſion.*
Imbecillity, *Weakneſs, feebleneſs.*
Impervious, *That cannot be paſſed or gone thorow.*
Impetigo, *A certain kind of dry Itch or ſcurf like the Leproſy.*
Impetuous, *Violently or with force, as it were ruſhing upon a thing.*
Impregnated, *Filled full with the vertue of a thing, as when any thing is infuſed in a liquid body, communicating its vertue to it.*
Inanition, *Emptineſs.*
Incitement, *A ſtirring up or provoking.*
Indication, *A ſhewing or manifeſting by ſign.*
Indomitable, *Untamable, that cannot be ſubdued.*
Inflated, *Blown or puffed up as a Bladder with wind.*

Ingeſtion, *A putting or pouring into a thing, as meat and drink into the ſtomach.*
Inguinal, *Belonging to the Groin.*
Inordinations, *Diſorderings, irregularities, or out of order.*
Inſipid, *Without taſte or ſmack.*
Inſpiration, *A blowing in, or a drawing in of the breath.*
Intenſe, *Strong, violent, great.*
Intercoſtals, *Between the Ribs, Nerves, ſo called, becauſe deſcending from the Brain, they run between the Ribs, and ſo deſcend to the Inwards.*
Internodia, *Between the joynts or knots, as the ſpaces in a Ratoon Cane between the joynts or knots.*
Internuncius, *A Meſſenger that goes between.*
Interſtitia, *The ſpaces between other diſtances as the ſpaces between the Ribs, or the joyntings of the back-bone.*
Inteſtines, *The Entrails or the Guts.*
Intrinſical, *Inward.*
Inverſe, *A turning inſide out, or outſide in, upſide down, quite contrary.*
Inverted, *Turned wrong-ſide out or upſide down, quite changed from its natural ſcituation.*
Involuntary, *Not with the will, unwilling.*
Irradiation, *A beaming forth or lasting forth beams like the Sun. Sometimes applyed to the ſpirits beaming themſelves forth, or running forth from their Centre like beams.*
Irrigation, *A watering, wetting or moiſtning.*
Irritate, *To provoke, anger or ſtir up.*
Irritated, *Provoked, anger'd, or ſtirred up.*
Iſchuria, *The diſeaſe of the Bladder, the ſtoppage of the Water, when it cannot come forth but by drops and with pain.*
Iſchuretical, *One ſo troubled with that diſtemper.*
Jugular, *Belonging to the Throat, the Throat-vein and Artery.*
Julap, *A cooling Cordial, or a mixed Potion to cool and refreſh the heated ſpirits, uſed in Feavers.*

L

Lactiform, *Like milk, or in the form of milk.*
Languor, *Feebleneſs, failing or decay of ſtrength fainting, or weakneſs of ſpirits.*
Larynx, *The top of the Aſper Artery or the head thereof, which reacheth up to the Mouth or Jaw, which with the bone* Hyoides *joyned thereto, ſerves for breathing and forming of the voyce, or the air into articulate ſounds.*
Laſſitude, *Wearineſs and irkſomneſs.*
Lateral, *Belonging to the ſide.*
Latex, *Liquor or Juyce of any ſort in the Body.*
Laudanum, *A Medicine uſed by Phyſitians to cauſe reſt, given in difficult Caſes.*
Lienary, *Belonging to the Spleen.*
Leipothymy, *A ſwouning or fainting away of the ſpirits.*
Lethiferous, *Deadly, that cauſeth death.*
Leucophlegmacy, *The kind of Dropſy that riſeth of white phlegm throughout all the Body, and makes the fleſh ſpongy.*
Ligature, *A band or ſtring bound hard about the Arm, Leg, or any other part of the Body.*
Limature, *The pouder or duſt that cometh of fileing, the fileings of ſteel or other metals.*
Limpid, *Clear, pure, and bright like Water.*
Linctus, *A Medicine that is to be lick'd with the Tongue.*
Liniments, *Ointments.*
Lixivial, *Belonging to Lie made of Aſhes.*
Lobes, *Lappets, or ſuch as the Liver is diſtinguiſhed into.*
Lochia, *All that comes away from a Woman after ſhe is brought to bed.*
Locomotive, *That moves from place to place.*
Lucophlegmacy, *See* Leucophlegmacy.
Lumbary, *Belonging to the Loins.*
Luxuriat, *To grow rank or abound.*
Lymphic, Lymphatic, *Veſſels: that carry or contain the wateriſh humors of the Body.*
Lympheducts, *Water-Carriers, or Conveyors, the ſame ſort of Veſſels which carry forth the wateriſh humors.*

M

Magma, *The blended dross and faeces of ſeveral Metals, as alſo of Chymical Extractions.*
Mammillary, *Proceſſes in the Temples, Bones hanging down like broken brows of Banks repreſenting the faſhion of Teats and Cows Udders.*
Manſorius, Maſſoterie, *A Muſcle, which ſpringing up circularly from the Throat-bone of the upper Jaw, moveth the nether Jaw.*
Mandible, *The Jaw wherein the Teeth are ſet.*
Maſtic, *A certain medicinal Gum.*
Maſticator, *The Pipe or Conduit that conveys the pituitous matter out of the Head into the Mouth.*
Matrace, *A Veſſel uſed for Chymical Diſtillations.*
Maturation, *A ripening.*
Maxillary, Maxillar, *Belonging to the Jaws.*
Mechoacan, *A purging Drug brought from the Indies.*
Meconium, *The juice of the Leaves and heads of* Poppy.
Medaſtinum, *Or* Mediaſtinum: *the thin membrane that divides the middle belly or the Breaſt, from the Throat to the Midriff into two boſoms or hollows: one on the right ſide, the other on the left,*
Medullar, *Marrowy, or belonging to the marrow or pith, or the white ſubſtance of the Brain.*
Membranes, *The little thin skins joyning the bones and ſinews together in ſeveral parts of the body: the upper thin skins of any part.*
Meninges, *The thin skins that enwrap the Brain,*

both of the pia mater & dura mater: one called the hard, the other the ſoft Meninx.

Menſtruum, A preparation made by Chymiſts to diſſolve metals, alſo to extract tinctures and the virtues of medicinal druggs, woods, flowers, herbs, &c.

Meſentery, A certain thick fat skin, or the double skin that faſtens the bowels to the back, and each to other.

Meſeraic, Veins ariſe, or are rather incloſed in Meſentery, being branches of the great vein, by which the Guts are nouriſhed, and the juice of the meat concocted, is conveyed to the Liver to be made blood.

Mercurie, Quick-ſilver, and its preparations of it.

Metaphyſical, Supernatural; things of ſublime ſpeculation beyond nature.

Metaſtaſis, Is tranſlation, or when a diſeaſe removes out of one place into another.

Metatheſis, Is tranſpoſing, the puting of one thing for another.

Miaſm, Infection or taint.

Microſcope, A Perſpective-glaſs to behold minute, and very ſmall bodies, a Magnifying glaſs.

Millepedes, The hundred-feeted Creature, and Heſlog-ſows, or Hog-lice.

Mirabolans, A certain medicinal fruit brought out of the Indies.

Modification, A meaſuring or bringing into meaſure.

Morbid, } Sick, corrupt, filthy, or naughty.
Morbifick, } That cauſeth the Sickneſs or diſeaſe.

Mucilage, Thick boiling up of a thing to a gelly, or thick conſiſtency.

Munited, Defended or fortified.

Muſcles, Parts of the body that ſerve for motion, ſofter and more fleſhy than the ſinews.

Muſculous, Full of Muſcles, or belonging to the Muſcles.

Myologie, The doctrine of the Muſcles.

N.

Narcotick, Stupifactive, or that makes the part ſenſleſs.

Nates, Two prominences in the brain, ſo called becauſe in the form of Buttocks.

Natiform, In the form of a Buttock.

Neoterics, People or men of late times.

Nepenthe, A drink to drive away melancholy.

Nephritis, A pain in the reins of the back, alſo the Stone or Gravel in the Reins.

Nephritic, One troubled with the pain in the Reins.

Nerves, Are the ſinews which convey the ſpirits that ſerve for life and motion through the whole body.

Neurologie, The doctrine of the Nerves.

Nitre, That as is uſually called Saltpetre: A ſalt taken out of the earth.

Nitroſulphureous, Nitre mix'd with Sulphur, or of a nitrous and ſulphureous nature or quality.

O.

Oblique, Croſs, traverſe, a ſlope not ſtrait or right.

Oblong, Longiſh or ſomewhat long.

Oeconomie, A certain order of doing any thing, an houſhold rule, regiment or governance.

Oeſophagus, The mouth of the ſtomack.

Olibanum, An outlandiſh Gum.

Opiologie, The doctrine of Opium.

Opium, Made up of the juice of wild poppie, uſed to ſtupifie and bring into a ſenſleſs ſleep.

Opiats, Medicines made of Opium for ſome part of its ingredients to cauſe ſleep and eaſe for pains.

Optic, Belonging to the ſight, as the Nerves that bring the virtue of ſeeing to the eyes.

Opopanax, The juice made of a certain herb.

Ophthalmic, A medicine to cure the diſeaſes of the eyes.

Orgaſm, Rage or fury.

Orifice, The hole of a wound, or the mouth of any thing.

Origine, Beginning, riſe or birth of a thing.

Orbicular, Of a round form or ſhape.

Orthopnœa, Is ſuch a ſtraitneſs of breath, that one cannot breath, or fetch breath without ſtretching out of the neck, or holding it upright.

Os Pubis, Is the bone at the bottom of the belly, juſt above the privie member.

Os Sacrum, Or the ſacred bone, is the great bone upon which the end of the ridge or back-bone reſteth.

Oviparous, Egg-bearing Creatures, or that lays Eggs.

P.

Panacea, All-heal, or a plaiſter or medicine to heal all things.

Pancreas, Called in an Hog the Sweet-bread. It is a remarkable kirnel placed below the Ventricle, and ſerves for a diviſion of the Vena porta, as alſo to defend the Ventricle from touching the back.

Papillary, Belonging to the Teats, or like paps or teats of a dug.

Papillæ, Little paps, or little pieces of fleſh in the body, ſo called of the ſhape of paps.

Paracentiſis, Is an inciſion made to draw forth the water from thoſe ſwelled with the Dropſie, vulgarly called a Tapping.

Paracelſus, A famous Dutch Emperick.

Paradox, A thing contrary to the common opinion.

Paralytick, That is troubled with the Palſie.

Parallel, Equal, alike, like a line drawn to write by another.

Parenchyma, The ſubſtance of the Liver, Spleen, and Lights, ſuppoſed to be made up of congealed thick blood, therefore ſo called.

Parotida, Parotides, *The two chief Arteries and Veins on the right and left side the throat, going up towards the ears.*

Parotid, *To them belonging.*

Particles, *Little parts or portions of any thing.*

Paroxiſms, *Fits, or the returns of fits, as of an Ague or Feavour.*

Pathetic, *To paſſion belonging, Nerves ſo called by Dr.* Willis.

Pathologie, *The doctrine of the paſſions, alſo as Ætiologie,*

Pathognomic, Pathognotic, *That moveth the affections, or that properly belongs to the thing.*

Pepaſmus, *A kind of a concoction of the humors in the diſeaſe.*

Percolation, *A ſtraining thorow.*

Pericardium, *The thin skin or membrane covering the whole heart like a caſe.*

Peritonæum, *The inner skin or rim of the belly joyned to the Caul, wherewith all the Intrails are covered, called by the Anatomiſts* Siphach.

Peripneumonia, *An Inflammation or Impoſtum of the Lungs, with a ſhortneſs of breath.*

Periſtaltick, *Motion, a certain motion compaſſing about, as in certain Convulſions.*

Perſpiration, *Breathing thorow, as ſweat through the pores of the body.*

Perturbations, *Diſturbings, vexing troubles, diſturbances.*

Pervious, *That many be paſſed through, or that has a paſſage or way through it.*

Peruvian, *Belonging to the Country of* Peru, *as* Peruvian *Balſom thence brought.*

Pharmacy, *The Medicines of the Apothecaries; or the art of making them up.*

Pharmaceuticks, *The part of Phyſick that cureth with Medicines.*

Phænomena, *Appearances of things.*

Philonium, *A Confection made of many ingredients compounded together.*

Philtre, *A potion to cauſe Love, or poyſonous Medicines that operate magically, or not naturally.*

Phlebotomie, *Letting blood, or opening of a Vein.*

Phlegmon, *An Inflammation of the blood, with a red ſwelling.*

Phlegoſis, *The like Inflammation fiery red.*

Phthiſis, *The Conſumption of the Lungs, with a waſting away,*

Phthiſic, *Belonging to that diſeaſe, or that has it.*

Phyſiologie, *The reaſoning of the Nature of a thing, or the ſearching it out.*

Pia Mater, *The thinner inward ſoft skin that inwrappeth the pith and marrow of the brain, and is every where joyned to it; called the thinner and ſoft Meninx.*

Pica, *The longing diſeaſe of Women with Child.*

Pineal, *Kirnel in the brain, in form of a Pine-apple, called alſo* Conarium.

Pituitous, *Snotty thick phlegmatick matter.*

Plaſtic, *Formative, or that worketh and formeth.*

Plenitude, *Fulneſs or ſtore.*

Plethora, *A fulneſs or plenty of humors in the body, good or bad.*

Pleura, *A skin or membrane which clotheth the ribs on the inſide, which being inflamed by the blood, cauſeth the Diſeaſe called the Pleuriſie.*

Pneumatic, *Windy, or belonging to wind or breath.*

Pneumonic, *One ſick of the diſeaſe of the Lungs.*

Polypus, *A filthy diſeaſe in the noſe, breeding ſtinking and ulcerous fleſh within the noſtrils.*

Pontic, *Belonging to the Sea, or to the Country of* Pontus.

Porta Vena, *Is a Vein that hath many ſmall roots faſtened to the Liver, from whence ariſing grow into one trunk or ſtock, which going forth from between two eminent lobes of the Liver, paſſes into the Gall, Ventricle, Spleen, Meſentery, and Caul, and other parts of the body.*

Pores, *Are the little ſmall holes or breathing places in the skin of the body, through which heat and moiſture inſenſibly breath continually.*

Porous, *Full of ſuch like holes or pores.*

Praxis, *Practice or action.*

Præcipitation, *A caſting down, uſed by the Chyſor a certain way of diſtillation, when the matter is thrown back into the Receiver.*

Præternatural, *Beſides or more than natural, not natural, or beſides nature.*

Præceding, *Going before.*

Prævious, *That went before.*

Præcordia, *The parts about the heart, as the Diaphragma, or midriff ſeparating the heart from the other bowels.*

Præmiſed, *Sent before, or before made known.*

Præpollency, *Of very great force, ſtrength, excellency, or virtue.*

Priapiſmus, *Is a diſeaſe in the Yard, that cauſeth it always to be ſtretch'd forth, and extended without any thing provoking it.*

Primigenious, *The firſt original, not having its beginning or birth of another.*

Procatartic, *Remoet, not next cauſe of a diſeaſe.*

Proceſſes, *The parts of a bone (or other parts) that exceed the natural height or poſture, and are yet dependences of the bone and parts, and proceed or go out from it; as alſo ſome Nerves going forth of other Nerves, being ſtill parts of the main ſtock.*

Profuſions, *A pouring forth, or running, or ſtreading abroad.*

Profluvium, *A flowing of humors, a guſhing forth in abundance, a flood.*

Profligated, *Driven away or overthrown, diſcomfited.*

Prognoſis, *The præſcience or fore-knowledge, or Prognoſtication of the event of the diſeaſe.*

Promptuary, *A Store-houſe, or place where any thing is laid up.*

Prominences, *Bunchings forth, thoſe parts that notably ſhew themſelves above the reſt, as a hill in a plain.*

Prophaſis, *The appearing or ſhewing of a thing.*

Prophylactic, *That part of Phyſick that preventeth and preſerveth from diſeaſes.*

Proſtatæ, *Kernels in the Groyn, or about the priviemembers.*

Protenſion, *A ſtretching forth at length.*

Protraction, *A drawing forth at length, alſo a prolonging.*

Protuberance, *A bunching forth above the reſt.*

Protruſion, *A thruſting forward.*

Pſoa, *A great muſcle beginning at the* 11th. *rib, and going through the bowels to the priviemembers.*

Pſora, *The ſcabbado, or ſcabbineſs with puſtles.*

Ptyaliſmus, *Salivation, or a great flux of ſpitting.*

Ptiſan, *Decocted Barly, with other ingredients.*

Puretology, *The doctrine, or a diſcourſe of Feavors.*

Pungitive, *Pricking like needles.*

Purulent, *Full of matter or filthy corruption; as a Bile or Impoſtum.*

Pubis, *That part of the privy-parts, where the hair grows.*

Pulſific. *That ſtrikes as the Pulſe or beating of the Arterie, or that cauſes ſuch ſtriking or pulſe.*

Pylorus, *Is the lower mouth of the ſtomach or ventricle, whereby the meat being digeſted, is tranſmitted into the Stomach-gut or Maw-gut.*

Pyramidical, *Of the ſhape or form of a Pyramide, broad at bottom, and ſharp at the top.*

Pyretology, *The doctrine of Feavers, or of fire.*

Q.

Quotidian, *Daily or every day: an Ague that comes every day.*

Quartan, *Every fourth day; an Ague that has two days of intermiſſion, and comes on the fourth day again.*

R.

Ramifications, *Branchings forth like the Veins, Arteries, and Nerves up and down the body, reſembling the ſmall twigs and branchings of Trees.*

Rareſaction, *A making of any thing rare or thin.*

Ratiocination, *Reaſoning, debating, or arguing of a thing, or the faculty of reaſoning.*

Reciprocation, *A returning back, or a mutual partaking of a thing, or depending on another by a mutual conſequence.*

Recrement, *Any ſuperfluous matter, or thing in the blood or body, or any of the parts.*

Redundancy, *Superfluity, overflowing too much of a thing.*

Receſſes, *The private and hidden parts of the body, or any hid place.*

Refection, *A repaſt of meat and drink, a refreſhing.*

Refraction, *A breaking off, or rebounding back.*

Reflexion, *A bending back, or rebounding.*

Refrigerate, *To make cool, or to refreſh with cooling, as fanning one in great heat.*

Regurgitate, *To ſwallow up again; or to ſup up again what it before had parted with.*

Regulus, *The droſs of metals.*

Renal, *Belonging to the Reins.*

Reiterated, *Repeated, or the ſame thing done or performed again.*

Remora, *A ſtop, let, or ſtay to any thing; a figurative ſpeech taken from a little fiſh ſo called, which is ſaid by cleaving to the keel of a ſhip, to ſtay it in its courſe.*

Repletion, *A fulneſs or filling full, or abounding.*

Repullulate, *To bud or ſpring forth again, as trees in the ſpring.*

Reſine, *A Chymical extraction of ſeveral druggs ſo called, being in ſubſtance like to Roſine or Reſine.*

Reſpiration, *A breathing forth or a venting.*

Reſolution, *A diſſolving or unbinding, a looſning.*

Retort, *A Chymical Veſſel.*

Reverberatory, *A furnace by which matter is calcined or conſumed with the flame.*

Rhomboides, *A Geometrical figure with unequal ſides.*

Rhombus, *A Geometrical figure, with equal ſides, but not right angl'd, like a quarry of glaſs.*

Rhubarb, *A root brought out of the* Eaſt-Indies, *almoſt like a dock-root, uſed to purge choler.*

Riſibility, *Laughter, or the faculty of laughing.*

Riverius, *A famous Phyſician.*

Rotation, *A going round like a wheel, a moving round.*

Rudiments, *The firſt beginnings and principles of things.*

S.

Saline, *Saltiſh, or belonging to Salt,*

Salt-peter, *Or Salt of the Rock: A Salt got out of the Earth, contracted from ſeveral dungs of Fowls or other Creatures, as Pigeons, Poultrey, and Cattel, and from the Urines of Beaſts, and is one of the Ingredients of which they make Gunpowder, much uſed in Chymiſtry.*

Sal-prunella, *A Salt made out of Salt-peter.*

Sal-ammoniacus, *A Salt of the Earth, found among the Sands in* Lybia,

Sal-alcali, *Salt of aſhes made of the herb* Kali, *but uſed alſo for the ſalt of other herbs burnt to aſhes, and ſo extracted.*

Salvatella, *Vein: Is a branch, which ſpringing out of a Cephalick Vrin, in the outſide of the Cubit, ſtretcheth above the wriſt and extream part of the hand, between the Ring-finger and the little finger.*

Salivate, *To ſpit, or cauſe one to void much ſpittle.*

Salivation, *A great flux of ſpitting, or avoiding of ſpittle more than ordinary at the mouth.*

Sanguineous, *Bloody, or belonging to the blood.*

Sanguification, *The making of blood, or the changing the nouriſhment into blood.*

Sanguiducts,

Sanguiducts, *The Veſſels that carry the blood through the body, as the Veins and Arteries.*

Sarſaparilla, *A drug brought from the* Weſt-Indies, *uſed in many decoctions.*

Sagapenum, *A kind of Gum or Roſin that runs forth of the ſhrub called* Ferula.

Scammony, *The juice of an herb which violently purgeth choler; it is alſo called* Diagridium.

Scapular, *Muſcle; a muſcle belonging to the ſhoulders, and ſerves for the moving of them.*

Scheam, *Is a figure or draught of a thing; alſo taken for an Aſtrological Table of the* 12. *Houſes.*

Schirri & Scirri, *Are hard ſwellings in the fleſh, without pain, but hardly curable.*

Schirrous, *Full of ſuch hard ſwellings.*

Sclerotick, *That is troubled with ſome tumor in the third panicle of the eye, called the* Cornea membrana. *or ſomewhere thereabouts.*

Scorbutick, *That is troubled with the diſeaſe called the* Scorbute *or Scurvey.*

Scordium, *A uſeful herb in Phyſick, having leaves almoſt like Germander.*

Scotomies, Scotomie, *Turnings round; a diſeaſe in the head, when all things ſeem to turn round.*

Scrotum, *The outward skin of the Cods, where the hair grows.*

Scutiform, *In the form of a Shield or Buckler.*

Sedal, *Veins: the Veins in the Fundament.*

Seclusion, *A thruſting forth, or out.*

Secundine, *The After-birth, or that which inwraps the Child, which follows after the Birth of the Child; vulgarly called the After-burthen; of Anatomiſts the* 4th. *membrane of the eye, called* Chorion; *and that firſt clotheth the optic ſinew is called the* Secundine.

Secretion, *A ſeparation or putting apart.*

Secreted, *Separated apart.*

Senna, *Or Sena, the leaves of a Plant, that Purgeth Phlegm, Choler and Melancholy.*

Senſory, *The orgain of feeling, or of diſcriminating by the ſenſes; the common ſenſory or ſeat of ſuch organ, placed in the brain.*

Septic. *That hath the force of corrupting or putrifying, or that maketh rotten or ripe the matter in a ſoar.*

Series, *An order, courſe, or ſucceſſion of things, a row or courſe of things orderly one after another.*

Serous, *Humor, the whey or watery humor that accompanieth the blood, and which makes it fluid, and is ſeparated and put off from the blood into the parts of the body.*

Seroſities, *Such ſerous humours abounding.*

Serum, *The whey or watery humor of the blood, the ſubſtance of the ſerous humor.*

Sinus, *A boſom or a hollow turning, or outlet of waters, or an inlet or arm of the Sea.*

Soldanella, *Is the Sea-colewort or Folefoot.*

Solitive, *Looſening, or that maketh the body looſe.*

Solſtices, *Are two, the Summer and the Winter ſolſtice; the firſt is about the twelfth of* June, *when the Sun is neareſt to us, and makes with us the longeſt day; the laſt is about the* 12. *of* December, *when the Sun is at its greateſt diſtance from us, and makes with us the ſhorteſt day.*

Solving, *Looſening or unbinding.*

Solution, *A looſning or weakning, as of the Nerves or joynts.*

Solvent, *That which diſſolveth or openeth the parts of the matter to be wrought upon.*

Spagiric, *Belonging to Alchymie, or to the Chymical art.*

Spaſms, *Cramps or Convulſions of the Nerves.*

Spaſmodic, *Belonging to the Cramp or Convulſion, or hauling of the ſinews.*

Spaſmology, *The doctrine of the Convulſion or Cramp of the ſinews.*

Speculative, *Contemplative or notional.*

Speculation, *A ſeeing or diſcovering a thing by contemplation.*

Species, *A kind more particular than Genus, and may be communicated to more generals; as a Cow and an Horſe are of a different ſpecies, but both Animals or Beaſts.*

Spermatic, *Belonging to the ſperm or ſeed.*

Sphaceliſmus, *A blaſting or a mortification of a part.*

Sphincter, *Is the round muſcle that encompaſſes the mouth of the Arſe-gut, which keeps the excrements from an involuntary coming forth.*

Spine, *The back-bone, or long-joynted bone that goes down the back.*

Spina dorſi, *The ſame; the bone of the back, the Chine.*

Spinal, *Belonging to that bone.*

Spiral, *A turning about, and as it were aſcending.*

Splanchnic, Splanchnical, *Belonging to the Spleen.*

Splenitic, *Troubled with the diſeaſe of the Spleen.*

Spodium, *A ſort of ſoot made out of the making and trying of braſs.*

Spontaneous, *Willingly or of one accord, or by the command of the will.*

Sporadical, *That ſeaſeth not after an uſual manner; diſeaſes that ſeize privatly here and there on People diſperſedly, not generally or epidemically.*

Squinancy, *Or Squincy, is a ſwelling in the throat, with an inflamation.*

Stagmas, *The mixtures of metals, or other Chymical things ſet together to ferment and operate one upon the other.*

Stagnation, *A ſtanding ſtill without motion, as a pool.*

Sternothyroeidal, *Muſcle: A Muſcle which reaches from the* Sternon *to the* Os Pubis.

Sternon, *That part of the breaſt where the ribs meet.*

Stibium, *Antimony.*

Stiptic, *Or* Styptic, *that ſtrainеth, bindeth, or is reſtrictive.*

Strumous, *That belongeth to the Kings evil, or he that hath that diſeaſe.*

Subclavian, *Veſſels: The veſſels that belong to the little ribs of the breaſt.*

Sublimate, *White Mercury, or Quick-ſilver Chymically ſublimed; Mercury ſublimate: of a poyſonous nature.*

Subſide, *To ſink down, or fall to the bottom.*

Subſidiarie, *That cometh for aid, or to help, or bringing aid or help.*

Subaction, *A kneading, working, exerciſing, or bringing under.*

Suffuſion, *A ſpreading abroad, or pouring forth.*

Sudation, *A ſweating,*

Sudorific, *That cauſeth ſweating.*

Sulphur, *Brimſtone which is found in Mines in the Earth, taken alſo for one of the Chymiſts principles.*

Sulphureous, *Brimſtony, or belonging to Brimſtone.*

Superficies, *The outſide, or overmoſt part of any thing.*

Suppuration, *A ripening or gathering together of the matter of a ſore.*

Surculs, *Little or ſmall ſhoots or ſpriggs.*

Sutures, *The joynings together of the bones of the head, which appear as if ſowed together with long ſtitches.*

Symptom, *Is an effect accident, or paſſion following any ſickneſs, or any ſenſible grief joyned with a diſeaſe, beſides the diſeaſe it ſelf, as Head-ach with a Feavor.*

Sympathy, *Is a natural paſſion of one thing to another, or an agreement in qualities.*

Sympathic, *Agreeing in affections or paſſions.*

Symphony, *A conſent or agreement in harmony.*

Sympraxis, *A joynt exerciſing or agreement in practice or action; a conſent in operation.*

Syncope, *A ſwooning, or a loſs of all ſenſe.*

Synochus, *Is a Feavour without changes or intermiſſions, a continual feavour.*

Synthetis, *A figure contrary to Analyſis; a conceſſion of ſome things ariſing from the matter.*

Syſtaſis, *Conſtitution.*

Syſtem, *The work or part of ſomething that is conſtituted; or a theam or work compacted of ſeveral parts, a part of which is a Syſtem.*

Syſtole, *Is the motion of the heart and arteries, contrary to Diaſtole, by the which they are contracted, but by this they are dilated.*

Syzygies, *Are the Nerves that carry the ſenſe from the brain to the whole body; alſo the Conjunctions of the Sun, Moon, and Stars.*

T.

Tabes dorſalis, *The mourning of the Chine; a waſting or conſumption of the back.* 28

Tabid, *Conſumptive, pining, or waſting,*

Tamarinds, *An outlandiſh fruit, good to quench thirſt, and to allay the heat of choler, uſed in Medicines.*

Tarantula, *A little venemous Creature found in* Apulia, *a part of* Italy, *whoſe poyſon being by biting diffuſed through the body, ſtrikes the Nerves with ſtrange tumors and Convulſions, which is only curable by the party ſo bitten, being provoked to continual dancing, by which means the poyſon is evacuated through the pores from the Nerves.*

Tartar, *Is a concreted matter taken from the Lees of Wine, very medicinable.*

Tenacious, *Holding or cleaving faſt.*

Tenaſm, *A great deſire of going to ſtool, and yet can do nothing.*

Tenuous, *Thin, ſlender, or ſmall.*
